Create a Vscan On-Demand policy

POST /protocols/vscan/{svm.uuid}/on-demand-policies

Introduced In: 9.6

Creates a Vscan On-Demand policy. Created only on a data SVM.

Important notes:

- Only one policy can be scheduled at a time on an SVM. Use schedule name or schedule uuid to schedule an On-Demand policy.
- Scanning must be enabled on the SVM before the policy is scheduled to run.
- The `exclude_extensions` setting overrides the `include_extensions` setting. Set `scan_without_extension` to `true` to scan files without extensions.

Required properties

- `svm.uuid` - Existing SVM in which to create the Vscan On-Demand policy.
- `name` - Name of the Vscan On-Demand policy. Maximum length is 256 characters.
- `log_path` - Path from the Vserver root where the On-Demand policy report is created.
- `scan_paths` - List of paths that need to be scanned.

Recommended optional properties

- `schedule` - Scan schedule. It is recommended to set the schedule property, as it dictates when to scan for viruses.

Default property values

If not specified in POST, the following default property values are assigned:

- `include_extensions` - *
- `max_file_size` - *10737418240*
- `scan_without_extension` - *true*

Related ONTAP commands

    }
  }
}
```

Error

Status: Default

ONTAP Error Response Codes

Error Code	Description
10027101	The file size must be in the range 1KB to 1TB
10027107	The include extensions list cannot be empty. Specify at least one extension for inclusion.
10027164	An On-Demand policy cannot be scheduled, as the Vscan is disabled. Enable the Vscan and retry the operation.
10027167	The specified schedule does not exist. Create the schedule or create a policy without specifying the schedule.
10027168	The specified scan path does not exist. The scan path must be specified from the root of the SVM, and must begin with UNIX path delimiters (use "/" not "\")
10027169	The specified scan path is not supported for scanning.
10027173	The new On-Demand policy cannot be created as the SVM has reached the maximum number of On-Demand policies allowed. Delete an existing policy in order to create a new policy.
10027174	The specified exclude path is invalid. The path must be specified from the root of the SVM, and must begin with UNIX path delimiters (use "/" not "\")
10027175	An On-Demand policy cannot be scheduled as the Vserver is not in an operational state.
10027176	The log-path specified does not exist. The log path must be specified from the root of the SVM, and must begin with UNIX path delimiters (use "/" not "\").
10027177	The log path specified is not supported.
10027253	The number of paths specified exceeds the configured maximum number of paths. You cannot specify more than the maximum number of configured paths.
10027254	The number of extensions specified exceeds the configured maximum number of extensions. You cannot specify more than the maximum number of configured extensions.
10027255	Another policy is already scheduled. Only one policy per SVM is allowed to be scheduled at any one time. Create a policy without specifying a schedule.

ONTAP Error Response Codes

Error Code	Description
10027101	The file size must be in the range 1KB to 1TB
10027107	The include extensions list cannot be empty. Specify at least one extension for inclusion.
10027164	An On-Demand policy cannot be scheduled, as the Vscan is disabled. Enable the Vscan and retry the operation.
10027167	The specified schedule does not exist. Create the schedule or create a policy without specifying the schedule.
10027168	The specified scan path does not exist. The scan path must be specified from the root of the SVM, and must begin with UNIX path delimiters (use "/" not "\")
10027169	The specified scan path is not supported for scanning.
10027174	The specified exclude path is invalid. The path must be specified from the root of the SVM, and must begin with UNIX path delimiters (use "/" not "\")
10027175	An On-Demand policy cannot be scheduled as the SVM is not in an operational state.
10027176	The log-path specified does not exist. The log path must be specified from the root of the SVM, and must begin with UNIX path delimiters (use "/" not "\")
10027177	The log path specified is not supported.
10027253	The number of paths specified exceeds the configured maximum number of paths. You cannot specify more than the maximum number of configured paths.
10027254	The number of extensions specified exceeds the configured maximum number of extensions. You cannot specify more than the maximum number of configured extensions.
10027255	Another policy is already scheduled. Only one policy per SVM is allowed to be scheduled at any one time. Update a policy without specifying a schedule.

Manage Vscan scanner-pool configuration

Protocols Vscan svm.uuid scanner-pools endpoint overview

Overview

A scanner-pool defines the Vscan servers and privileged users that can connect to SVMs and a scanner policy or role determines whether a scanner-pool is active. You can configure a scanner-pool to be used on the local cluster or any other cluster in an MCC/DR setup.

Examples

Retrieving all fields for all scanner-pools of an SVM

```
# The API:
/api/protocols/vscan/{svm.uuid}/scanner-pools

# The call:
curl -X GET "https://<mgmt-ip>/api/protocols/vscan/<svm-uuid>/scanner-
pools?fields=*&return_records=true&return_timeout=15" -H "accept:
application/json"

# The response:
{
  "records": [
    {
      "svm": {
        "uuid": "0e2f7c91-f227-11e8-9601-0050568ecc06"
      },
      "name": "scanner-1",
      "servers": [
        "1.1.1.1",
        "10.72.204.27"
      ],
      "privileged_users": [
        "cifs\\u1",
        "cifs\\u2"
      ],
      "role": "primary"
    },
    {
      "svm": {
        "uuid": "0e2f7c91-f227-11e8-9601-0050568ecc06"
      },
      "name": "scanner-2",
      "servers": [
        "1.1.1.1",
        "10.72.204.27"
      ],
      "privileged_users": [
        "cifs\\u1",
        "cifs\\u2"
      ],
      "role": "secondary"
    }
  ],
  "num_records": 2
}
```

Retrieving all scanner-pools with *role* set as *secondary*

```
# The API:
/api/protocols/vscan/{svm.uuid}/scanner-pools

# The call:
curl -X GET "https://<mgmt-ip>/api/protocols/vscan/<svm-uuid>/scanner-pools?role=secondary&fields=*&return_records=true&return_timeout=15" -H "accept: application/json"

# The response:
{
  "records": [
    {
      "svm": {

Parameters

Name	Type	In	Required	Description
cluster.name	string	query	False	Filter by cluster.name
cluster.uuid	string	query	False	Filter by cluster.uuid

Name	Type	In	Required	Description
role	string	query	False	Filter by role
privileged_users	string	query	False	Filter by privileged_users
servers	string	query	False	Filter by servers
name	string	query	False	Filter by name
svm.uuid	string	path	True	UUID of the SVM to which this object belongs.
fields	array[string]	query	False	Specify the fields to return.
max_records	integer	query	False	Limit the number of records returned.
return_records	boolean	query	False	The default is true for GET calls. When set to false, only the number of records is returned. <ul style="list-style-type: none"> • Default value: 1
return_timeout	integer	query	False	The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached. <ul style="list-style-type: none"> • Default value: 1 • Max value: 120 • Min value: 0

Name	Type	In	Required	Description
order_by	array[string]	query	False	Order results by specified fields and optional [asc

Create a Vscan scanner-pool configuration for an SVM

POST /protocols/vscan/{svm.uuid}/scanner-pools

Introduced In: 9.6

Creates a Vscan scanner-pool configuration for a specified SVM. You can create a scanner-pool with all fields specified or only mandatory fields specified.

Important notes:

- A scanner-pool must have servers and privileged users specified.
- If the role or cluster is not specified, the scanner-pool is created on the local cluster with the role set as `primary`.
*Only one of the fields `cluster-uuid` or `cluster-name` is required.

Required properties

- `svm.uuid` or `svm.name` - Existing SVM in which to create the Vscan configuration.
- `name` - Scanner-pool name.
- `privileged_users` - List of privileged users.
- `servers` - List of server IP addresses or FQDNs.

Recommended optional properties

- `role` - Setting a role for a scanner-pool is recommended.
- `cluster` - Passing the cluster name or UUID (or both) in a multi-cluster environment is recommended.

Default property values

If not specified in POST, the following default property values are assigned:

- `role` - `primary`
- `cluster.name` - Local cluster name.
- `cluster.uuid` - Local cluster UUID.

Related ONTAP commands

- `vserver vscan scanner-pool create`
- `vserver vscan scanner-pool apply-policy`
- `vserver vscan scanner-pool privileged-users add`
- `vserver vscan scanner-pool servers add`

Delete a Vscan scanner-pool configuration

```
DELETE /protocols/vscan/{svm.uuid}/scanner-pools/{name}
```

Introduced In: 9.6

Deletes a Vscan scanner-pool configuration.

Important notes:

- The Vscan scanner-pool DELETE endpoint deletes all of the Vscan scanner-pools for a specified SVM.
- If a Vscan is enabled, it requires at least one scanner-pool to be in the active state. Therefore, disable Vscan on the specified SVM so all the scanner-pools configured on that SVM can be deleted.

Related ONTAP commands

- `vserver vscan scanner-pool delete`

Update the Vscan scanner-pool configuration for an SVM

```
PATCH /protocols/vscan/{svm.uuid}/scanner-pools/{name}
```

Introduced In: 9.6

Updates the Vscan scanner-pool configuration of an SVM.

Important notes:

- Along with servers and privileged-users, the role of a scanner-pool can also be updated with the cluster on which a scanner-pool is allowed.
- If role is specified and cluster isn't, then role is applied to the local cluster.

Related ONTAP commands

NDMP

NDMP overview

NDMP (Network Data Management Protocol) provides an open standard for network-based backup of network-attached storage (NAS). NDMP minimizes the coding required for different applications by providing standard commands for backing up and restoring file servers. NDMP increases the speed and efficiency of NAS data protection, as data can bypass backup servers and be written directly to tape storage. Starting from ONTAP 8.2, the software supports SVM aware NDMP backups. This helps in optimizing NDMP backup performance by choosing efficient data transfer paths and is fully compatible with integrated non-disruptive operations and volume mobility capabilities of ONTAP software. In order to support this feature, a CAB extension must be implemented by backup vendors.

These APIs allow you to manage the following endpoints:

- ndmp
- ndmp nodes
- ndmp svms
- ndmp sessions

APIs

NDMP

These APIs are used to manage NDMP mode, SVM-scope or node-scope.

NDMP nodes

These APIs are used to manage node configurations.

NDMP SVMs

These APIs are used to manage NDMP configurations of SVMs.

NDMP sessions

These APIs are used to manage diagnostic information on NDMP sessions belonging to a specific SVM in the case of SVM-scope or to a specific node in the case of node-scope.

Manage NDMP mode

Protocols NDMP endpoint overview

You can use this API to manage NDMP mode: SVM-scope or node-scope.

Examples

Updates NDMP mode to SVM:

```
PATCH "/api/protocols/ndmp" '{"mode":"svm"}'
```

Updates NDMP mode to node:

```
PATCH "/api/protocols/ndmp" '{"mode":"node"}'
```

Retrieve current NDMP mode

GET /protocols/ndmp

Introduced In: 9.7

Retrieves the current NDMP mode.

Related ONTAP commands

Manage NDMP node configurations

Protocols NDMP nodes endpoint overview

You can use this API to manage node configurations. The authentication types "plaintext" and "plaintext_sso" are used to show that the password uses clear text. Also, they contain no differences for NDMP node scope.

Examples

Updates "enabled" and "authentication_types" fields:

```
PATCH "/api/protocols/ndmp/nodes/13bb2092-458b-11e9-9c06-0050568ea64e"
'{"enabled":"false","authentication_types":["plaintext"]}'
```

Updates the "user" field:

```
PATCH "/api/protocols/ndmp/nodes/13bb2092-458b-11e9-9c06-0050568ea64e"
'{"user":"user22"}'
```

Retrieve the NDMP node configurations for all nodes

GET /protocols/ndmp/nodes

Introduced In: 9.7

Retrieves NDMP node configurations for all of the nodes.

Manage NDMP session configurations

Protocols NDMP sessions endpoint overview

You can use this API to manage diagnostic information on NDMP sessions belonging to a specific SVM in the case of SVM-scope or to a specific node in the case of node-scope.

Examples

Retrieves NDMP session details under node-scope:

```
GET "/api/protocols/ndmp/sessions/9b372ce7-3a4b-11e9-a7f8-0050568e3d73/2000"
```

Retrieves NDMP session details under SVM-scope:

```
GET "/api/protocols/ndmp/sessions/13bb2092-458b-11e9-9c06-0050568ea604/2000:4000"
```

Deletes NDMP session details under node-scope:

```
DELETE "/api/protocols/ndmp/sessions/9b372ce7-3a4b-11e9-a7f8-0050568e3d73/2000"
```

Deletes NDMP session details under SVM-scope:

```
DELETE "/api/protocols/ndmp/sessions/13bb2092-458b-11e9-9c06-0050568ea604/2000:4000"
```

Retrieve NDMP sessions

```
GET /protocols/ndmp/sessions
```

Introduced In: 9.7

Retrieves a collection of NDMP sessions. In the case of SVM-scope, if this API is executed on a data IP, it displays the list of NDMP sessions under the specified SVM; otherwise it displays the list of NDMP sessions for all the SVMs under the cluster. In the case of node-scope, it displays the list of NDMP sessions for all nodes.

Update the NDMP configuration for an SVM

```
PATCH /protocols/ndmp/svms/{svm.uuid}
```

Introduced In: 9.7

Updates the NDMP configuration for a specific SVM.

Related ONTAP commands

NVMe

NVMe overview

Overview

The Non-Volatile Memory Express (NVMe) API endpoints and objects provide for configuration, provisioning and management of the NVMe-related objects.

NVMe over Fabrics (NVMe-oF) refers to the extensions and changes to the base NVMe command set to support NVMe commands over a fabric interconnect and from multiple hosts simultaneously. ONTAP implements elements of both NVMe and NVMe-oF. Throughout this documentation, NVMe is generally used to refer to both NVMe and NVMe-oF.

Fibre Channel Logins

Fibre Channel logins represent connections, formed by Fibre Channel initiators, that have successfully logged in to ONTAP. This represents the Fibre Channel login on which higher-level protocols such as Fibre Channel Protocol (FCP) and Non-Volatile Memory Express over Fibre Channel (NVMe over FC) rely.

The Fibre Channel logins REST API provides information about active Fibre Channel logins.

NVMe Interfaces

NVMe interfaces are network interfaces configured to support an NVMe over Fabrics protocol. The NVMe interfaces are Fibre Channel interfaces supporting an NVMe-oF data protocol. Regardless of the underlying physical and data protocol, NVMe interfaces are treated equally for the host-side application configuration. This endpoint provides a consolidated view of all NVMe interfaces for the purpose of configuring host-side applications.

The NVMe interfaces REST API provides NVMe-specific information about network interfaces configured to support an NVMe-oF protocol.

Learn More

- *Fibre Channel Interfaces* found in the *networking* section. Fibre Channel interfaces are the logical endpoints for Fibre Channel network connections to an SVM.

NVMe Services

A Non-Volatile Memory Express (NVMe) service defines the properties of the NVMe controller target for an SVM. There can be at most one NVMe service for a given SVM. An SVM's NVMe service must be created before NVMe host initiators can connect to the SVM.

The Non-Volatile Memory Express (NVMe) service REST API allows you to create, update, delete, and discover NVMe services for SVMs.

NVMe Subsystem Controllers

Non-Volatile Memory Express (NVMe) subsystem controllers represent dynamic connections between hosts and a storage solution.

The NVMe subsystem controllers REST API provides information about connected hosts.

NVMe Subsystem Maps

An NVMe subsystem map is an association of an NVMe namespace with an NVMe subsystem. When an NVMe namespace is mapped to an NVMe subsystem, the NVMe subsystem's hosts are granted access to the NVMe namespace. The relationship between an NVMe subsystem and an NVMe namespace is one subsystem to many namespaces.

The NVMe subsystem map REST API allows you to create, delete, and discover NVMe subsystem maps.

NVMe Subsystems

An NVMe subsystem maintains configuration state and namespace access control for a set of NVMe-connected hosts.

The NVMe subsystem REST API allows you to create, update, delete, and discover NVMe subsystems. It also allows you to add and remove NVMe hosts that can access the subsystem and associated namespaces.

NVMe Namespaces

An NVMe namespace is a collection of addressable logical blocks presented to hosts connected to the storage virtual machine using the NVMe over Fabrics protocol.

The NVMe namespace REST API allows you to create, update, delete, and discover NVMe namespaces.

View NVMe interfaces

Protocols NVMe interfaces endpoint overview

Overview

NVMe interfaces are network interfaces configured to support an NVMe over Fabrics (NVMe-oF) protocol. The NVMe interfaces are Fibre Channel (FC) interfaces supporting an NVMe-oF data protocol. Regardless of the underlying physical and data protocol, NVMe interfaces are treated equally for host-side application configuration. This endpoint provides a consolidated view of all NVMe interfaces for the purpose of configuring host-side applications.

The NVMe interfaces REST API provides NVMe-specific information about network interfaces configured to support an NVMe-oF protocol.

NVMe interfaces must be created using the protocol-specific endpoints for FC interfaces. See [POST /network/fc/interfaces](#) . After creation, the interfaces are available via this interface.

Examples

Retrieving summary information for all NVMe interfaces

```
# The API:
GET /api/protocols/nvme/interfaces

# The call:
curl -X GET 'https://<mgmt-ip>/api/protocols/nvme/interfaces' -H 'accept:
application/hal+json'
```

```

# The response:
{
  "records": [
    {

self	href	

node

The node on which the FC port is located.

Name	Type	Description
name	string	The name of the node on which the FC port is located.

port

An FC port is the physical port of an FC adapter on a cluster node that can be connected to an FC network.

Name	Type	Description
_links	_links	
name	string	The name of the FC port.
node	node	The node on which the FC port is located.
uuid	string	The unique identifier of the FC port.

fc_interface

The attributes specific to a Fibre Channel-based NVMe interface.

Name	Type	Description
_links	_links	
port	port	An FC port is the physical port of an FC adapter on a cluster node that can be connected to an FC network.

Name	Type	Description
wwnn	string	The WWNN (world wide node name) of the Fibre Channel NVMe interface.
wwpn	string	The WWPN (world wide port name) of the Fibre Channel NVMe interface.

node

Name	Type	Description
_links	_links	
name	string	
uuid	string	

svm

Name	Type	Description
_links	_links	
name	string	The name of the SVM.
uuid	string	The unique identifier of the SVM.

error_arguments

Name	Type	Description
code	string	Argument code
message	string	Message argument

error

Name	Type	Description
arguments	array[error_arguments]	Message arguments
code	string	Error code
message	string	Error message
target	string	The target parameter that caused the error.

Manage NVMe services

Protocols NVMe services endpoint overview

Overview

A Non-Volatile Memory Express (NVMe) service defines the properties of the NVMe controller target for an SVM. There can be at most one NVMe service for an SVM. An SVM's NVMe service must be created before NVMe host initiators can connect to the SVM.

The Non-Volatile Memory Express (NVMe) service REST API allows you to create, update, delete, and discover NVMe services for SVMs.

Performance monitoring

Performance of the SVM can be monitored by the `metric.*` and `statistics.*` properties. These show the performance of the SVM in terms of IOPS, latency and throughput. The `metric.*` properties denote an average whereas `statistics.*` properties denote a real-time monotonically increasing value aggregated across all nodes.

Examples

Creating an NVMe service for an SVM

The simplest way to create an NVMe service is to specify only the SVM, either by name or UUID. By default, the new NVMe service is enabled.

In this example, the `return_records` query parameter is used to retrieve the new NVMe service object in the REST response.

```

# The API:
POST /api/protocols/nvme/services

# The call:
curl -X POST 'https://<mgmt-
ip>/api/protocols/nvme/services?return_records=true' -H 'accept:
application/hal+json' -d '{ "svm": { "name": "svm1" } }'

# The response:
{
  "num_records": 1,
  "records": [
    {
      "svm": {
        "uuid": "bfb1beb0-dc69-11e8-b29f-005056bb7341",
        "name": "svm1",
        "_links": {
          "self": {
            "href": "/api/svm/svms/bfb1beb0-dc69-11e8-b29f-005056bb7341"
          }
        }
      },
      "enabled": true,
      "_links": {
        "self": {
          "href": "/api/protocols/nvme/services/bfb1beb0-dc69-11e8-b29f-
005056bb7341"
        }
      }
    }
  ]
}

```

Retrieving the NVMe services for all SVMs in the cluster

```

# The API:
GET /api/protocols/nvme/services

# The call:
curl -X GET 'https://<mgmt-ip>/api/protocols/nvme/services' -H 'accept:
application/hal+json'

# The response:

```

```

{
  "records": [
    {
      "svm": {
        "uuid": "ab60c350-dc68-11e8-9711-005056bbe408",
        "name": "svm0",
        "_links": {
          "self": {
            "href": "/api/svm/svms/ab60c350-dc68-11e8-9711-005056bbe408"
          }
        }
      },
      "_links": {
        "self": {
          "href": "/api/protocols/nvme/services/ab60c350-dc68-11e8-9711-005056bbe408"
        }
      }
    },
    {
      "svm": {
        "uuid": "bfb1beb0-dc69-11e8-b29f-005056bb7341",
        "name": "svm1",
        "_links": {
          "self": {
            "href": "/api/svm/svms/bfb1beb0-dc69-11e8-b29f-005056bb7341"
          }
        }
      },
      "_links": {
        "self": {
          "href": "/api/protocols/nvme/services/bfb1beb0-dc69-11e8-b29f-005056bb7341"
        }
      }
    }
  ],
  "num_records": 2,
  "_links": {
    "self": {
      "href": "/api/protocols/nvme/services"
    }
  }
}

```

Retrieving details for a specific NVMe service

The NVMe service is identified by the UUID of its SVM.

```
# The API:
GET /api/protocols/nvme/services/{svm.uuid}

# The call:
curl -X GET 'https://<mgmt-ip>/api/protocols/nvme/services/bfb1beb0-dc69-11e8-b29f-005056bb7341' -H 'accept: application/hal+json'

# The response:
{
  "svm": {
    "uuid": "bfb1beb0-dc69-11e8-b29f-005056bb7341",
    "name": "svm1",
    "_links": {
      "self": {
        "href": "/api/svm/svms/bfb1beb0-dc69-11e8-b29f-005056bb7341"
      }
    }
  },
  "enabled": true,
  "_links": {
    "self": {
      "href": "/api/protocols/nvme/services/bfb1beb0-dc69-11e8-b29f-005056bb7341"
    }
  }
}
```

Disabling an NVMe service

Disabling an NVMe service shuts down all active NVMe connections for the SVM and prevents the creation of new NVMe connections.

The NVMe service to update is identified by the UUID of its SVM.

```
# The API:
PATCH /api/protocols/nvme/services/{svm.uuid}

# The call:
curl -X PATCH 'https://<mgmt-ip>/api/protocols/nvme/services/bfb1beb0-
dc69-11e8-b29f-005056bb7341' -H 'accept: application/hal+json' -d '{
"enabled": "false" }'
```

You can retrieve the NVMe service to confirm the change.

```
# The API:
GET /api/protocols/nvme/services/{svm.uuid}

# The call:
curl -X GET 'https://<mgmt-ip>/api/protocols/nvme/services/bfb1beb0-dc69-
11e8-b29f-005056bb7341' -H 'accept: application/hal+json'

# The response:
{
"svm": {
  "uuid": "bfb1beb0-dc69-11e8-b29f-005056bb7341",
  "name": "svm1",
  "_links": {
    "self": {
      "href": "/api/svm/svms/bfb1beb0-dc69-11e8-b29f-005056bb7341"
    }
  }
},
"enabled": false,
"_links": {
  "self": {
    "href": "/api/protocols/nvme/services/bfb1beb0-dc69-11e8-b29f-
005056bb7341"
  }
}
}
```

Deleting an NVMe service

The NVMe service must be disabled before it can be deleted. In addition, all NVMe interfaces, subsystems, and subsystem maps associated with the SVM must first be deleted.

The NVMe service to delete is identified by the UUID of its SVM.

```
# The API:
DELETE /api/protocols/nvme/services/{svm.uuid}

# The call:
curl -X DELETE 'https://<mgmt-ip>/api/protocols/nvme/services/bfblbeb0-
dc69-11e8-b29f-005056bb7341' -H 'accept: application/hal+json'
```

Retrieve NVMe services

GET /protocols/nvme/services

Introduced In: 9.6

Retrieves NVMe services.

Expensive properties

There is an added cost to retrieving values for these properties. They are not included by default in GET results and must be explicitly requested using the `fields` query parameter. See [Requesting specific fields](#) to learn more.

- `statistics.*`
- `metric.*`

Related ONTAP commands

- `vserver nvme show`

Learn more

- [DOC /protocols/nvme/services](#)

Parameters

Name	Type	In	Required	Description
enabled	boolean	query	False	Filter by enabled
statistics.timestamp	string	query	False	Filter by statistics.timestamp <ul style="list-style-type: none">• Introduced in: 9.7

Name	Type	In	Required	Description
statistics.iops_raw.total	integer	query	False	Filter by statistics.iops_raw.total • Introduced in: 9.7
statistics.iops_raw.other	integer	query	False	Filter by statistics.iops_raw.other • Introduced in: 9.7
statistics.iops_raw.read	integer	query	False	Filter by statistics.iops_raw.read • Introduced in: 9.7
statistics.iops_raw.write	integer	query	False	Filter by statistics.iops_raw.write • Introduced in: 9.7
statistics.latency_raw.total	integer	query	False	Filter by statistics.latency_raw.total • Introduced in: 9.7
statistics.latency_raw.other	integer	query	False	Filter by statistics.latency_raw.other • Introduced in: 9.7
statistics.latency_raw.read	integer	query	False	Filter by statistics.latency_raw.read • Introduced in: 9.7

Name	Type	In	Required	Description
statistics.latency_raw.write	integer	query	False	Filter by statistics.latency_raw.write • Introduced in: 9.7
statistics.status	string	query	False	Filter by statistics.status • Introduced in: 9.7
statistics.throughput_raw.total	integer	query	False	Filter by statistics.throughput_raw.total • Introduced in: 9.7
statistics.throughput_raw.read	integer	query	False	Filter by statistics.throughput_raw.read • Introduced in: 9.7
statistics.throughput_raw.write	integer	query	False	Filter by statistics.throughput_raw.write • Introduced in: 9.7
svm.uuid	string	query	False	Filter by svm.uuid
svm.name	string	query	False	Filter by svm.name
metric.timestamp	string	query	False	Filter by metric.timestamp • Introduced in: 9.7

Name	Type	In	Required	Description
metric.throughput.total	integer	query	False	Filter by metric.throughput.total • Introduced in: 9.7
metric.throughput.read	integer	query	False	Filter by metric.throughput.read • Introduced in: 9.7
metric.throughput.write	integer	query	False	Filter by metric.throughput.write • Introduced in: 9.7
metric.latency.total	integer	query	False	Filter by metric.latency.total • Introduced in: 9.7
metric.latency.other	integer	query	False	Filter by metric.latency.other • Introduced in: 9.7
metric.latency.read	integer	query	False	Filter by metric.latency.read • Introduced in: 9.7
metric.latency.write	integer	query	False	Filter by metric.latency.write • Introduced in: 9.7

Name	Type	In	Required	Description
metric.iops.total	integer	query	False	Filter by metric.iops.total • Introduced in: 9.7
metric.iops.other	integer	query	False	Filter by metric.iops.other • Introduced in: 9.7
metric.iops.read	integer	query	False	Filter by metric.iops.read • Introduced in: 9.7
metric.iops.write	integer	query	False	Filter by metric.iops.write • Introduced in: 9.7
metric.duration	string	query	False	Filter by metric.duration • Introduced in: 9.7
metric.status	string	query	False	Filter by metric.status • Introduced in: 9.7
fields	array[string]	query	False	Specify the fields to return.
max_records	integer	query	False	Limit the number of records returned.
return_records	boolean	query	False	The default is true for GET calls. When set to false, only the number of records is returned. • Default value: 1

Name	Type	In	Required	Description
return_timeout	integer	query	False	<p>The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached.</p> <ul style="list-style-type: none"> • Default value: 1 • Max value: 120 • Min value: 0
order_by	array[string]	query	False	Order results by specified fields and optional [asc

Response

Status: 200, Ok

Name	Type	Description

iops

The rate of I/O operations observed at the storage object.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Performance metric for write I/O operations.

latency

The round trip latency in microseconds observed at the storage object.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Performance metric for write I/O operations.

throughput

The rate of throughput bytes per second observed at the storage object.

Name	Type	Description
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Performance metric for write I/O operations.

metric

Name	Type	Description
_links	_links	
duration	string	The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:
iops	iops	The rate of I/O operations observed at the storage object.

Name	Type	Description
latency	latency	The round trip latency in microseconds observed at the storage object.
status	string	Any errors associated with the sample. For example, if the aggregation of data over multiple nodes fails then any of the partial errors might be returned, "ok" on success, or "error" on any internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.
throughput	throughput	The rate of throughput bytes per second observed at the storage object.
timestamp	string	The timestamp of the performance data.

iops_raw

The number of I/O operations observed at the storage object. This should be used along with delta time to calculate the rate of I/O operations per unit of time.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.

Name	Type	Description
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Performance metric for write I/O operations.

latency_raw

The raw latency in microseconds observed at the storage object. This should be divided by the raw IOPS value to calculate the average latency per I/O operation.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Performance metric for write I/O operations.

throughput_raw

Throughput bytes observed at the storage object. This should be used along with delta time to calculate the rate of throughput bytes per unit of time.

Name	Type	Description
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Performance metric for write I/O operations.

statistics

Name	Type	Description
iops_raw	iops_raw	The number of I/O operations observed at the storage object. This should be used along with delta time to calculate the rate of I/O operations per unit of time.
latency_raw	latency_raw	The raw latency in microseconds observed at the storage object. This should be divided by the raw IOPS value to calculate the average latency per I/O operation.
status	string	Any errors associated with the sample. For example, if the aggregation of data over multiple nodes fails then any of the partial errors might be returned, "ok" on success, or "error" on any internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.
throughput_raw	throughput_raw	Throughput bytes observed at the storage object. This should be used along with delta time to calculate the rate of throughput bytes per unit of time.
timestamp	string	The timestamp of the performance data.

svm

Name	Type	Description
_links	_links	
name	string	The name of the SVM.
uuid	string	The unique identifier of the SVM.

nvme_service

A Non-Volatile Memory Express (NVMe) service defines the properties of the NVMe controller target for an SVM. There can be at most one NVMe service for an SVM. An SVM's NVMe service must be created before NVMe host initiators can connect to the SVM.

An NVMe service is identified by the UUID of its SVM.

Name	Type	Description
_links	_links	
enabled	boolean	The administrative state of the NVMe service. The NVMe service can be disabled to block all NVMe connectivity to the SVM. This is optional in POST and PATCH. The default setting is <i>true</i> (enabled) in POST.
metric	metric	
statistics	statistics	
svm	svm	

error_arguments

Name	Type	Description
code	string	Argument code
message	string	Message argument

error

Name	Type	Description
arguments	array[error_arguments]	Message arguments
code	string	Error code

Name	Type	Description
message	string	Error message
target	string	The target parameter that caused the error.

Create an NVMe service

POST /protocols/nvme/services

Introduced In: 9.6

Creates an NVMe service.

Required properties

- `svm.uuid` or `svm.name` - The existing SVM in which to create the NVMe service.

Related ONTAP commands

- `vserver nvme create`

ONTAP Error Response Codes

Error Code	Description
1115127	The cluster lacks a valid NVMe license.
2621462	The supplied SVM does not exist.
2621507	NVMe is not allowed for the specified SVM.
2621706	The specified <code>svm.uuid</code> and <code>svm.name</code> do not refer to the same SVM.
2621707	No SVM was specified. Either <code>svm.name</code> or <code>svm.uuid</code> must be supplied.

Error Code	Description
5374893	The SVM is stopped. The SVM must be running to create an NVMe service.
72089650	An NVMe service already exists for the specified SVM.
72089900	An NVMe service cannot be creating in an SVM that is configured for a SAN protocol.

Name	Type	Description
error	error	

Example error

```

{
  "error": {
    "arguments": {
      "code": "string",
      "message": "string"
    },
    "code": "4",
    "message": "entry doesn't exist",
    "target": "uuid"
  }
}

iops

The rate of I/O operations observed at the storage object.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Performance metric for write I/O operations.

latency

The round trip latency in microseconds observed at the storage object.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.
read	integer	Performance metric for read I/O operations.

Name	Type	Description
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Performance metric for write I/O operations.

throughput

The rate of throughput bytes per second observed at the storage object.

Name	Type	Description
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Performance metric for write I/O operations.

metric

Name	Type	Description
_links	_links	
duration	string	The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:
iops	iops	The rate of I/O operations observed at the storage object.
latency	latency	The round trip latency in microseconds observed at the storage object.

Name	Type	Description
status	string	Any errors associated with the sample. For example, if the aggregation of data over multiple nodes fails then any of the partial errors might be returned, "ok" on success, or "error" on any internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.
throughput	throughput	The rate of throughput bytes per second observed at the storage object.
timestamp	string	The timestamp of the performance data.

iops_raw

The number of I/O operations observed at the storage object. This should be used along with delta time to calculate the rate of I/O operations per unit of time.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.
read	integer	Performance metric for read I/O operations.

Name	Type	Description
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Performance metric for write I/O operations.

latency_raw

The raw latency in microseconds observed at the storage object. This should be divided by the raw IOPS value to calculate the average latency per I/O operation.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Performance metric for write I/O operations.

throughput_raw

Throughput bytes observed at the storage object. This should be used along with delta time to calculate the rate of throughput bytes per unit of time.

Name	Type	Description
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Performance metric for write I/O operations.

statistics

Name	Type	Description
iops_raw	iops_raw	The number of I/O operations observed at the storage object. This should be used along with delta time to calculate the rate of I/O operations per unit of time.
latency_raw	latency_raw	The raw latency in microseconds observed at the storage object. This should be divided by the raw IOPS value to calculate the average latency per I/O operation.
status	string	Any errors associated with the sample. For example, if the aggregation of data over multiple nodes fails then any of the partial errors might be returned, "ok" on success, or "error" on any internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.
throughput_raw	throughput_raw	Throughput bytes observed at the storage object. This should be used along with delta time to calculate the rate of throughput bytes per unit of time.
timestamp	string	The timestamp of the performance data.

svm

Name	Type	Description
_links	_links	
name	string	The name of the SVM.
uuid	string	The unique identifier of the SVM.

nvme_service

A Non-Volatile Memory Express (NVMe) service defines the properties of the NVMe controller target for an SVM. There can be at most one NVMe service for an SVM. An SVM's NVMe service must be created before NVMe host initiators can connect to the SVM.

An NVMe service is identified by the UUID of its SVM.

Name	Type	Description
_links	_links	
enabled	boolean	The administrative state of the NVMe service. The NVMe service can be disabled to block all NVMe connectivity to the SVM. This is optional in POST and PATCH. The default setting is <i>true</i> (enabled) in POST.

code	string	Error code
message	string	Error message
target	string	The target parameter that caused the error.

Delete an NVMe service

```
DELETE /protocols/nvme/services/{svm.uuid}
```

Introduced In: 9.6

Deletes an NVMe service. An NVMe service must be disabled before it can be deleted. In addition, all NVMe interfaces, subsystems, and subsystem maps associated with the SVM must first be deleted.

Related ONTAP commands

- `vserver nvme delete`

Learn more

- [DOC /protocols/nvme/services](#)

Parameters

Name	Type	In	Required	Description
svm.uuid	string	path	True	The unique identifier of the SVM whose NVMe service is to be deleted.

Response

```
Status: 200, Ok
```

Error

```
Status: Default
```

ONTAP Error Response Codes

Error Code	Description
2621462	The supplied SVM does not exist.
72089651	The supplied SVM does not have an NVMe service.
72089653	There are subsystems associated with the NVMe service SVM. The subsystems must be removed before deleting the NVMe service.
72089654	There are NVMe-oF LIFs associated with the NVMe service SVM. The LIFs must be removed before deleting the NVMe service.
72090028	The NVMe service is enabled. The NVMe service must be disabled before it can be deleted.

arguments	array[error_arguments]	Message arguments
code	string	Error code
message	string	Error message

Name	Type	Description
target	string	The target parameter that caused the error.

Retrieve NVMe protocol historical performance metrics

GET /protocols/nvme/services/{svm.uuid}/metrics

Introduced In: 9.7

Retrieves historical performance metrics for NVMe protocol of an SVM.

Parameters

Name	Type	In	Required	Description
timestamp	string	query	False	Filter by timestamp
throughput.total	integer	query	False	Filter by throughput.total
throughput.read	integer	query	False	Filter by throughput.read
throughput.write	integer	query	False	Filter by throughput.write
duration	string	query	False	Filter by duration
status	string	query	False	Filter by status
latency.total	integer	query	False	Filter by latency.total
latency.other	integer	query	False	Filter by latency.other
latency.read	integer	query	False	Filter by latency.read
latency.write	integer	query	False	Filter by latency.write
iops.total	integer	query	False	Filter by iops.total
iops.other	integer	query	False	Filter by iops.other
iops.read	integer	query	False	Filter by iops.read

Name	Type	In	Required	Description
iops.write	integer	query	False	Filter by iops.write
svm.uuid	string	path	True	Unique identifier of the SVM.
interval	string	query	False	<p>The time range for the data. Examples can be 1h, 1d, 1m, 1w, 1y. The period for each time range is as follows:</p> <ul style="list-style-type: none"> • 1h: Metrics over the most recent hour sampled over 15 seconds. • 1d: Metrics over the most recent day sampled over 5 minutes. • 1w: Metrics over the most recent week sampled over 30 minutes. • 1m: Metrics over the most recent month sampled over 2 hours. • 1y: Metrics over the most recent year sampled over a day. • Default value: 1 • enum: ["1h", "1d", "1w", "1m", "1y"]

Name	Type	In	Required	Description
return_timeout	integer	query	False	The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached. <ul style="list-style-type: none"> • Default value: 1 • Max value: 120 • Min value: 0
fields	array[string]	query	False	Specify the fields to return.
max_records	integer	query	False	Limit the number of records returned.
order_by	array[string]	query	False	Order results by specified fields and optional [asc
desc] direction. Default direction is 'asc' for ascending.	return_records	boolean	query	False

Response

Status: 200, Ok

Name	Type	Description
_links	_links	
num_records	integer	Number of records
records	array[records]	

Example response

```
{

_links

Name	Type	Description
next	href	
self	href	

_links

Name	Type	Description
self	href	

iops

The rate of I/O operations observed at the storage object.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Performance metric for write I/O operations.

latency

The round trip latency in microseconds observed at the storage object.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Performance metric for write I/O operations.

svm

Name	Type	Description
uuid	string	The unique identifier of the SVM.

throughput

The rate of throughput bytes per second observed at the storage object.

Name	Type	Description
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Performance metric for write I/O operations.

records

Performance numbers, such as IOPS latency and throughput, for SVM protocols.

Name	Type	Description
_links	_links	

Name	Type	Description
duration	string	The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:
iops	iops	The rate of I/O operations observed at the storage object.
latency	latency	The round trip latency in microseconds observed at the storage object.
status	string	Any errors associated with the sample. For example, if the aggregation of data over multiple nodes fails then any of the partial errors might be returned, "ok" on success, or "error" on any internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.
svm	svm	
throughput	throughput	The rate of throughput bytes per second observed at the storage object.
timestamp	string	The timestamp of the performance data.

error_arguments

Name	Type	Description
code	string	Argument code
message	string	Message argument

error

Name	Type	Description
arguments	array[error_arguments]	Message arguments
code	string	Error code
message	string	Error message
target	string	The target parameter that caused the error.

View NVMe subsystem controllers

Protocols NVMe subsystem-controllers endpoint overview

Overview

Non-Volatile Memory Express (NVMe) subsystem controllers represent dynamic connections between hosts and a storage solution.

The NVMe subsystem controllers REST API provides information about connected hosts.

Examples

Retrieving the NVMe subsystem controllers for the entire system

```
# The API:
GET /api/protocols/nvme/subsystem-controllers

# The call:
curl -X GET 'https://<mgmt-ip>/api/protocols/nvme/subsystem-controllers'
-H 'accept: application/hal+json'

# The response:
{
  "records": [
    {
      "svm": {
        "uuid": "f0f5b928-2593-11e9-94c4-00a0989a1c8e",
```

Parameters

Name	Type	In	Required	Description
id	string	query	False	Filter by id
interface.name	string	query	False	Filter by interface.name
interface.uuid	string	query	False	Filter by interface.uuid
interface.transport_address	string	query	False	Filter by interface.transport_address
subsystem.name	string	query	False	Filter by subsystem.name
subsystem.uuid	string	query	False	Filter by subsystem.uuid
admin_queue.depth	integer	query	False	Filter by admin_queue.depth
svm.uuid	string	query	False	Filter by svm.uuid
svm.name	string	query	False	Filter by svm.name
node.name	string	query	False	Filter by node.name

Name	Type	In	Required	Description
node.uuid	string	query	False	Filter by node.uuid
io_queue.count	integer	query	False	Filter by io_queue.count
io_queue.depth	integer	query	False	Filter by io_queue.depth
host.nqn	string	query	False	Filter by host.nqn
host.id	string	query	False	Filter by host.id
host.transport_addresses	string	query	False	Filter by host.transport_addresses
fields	array[string]	query	False	Specify the fields to return.
max_records	integer	query	False	Limit the number of records returned.
return_records	boolean	query	False	<p>The default is true for GET calls. When set to false, only the number of records is returned.</p> <ul style="list-style-type: none"> • Default value: 1
return_timeout	integer	query	False	<p>The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached.</p> <ul style="list-style-type: none"> • Default value: 1 • Max value: 120 • Min value: 0

Name	Type	In	Required	Description
order_by	array[string]	query	False	Order results by specified fields and optional [asc

Response

Status: 200, Ok

Name	Type	Description
_links	_links	
num_records	integer	Number of records.
records	array[nvme_subsystem_controller]

Manage NVMe subsystem maps

Protocols NVMe subsystem-maps endpoint overview

Overview

An NVMe subsystem map is an association of an NVMe namespace with an NVMe subsystem. When an NVMe namespace is mapped to an NVMe subsystem, the NVMe subsystem's hosts are granted access to the NVMe namespace. The relationship between an NVMe subsystem and an NVMe namespace is one subsystem to many namespaces.

The NVMe subsystem map REST API allows you to create, delete and discover NVMe subsystem maps.

Examples

Creating an NVMe subsystem map

```
# The API:
POST /api/protocols/nvme/subsystem-maps

# The call:
curl -X POST 'https://<mgmt-ip>/api/protocols/nvme/subsystem-maps' -H
'accept: application/hal+json' -d '{ "svm": { "name": "svm1" },
"subsystem": { "name": "subsystem1" }, "namespace": { "name":
"/vol/vol1/namespacel" } }'
```

Retrieving all of the NVMe subsystem maps

```
# The API:
GET /api/protocols/nvme/subsystem-maps

# The call:
curl -X GET 'https://<mgmt-ip>/api/protocols/nvme/subsystem-maps' -H
```

```
'accept: application/hal+json'
```

```
# The response:
```

```
{  
  "records": [  
    {  
      "svm": {  
        "uuid": "0e91b214-fe40-11e8-91a0-005056a79967",  
        "name": "svm1",  
        "_links": {  
          "self": {  
            "href": "/api/svm/svms/0e91b214-fe40-11e8-91a0-005056a79967"  
          }  
        }  
      },  
      "subsystem": {  
        "uuid": "580a6b1e-fe43-11e8-91a0-005056a79967",

        }  
      }  
    },  
    "num_records": 1,  
    "_links": {  
      "self": {
```

```
    "href": "/api/protocols/nvme/subsystem-maps"
  }
}
}
```

Retrieving a specific NVMe subsystem map

The NVMe subsystem map is identified by the UUID of the NVMe subsystem followed by the UUID of the NVMe namespace.

```
# The API:
GET /api/protocols/nvme/subsystem-maps/{subsystem.uuid}/{namespace.uuid}

# The call:
curl -X GET 'https://<mgmt-ip>/api/protocols/nvme/subsystem-maps/580a6b1e-
fe43-11e8-91a0-005056a79967/3ccdedc6-2519-4206-bc1f-b0f4adab6f89' -H
'accept: application/hal+json'

# The response:
{
  "svm": {
    "uuid": "0e91b214-fe40-11e8-91a0-005056a79967",
    "name": "svm1",
    "_links": {
      "self": {
        "href": "/api/svm/svms/0e91b214-fe40-11e8-91a0-005056a79967"
      }
    }
  },
  "subsystem": {
    "uuid": "580a6b1e-fe43-11e8-91a0-005056a79967",
    "name": "subsystem1",
    "_links": {
      "self": {
        "href": "/api/protocols/nvme/subsystems/580a6b1e-fe43-11e8-91a0-
005056a79967"
      }
    }
  },
  "namespace": {
    "uuid": "3ccdedc6-2519-4206-bc1f-b0f4adab6f89",
    "name": "/vol/vol1/namespacel",
    "node": {
      "name": "node1",

```

```

    "uuid": "012b4508-67d6-4788-8c2d-801f254ce976",
    "_links": {
      "self": {
        "href": "/api/cluster/nodes/012b4508-67d6-4788-8c2d-801f254ce976"
      }
    }
  },
  "_links": {
    "self": {
      "href": "/api/storage/namespaces/3ccdedc6-2519-4206-bc1f-
b0f4adab6f89"
    }
  }
},
"nsid": "00000001h",
"_links": {
  "self": {
    "href": "/api/protocols/nvme/subsystem-maps/580a6b1e-fe43-11e8-91a0-
005056a79967/3ccdedc6-2519-4206-bc1f-b0f4adab6f89"
  }
}
}
}

```

Deleting an NVMe subsystem map

```

# The API:
DELETE /api/protocols/nvme/subsystem-
maps/{subsystem.uuid}/{namespace.uuid}

# The call:
curl -X DELETE 'https://<mgmt-ip>/api/protocols/nvme/subsystem-
maps/580a6b1e-fe43-11e8-91a0-005056a79967/3ccdedc6-2519-4206-bc1f-
b0f4adab6f89' -H 'accept: application/hal+json'

```

Retrieve NVMe subsystem maps

```
GET /protocols/nvme/subsystem-maps
```

Introduced In: 9.6

Retrieves NVMe subsystem maps.

Expensive properties

There is an added cost to retrieving values for these properties. They are not included by default in GET results and must be explicitly requested using the `fields` query parameter. See [Requesting specific fields](#) to learn more.

- `anagrpId`

Related ONTAP commands

- `vserver nvme subsystem map show`

Create an NVMe subsystem map

POST /protocols/nvme/subsystem-maps

Introduced In: 9.6

Creates an NVMe subsystem map.

Required properties

- `svm.uuid` or `svm.name` - Existing SVM in which to create the NVMe subsystem map.
- `namespace.uuid` or `namespace.name` - Existing NVMe namespace to map to the specified NVMe subsystem.
- `subsystem.uuid` or `subsystem.name` - Existing NVMe subsystem to map to the specified NVMe namespace.

Error

Status: Default

ONTAP Error Response Codes

Error Code	Description
72089790	The supplied NVMe namespace is already mapped to the supplied NVMe subsystem.
72089793	An NVMe namespace in a Snapshot copy cannot be mapped.
72089799	The NVMe namespace is the destination of an ongoing restore operation and is inaccessible for I/O and management.
72089902	A node does not have an NVMe interface configured.
72089903	Multiple nodes do not have an NVMe interface configured.
72089904	The aggregate must be given back to its home node prior to mapping the NVMe namespace it contains.
72090001	The NVMe subsystem specified by <code>subsystem.uuid</code> was not found.
72090005	The specified <code>namespace.uuid</code> and <code>namespace.name</code> refer to different NVMe namespaces.
72090006	The NVMe namespace specified by <code>namespace.uuid</code> was not found.
72090007	The NVMe namespace specified by <code>namespace.name</code> was not found.
72090020	The specified <code>subsystem.uuid</code> and <code>subsystem.name</code> refer to different NVMe subsystems.

Error Code	Description
72090021	The NVMe subsystem specified by <code>subsystem.name</code> was not found.

Name	Type	Description
error	error

Manage NVMe subsystems

Protocols NVMe subsystems endpoint overview

Overview

An NVMe subsystem maintains configuration state and namespace access control for a set of NVMe-connected hosts.

The NVMe subsystem REST API allows you to create, update, delete, and discover NVMe subsystems as well as add and remove NVMe hosts that can access the subsystem and associated namespaces.

Examples

Creating an NVMe subsystem

```
# The API:
POST /api/protocols/nvme/subsystems

# The call:
curl -X POST 'https://<mgmt-ip>/api/protocols/nvme/subsystems' -H 'accept:
application/json' -d '{ "svm": { "name": "svm1" }, "name": "subsystem1",
"os_type": "linux" }'
```

Creating an NVMe subsystem with multiple NVMe subsystem hosts

```
# The API:
POST /api/protocols/nvme/subsystems

# The call:
curl -X POST 'https://<mgmt-ip>/api/protocols/nvme/subsystems' -H 'accept:
application/json' -d '{ "svm": { "name": "svm1" }, "name": "subsystem2",
"os_type": "vmware", "hosts": [ { "nqn": "nqn.1992-01.example.com:host1"
}, { "nqn": "nqn.1992-01.example.com:host2" } ] }'
```

Retrieving all NVMe subsystems

```
# The API:
GET /api/protocols/nvme/subsystems

# The call:
curl -X GET 'https://<mgmt-ip>/api/protocols/nvme/subsystems' -H 'accept:
application/json'

# The response:
{
  "records": [
    {
      "svm": {
        "uuid": "a009a9e7-4081-b576-7575-ada21efcaf16",
        "name": "svm1",
      },
      "uuid": "acde901a-a379-4a91-9ea6-1b728ed6696f",
      "name": "subsystem1",
    },
    {
      "svm": {
        "uuid": "a009a9e7-4081-b576-7575-ada21efcaf16",
        "name": "svm1",
      },
      "uuid": "bcde901a-a379-4a91-9ea6-1b728ed6696f",
      "name": "subsystem2",
    }
  ],
  "num_records": 2,
}
```

Retrieving all NVMe subsystems with OS type *linux*

Note that the `os_type` query parameter is used to perform the query.

```
# The API:
GET /api/protocols/nvme/subsystems

# The call:
curl -X GET 'https://<mgmt-
ip>/api/protocols/nvme/subsystems?os_type=linux' -H 'accept:
application/json'

# The response:
{
  "records": [
    {
      "svm": {
        "uuid": "a009a9e7-4081-b576-7575-ada21efcaf16",
        "name": "svm1",
      },
      "uuid": "acde901a-a379-4a91-9ea6-1b728ed6696f",
      "name": "subsystem1",
      "os_type": "linux",
    }
  ],
  "num_records": 1,
}
```

Retrieving a specific NVMe subsystem

```
# The API:
GET /api/protocols/nvme/subsystems/{uuid}

# The call:
curl -X GET 'https://<mgmt-ip>/api/protocols/nvme/subsystems/acde901a-
a379-4a91-9ea6-1b728ed6696f' -H 'accept: application/json'

# The response:
{
  "svm": {
    "uuid": "a009a9e7-4081-b576-7575-ada21efcaf16",
    "name": "svm1",
  },
  "uuid": "acde901a-a379-4a91-9ea6-1b728ed6696f",
  "name": "subsystem1",
  "os_type": "linux",
  "target_nqn": "nqn.1992-
08.com.netapp:sn.d04594ef915b4c73b642169e72e4c0b1:subsystem.subsystem1",
  "serial_number": "wtJNKNKD-uPLAAAAAAD",
  "io_queue": {
    "default": {
      "count": 4,
      "depth": 32
    }
  }
}
```

Retrieving the NVMe namespaces mapped to a specific NVMe subsystem

Note that the `fields` query parameter is used to specify the desired properties.

```
# The API:
GET /api/protocols/nvme/subsystems/{uuid}

# The call:
curl -X GET 'https://<mgmt-ip>/api/protocols/nvme/subsystems/acde901a-
a379-4a91-9ea6-1b728ed6696f?fields=subsystem_maps' -H 'accept:
application/json'

# The response:
{
  "svm": {
    "uuid": "a009a9e7-4081-b576-7575-ada21efcaf16",
    "name": "svm1",
  },
  "uuid": "acde901a-a379-4a91-9ea6-1b728ed6696f",
  "name": "subsystem1",
  "subsystem_maps": [
    {
      "anagrpid": "00000001h",
      "namespace": {
        "uuid": "eeaaca23-128d-4a7d-be4a-dc9106705799",
        "name": "/vol/vol1/namespacel"
      },
      "nsid": "00000001h"
    },
    {
      "anagrpid": "00000002h",
      "namespace": {
        "uuid": "feaaca23-83a0-4a7d-beda-dc9106705799",
        "name": "/vol/vol1/namespace2"
      },
      "nsid": "00000002h"
    }
  ]
}
```

Adding a comment about an NVMe subsystem

```
# The API:
PATCH /api/protocols/nvme/subsystems/{uuid}

# The call:
curl -X PATCH 'https://<mgmt-ip>/api/protocols/nvme/subsystems/acde901a-
a379-4a91-9ea6-1b728ed6696f' -H 'accept: application/json' -d '{
"comment": "A brief comment about the subsystem" }'
```

Deleting an NVMe subsystem

```
# The API:
DELETE /api/protocols/nvme/subsystems/{uuid}

# The call:
curl -X DELETE 'https://<mgmt-ip>/api/protocols/nvme/subsystems/acde901a-
a379-4a91-9ea6-1b728ed6696f' -H 'accept: application/json'
```

Deleting an NVMe subsystem with mapped NVMe namespaces

Normally, deleting an NVMe subsystem that has mapped NVMe namespaces is not allowed. The deletion can be forced using the `allow_delete_while_mapped` query parameter.

```
# The API:
DELETE /api/protocols/nvme/subsystems/{uuid}

# The call:
curl -X DELETE 'https://<mgmt-ip>/api/protocols/nvme/subsystems/acde901a-
a379-4a91-9ea6-1b728ed6696f?allow_delete_while_mapped=true' -H 'accept:
application/json'
```

Delete an NVMe subsystem with NVMe subsystem hosts

Normally, deleting an NVMe subsystem with NVMe subsystem hosts is disallowed. The deletion can be forced using the `allow_delete_with_hosts` query parameter.

```
# The API:
DELETE /api/protocols/nvme/subsystems/{uuid}

# The call:
curl -X DELETE 'https://<mgmt-ip>/api/protocols/nvme/subsystems/acde901a-
a379-4a91-9ea6-1b728ed6696f?allow_delete_with_hosts=true' -H 'accept:
application/json'
```

An NVMe Subsystem Host

An NVMe subsystem host is a network host provisioned to an NVMe subsystem to access namespaces mapped to that subsystem.

Examples

Adding an NVMe subsystem host to an NVMe subsystem

```
# The API:
POST /protocols/nvme/subsystems/{subsystem.uuid}/hosts

# The call:
curl -X POST 'https://<mgmt-ip>/api/protocols/nvme/subsystems/acde901a-
a379-4a91-9ea6-1b728ed6696f/hosts' -H 'accept: application/json' -d '{
"nqn": "nqn.1992-01.com.example:subsys1.host1" }'
```

Adding multiple NVMe subsystem hosts to an NVMe subsystem

```
# The API:
POST /protocols/nvme/subsystems/{subsystem.uuid}/hosts

# The call:
curl -X POST 'https://<mgmt-ip>/api/protocols/nvme/subsystems/acde901a-
a379-4a91-9ea6-1b728ed6696f/hosts' -H 'accept: application/json' -d '{
"records": [ { "nqn": "nqn.1992-01.com.example:subsys1.host2" }, { "nqn":
"nqn.1992-01.com.example:subsys1.host3" } ] }'
```

Retrieving all NVMe subsystem hosts for an NVMe subsystem

```
# The API:
GET /protocols/nvme/subsystems/{subsystem.uuid}/hosts

# The call:
curl -X GET 'https://<mgmt-ip>/api/protocols/nvme/subsystems/acde901a-
a379-4a91-9ea6-1b728ed6696f/hosts' -H 'accept: application/json'

# The response:
{
  "records": [
    {
      "nqn": "nqn.1992-01.com.example:subsys1.host1",
    },
    {
      "nqn": "nqn.1992-01.com.example:subsys1.host2",
    },
    {
      "nqn": "nqn.1992-01.com.example:subsys1.host3",
    }
  ],
  "num_records": 3,
}
```

Retrieving a specific NVMe subsystem host for an NVMe subsystem

```
# The API:
GET /protocols/nvme/subsystems/{subsystem.uuid}/hosts/{nqn}

# The call:
curl -X GET 'https://<mgmt-ip>/api/protocols/nvme/subsystems/acde901a-
a379-4a91-9ea6-1b728ed6696f/hosts/nqn.1992-01.com.example:subsys1.host1'
-H 'accept: application/json'

# The response:
{
  "subsystem": {
    "uuid": "acde901a-a379-4a91-9ea6-1b728ed6696f",
  },
  "nqn": "nqn.1992-01.com.example:subsys1.host1",
  "io_queue": {
    "count": 4,
    "depth": 32
  },
}
```

Deleting an NVMe subsystem host from an NVMe subsystem

```
# The API:
DELETE /protocols/nvme/subsystems/{subsystem.uuid}/hosts/{nqn}

# The call:
curl -X DELETE 'https://<mgmt-ip>/api/protocols/nvme/subsystems/acde901a-
a379-4a91-9ea6-1b728ed6696f/hosts/nqn.1992-01.com.example:subsys1.host1'
-H 'accept: application/json'
```

Retrieve NVMe subsystems

```
GET /protocols/nvme/subsystems
```

Introduced In: 9.6

Retrieves NVMe subsystems.

hosts

Name	Type	Description
nqn	string	The NVMe qualified name (NQN) used to identify the NVMe storage target.

default

The default I/O queue parameters inherited by NVMe hosts in the NVMe subsystem.

Name	Type	Description
count	integer	The number of host I/O queue pairs.
depth	integer	The host I/O queue depth.

io_queue

The properties of the submission queue used to submit I/O commands for execution by the NVMe controller.

Name	Type	Description
default	default	The default I/O queue parameters inherited by NVMe hosts in the NVMe subsystem.

namespace

An NVMe namespace mapped to the NVMe subsystem.

Name	Type	Description
_links	_links	
name	string	The name of the NVMe namespace.
uuid	string	The unique identifier of the NVMe namespace.

subsystem_maps

An NVMe namespace mapped to the NVMe subsystem.

Name	Type	Description
_links	_links	
anagrpid	string	The Asymmetric Namespace Access Group ID (ANAGRPID) of the NVMe namespace. The format for an ANAGRPIP is 8 hexadecimal digits (zero-filled) followed by a lower case "h".
namespace	namespace	An NVMe namespace mapped to the NVMe subsystem.
nsid	string	The NVMe namespace identifier. This is an identifier used by an NVMe controller to provide access to the NVMe namespace. The format for an NVMe namespace identifier is 8 hexadecimal digits (zero-filled) followed by a lower case "h".

svm

Name	Type	Description
_links	_links	
name	string	The name of the SVM.
uuid	string	The unique identifier of the SVM.

nvme_subsystem

An NVMe subsystem maintains configuration state and namespace access control for a set of NVMe-connected hosts.

Name	Type	Description
_links	_links	
comment	string	A configurable comment for the NVMe subsystem. Optional in POST and PATCH.
delete_on_unmap	boolean	An option that causes the subsystem to be deleted when the last subsystem map associated with it is deleted. This property defaults to <i>false</i> when the subsystem is created.
hosts	array[hosts]	The NVMe hosts configured for access to the NVMe subsystem. Optional in POST.
io_queue	io_queue	The properties of the submission queue used to submit I/O commands for execution by the NVMe controller.
name	string	The name of the NVMe subsystem. Once created, an NVMe subsystem cannot be renamed. Required in POST.
os_type	string	The host operating system of the NVMe subsystem's hosts. Required in POST.
serial_number	string	The serial number of the NVMe subsystem.

Name	Type	Description
subsystem_maps	array[subsystem_maps]	<p>The NVMe namespaces mapped to the NVMe subsystem.</p> <p>There is an added cost to retrieving property values for <code>subsystem_maps</code>. They are not populated for either a collection GET or an instance GET unless explicitly requested using the <code>fields</code> query parameter. See Requesting specific fields to learn more.</p>
svm	svm	
target_nqn	string	The NVMe qualified name (NQN) used to identify the NVMe storage target.
uuid	string	The unique identifier of the NVMe subsystem.
vendor_uuids	array[string]	<p>Vendor-specific identifiers (UUIDs) optionally assigned to an NVMe subsystem when the subsystem is created. The identifiers are used to enable vendor-specific NVMe protocol features. The identifiers are provided by a host application vendor and shared with NetApp prior to a joint product release. Creating an NVMe subsystem with an unknown or non-specific identifier will have no effect on the NVMe subsystem. Refer to the ONTAP SAN Administration Guide for a list of the supported vendor-specific identifiers. After a subsystem is created, the vendor-specific identifiers cannot be changed or removed. Optional in POST.</p> <ul style="list-style-type: none"> • Introduced in: 9.9 • readCreate: 1

error_arguments

Name	Type	Description
code	string	Argument code
message	string	Message argument

error

Name	Type	Description
arguments	array[error_arguments]	Message arguments
code	string	Error code
message	string	Error message
target	string	The target parameter that caused the error.

Create an NVMe subsystem

POST `/protocols/nvme/subsystems`

Introduced In: 9.6

Creates an NVMe subsystem.

Required properties

- `svm.uuid` or `svm.name` - Existing SVM in which to create the NVMe subsystem.
- `name` - Name for NVMe subsystem. Once created, an NVMe subsystem cannot be renamed.
- `os_type` - Operating system of the NVMe subsystem's hosts.

Related ONTAP commands

- `vserver nvme subsystem create`

Error

Status: Default

ONTAP Error Response Codes

Error Code	Description
2621462	The supplied SVM does not exist.
2621706	The specified <code>svm.uuid</code> and <code>svm.name</code> do not refer to the same SVM.
2621707	The <code>svm.uuid</code> or <code>svm.name</code> must be provided.
72089635	Setting vendor-specific UUIDs on NVMe subsystems is not supported until the effective cluster version is 9.9 or later.
72089709	The NVMe subsystem name contains an invalid character.
72089711	An invalid vendor-specific UUID was specified.
72089712	A duplicate vendor-specific UUID was specific.
72089713	Too many vendor UUIDs were supplied.
72089771	The NQN is invalid. A non-empty qualifier is required after the prefix. An example of a valid NQN is <code>nqn.1992-01.com.example:string</code> .

Error Code	Description
72089772	The NQN is invalid. Add the prefix 'nqn'. An example of a valid NQN is <i>nqn.1992-01.com.example:string</i> .
72089773	The NQN is invalid. The date field must be formatted <i>yyyy-mm</i> . An example of a valid NQN is <i>nqn.1992-01.com.example:string</i> .
72090025	The NVMe subsystem already exists for the SVM.
72090029	The NVMe service does not exist.
72090030	A partial success occurred while adding multiple NVMe subsystem hosts to an NVMe subsystem.
72090035	Passing NVMe subsystem host NQNs on NVMe subsystem POST requires an effective cluster version of 9.7 or later.
72090036	The <code>hosts.nqn</code> NVMe subsystem property must contain unique values.

Retrieve NVMe subsystem hosts

GET /protocols/nvme/subsystems/{subsystem.uuid}/hosts

Introduced In: 9.6

Retrieves the NVMe subsystem hosts of an NVMe subsystem.

Expensive properties

There is an added cost to retrieving values for these properties. They are not included by default in GET results and must be explicitly requested using the `fields` query parameter. See [Requesting specific fields](#) to learn more.

Parameters

Name	Type	In	Required	Description
subsystem.uuid	string	path	True	The unique identifier of the NVMe subsystem.
fields	array[string]	query	False	Specify the fields to return.
max_records	integer	query	False	Limit the number of records returned.

Name	Type	In	Required	Description
return_records	boolean	query	False	The default is true for GET calls. When set to false, only the number of records is returned. <ul style="list-style-type: none"> • Default value: 1
return_timeout	integer	query	False	The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached. <ul style="list-style-type: none"> • Default value: 1 • Max value: 120 • Min value: 0
order_by	array[string]	query	False	Order results by specified fields and optional [asc

Parameters

Name	Type	In	Required	Description
uuid	string	path	True	The unique identifier of the NVMe subsystem.
fields	array[string]	query	False	Specify the fields to return.

Response

Status: 200, Ok

Name	Type	Description
<code>_links</code>	_links	
comment	string	A configurable comment for the NVMe subsystem. Optional in POST and PATCH.

Name	Type	Description
delete_on_unmap	boolean	An option that causes the subsystem to be deleted when the last subsystem map associated with it is deleted. This property defaults to <i>false</i> when the subsystem is created.
hosts	array[hosts]	The NVMe hosts configured for access to the NVMe subsystem. Optional in POST.
io_queue	io_queue	The properties of the submission queue used to submit I/O commands for execution by the NVMe controller.
name	string	The name of the NVMe subsystem. Once created, an NVMe subsystem cannot be renamed. Required in POST.
os_type	string	The host operating system of the NVMe subsystem's hosts. Required in POST.
serial_number	string	The serial number of the NVMe subsystem.
subsystem_maps	array[subsystem_maps]	The NVMe namespaces mapped to the NVMe subsystem. There is an added cost to retrieving property values for <code>subsystem_maps</code> . They are not populated for either a collection GET or an instance GET unless explicitly requested using the <code>fields</code> query parameter. See Requesting specific fields to learn more.
svm	svm	
target_nqn	string	The NVMe qualified name (NQN) used to identify the NVMe storage target.
uuid	string	The unique identifier of the NVMe subsystem.

Name	Type	Description
vendor_uuids	array[string]	<p>Vendor-specific identifiers (UUIDs) optionally assigned to an NVMe subsystem when the subsystem is created. The identifiers are used to enable vendor-specific NVMe protocol features. The identifiers are provided by a host application vendor and shared with NetApp prior to a joint product release. Creating an NVMe subsystem with an unknown or non-specific identifier will have no effect on the NVMe subsystem. Refer to the ONTAP SAN Administration Guide for a list of the supported vendor-specific identifiers. After a subsystem is created, the vendor-specific identifiers cannot be changed or removed. Optional in POST.</p> <ul style="list-style-type: none"> • Introduced in: 9.9 • readCreate: 1

Parameters

Name	Type	In	Required	Description
uuid	string	path	True	The unique identifier of the NVMe subsystem.

Request Body

Name	Type	Description
_links	_links	

Name	Type	Description
comment	string	A configurable comment for the NVMe subsystem. Optional in POST and PATCH.
delete_on_unmap	boolean	An option that causes the subsystem to be deleted when the last subsystem map associated with it is deleted. This property defaults to <i>false</i> when the subsystem is created.
hosts	array[hosts]	The NVMe hosts configured for access to the NVMe subsystem. Optional in POST.
io_queue	io_queue	The properties of the submission queue used to submit I/O commands for execution by the NVMe controller.
name	string	The name of the NVMe subsystem. Once created, an NVMe subsystem cannot be renamed. Required in POST.
os_type	string	The host operating system of the NVMe subsystem's hosts. Required in POST.
serial_number	string	The serial number of the NVMe subsystem.
subsystem_maps	array[subsystem_maps]	The NVMe namespaces mapped to the NVMe subsystem. There is an added cost to retrieving property values for <code>subsystem_maps</code> . They are not populated for either a collection GET or an instance GET unless explicitly requested using the <code>fields</code> query parameter. See Requesting specific fields to learn more.
svm	svm	

Name	Type	Description
target_nqn	string	The NVMe qualified name (NQN) used to identify the NVMe storage target.
uuid	string	The unique identifier of the NVMe subsystem.
vendor_uuids	array[string]	<p>Vendor-specific identifiers (UUIDs) optionally assigned to an NVMe subsystem when the subsystem is created. The identifiers are used to enable vendor-specific NVMe protocol features. The identifiers are provided by a host application vendor and shared with NetApp prior to a joint product release. Creating an NVMe subsystem with an unknown or non-specific identifier will have no effect on the NVMe subsystem. Refer to the ONTAP SAN Administration Guide for a list of the supported vendor-specific identifiers. After a subsystem is created, the vendor-specific identifiers cannot be changed or removed. Optional in POST.</p> <ul style="list-style-type: none"> • Introduced in: 9.9 • readCreate: 1

Manage NVMe namespaces

Storage namespaces endpoint overview

Overview

An NVMe namespace is a collection of addressable logical blocks presented to hosts connected to the storage virtual machine using the NVMe over Fabrics protocol.

The NVMe namespace REST API allows you to create, update, delete and discover NVMe namespaces.

In ONTAP, an NVMe namespace is located within a volume. Optionally, it can be located within a qtree in a volume.

An NVMe namespace is created to a specified size using thin or thick provisioning as determined by the volume on which it is created. NVMe namespaces support being cloned. An NVMe namespace cannot be renamed, resized, or moved to a different volume. NVMe namespaces do not support the assignment of a QoS policy for performance management, but a QoS policy can be assigned to the volume containing the namespace. See the NVMe namespace object model to learn more about each of the properties supported by the NVMe namespace REST API.

An NVMe namespace must be mapped to an NVMe subsystem to grant access to the subsystem's hosts. Hosts can then access the NVMe namespace and perform I/O using the NVMe over Fabrics protocol.

Performance monitoring

Performance of an NVMe namespace can be monitored by observing the `metric.*` and `statistics.*` properties. These properties show the performance of an NVMe namespace in terms of IOPS, latency, and throughput. The `metric.*` properties denote an average, whereas `statistics.*` properties denote a real-time monotonically increasing value aggregated across all nodes.

Examples

Creating an NVMe namespace

This example creates a 300 gigabyte NVMe namespace, with 4096-byte blocks, in SVM `svm1`, volume `vol1`, configured for use by `linux` hosts. The `return_records` query parameter is used to retrieve properties of the newly created NVMe namespace in the POST response.

```
# The API:
POST /api/storage/namespaces

# The call:
```

```
curl -X POST 'https://<mgmt-  
ip>/api/storage/namespaces?return_records=true' -H 'accept:  
application/hal+json' -d '{ "svm": { "name": "svm1" }, "os_type": "linux",  
"space": { "block_size": "4096", "size": "300G" }, "name" :  
"/vol/voll/namespacel" }'
```

The response:

```
{  
  "num_records": 1,  
  "records": [  
    {  
      "uuid": "dccdc3e6-cf4e-498f-bec6-f7897f945669",

  "self": {
    "href": "/api/storage/namespaces/dccdc3e6-cf4e-498f-bec6-
f7897f945669"
  }
}
]
}
```

Updating an NVMe namespace

This example sets the `comment` property of an NVMe namespace.

```
# The API:
PATCH /api/storage/namespaces/{uuid}

# The call:
curl -X PATCH 'https://<mgmt-ip>/api/storage/namespaces/dccdc3e6-cf4e-
498f-bec6-f7897f945669' -H 'accept: application/hal+json' -d '{ "comment":
"Data for the research department." }'
```

Retrieving NVMe namespaces

This example retrieves summary information for all online NVMe namespaces in SVM `svm1`. The `svm.name` and `status.state` query parameters are to find the desired NVMe namespaces.

```
# The API:
GET /api/storage/namespaces

# The call:
curl -X GET 'https://<mgmt-
ip>/api/storage/namespaces?svm.name=svm1&status.state=online' -H 'accept:
application/hal+json'

# The response:
{
```

```
"records": [  
  {  
    "uuid": "5c254d22-96a6-42ac-aad8-0cd9ebd126b6",  
    "svm": {  
      "name": "svm1"  
    },  
    "name": "/vol/vol1/namespace2",  
    "status": {  
      "state": "online"  
    },  
    "_links": {  
      "self": {  
        "href": "/api/storage/namespaces/5c254d22-96a6-42ac-aad8-  
0cd9ebd126b6"  
      }  
    }  
  },  
  {  
    "uuid": "dccdc3e6-cf4e-498f-bec6-f7897f945669",  
    "svm": {  
      "name": "svm1"  
    },  
    "name": "/vol/vol1/namespace1",  
    "status": {  
      "state": "online"  
    },  
    "_links": {  
      "self": {  
        "href": "/api/storage/namespaces/dccdc3e6-cf4e-498f-bec6-

      }  
    }  
  },  
  {  
    "uuid": "be732687-20cf-47d2-a0e2-2a989d15661d",  
    "svm": {  
      "name": "svm1"  
    },  
    "name": "/vol/vol2/namespace3",  
    "status": {  
      "state": "online"  
    },  
    "_links": {  
      "self": {  
        "href": "/api/storage/namespaces/be732687-20cf-47d2-a0e2-  
2a989d15661d"  
      }  
    }  
  }  
]
```

```

    }
  }
},
"num_records": 3,
"_links": {
  "self": {
    "href": "/api/storage/namespaces?svm.name=svm1&status.state=online"
  }
}
}
}

```

Retrieving details for a specific NVMe namespace

In this example, the `fields` query parameter is used to request all fields, including advanced fields, that would not otherwise be returned by default for the NVMe namespace.

```

# The API:
GET /api/storage/namespaces/{uuid}

# The call:
curl -X GET 'https://<mgmt-ip>/api/storage/namespaces/dccdc3e6-cf4e-498f-
bec6-f7897f945669?fields=**' -H 'accept: application/hal+json'

# The response:

```

Cloning NVMe namespaces

A clone of an NVMe namespace is an independent "copy" of the namespace that shares unchanged data blocks with the original. As blocks of the source and clone are modified, unique blocks are written for each. NVMe namespace clones can be created quickly and consume very little space initially. They can be created for the purpose of back-up, or to replicate data for multiple consumers.

An NVMe namespace clone can also be set to auto-delete by setting the `auto_delete` property. If the namespace's volume is configured for automatic deletion, NVMe namespaces that have auto-delete enabled are deleted when a volume is nearly full to reclaim a target amount of free space in the volume.

Creating a new NVMe namespace clone

You create an NVMe namespace clone as you create any NVMe namespace — a POST to [/storage/namespaces](#). Set `clone.source.uuid` or `clone.source.name` to identify the source NVMe namespace from which the clone is created. The NVMe namespace clone and its source must reside in the same volume.

The source NVMe namespace can reside in a Snapshot copy, in which case, the `clone.source.name` field must be used to identify it. Add `/.snapshot/<snapshot_name>` to the path after the volume name to identify the Snapshot copy. For example `/vol/vol1/.snapshot/snap1/namespace1`.

```
# The API:  
POST /api/storage/namespaces  
  
# The call:  
curl -X POST 'https://<mgmt-ip>/api/storage/namespaces' -H 'accept:  
application/hal+json' -d '{ "svm": { "name": "svm1" }, "name":  
"/vol/vol1/namespace2clone1", "clone": { "source": { "name":  
"/vol/vol1/namespace2" } } }'
```

Over-writing an existing NVMe namespace's data as a clone of another

You can over-write an existing NVMe namespace as a clone of another. You do this as a PATCH on the NVMe namespace to overwrite — a PATCH to [/storage/namespaces/{uuid}](#). Set the `clone.source.uuid` or `clone.source.name` property to identify the source NVMe namespace from which the clone data is taken. The NVMe namespace clone and its source must reside in the same volume.

When used in a PATCH, the patched NVMe namespace's data is over-written as a clone of the source and the following properties are preserved from the patched namespace unless otherwise specified as part of the PATCH: `auto_delete`, `subsystem_map`, `status.state`, and `uuid`.

```
# The API:
PATCH /api/storage/namespaces/{uuid}

# The call:
curl -X PATCH 'https://<mgmt-ip>/api/storage/namespaces/dccdc3e6-cf4e-498f-bec6-f7897f945669' -H 'accept: application/hal+json' -d '{ "clone": { "source": { "name": "/vol/vol1/namespace2" } } }'
```

Deleting an NVMe namespace

```
# The API:
DELETE /api/storage/namespaces/{uuid}

# The call:
curl -X DELETE 'https://<mgmt-ip>/api/storage/namespaces/5c254d22-96a6-42ac-aad8-0cd9ebd126b6' -H 'accept: application/hal+json'
```

Retrieve NVMe namespaces

GET /storage/namespaces

Introduced In: 9.6

Retrieves NVMe namespaces.

Expensive properties

There is an added cost to retrieving values for these properties. They are not included by default in GET results and must be explicitly requested using the `fields` query parameter. See [Requesting specific fields](#) to learn more.

- `auto_delete`
- `subsystem_map.*`
- `status.mapped`
- `statistics.*`
- `metric.*`

Related ONTAP commands

- `vserver nvme namespace show`
- `vserver nvme subsystem map show`

Parameters

Name	Type	In	Required	Description
auto_delete	boolean	query	False	Filter by auto_delete
name	string	query	False	Filter by name
uuid	string	query	False	Filter by uuid
svm.uuid	string	query	False	Filter by svm.uuid
svm.name	string	query	False	Filter by svm.name
comment	string	query	False	Filter by comment
statistics.latency_read.total	integer	query	False	Filter by statistics.latency_read.total <ul style="list-style-type: none">• Introduced in: 9.8
statistics.latency_read.other	integer	query	False	Filter by statistics.latency_read.other <ul style="list-style-type: none">• Introduced in: 9.8
statistics.latency_read.read	integer	query	False	Filter by statistics.latency_read.read <ul style="list-style-type: none">• Introduced in: 9.8
statistics.latency_read.write	integer	query	False	Filter by statistics.latency_read.write <ul style="list-style-type: none">• Introduced in: 9.8

Name	Type	In	Required	Description
statistics.throughput_raw.total	integer	query	False	Filter by statistics.throughput_raw.total • Introduced in: 9.8
statistics.throughput_raw.read	integer	query	False	Filter by statistics.throughput_raw.read • Introduced in: 9.8
statistics.throughput_raw.write	integer	query	False	Filter by statistics.throughput_raw.write • Introduced in: 9.8
statistics.status	string	query	False	Filter by statistics.status • Introduced in: 9.8
statistics.iops_raw.total	integer	query	False	Filter by statistics.iops_raw.total • Introduced in: 9.8
statistics.iops_raw.other	integer	query	False	Filter by statistics.iops_raw.other • Introduced in: 9.8
statistics.iops_raw.read	integer	query	False	Filter by statistics.iops_raw.read • Introduced in: 9.8

Name	Type	In	Required	Description
statistics.iops_raw.write	integer	query	False	Filter by statistics.iops_raw.write • Introduced in: 9.8
statistics.timestamp	string	query	False	Filter by statistics.timestamp • Introduced in: 9.8
os_type	string	query	False	Filter by os_type
space.block_size	integer	query	False	Filter by space.block_size
space.used	integer	query	False	Filter by space.used
space.guarantee.requested	boolean	query	False	Filter by space.guarantee.requested
space.guarantee.reserved	boolean	query	False	Filter by space.guarantee.reserved
space.size	integer	query	False	Filter by space.size
enabled	boolean	query	False	Filter by enabled
metric.timestamp	string	query	False	Filter by metric.timestamp • Introduced in: 9.8
metric.status	string	query	False	Filter by metric.status • Introduced in: 9.8

Name	Type	In	Required	Description
metric.throughput.total	integer	query	False	Filter by metric.throughput.total • Introduced in: 9.8
metric.throughput.read	integer	query	False	Filter by metric.throughput.read • Introduced in: 9.8
metric.throughput.write	integer	query	False	Filter by metric.throughput.write • Introduced in: 9.8
metric.duration	string	query	False	Filter by metric.duration • Introduced in: 9.8
metric.latency.total	integer	query	False	Filter by metric.latency.total • Introduced in: 9.8
metric.latency.other	integer	query	False	Filter by metric.latency.other • Introduced in: 9.8
metric.latency.read	integer	query	False	Filter by metric.latency.read • Introduced in: 9.8

Name	Type	In	Required	Description
metric.latency.write	integer	query	False	Filter by metric.latency.write • Introduced in: 9.8
metric.iops.total	integer	query	False	Filter by metric.iops.total • Introduced in: 9.8
metric.iops.other	integer	query	False	Filter by metric.iops.other • Introduced in: 9.8
metric.iops.read	integer	query	False	Filter by metric.iops.read • Introduced in: 9.8
metric.iops.write	integer	query	False	Filter by metric.iops.write • Introduced in: 9.8
create_time	string	query	False	Filter by create_time • Introduced in: 9.7
subsystem_map.subsystem.name	string	query	False	Filter by subsystem_map.subsystem.name
subsystem_map.subsystem.uuid	string	query	False	Filter by subsystem_map.subsystem.uuid
subsystem_map.nsid	string	query	False	Filter by subsystem_map.nsid

Name	Type	In	Required	Description
subsystem_map.ana grpid	string	query	False	Filter by subsystem_map.ana grpid
location.qtree.id	integer	query	False	Filter by location.qtree.id
location.qtree.name	string	query	False	Filter by location.qtree.name
location.namespace	string	query	False	Filter by location.namespace
location.volume.nam e	string	query	False	Filter by location.volume.nam e
location.volume.uuid	string	query	False	Filter by location.volume.uuid
status.state	string	query	False	Filter by status.state
status.read_only	boolean	query	False	Filter by status.read_only
status.container_stat e	string	query	False	Filter by status.container_stat e
status.mapped	boolean	query	False	Filter by status.mapped
fields	array[string]	query	False	Specify the fields to return.
max_records	integer	query	False	Limit the number of records returned.
return_records	boolean	query	False	The default is true for GET calls. When set to false, only the number of records is returned. • Default value: 1

Name	Type	In	Required	Description
return_timeout	integer	query	False	<p>The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached.</p> <ul style="list-style-type: none"> • Default value: 1 • Max value: 120 • Min value: 0
order_by	array[string]	query	False	Order results by specified fields and optional [asc

Response

Status: 200, Ok

Name	Type	Description
_links	_links	
num_records	integer	Number of records.
records	array[nvme_namespace]

_links

Name	Type	Description
self	href	

source

The source NVMe namespace for a namespace clone operation. This can be specified using property `clone.source.uuid` or `clone.source.name`. If both properties are supplied, they must refer to the same namespace.

Valid in POST to create a new NVMe namespace as a clone of the source.

Valid in PATCH to overwrite an existing NVMe namespace's data as a clone of another.

Name	Type	Description
name	string	The fully qualified path name of the clone source NVMe namespace composed of a "/vol" prefix, the volume name, the (optional) qtree name and base name of the namespace. Valid in POST and PATCH.
uuid	string	The unique identifier of the clone source NVMe namespace. Valid in POST and PATCH.

clone

This sub-object is used in POST to create a new NVMe namespace as a clone of an existing namespace, or PATCH to overwrite an existing namespace as a clone of another. Setting a property in this sub-object indicates that a namespace clone is desired.

When used in a PATCH, the patched NVMe namespace's data is over-written as a clone of the source and the following properties are preserved from the patched namespace unless otherwise specified as

part of the PATCH: `auto_delete` (unless specified in the request), `subsystem_map`, `status.state`, and `uuid`.

Name	Type	Description
<code>source</code>	source	<p>The source NVMe namespace for a namespace clone operation. This can be specified using property <code>clone.source.uuid</code> or <code>clone.source.name</code>. If both properties are supplied, they must refer to the same namespace.</p> <p>Valid in POST to create a new NVMe namespace as a clone of the source.</p> <p>Valid in PATCH to overwrite an existing NVMe namespace's data as a clone of another.</p>

qtree

The qtree in which the NVMe namespace is optionally located. Valid in POST.

If properties `name` and `location.qtree.name` and/or `location.qtree.uuid` are specified in the same request, they must refer to the same qtree.

NVMe namespaces do not support rename.

Name	Type	Description
<code>_links</code>	_links	
<code>id</code>	integer	The identifier for the qtree, unique within the qtree's volume.
<code>name</code>	string	The name of the qtree.

volume

The volume in which the NVMe namespace is located. Valid in POST.

If properties `name` and `location.volume.name` and/or `location.volume.uuid` are specified in the same request, they must refer to the same volume.

NVMe namespaces do not support movement between volumes.

Name	Type	Description
<code>_links</code>	_links	

Name	Type	Description
name	string	The name of the volume.
uuid	string	<p>Unique identifier for the volume. This corresponds to the instance-uuid that is exposed in the CLI and ONTAPI. It does not change due to a volume move.</p> <ul style="list-style-type: none"> • example: 028baa66-41bd-11e9-81d5-00a0986138f7 • Introduced in: 9.6

location

The location of the NVMe namespace within the ONTAP cluster. Valid in POST.

NVMe namespaces do not support rename, or movement between volumes.

Name	Type	Description
namespace	string	<p>The base name component of the NVMe namespace. Valid in POST.</p> <p>If properties <code>name</code> and <code>location.namespace</code> are specified in the same request, they must refer to the base name.</p> <p>NVMe namespaces do not support rename.</p>
qtree	qtree	<p>The qtree in which the NVMe namespace is optionally located. Valid in POST.</p> <p>If properties <code>name</code> and <code>location.qtree.name</code> and/or <code>location.qtree.uuid</code> are specified in the same request, they must refer to the same qtree.</p> <p>NVMe namespaces do not support rename.</p>

Name	Type	Description
volume	volume	<p>The volume in which the NVMe namespace is located. Valid in POST.</p> <p>If properties <code>name</code> and <code>location.volume.name</code> and/or <code>location.volume.uuid</code> are specified in the same request, they must refer to the same volume.</p> <p>NVMe namespaces do not support movement between volumes.</p>

iops

The rate of I/O operations observed at the storage object.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Performance metric for write I/O operations.

latency

The round trip latency in microseconds observed at the storage object.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.

Name	Type	Description
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Performance metric for write I/O operations.

throughput

The rate of throughput bytes per second observed at the storage object.

Name	Type	Description
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Performance metric for write I/O operations.

metric

Performance numbers, such as IOPS latency and throughput

Name	Type	Description
_links	_links	
duration	string	The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:
iops	iops	The rate of I/O operations observed at the storage object.
latency	latency	The round trip latency in microseconds observed at the storage object.

Name	Type	Description
status	string	Any errors associated with the sample. For example, if the aggregation of data over multiple nodes fails then any of the partial errors might be returned, "ok" on success, or "error" on any internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.
throughput	throughput	The rate of throughput bytes per second observed at the storage object.
timestamp	string	The timestamp of the performance data.

guarantee

Properties that request and report the space guarantee for the NVMe namespace.

Name	Type	Description
requested	boolean	<p>The requested space reservation policy for the NVMe namespace. If <i>true</i>, a space reservation is requested for the namespace; if <i>false</i>, the namespace is thin provisioned. Guaranteeing a space reservation request for a namespace requires that the volume in which the namespace resides also be space reserved and that the fractional reserve for the volume be 100%.</p> <p>The space reservation policy for an NVMe namespace is determined by ONTAP.</p> <ul style="list-style-type: none"> • readOnly: 1 • Introduced in: 9.6
reserved	boolean	<p>Reports if the NVMe namespace is space guaranteed.</p> <p>This property is <i>true</i> if a space guarantee is requested and the containing volume and aggregate support the request. This property is <i>false</i> if a space guarantee is not requested or if a space guarantee is requested and either the containing volume and aggregate do not support the request.</p>

space

The storage space related properties of the NVMe namespace.

Name	Type	Description
block_size	integer	<p>The size of blocks in the namespace in bytes.</p> <p>Valid in POST when creating an NVMe namespace that is not a clone of another. Disallowed in POST when creating a namespace clone.</p> <p>Valid in POST.</p>

Name	Type	Description
guarantee	guarantee	Properties that request and report the space guarantee for the NVMe namespace.
size	integer	<p>The total provisioned size of the NVMe namespace.</p> <p>NVMe namespaces do not support resize.</p> <p>The maximum and minimum sizes listed here are the absolute maximum and absolute minimum sizes in bytes. The maximum size is variable with respect to large NVMe namespace support in ONTAP. If large namespaces are supported, the maximum size is 128 TB (140737488355328 bytes) and if not supported, the maximum size is just under 16 TB (17557557870592 bytes). The minimum size supported is always 4096 bytes.</p> <p>For more information, see <i>Size properties</i> in the <i>docs</i> section of the ONTAP REST API documentation.</p> <ul style="list-style-type: none"> • example: 1073741824 • Max value: 140737488355328 • Min value: 4096 • Introduced in: 9.6 • readCreate: 1

Name	Type	Description
used	integer	<p>The amount of space consumed by the main data stream of the NVMe namespace.</p> <p>This value is the total space consumed in the volume by the NVMe namespace, including filesystem overhead, but excluding prefix and suffix streams. Due to internal filesystem overhead and the many ways NVMe filesystems and applications utilize blocks within a namespace, this value does not necessarily reflect actual consumption/availability from the perspective of the filesystem or application. Without specific knowledge of how the namespace blocks are utilized outside of ONTAP, this property should not be used and an indicator for an out-of-space condition.</p> <p>For more information, see <i>Size properties</i> in the <i>docs</i> section of the ONTAP REST API documentation.</p> <ul style="list-style-type: none"> • readOnly: 1 • Introduced in: 9.6

iops_raw

The number of I/O operations observed at the storage object. This should be used along with delta time to calculate the rate of I/O operations per unit of time.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.
read	integer	Performance metric for read I/O operations.

Name	Type	Description
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Performance metric for write I/O operations.

latency_raw

The raw latency in microseconds observed at the storage object. This should be divided by the raw IOPS value to calculate the average latency per I/O operation.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Performance metric for write I/O operations.

throughput_raw

Throughput bytes observed at the storage object. This should be used along with delta time to calculate the rate of throughput bytes per unit of time.

Name	Type	Description
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Performance metric for write I/O operations.

statistics

These are raw performance numbers, such as IOPS latency and throughput. These numbers are aggregated across all nodes in the cluster and increase with the uptime of the cluster.

Name	Type	Description
iops_raw	iops_raw	The number of I/O operations observed at the storage object. This should be used along with delta time to calculate the rate of I/O operations per unit of time.
latency_raw	latency_raw	The raw latency in microseconds observed at the storage object. This should be divided by the raw IOPS value to calculate the average latency per I/O operation.
status	string	Any errors associated with the sample. For example, if the aggregation of data over multiple nodes fails then any of the partial errors might be returned, "ok" on success, or "error" on any internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.
throughput_raw	throughput_raw	Throughput bytes observed at the storage object. This should be used along with delta time to calculate the rate of throughput bytes per unit of time.
timestamp	string	The timestamp of the performance data.

status

Status information about the NVMe namespace.

Name	Type	Description
container_state	string	The state of the volume and aggregate that contain the NVMe namespace. Namespaces are only available when their containers are available.
mapped	boolean	Reports if the NVMe namespace is mapped to an NVMe subsystem. There is an added cost to retrieving this property's value. It is not populated for either a collection GET or an instance GET unless it is explicitly requested using the <code>fields</code> query parameter. See Requesting specific fields to learn more.
read_only	boolean	Reports if the NVMe namespace allows only read access.
state	string	The state of the NVMe namespace. Normal states for a namespace are <i>online</i> and <i>offline</i> . Other states indicate errors.

subsystem

The NVMe subsystem to which the NVMe namespace is mapped.

Name	Type	Description
_links	_links	
name	string	The name of the NVMe subsystem.
uuid	string	The unique identifier of the NVMe subsystem.

subsystem_map

The NVMe subsystem with which the NVMe namespace is associated. A namespace can be mapped to zero (0) or one (1) subsystems.

There is an added cost to retrieving property values for `subsystem_map`. They are not populated for either a collection GET or an instance GET unless explicitly requested using the `fields` query

parameter. See [Requesting specific fields](#) to learn more.

Name	Type	Description
_links	_links	
anagrpId	string	The Asymmetric Namespace Access Group ID (ANAGRPID) of the NVMe namespace. The format for an ANAGRPID is 8 hexadecimal digits (zero-filled) followed by a lower case "h".
nsid	string	The NVMe namespace identifier. This is an identifier used by an NVMe controller to provide access to the NVMe namespace. The format for an NVMe namespace identifier is 8 hexadecimal digits (zero-filled) followed by a lower case "h".
subsystem	subsystem	The NVMe subsystem to which the NVMe namespace is mapped.

svm

Name	Type	Description
_links	_links	
name	string	The name of the SVM.
uuid	string	The unique identifier of the SVM.

nvme_namespace

An NVMe namespace is a collection of addressable logical blocks presented to hosts connected to the storage virtual machine using the NVMe over Fabrics protocol.

In ONTAP, an NVMe namespace is located within a volume. Optionally, it can be located within a qtree in a volume.

An NVMe namespace is created to a specified size using thin or thick provisioning as determined by the volume on which it is created. NVMe namespaces support being cloned. An NVMe namespace cannot be renamed, resized, or moved to a different volume. NVMe namespaces do not support the assignment of a QoS policy for performance management, but a QoS policy can be assigned to the volume containing the namespace. See the NVMe namespace object model to learn more about each of the properties supported by the NVMe namespace REST API.

An NVMe namespace must be mapped to an NVMe subsystem to grant access to the subsystem's hosts. Hosts can then access the NVMe namespace and perform I/O using the NVMe over Fabrics protocol.

Name	Type	Description
_links	_links	
auto_delete	boolean	<p>This property marks the NVMe namespace for auto deletion when the volume containing the namespace runs out of space. This is most commonly set on namespace clones.</p> <p>When set to <i>true</i>, the NVMe namespace becomes eligible for automatic deletion when the volume runs out of space. Auto deletion only occurs when the volume containing the namespace is also configured for auto deletion and free space in the volume decreases below a particular threshold.</p> <p>This property is optional in POST and PATCH. The default value for a new NVMe namespace is <i>false</i>.</p> <p>There is an added cost to retrieving this property's value. It is not populated for either a collection GET or an instance GET unless it is explicitly requested using the <code>fields</code> query parameter. See Requesting specific fields to learn more.</p>

Name	Type	Description
clone	clone	<p>This sub-object is used in POST to create a new NVMe namespace as a clone of an existing namespace, or PATCH to overwrite an existing namespace as a clone of another. Setting a property in this sub-object indicates that a namespace clone is desired.</p> <p>When used in a PATCH, the patched NVMe namespace's data is over-written as a clone of the source and the following properties are preserved from the patched namespace unless otherwise specified as part of the PATCH: <code>auto_delete</code> (unless specified in the request), <code>subsystem_map</code>, <code>status.state</code>, and <code>uuid</code>.</p>
comment	string	A configurable comment available for use by the administrator. Valid in POST and PATCH.
create_time	string	The time the NVMe namespace was created.
enabled	boolean	The enabled state of the NVMe namespace. Certain error conditions cause the namespace to become disabled. If the namespace is disabled, you can check the <code>state</code> property to determine what error disabled the namespace. An NVMe namespace is enabled automatically when it is created.

Name	Type	Description
location	location	<p>The location of the NVMe namespace within the ONTAP cluster. Valid in POST.</p> <p>NVMe namespaces do not support rename, or movement between volumes.</p> <ul style="list-style-type: none"> • Introduced in: 9.6 • readCreate: 1
metric	metric	Performance numbers, such as IOPS latency and throughput
name	string	<p>The fully qualified path name of the NVMe namespace composed of a "/vol" prefix, the volume name, the (optional) qtree name and base name of the namespace. Valid in POST.</p> <p>NVMe namespaces do not support rename, or movement between volumes.</p>
os_type	string	<p>The operating system type of the NVMe namespace.</p> <p>Required in POST when creating an NVMe namespace that is not a clone of another. Disallowed in POST when creating a namespace clone.</p>
space	space	The storage space related properties of the NVMe namespace.
statistics	statistics	These are raw performance numbers, such as IOPS latency and throughput. These numbers are aggregated across all nodes in the cluster and increase with the uptime of the cluster.
status	status	Status information about the NVMe namespace.

Name	Type	Description
subsystem_map	subsystem_map	The NVMe subsystem with which the NVMe namespace is associated. A namespace can be mapped to zero (0) or one (1) subsystems. There is an added cost to retrieving property values for <code>subsystem_map</code> . They are not populated for either a collection GET or an instance GET unless explicitly requested using the <code>fields</code> query parameter. See Requesting specific fields to learn more.
svm	svm	
uuid	string	The unique identifier of the NVMe namespace.

error_arguments

Name	Type	Description
code	string	Argument code
message	string	Message argument

error

Name	Type	Description
arguments	array[error_arguments]	Message arguments
code	string	Error code
message	string	Error message
target	string	The target parameter that caused the error.

Create an NVMe namespace

POST `/storage/namespaces`

Introduced In: 9.6

Creates an NVMe namespace.

Required properties

- `svm.uuid` or `svm.name` - Existing SVM in which to create the NVMe namespace.
- `name`, `location.volume.name` or `location.volume.uuid` - Existing volume in which to create the NVMe namespace.
- `name` or `location.namespace` - Base name for the NVMe namespace.
- `os_type` - Operating system from which the NVMe namespace will be accessed. (Not used for clones, which are created based on the `os_type` of the source NVMe namespace.)
- `space.size` - Size for the NVMe namespace. (Not used for clones, which are created based on the size of the source NVMe namespace.)

Default property values

If not specified in POST, the following default property values are assigned:

- `auto_delete` - *false*
- `space.block_size` - 4096 (512 when 'os_type' is *vmware*)

Related ONTAP commands

- `volume file clone autodelete`
- `volume file clone create`
- `vserver nvme namespace create`

Parameters

Name	Type	In	Required	Description
<code>return_records</code>	boolean	query	False	The default is false. If set to true, the records are returned. • Default value:

Request Body

Name	Type	Description
<code>_links</code>	_links	

Name	Type	Description
auto_delete	boolean	<p>This property marks the NVMe namespace for auto deletion when the volume containing the namespace runs out of space. This is most commonly set on namespace clones.</p> <p>When set to <i>true</i>, the NVMe namespace becomes eligible for automatic deletion when the volume runs out of space. Auto deletion only occurs when the volume containing the namespace is also configured for auto deletion and free space in the volume decreases below a particular threshold.</p> <p>This property is optional in POST and PATCH. The default value for a new NVMe namespace is <i>false</i>.</p> <p>There is an added cost to retrieving this property's value. It is not populated for either a collection GET or an instance GET unless it is explicitly requested using the <code>fields</code> query parameter. See Requesting specific fields to learn more.</p>
clone	clone	<p>This sub-object is used in POST to create a new NVMe namespace as a clone of an existing namespace, or PATCH to overwrite an existing namespace as a clone of another. Setting a property in this sub-object indicates that a namespace clone is desired.</p> <p>When used in a PATCH, the patched NVMe namespace's data is over-written as a clone of the source and the following properties are preserved from the patched namespace unless otherwise specified as part of the PATCH: <code>auto_delete</code> (unless specified in the request), <code>subsystem_map</code>, <code>status.state</code>, and <code>uuid</code>.</p>

Name	Type	Description
comment	string	A configurable comment available for use by the administrator. Valid in POST and PATCH.
create_time	string	The time the NVMe namespace was created.
enabled	boolean	The enabled state of the NVMe namespace. Certain error conditions cause the namespace to become disabled. If the namespace is disabled, you can check the <code>state</code> property to determine what error disabled the namespace. An NVMe namespace is enabled automatically when it is created.
location	location	<p>The location of the NVMe namespace within the ONTAP cluster. Valid in POST.</p> <p>NVMe namespaces do not support rename, or movement between volumes.</p> <ul style="list-style-type: none"> • Introduced in: 9.6 • readCreate: 1
metric	metric	Performance numbers, such as IOPS latency and throughput
name	string	<p>The fully qualified path name of the NVMe namespace composed of a <code>"/vol"</code> prefix, the volume name, the (optional) <code>qtree</code> name and base name of the namespace. Valid in POST.</p> <p>NVMe namespaces do not support rename, or movement between volumes.</p>

Name	Type	Description
os_type	string	<p>The operating system type of the NVMe namespace.</p> <p>Required in POST when creating an NVMe namespace that is not a clone of another. Disallowed in POST when creating a namespace clone.</p>
space	space	The storage space related properties of the NVMe namespace.
statistics	statistics	These are raw performance numbers, such as IOPS latency and throughput. These numbers are aggregated across all nodes in the cluster and increase with the uptime of the cluster.
status	status	Status information about the NVMe namespace.
subsystem_map	subsystem_map	<p>The NVMe subsystem with which the NVMe namespace is associated. A namespace can be mapped to zero (0) or one (1) subsystems.</p> <p>There is an added cost to retrieving property values for <code>subsystem_map</code>. They are not populated for either a collection GET or an instance GET unless explicitly requested using the <code>fields</code> query parameter. See Requesting specific fields to learn more.</p>
svm	svm	
uuid	string	The unique identifier of the NVMe namespace.

Error

Status: Default

ONTAP Error Response Codes

Error Code	Description
917927	The specified volume was not found.
918236	The specified <code>location.volume.uuid</code> and <code>location.volume.name</code> do not refer to the same volume.
2621462	The supplied SVM does not exist.
2621706	The specified <code>svm.uuid</code> and <code>svm.name</code> do not refer to the same SVM.
2621707	No SVM was specified. Either <code>svm.name</code> or <code>svm.uuid</code> must be supplied.
5242927	The specified qtree was not found.
5242950	The specified <code>location.qtree.id</code> and <code>location.qtree.name</code> do not refer to the same qtree.
5374352	An invalid name was provided for the NVMe namespace.
5374858	The volume specified by <code>name</code> is not the same as that specified by <code>location.volume</code> .
5374860	The qtree specified by <code>name</code> is not the same as that specified by <code>location.qtree</code> .
5374861	The NVMe namespace base name specified by <code>name</code> is not the same as that specified by <code>location.name</code> .
5374862	No NVMe namespace path base name was provided for the namespace.
13565952	The NVMe namespace clone request failed.
72089720	NVMe namespaces cannot be created in Snapshot copies.
72089721	The volume specified is in a load sharing mirror relationship. Namespaces are not supported in load sharing mirrors.
72089722	A negative size was provided for the NVMe namespace.
72089723	The specified size is too small for the NVMe namespace.
72089724	The specified size is too large for the NVMe namespace.
72089725	A LUN or NVMe namespace already exists at the specified path.
72089727	NVMe namespaces cannot be created on an SVM root volume.

Error Code	Description
72089728	NVMe namespaces cannot be created on a FlexGroup volume.
72089732	An NVMe namespace name can only contain characters A-Z, a-z, 0-9, "-", ".", "_", "{" and "}".
72090005	The specified <code>clone.source.uuid</code> and <code>clone.source.name</code> do not refer to the same NVMe namespace.
72090006	The specified <code>clone.source</code> was not found.
72090007	The specified <code>clone.source</code> was not found.
72090009	An error occurred after successfully creating the NVMe namespace. Some properties were not set.
72090012	The property cannot be specified when creating an NVMe namespace clone. The <code>target</code> property of the error object identifies the property.
72090013	The property is required except when creating an NVMe namespace clone. The <code>target</code> property of the error object identifies the property.
72090014	No volume was specified for the NVMe namespace.
72090015	An error occurred after successfully creating the NVMe namespace preventing the retrieval of its properties.
72090033	The <code>clone.source.uuid</code> property is not supported when specifying a source NVMe namespace from a Snapshot copy.

    "target": "uuid"
  }
}
```

Definitions

See Definitions

href

Name	Type	Description
href	string	

_links

Name	Type	Description
self	href	

source

The source NVMe namespace for a namespace clone operation. This can be specified using property `clone.source.uuid` or `clone.source.name`. If both properties are supplied, they must refer to the same namespace.

Valid in POST to create a new NVMe namespace as a clone of the source.

Valid in PATCH to overwrite an existing NVMe namespace's data as a clone of another.

Name	Type	Description
name	string	The fully qualified path name of the clone source NVMe namespace composed of a "/vol" prefix, the volume name, the (optional) qtree name and base name of the namespace. Valid in POST and PATCH.
uuid	string	The unique identifier of the clone source NVMe namespace. Valid in POST and PATCH.

clone

This sub-object is used in POST to create a new NVMe namespace as a clone of an existing namespace, or PATCH to overwrite an existing namespace as a clone of another. Setting a property in this sub-object indicates that a namespace clone is desired.

When used in a PATCH, the patched NVMe namespace's data is over-written as a clone of the source and the following properties are preserved from the patched namespace unless otherwise specified as part of the PATCH: `auto_delete` (unless specified in the request), `subsystem_map`, `status.state`, and `uuid`.

Name	Type	Description
source	source	<p>The source NVMe namespace for a namespace clone operation. This can be specified using property <code>clone.source.uuid</code> or <code>clone.source.name</code>. If both properties are supplied, they must refer to the same namespace.</p> <p>Valid in POST to create a new NVMe namespace as a clone of the source.</p> <p>Valid in PATCH to overwrite an existing NVMe namespace's data as a clone of another.</p>

qtree

The qtree in which the NVMe namespace is optionally located. Valid in POST.

If properties `name` and `location.qtree.name` and/or `location.qtree.uuid` are specified in the same request, they must refer to the same qtree.

NVMe namespaces do not support rename.

Name	Type	Description
_links	_links	
id	integer	The identifier for the qtree, unique within the qtree's volume.
name	string	The name of the qtree.

volume

The volume in which the NVMe namespace is located. Valid in POST.

If properties `name` and `location.volume.name` and/or `location.volume.uuid` are specified in the same request, they must refer to the same volume.

NVMe namespaces do not support movement between volumes.

Name	Type	Description
_links	_links	
name	string	The name of the volume.

Name	Type	Description
uuid	string	<p>Unique identifier for the volume. This corresponds to the instance-uuid that is exposed in the CLI and ONTAPI. It does not change due to a volume move.</p> <ul style="list-style-type: none"> • example: 028baa66-41bd-11e9-81d5-00a0986138f7 • Introduced in: 9.6

location

The location of the NVMe namespace within the ONTAP cluster. Valid in POST.

NVMe namespaces do not support rename, or movement between volumes.

Name	Type	Description
namespace	string	<p>The base name component of the NVMe namespace. Valid in POST.</p> <p>If <code>properties.name</code> and <code>location.namespace</code> are specified in the same request, they must refer to the base name.</p> <p>NVMe namespaces do not support rename.</p>
qtree	qtree	<p>The qtree in which the NVMe namespace is optionally located. Valid in POST.</p> <p>If <code>properties.name</code> and <code>location.qtree.name</code> and/or <code>location.qtree.uuid</code> are specified in the same request, they must refer to the same qtree.</p> <p>NVMe namespaces do not support rename.</p>

Name	Type	Description
volume	volume	<p>The volume in which the NVMe namespace is located. Valid in POST.</p> <p>If properties <code>name</code> and <code>location.volume.name</code> and/or <code>location.volume.uuid</code> are specified in the same request, they must refer to the same volume.</p> <p>NVMe namespaces do not support movement between volumes.</p>

iops

The rate of I/O operations observed at the storage object.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Performance metric for write I/O operations.

latency

The round trip latency in microseconds observed at the storage object.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.

Name	Type	Description
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Performance metric for write I/O operations.

throughput

The rate of throughput bytes per second observed at the storage object.

Name	Type	Description
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Performance metric for write I/O operations.

metric

Performance numbers, such as IOPS latency and throughput

Name	Type	Description
_links	_links	
duration	string	The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:
iops	iops	The rate of I/O operations observed at the storage object.
latency	latency	The round trip latency in microseconds observed at the storage object.

Name	Type	Description
status	string	Any errors associated with the sample. For example, if the aggregation of data over multiple nodes fails then any of the partial errors might be returned, "ok" on success, or "error" on any internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.
throughput	throughput	The rate of throughput bytes per second observed at the storage object.
timestamp	string	The timestamp of the performance data.

guarantee

Properties that request and report the space guarantee for the NVMe namespace.

Name	Type	Description
requested	boolean	<p>The requested space reservation policy for the NVMe namespace. If <i>true</i>, a space reservation is requested for the namespace; if <i>false</i>, the namespace is thin provisioned. Guaranteeing a space reservation request for a namespace requires that the volume in which the namespace resides also be space reserved and that the fractional reserve for the volume be 100%.</p> <p>The space reservation policy for an NVMe namespace is determined by ONTAP.</p> <ul style="list-style-type: none"> • readOnly: 1 • Introduced in: 9.6
reserved	boolean	<p>Reports if the NVMe namespace is space guaranteed.</p> <p>This property is <i>true</i> if a space guarantee is requested and the containing volume and aggregate support the request. This property is <i>false</i> if a space guarantee is not requested or if a space guarantee is requested and either the containing volume and aggregate do not support the request.</p>

space

The storage space related properties of the NVMe namespace.

Name	Type	Description
block_size	integer	<p>The size of blocks in the namespace in bytes.</p> <p>Valid in POST when creating an NVMe namespace that is not a clone of another. Disallowed in POST when creating a namespace clone.</p> <p>Valid in POST.</p>

Name	Type	Description
guarantee	guarantee	Properties that request and report the space guarantee for the NVMe namespace.
size	integer	<p>The total provisioned size of the NVMe namespace.</p> <p>NVMe namespaces do not support resize.</p> <p>The maximum and minimum sizes listed here are the absolute maximum and absolute minimum sizes in bytes. The maximum size is variable with respect to large NVMe namespace support in ONTAP. If large namespaces are supported, the maximum size is 128 TB (140737488355328 bytes) and if not supported, the maximum size is just under 16 TB (17557557870592 bytes). The minimum size supported is always 4096 bytes.</p> <p>For more information, see <i>Size properties</i> in the <i>docs</i> section of the ONTAP REST API documentation.</p> <ul style="list-style-type: none"> • example: 1073741824 • Max value: 140737488355328 • Min value: 4096 • Introduced in: 9.6 • readCreate: 1

Name	Type	Description
used	integer	<p>The amount of space consumed by the main data stream of the NVMe namespace.</p> <p>This value is the total space consumed in the volume by the NVMe namespace, including filesystem overhead, but excluding prefix and suffix streams. Due to internal filesystem overhead and the many ways NVMe filesystems and applications utilize blocks within a namespace, this value does not necessarily reflect actual consumption/availability from the perspective of the filesystem or application. Without specific knowledge of how the namespace blocks are utilized outside of ONTAP, this property should not be used and an indicator for an out-of-space condition.</p> <p>For more information, see <i>Size properties</i> in the <i>docs</i> section of the ONTAP REST API documentation.</p> <ul style="list-style-type: none"> • readOnly: 1 • Introduced in: 9.6

iops_raw

The number of I/O operations observed at the storage object. This should be used along with delta time to calculate the rate of I/O operations per unit of time.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.
read	integer	Performance metric for read I/O operations.

Name	Type	Description
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Performance metric for write I/O operations.

latency_raw

The raw latency in microseconds observed at the storage object. This should be divided by the raw IOPS value to calculate the average latency per I/O operation.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Performance metric for write I/O operations.

throughput_raw

Throughput bytes observed at the storage object. This should be used along with delta time to calculate the rate of throughput bytes per unit of time.

Name	Type	Description
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Performance metric for write I/O operations.

statistics

These are raw performance numbers, such as IOPS latency and throughput. These numbers are aggregated across all nodes in the cluster and increase with the uptime of the cluster.

Name	Type	Description
iops_raw	iops_raw	The number of I/O operations observed at the storage object. This should be used along with delta time to calculate the rate of I/O operations per unit of time.
latency_raw	latency_raw	The raw latency in microseconds observed at the storage object. This should be divided by the raw IOPS value to calculate the average latency per I/O operation.
status	string	Any errors associated with the sample. For example, if the aggregation of data over multiple nodes fails then any of the partial errors might be returned, "ok" on success, or "error" on any internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.
throughput_raw	throughput_raw	Throughput bytes observed at the storage object. This should be used along with delta time to calculate the rate of throughput bytes per unit of time.
timestamp	string	The timestamp of the performance data.

status

Status information about the NVMe namespace.

Name	Type	Description
container_state	string	The state of the volume and aggregate that contain the NVMe namespace. Namespaces are only available when their containers are available.
mapped	boolean	Reports if the NVMe namespace is mapped to an NVMe subsystem. There is an added cost to retrieving this property's value. It is not populated for either a collection GET or an instance GET unless it is explicitly requested using the <code>fields</code> query parameter. See Requesting specific fields to learn more.
read_only	boolean	Reports if the NVMe namespace allows only read access.
state	string	The state of the NVMe namespace. Normal states for a namespace are <i>online</i> and <i>offline</i> . Other states indicate errors.

subsystem

The NVMe subsystem to which the NVMe namespace is mapped.

Name	Type	Description
_links	_links	
name	string	The name of the NVMe subsystem.
uuid	string	The unique identifier of the NVMe subsystem.

subsystem_map

The NVMe subsystem with which the NVMe namespace is associated. A namespace can be mapped to zero (0) or one (1) subsystems.

There is an added cost to retrieving property values for `subsystem_map`. They are not populated for either a collection GET or an instance GET unless explicitly requested using the `fields` query

parameter. See [Requesting specific fields](#) to learn more.

Name	Type	Description
_links	_links	
anagrpid	string	The Asymmetric Namespace Access Group ID (ANAGRPID) of the NVMe namespace. The format for an ANAGRPID is 8 hexadecimal digits (zero-filled) followed by a lower case "h".
nsid	string	The NVMe namespace identifier. This is an identifier used by an NVMe controller to provide access to the NVMe namespace. The format for an NVMe namespace identifier is 8 hexadecimal digits (zero-filled) followed by a lower case "h".
subsystem	subsystem	The NVMe subsystem to which the NVMe namespace is mapped.

svm

Name	Type	Description
_links	_links	
name	string	The name of the SVM.
uuid	string	The unique identifier of the SVM.

nvme_namespace

An NVMe namespace is a collection of addressable logical blocks presented to hosts connected to the storage virtual machine using the NVMe over Fabrics protocol.

In ONTAP, an NVMe namespace is located within a volume. Optionally, it can be located within a qtree in a volume.

An NVMe namespace is created to a specified size using thin or thick provisioning as determined by the volume on which it is created. NVMe namespaces support being cloned. An NVMe namespace cannot be renamed, resized, or moved to a different volume. NVMe namespaces do not support the assignment of a QoS policy for performance management, but a QoS policy can be assigned to the volume containing the namespace. See the NVMe namespace object model to learn more about each of the properties supported by the NVMe namespace REST API.

An NVMe namespace must be mapped to an NVMe subsystem to grant access to the subsystem's hosts. Hosts can then access the NVMe namespace and perform I/O using the NVMe over Fabrics protocol.

Name	Type	Description
_links	_links	
auto_delete	boolean	<p>This property marks the NVMe namespace for auto deletion when the volume containing the namespace runs out of space. This is most commonly set on namespace clones.</p> <p>When set to <i>true</i>, the NVMe namespace becomes eligible for automatic deletion when the volume runs out of space. Auto deletion only occurs when the volume containing the namespace is also configured for auto deletion and free space in the volume decreases below a particular threshold.</p> <p>This property is optional in POST and PATCH. The default value for a new NVMe namespace is <i>false</i>.</p> <p>There is an added cost to retrieving this property's value. It is not populated for either a collection GET or an instance GET unless it is explicitly requested using the <code>fields</code> query parameter. See Requesting specific fields to learn more.</p>

Name	Type	Description
clone	clone	<p>This sub-object is used in POST to create a new NVMe namespace as a clone of an existing namespace, or PATCH to overwrite an existing namespace as a clone of another. Setting a property in this sub-object indicates that a namespace clone is desired.</p> <p>When used in a PATCH, the patched NVMe namespace's data is over-written as a clone of the source and the following properties are preserved from the patched namespace unless otherwise specified as part of the PATCH: <code>auto_delete</code> (unless specified in the request), <code>subsystem_map</code>, <code>status.state</code>, and <code>uuid</code>.</p>
comment	string	A configurable comment available for use by the administrator. Valid in POST and PATCH.
create_time	string	The time the NVMe namespace was created.
enabled	boolean	The enabled state of the NVMe namespace. Certain error conditions cause the namespace to become disabled. If the namespace is disabled, you can check the <code>state</code> property to determine what error disabled the namespace. An NVMe namespace is enabled automatically when it is created.

Name	Type	Description
location	location	<p>The location of the NVMe namespace within the ONTAP cluster. Valid in POST.</p> <p>NVMe namespaces do not support rename, or movement between volumes.</p> <ul style="list-style-type: none"> • Introduced in: 9.6 • readCreate: 1
metric	metric	Performance numbers, such as IOPS latency and throughput
name	string	<p>The fully qualified path name of the NVMe namespace composed of a "/vol" prefix, the volume name, the (optional) qtree name and base name of the namespace. Valid in POST.</p> <p>NVMe namespaces do not support rename, or movement between volumes.</p>
os_type	string	<p>The operating system type of the NVMe namespace.</p> <p>Required in POST when creating an NVMe namespace that is not a clone of another. Disallowed in POST when creating a namespace clone.</p>
space	space	The storage space related properties of the NVMe namespace.
statistics	statistics	These are raw performance numbers, such as IOPS latency and throughput. These numbers are aggregated across all nodes in the cluster and increase with the uptime of the cluster.
status	status	Status information about the NVMe namespace.

Name	Type	Description
subsystem_map	subsystem_map	The NVMe subsystem with which the NVMe namespace is associated. A namespace can be mapped to zero (0) or one (1) subsystems. There is an added cost to retrieving property values for <code>subsystem_map</code> . They are not populated for either a collection GET or an instance GET unless explicitly requested using the <code>fields</code> query parameter. See Requesting specific fields to learn more.
svm	svm	
uuid	string	The unique identifier of the NVMe namespace.

`_links`

Name	Type	Description
next	href	
self	href	

`error_arguments`

Name	Type	Description
code	string	Argument code
message	string	Message argument

`error`

Name	Type	Description
arguments	array[error_arguments]	Message arguments
code	string	Error code
message	string	Error message

Name	Type	Description
target	string	The target parameter that caused the error.

Delete an NVMe namespace

DELETE /storage/namespaces/{uuid}

Introduced In: 9.6

Deletes an NVMe namespace.

Related ONTAP commands

- `vserver nvme namespace delete`

Learn more

- [DOC /storage/namespaces](#)

Parameters

Name	Type	In	Required	Description
uuid	string	path	True	The unique identifier of the NVMe namespace to delete.
allow_delete_while_mapped	boolean	query	False	Allows deletion of a mapped NVMe namespace. A mapped NVMe namespace might be in use. Deleting a mapped namespace also deletes the namespace map and makes the data no longer available, possibly causing a disruption in the availability of data. This parameter should be used with caution. <ul style="list-style-type: none"> • Default value:

Name	Type	Description
href	string	

_links

Name	Type	Description
self	href	

source

The source NVMe namespace for a namespace clone operation. This can be specified using property `clone.source.uuid` or `clone.source.name`. If both properties are supplied, they must refer to the same namespace.

Valid in POST to create a new NVMe namespace as a clone of the source.

Valid in PATCH to overwrite an existing NVMe namespace's data as a clone of another.

Name	Type	Description
name	string	The fully qualified path name of the clone source NVMe namespace composed of a "/vol" prefix, the volume name, the (optional) qtree name and base name of the namespace. Valid in POST and PATCH.
uuid	string	The unique identifier of the clone source NVMe namespace. Valid in POST and PATCH.

clone

This sub-object is used in POST to create a new NVMe namespace as a clone of an existing namespace, or PATCH to overwrite an existing namespace as a clone of another. Setting a property in this sub-object indicates that a namespace clone is desired.

When used in a PATCH, the patched NVMe namespace's data is over-written as a clone of the source and the following properties are preserved from the patched namespace unless otherwise specified as part of the PATCH: `auto_delete` (unless specified in the request), `subsystem_map`, `status.state`, and `uuid`.

Name	Type	Description
source	source	<p>The source NVMe namespace for a namespace clone operation. This can be specified using property <code>clone.source.uuid</code> or <code>clone.source.name</code>. If both properties are supplied, they must refer to the same namespace.</p> <p>Valid in POST to create a new NVMe namespace as a clone of the source.</p> <p>Valid in PATCH to overwrite an existing NVMe namespace's data as a clone of another.</p>

qtree

The qtree in which the NVMe namespace is optionally located. Valid in POST.

If properties `name` and `location.qtree.name` and/or `location.qtree.uuid` are specified in the same request, they must refer to the same qtree.

NVMe namespaces do not support rename.

Name	Type	Description
_links	_links	
id	integer	The identifier for the qtree, unique within the qtree's volume.
name	string	The name of the qtree.

volume

The volume in which the NVMe namespace is located. Valid in POST.

If properties `name` and `location.volume.name` and/or `location.volume.uuid` are specified in the same request, they must refer to the same volume.

NVMe namespaces do not support movement between volumes.

Name	Type	Description
_links	_links	
name	string	The name of the volume.

Name	Type	Description
uuid	string	<p>Unique identifier for the volume. This corresponds to the instance-uuid that is exposed in the CLI and ONTAPI. It does not change due to a volume move.</p> <ul style="list-style-type: none"> • example: 028baa66-41bd-11e9-81d5-00a0986138f7 • Introduced in: 9.6

location

The location of the NVMe namespace within the ONTAP cluster. Valid in POST.

NVMe namespaces do not support rename, or movement between volumes.

Name	Type	Description
namespace	string	<p>The base name component of the NVMe namespace. Valid in POST.</p> <p>If <code>properties.name</code> and <code>location.namespace</code> are specified in the same request, they must refer to the base name.</p> <p>NVMe namespaces do not support rename.</p>
qtree	qtree	<p>The qtree in which the NVMe namespace is optionally located. Valid in POST.</p> <p>If <code>properties.name</code> and <code>location.qtree.name</code> and/or <code>location.qtree.uuid</code> are specified in the same request, they must refer to the same qtree.</p> <p>NVMe namespaces do not support rename.</p>

Name	Type	Description
volume	volume	<p>The volume in which the NVMe namespace is located. Valid in POST.</p> <p>If properties <code>name</code> and <code>location.volume.name</code> and/or <code>location.volume.uuid</code> are specified in the same request, they must refer to the same volume.</p> <p>NVMe namespaces do not support movement between volumes.</p>

iops

The rate of I/O operations observed at the storage object.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Performance metric for write I/O operations.

latency

The round trip latency in microseconds observed at the storage object.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.

Name	Type	Description
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Performance metric for write I/O operations.

throughput

The rate of throughput bytes per second observed at the storage object.

Name	Type	Description
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Performance metric for write I/O operations.

metric

Performance numbers, such as IOPS latency and throughput

Name	Type	Description
_links	_links	
duration	string	The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:
iops	iops	The rate of I/O operations observed at the storage object.
latency	latency	The round trip latency in microseconds observed at the storage object.

Name	Type	Description
status	string	Any errors associated with the sample. For example, if the aggregation of data over multiple nodes fails then any of the partial errors might be returned, "ok" on success, or "error" on any internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.
throughput	throughput	The rate of throughput bytes per second observed at the storage object.
timestamp	string	The timestamp of the performance data.

guarantee

Properties that request and report the space guarantee for the NVMe namespace.

Name	Type	Description
requested	boolean	<p>The requested space reservation policy for the NVMe namespace. If <i>true</i>, a space reservation is requested for the namespace; if <i>false</i>, the namespace is thin provisioned. Guaranteeing a space reservation request for a namespace requires that the volume in which the namespace resides also be space reserved and that the fractional reserve for the volume be 100%.</p> <p>The space reservation policy for an NVMe namespace is determined by ONTAP.</p> <ul style="list-style-type: none"> • readOnly: 1 • Introduced in: 9.6
reserved	boolean	<p>Reports if the NVMe namespace is space guaranteed.</p> <p>This property is <i>true</i> if a space guarantee is requested and the containing volume and aggregate support the request. This property is <i>false</i> if a space guarantee is not requested or if a space guarantee is requested and either the containing volume and aggregate do not support the request.</p>

space

The storage space related properties of the NVMe namespace.

Name	Type	Description
block_size	integer	<p>The size of blocks in the namespace in bytes.</p> <p>Valid in POST when creating an NVMe namespace that is not a clone of another. Disallowed in POST when creating a namespace clone.</p> <p>Valid in POST.</p>

Name	Type	Description
guarantee	guarantee	Properties that request and report the space guarantee for the NVMe namespace.
size	integer	<p>The total provisioned size of the NVMe namespace.</p> <p>NVMe namespaces do not support resize.</p> <p>The maximum and minimum sizes listed here are the absolute maximum and absolute minimum sizes in bytes. The maximum size is variable with respect to large NVMe namespace support in ONTAP. If large namespaces are supported, the maximum size is 128 TB (140737488355328 bytes) and if not supported, the maximum size is just under 16 TB (17557557870592 bytes). The minimum size supported is always 4096 bytes.</p> <p>For more information, see <i>Size properties</i> in the <i>docs</i> section of the ONTAP REST API documentation.</p> <ul style="list-style-type: none"> • example: 1073741824 • Max value: 140737488355328 • Min value: 4096 • Introduced in: 9.6 • readCreate: 1

Name	Type	Description
used	integer	<p>The amount of space consumed by the main data stream of the NVMe namespace.</p> <p>This value is the total space consumed in the volume by the NVMe namespace, including filesystem overhead, but excluding prefix and suffix streams. Due to internal filesystem overhead and the many ways NVMe filesystems and applications utilize blocks within a namespace, this value does not necessarily reflect actual consumption/availability from the perspective of the filesystem or application. Without specific knowledge of how the namespace blocks are utilized outside of ONTAP, this property should not be used and an indicator for an out-of-space condition.</p> <p>For more information, see <i>Size properties</i> in the <i>docs</i> section of the ONTAP REST API documentation.</p> <ul style="list-style-type: none"> • readOnly: 1 • Introduced in: 9.6

iops_raw

The number of I/O operations observed at the storage object. This should be used along with delta time to calculate the rate of I/O operations per unit of time.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.
read	integer	Performance metric for read I/O operations.

Name	Type	Description
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Performance metric for write I/O operations.

latency_raw

The raw latency in microseconds observed at the storage object. This should be divided by the raw IOPS value to calculate the average latency per I/O operation.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Performance metric for write I/O operations.

throughput_raw

Throughput bytes observed at the storage object. This should be used along with delta time to calculate the rate of throughput bytes per unit of time.

Name	Type	Description
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Performance metric for write I/O operations.

statistics

These are raw performance numbers, such as IOPS latency and throughput. These numbers are aggregated across all nodes in the cluster and increase with the uptime of the cluster.

Name	Type	Description
iops_raw	iops_raw	The number of I/O operations observed at the storage object. This should be used along with delta time to calculate the rate of I/O operations per unit of time.
latency_raw	latency_raw	The raw latency in microseconds observed at the storage object. This should be divided by the raw IOPS value to calculate the average latency per I/O operation.
status	string	Any errors associated with the sample. For example, if the aggregation of data over multiple nodes fails then any of the partial errors might be returned, "ok" on success, or "error" on any internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.
throughput_raw	throughput_raw	Throughput bytes observed at the storage object. This should be used along with delta time to calculate the rate of throughput bytes per unit of time.
timestamp	string	The timestamp of the performance data.

status

Status information about the NVMe namespace.

Name	Type	Description
container_state	string	The state of the volume and aggregate that contain the NVMe namespace. Namespaces are only available when their containers are available.
mapped	boolean	Reports if the NVMe namespace is mapped to an NVMe subsystem. There is an added cost to retrieving this property's value. It is not populated for either a collection GET or an instance GET unless it is explicitly requested using the <code>fields</code> query parameter. See Requesting specific fields to learn more.
read_only	boolean	Reports if the NVMe namespace allows only read access.
state	string	The state of the NVMe namespace. Normal states for a namespace are <i>online</i> and <i>offline</i> . Other states indicate errors.

subsystem

The NVMe subsystem to which the NVMe namespace is mapped.

Name	Type	Description
_links	_links	
name	string	The name of the NVMe subsystem.
uuid	string	The unique identifier of the NVMe subsystem.

subsystem_map

The NVMe subsystem with which the NVMe namespace is associated. A namespace can be mapped to zero (0) or one (1) subsystems.

There is an added cost to retrieving property values for `subsystem_map`. They are not populated for either a collection GET or an instance GET unless explicitly requested using the `fields` query

parameter. See [Requesting specific fields](#) to learn more.

Name	Type	Description
_links	_links	
anagrpid	string	The Asymmetric Namespace Access Group ID (ANAGRPID) of the NVMe namespace. The format for an ANAGRPID is 8 hexadecimal digits (zero-filled) followed by a lower case "h".
nsid	string	The NVMe namespace identifier. This is an identifier used by an NVMe controller to provide access to the NVMe namespace. The format for an NVMe namespace identifier is 8 hexadecimal digits (zero-filled) followed by a lower case "h".
subsystem	subsystem	The NVMe subsystem to which the NVMe namespace is mapped.

svm

Name	Type	Description
_links	_links	
name	string	The name of the SVM.
uuid	string	The unique identifier of the SVM.

error_arguments

Name	Type	Description
code	string	Argument code
message	string	Message argument

error

Name	Type	Description
arguments	array[error_arguments]	Message arguments
code	string	Error code
message	string	Error message
target	string	The target parameter that caused the error.

Update an NVMe namespace

PATCH /storage/namespaces/{uuid}

Introduced In: 9.6

Updates an NVMe namespace.

Related ONTAP commands

- `volume file clone autodelete`
- `vserver nvme namespace modify`

Learn more

- [DOC /storage/namespaces](#)

Parameters

Name	Type	In	Required	Description
uuid	string	path	True	The unique identifier of the NVMe namespace to update.

Request Body

Name	Type	Description
_links	_links	

Name	Type	Description
auto_delete	boolean	<p>This property marks the NVMe namespace for auto deletion when the volume containing the namespace runs out of space. This is most commonly set on namespace clones.</p> <p>When set to <i>true</i>, the NVMe namespace becomes eligible for automatic deletion when the volume runs out of space. Auto deletion only occurs when the volume containing the namespace is also configured for auto deletion and free space in the volume decreases below a particular threshold.</p> <p>This property is optional in POST and PATCH. The default value for a new NVMe namespace is <i>false</i>.</p> <p>There is an added cost to retrieving this property's value. It is not populated for either a collection GET or an instance GET unless it is explicitly requested using the <code>fields</code> query parameter. See Requesting specific fields to learn more.</p>
clone	clone	<p>This sub-object is used in POST to create a new NVMe namespace as a clone of an existing namespace, or PATCH to overwrite an existing namespace as a clone of another. Setting a property in this sub-object indicates that a namespace clone is desired.</p> <p>When used in a PATCH, the patched NVMe namespace's data is over-written as a clone of the source and the following properties are preserved from the patched namespace unless otherwise specified as part of the PATCH: <code>auto_delete</code> (unless specified in the request), <code>subsystem_map</code>, <code>status.state</code>, and <code>uuid</code>.</p>

Name	Type	Description
comment	string	A configurable comment available for use by the administrator. Valid in POST and PATCH.
create_time	string	The time the NVMe namespace was created.
enabled	boolean	The enabled state of the NVMe namespace. Certain error conditions cause the namespace to become disabled. If the namespace is disabled, you can check the <code>state</code> property to determine what error disabled the namespace. An NVMe namespace is enabled automatically when it is created.
location	location	<p>The location of the NVMe namespace within the ONTAP cluster. Valid in POST.</p> <p>NVMe namespaces do not support rename, or movement between volumes.</p> <ul style="list-style-type: none"> • Introduced in: 9.6 • readCreate: 1
metric	metric	Performance numbers, such as IOPS latency and throughput
name	string	<p>The fully qualified path name of the NVMe namespace composed of a <code>"/vol"</code> prefix, the volume name, the (optional) <code>qtree</code> name and base name of the namespace. Valid in POST.</p> <p>NVMe namespaces do not support rename, or movement between volumes.</p>

Name	Type	Description
os_type	string	The operating system type of the NVMe namespace. Required in POST when creating an NVMe namespace that is not a clone of another. Disallowed in POST when creating a namespace clone.
space	space	The storage space related properties of the NVMe namespace.
statistics	statistics	These are raw performance numbers, such as IOPS latency and throughput. These numbers are aggregated across all nodes in the cluster and increase with the uptime of the cluster.
status	status	Status information about the NVMe namespace.
subsystem_map	subsystem_map	The NVMe subsystem with which the NVMe namespace is associated. A namespace can be mapped to zero (0) or one (1) subsystems. There is an added cost to retrieving property values for <code>subsystem_map</code> . They are not populated for either a collection GET or an instance GET unless explicitly requested using the <code>fields</code> query parameter. See Requesting specific fields to learn more.
svm	svm	
uuid	string	The unique identifier of the NVMe namespace.

Response

Status: 200, Ok

Error

Status: Default

ONTAP Error Response Codes

Error Code	Description
13565952	The namespace clone request failed.

Error Code	Description
72090005	The specified <code>clone.source.uuid</code> and <code>clone.source.name</code> do not refer to the same LUN.
72090006	The specified namespace was not found. This can apply to <code>clone.source</code> or the target namespace. The <code>target</code> property of the error object identifies the property.
72090007	The specified namespace was not found. This can apply to <code>clone.source</code> or the target namespace. The <code>target</code> property of the error object identifies the property.
72090010	An error occurred after successfully overwriting data for the namespace as a clone. Some properties were not modified.
72090011	An error occurred after successfully modifying some of the properties of the namespace. Some properties were not modified.
72090016	The namespace's aggregate is offline. The aggregate must be online to modify or remove the namespace.
72090017	The namespace's volume is offline. The volume must be online to modify or remove the namespace.

Name	Type	Description

href

Name	Type	Description
href	string	

_links

Name	Type	Description
self	href	

source

The source NVMe namespace for a namespace clone operation. This can be specified using property `clone.source.uuid` or `clone.source.name`. If both properties are supplied, they must refer to the same namespace.

Valid in POST to create a new NVMe namespace as a clone of the source.

Valid in PATCH to overwrite an existing NVMe namespace's data as a clone of another.

Name	Type	Description
name	string	The fully qualified path name of the clone source NVMe namespace composed of a "/vol" prefix, the volume name, the (optional) qtree name and base name of the namespace. Valid in POST and PATCH.
uuid	string	The unique identifier of the clone source NVMe namespace. Valid in POST and PATCH.

clone

This sub-object is used in POST to create a new NVMe namespace as a clone of an existing namespace, or PATCH to overwrite an existing namespace as a clone of another. Setting a property in this sub-object indicates that a namespace clone is desired.

When used in a PATCH, the patched NVMe namespace's data is over-written as a clone of the source and the following properties are preserved from the patched namespace unless otherwise specified as part of the PATCH: `auto_delete` (unless specified in the request), `subsystem_map`, `status.state`, and `uuid`.

Name	Type	Description
source	source	<p>The source NVMe namespace for a namespace clone operation. This can be specified using property <code>clone.source.uuid</code> or <code>clone.source.name</code>. If both properties are supplied, they must refer to the same namespace.</p> <p>Valid in POST to create a new NVMe namespace as a clone of the source.</p> <p>Valid in PATCH to overwrite an existing NVMe namespace's data as a clone of another.</p>

qtree

The qtree in which the NVMe namespace is optionally located. Valid in POST.

If properties `name` and `location.qtree.name` and/or `location.qtree.uuid` are specified in the same request, they must refer to the same qtree.

NVMe namespaces do not support rename.

Name	Type	Description
_links	_links	
id	integer	The identifier for the qtree, unique within the qtree's volume.
name	string	The name of the qtree.

volume

The volume in which the NVMe namespace is located. Valid in POST.

If properties `name` and `location.volume.name` and/or `location.volume.uuid` are specified in the same request, they must refer to the same volume.

NVMe namespaces do not support movement between volumes.

Name	Type	Description
_links	_links	
name	string	The name of the volume.

Name	Type	Description
uuid	string	<p>Unique identifier for the volume. This corresponds to the instance-uuid that is exposed in the CLI and ONTAPI. It does not change due to a volume move.</p> <ul style="list-style-type: none"> • example: 028baa66-41bd-11e9-81d5-00a0986138f7 • Introduced in: 9.6

location

The location of the NVMe namespace within the ONTAP cluster. Valid in POST.

NVMe namespaces do not support rename, or movement between volumes.

Name	Type	Description
namespace	string	<p>The base name component of the NVMe namespace. Valid in POST.</p> <p>If <code>properties.name</code> and <code>location.namespace</code> are specified in the same request, they must refer to the base name.</p> <p>NVMe namespaces do not support rename.</p>
qtree	qtree	<p>The qtree in which the NVMe namespace is optionally located. Valid in POST.</p> <p>If <code>properties.name</code> and <code>location.qtree.name</code> and/or <code>location.qtree.uuid</code> are specified in the same request, they must refer to the same qtree.</p> <p>NVMe namespaces do not support rename.</p>

Name	Type	Description
volume	volume	<p>The volume in which the NVMe namespace is located. Valid in POST.</p> <p>If properties <code>name</code> and <code>location.volume.name</code> and/or <code>location.volume.uuid</code> are specified in the same request, they must refer to the same volume.</p> <p>NVMe namespaces do not support movement between volumes.</p>

iops

The rate of I/O operations observed at the storage object.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Performance metric for write I/O operations.

latency

The round trip latency in microseconds observed at the storage object.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.

Name	Type	Description
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Performance metric for write I/O operations.

throughput

The rate of throughput bytes per second observed at the storage object.

Name	Type	Description
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Performance metric for write I/O operations.

metric

Performance numbers, such as IOPS latency and throughput

Name	Type	Description
_links	_links	
duration	string	The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:
iops	iops	The rate of I/O operations observed at the storage object.
latency	latency	The round trip latency in microseconds observed at the storage object.

Name	Type	Description
status	string	Any errors associated with the sample. For example, if the aggregation of data over multiple nodes fails then any of the partial errors might be returned, "ok" on success, or "error" on any internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.
throughput	throughput	The rate of throughput bytes per second observed at the storage object.
timestamp	string	The timestamp of the performance data.

guarantee

Properties that request and report the space guarantee for the NVMe namespace.

Name	Type	Description
requested	boolean	<p>The requested space reservation policy for the NVMe namespace. If <i>true</i>, a space reservation is requested for the namespace; if <i>false</i>, the namespace is thin provisioned. Guaranteeing a space reservation request for a namespace requires that the volume in which the namespace resides also be space reserved and that the fractional reserve for the volume be 100%.</p> <p>The space reservation policy for an NVMe namespace is determined by ONTAP.</p> <ul style="list-style-type: none"> • readOnly: 1 • Introduced in: 9.6
reserved	boolean	<p>Reports if the NVMe namespace is space guaranteed.</p> <p>This property is <i>true</i> if a space guarantee is requested and the containing volume and aggregate support the request. This property is <i>false</i> if a space guarantee is not requested or if a space guarantee is requested and either the containing volume and aggregate do not support the request.</p>

space

The storage space related properties of the NVMe namespace.

Name	Type	Description
block_size	integer	<p>The size of blocks in the namespace in bytes.</p> <p>Valid in POST when creating an NVMe namespace that is not a clone of another. Disallowed in POST when creating a namespace clone.</p> <p>Valid in POST.</p>

Name	Type	Description
guarantee	guarantee	Properties that request and report the space guarantee for the NVMe namespace.
size	integer	<p>The total provisioned size of the NVMe namespace.</p> <p>NVMe namespaces do not support resize.</p> <p>The maximum and minimum sizes listed here are the absolute maximum and absolute minimum sizes in bytes. The maximum size is variable with respect to large NVMe namespace support in ONTAP. If large namespaces are supported, the maximum size is 128 TB (140737488355328 bytes) and if not supported, the maximum size is just under 16 TB (17557557870592 bytes). The minimum size supported is always 4096 bytes.</p> <p>For more information, see <i>Size properties</i> in the <i>docs</i> section of the ONTAP REST API documentation.</p> <ul style="list-style-type: none"> • example: 1073741824 • Max value: 140737488355328 • Min value: 4096 • Introduced in: 9.6 • readCreate: 1

Name	Type	Description
used	integer	<p>The amount of space consumed by the main data stream of the NVMe namespace.</p> <p>This value is the total space consumed in the volume by the NVMe namespace, including filesystem overhead, but excluding prefix and suffix streams. Due to internal filesystem overhead and the many ways NVMe filesystems and applications utilize blocks within a namespace, this value does not necessarily reflect actual consumption/availability from the perspective of the filesystem or application. Without specific knowledge of how the namespace blocks are utilized outside of ONTAP, this property should not be used and an indicator for an out-of-space condition.</p> <p>For more information, see <i>Size properties</i> in the <i>docs</i> section of the ONTAP REST API documentation.</p> <ul style="list-style-type: none"> • readOnly: 1 • Introduced in: 9.6

iops_raw

The number of I/O operations observed at the storage object. This should be used along with delta time to calculate the rate of I/O operations per unit of time.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.
read	integer	Performance metric for read I/O operations.

Name	Type	Description
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Performance metric for write I/O operations.

latency_raw

The raw latency in microseconds observed at the storage object. This should be divided by the raw IOPS value to calculate the average latency per I/O operation.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Performance metric for write I/O operations.

throughput_raw

Throughput bytes observed at the storage object. This should be used along with delta time to calculate the rate of throughput bytes per unit of time.

Name	Type	Description
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Performance metric for write I/O operations.

statistics

These are raw performance numbers, such as IOPS latency and throughput. These numbers are aggregated across all nodes in the cluster and increase with the uptime of the cluster.

Name	Type	Description
iops_raw	iops_raw	The number of I/O operations observed at the storage object. This should be used along with delta time to calculate the rate of I/O operations per unit of time.
latency_raw	latency_raw	The raw latency in microseconds observed at the storage object. This should be divided by the raw IOPS value to calculate the average latency per I/O operation.
status	string	Any errors associated with the sample. For example, if the aggregation of data over multiple nodes fails then any of the partial errors might be returned, "ok" on success, or "error" on any internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.
throughput_raw	throughput_raw	Throughput bytes observed at the storage object. This should be used along with delta time to calculate the rate of throughput bytes per unit of time.
timestamp	string	The timestamp of the performance data.

status

Status information about the NVMe namespace.

Name	Type	Description
container_state	string	The state of the volume and aggregate that contain the NVMe namespace. Namespaces are only available when their containers are available.
mapped	boolean	Reports if the NVMe namespace is mapped to an NVMe subsystem. There is an added cost to retrieving this property's value. It is not populated for either a collection GET or an instance GET unless it is explicitly requested using the <code>fields</code> query parameter. See Requesting specific fields to learn more.
read_only	boolean	Reports if the NVMe namespace allows only read access.
state	string	The state of the NVMe namespace. Normal states for a namespace are <i>online</i> and <i>offline</i> . Other states indicate errors.

subsystem

The NVMe subsystem to which the NVMe namespace is mapped.

Name	Type	Description
_links	_links	
name	string	The name of the NVMe subsystem.
uuid	string	The unique identifier of the NVMe subsystem.

subsystem_map

The NVMe subsystem with which the NVMe namespace is associated. A namespace can be mapped to zero (0) or one (1) subsystems.

There is an added cost to retrieving property values for `subsystem_map`. They are not populated for either a collection GET or an instance GET unless explicitly requested using the `fields` query

parameter. See [Requesting specific fields](#) to learn more.

Name	Type	Description
_links	_links	
anagrpId	string	The Asymmetric Namespace Access Group ID (ANAGRPID) of the NVMe namespace. The format for an ANAGRPID is 8 hexadecimal digits (zero-filled) followed by a lower case "h".
nsid	string	The NVMe namespace identifier. This is an identifier used by an NVMe controller to provide access to the NVMe namespace. The format for an NVMe namespace identifier is 8 hexadecimal digits (zero-filled) followed by a lower case "h".
subsystem	subsystem	The NVMe subsystem to which the NVMe namespace is mapped.

svm

Name	Type	Description
_links	_links	
name	string	The name of the SVM.
uuid	string	The unique identifier of the SVM.

nvme_namespace

An NVMe namespace is a collection of addressable logical blocks presented to hosts connected to the storage virtual machine using the NVMe over Fabrics protocol.

In ONTAP, an NVMe namespace is located within a volume. Optionally, it can be located within a qtree in a volume.

An NVMe namespace is created to a specified size using thin or thick provisioning as determined by the volume on which it is created. NVMe namespaces support being cloned. An NVMe namespace cannot be renamed, resized, or moved to a different volume. NVMe namespaces do not support the assignment of a QoS policy for performance management, but a QoS policy can be assigned to the volume containing the namespace. See the NVMe namespace object model to learn more about each of the properties supported by the NVMe namespace REST API.

An NVMe namespace must be mapped to an NVMe subsystem to grant access to the subsystem's hosts. Hosts can then access the NVMe namespace and perform I/O using the NVMe over Fabrics protocol.

Name	Type	Description
_links	_links	
auto_delete	boolean	<p>This property marks the NVMe namespace for auto deletion when the volume containing the namespace runs out of space. This is most commonly set on namespace clones.</p> <p>When set to <i>true</i>, the NVMe namespace becomes eligible for automatic deletion when the volume runs out of space. Auto deletion only occurs when the volume containing the namespace is also configured for auto deletion and free space in the volume decreases below a particular threshold.</p> <p>This property is optional in POST and PATCH. The default value for a new NVMe namespace is <i>false</i>.</p> <p>There is an added cost to retrieving this property's value. It is not populated for either a collection GET or an instance GET unless it is explicitly requested using the <code>fields</code> query parameter. See Requesting specific fields to learn more.</p>

Name	Type	Description
clone	clone	<p>This sub-object is used in POST to create a new NVMe namespace as a clone of an existing namespace, or PATCH to overwrite an existing namespace as a clone of another. Setting a property in this sub-object indicates that a namespace clone is desired.</p> <p>When used in a PATCH, the patched NVMe namespace's data is over-written as a clone of the source and the following properties are preserved from the patched namespace unless otherwise specified as part of the PATCH: <code>auto_delete</code> (unless specified in the request), <code>subsystem_map</code>, <code>status.state</code>, and <code>uuid</code>.</p>
comment	string	A configurable comment available for use by the administrator. Valid in POST and PATCH.
create_time	string	The time the NVMe namespace was created.
enabled	boolean	The enabled state of the NVMe namespace. Certain error conditions cause the namespace to become disabled. If the namespace is disabled, you can check the <code>state</code> property to determine what error disabled the namespace. An NVMe namespace is enabled automatically when it is created.

Name	Type	Description
location	location	<p>The location of the NVMe namespace within the ONTAP cluster. Valid in POST.</p> <p>NVMe namespaces do not support rename, or movement between volumes.</p> <ul style="list-style-type: none"> • Introduced in: 9.6 • readCreate: 1
metric	metric	Performance numbers, such as IOPS latency and throughput
name	string	<p>The fully qualified path name of the NVMe namespace composed of a "/vol" prefix, the volume name, the (optional) qtree name and base name of the namespace. Valid in POST.</p> <p>NVMe namespaces do not support rename, or movement between volumes.</p>
os_type	string	<p>The operating system type of the NVMe namespace.</p> <p>Required in POST when creating an NVMe namespace that is not a clone of another. Disallowed in POST when creating a namespace clone.</p>
space	space	The storage space related properties of the NVMe namespace.
statistics	statistics	These are raw performance numbers, such as IOPS latency and throughput. These numbers are aggregated across all nodes in the cluster and increase with the uptime of the cluster.
status	status	Status information about the NVMe namespace.

Name	Type	Description
subsystem_map	subsystem_map	The NVMe subsystem with which the NVMe namespace is associated. A namespace can be mapped to zero (0) or one (1) subsystems. There is an added cost to retrieving property values for <code>subsystem_map</code> . They are not populated for either a collection GET or an instance GET unless explicitly requested using the <code>fields</code> query parameter. See Requesting specific fields to learn more.
svm	svm	
uuid	string	The unique identifier of the NVMe namespace.

error_arguments

Name	Type	Description
code	string	Argument code
message	string	Message argument

error

Name	Type	Description
arguments	array[error_arguments]	Message arguments
code	string	Error code
message	string	Error message
target	string	The target parameter that caused the error.

Retrieve historical performance metrics for an NVMe namespace

GET `/storage/namespaces/{uuid}/metrics`

Introduced In: 9.8

Retrieves historical performance metrics for an NVMe namespace.

Parameters

Name	Type	In	Required	Description
timestamp	string	query	False	Filter by timestamp
status	string	query	False	Filter by status
throughput.total	integer	query	False	Filter by throughput.total
throughput.other	integer	query	False	Filter by throughput.other
throughput.read	integer	query	False	Filter by throughput.read
throughput.write	integer	query	False	Filter by throughput.write
latency.total	integer	query	False	Filter by latency.total
latency.other	integer	query	False	Filter by latency.other
latency.read	integer	query	False	Filter by latency.read
latency.write	integer	query	False	Filter by latency.write
duration	string	query	False	Filter by duration
iops.total	integer	query	False	Filter by iops.total
iops.other	integer	query	False	Filter by iops.other
iops.read	integer	query	False	Filter by iops.read
iops.write	integer	query	False	Filter by iops.write
uuid	string	path	True	Unique identifier of the NVMe namespace.

Name	Type	In	Required	Description
interval	string	query	False	<p>The time range for the data. Examples can be 1h, 1d, 1m, 1w, 1y. The period for each time range is as follows:</p> <ul style="list-style-type: none"> • 1h: Metrics over the most recent hour sampled over 15 seconds. • 1d: Metrics over the most recent day sampled over 5 minutes. • 1w: Metrics over the most recent week sampled over 30 minutes. • 1m: Metrics over the most recent month sampled over 2 hours. • 1y: Metrics over the most recent year sampled over a day. • Default value: 1 • enum: ["1h", "1d", "1w", "1m", "1y"]

Name	Type	In	Required	Description
return_timeout	integer	query	False	The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached. <ul style="list-style-type: none"> • Default value: 1 • Max value: 120 • Min value: 0
fields	array[string]	query	False	Specify the fields to return.
max_records	integer	query	False	Limit the number of records returned.
order_by	array[string]	query	False	Order results by specified fields and optional [asc
desc] direction. Default direction is 'asc' for ascending.	return_records	boolean	query	False

Response

Status: 200, Ok

Name	Type	Description
_links	_links	
num_records	integer	Number of records
records	array[records]	

Example response

```
{
  "_links": {
    "next": {
      "href": "/api/resourcelink"
    },
    "self": {
      "href": "/api/resourcelink"
    }
  },
  "records": {
    "_links": {
      "self": {
        "href": "/api/resourcelink"
      }
    },
    "duration": "PT15S",
    "iops": {
      "read": "200",
      "total": "1000",
      "write": "100"
    },
    "latency": {
      "read": "200",
      "total": "1000",
      "write": "100"
    },
    "status": "ok",
    "throughput": {
      "read": "200",
      "total": "1000",
      "write": "100"
    },
    "timestamp": "2017-01-25T11:20:13Z"
  }
}
```

Error

Status: Default, Error

Name	Type	Description
error	error	

Example error

```
{
  "error": {
    "arguments": {
      "code": "string",
      "message": "string"
    },
    "code": "4",
    "message": "entry doesn't exist",
    "target": "uuid"
  }
}
```

self	href	

_links

Name	Type	Description
self	href	

iops

The rate of I/O operations observed at the storage object.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Performance metric for write I/O operations.

latency

The round trip latency in microseconds observed at the storage object.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Performance metric for write I/O operations.

throughput

The rate of throughput bytes per second observed at the storage object.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Performance metric for write I/O operations.

records

Performance numbers, such as IOPS latency and throughput.

Name	Type	Description
_links	_links	

Name	Type	Description
duration	string	The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:
iops	iops	The rate of I/O operations observed at the storage object.
latency	latency	The round trip latency in microseconds observed at the storage object.
status	string	Errors associated with the sample. For example, if the aggregation of data over multiple nodes fails, then any partial errors might return "ok" on success or "error" on an internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.
throughput	throughput	The rate of throughput bytes per second observed at the storage object.
timestamp	string	The timestamp of the performance data.

error_arguments

Name	Type	Description
code	string	Argument code
message	string	Message argument

error

Name	Type	Description
arguments	array[error_arguments]	Message arguments
code	string	Error code
message	string	Error message
target	string	The target parameter that caused the error.

Name-services

Name-services overview

Overview

ONTAP uses name-services to obtain information about users and clients. This information is used to authenticate users accessing data on or administering the storage system, and to map user credentials in a mixed environment. If the user database is stored in NIS or LDAP servers, NIS and LDAP name services need to be configured in ONTAP.

DNS is used for resolving the hostnames. ns-switch is used to configure the SVMs with sources to search for network information and the order in which to search them.

Manage DNS configurations

Name-services dns endpoint overview

Overview

Displays DNS information and controls the DNS subsystem. DNS domain name and DNS servers are required parameters.

Retrieving DNS information

The DNS GET endpoint retrieves all of the DNS configurations for all SVMs.

DNS configuration for the cluster is retrieved via [/api/cluster](#) .

Examples

Retrieving all of the fields for all of the DNS configurations

```
# The API:
/api/name-services/dns

# The call:
curl -X GET "https://<mgmt-ip>/api/name-services/dns?fields=*" -H "accept:
application/hal+json"

# The response:
{
  "records": [
    {
      "svm": {
        "uuid": "27eff5d8-22b2-11eb-8038-0050568ed32c",
        "name": "clust-1",
        "_links": {
          "self": {
            "href": "/api/svm/svms/179d3c85-7053-11e8-b9b8-005056b41bd1"
          }
        }
      },
      "domains": [
        "domain.example.com"
      ],

  }
}
}
```

Creating a DNS configuration

The DNS POST endpoint creates a DNS configuration for the specified SVM.

Examples

Specifying only the required fields

```
# The API:
/api/name-services/dns

# The call:
curl -X POST "https://<mgmt-ip>/api/name-services/dns" -H "accept:
application/hal+json" -H "Content-Type: application/json" -d "{ \"svm\": {
\"uuid\": \"179d3c85-7053-11e8-b9b8-005056b41bd1\" }, \"domains\": [
\"domainA.example.com\" ], \"servers\": [ \"10.10.10.10\" ]}"
```

Specifying the optional fields as well

```
# The API:
/api/name-services/dns

# The call:
curl -X POST "https://<mgmt-ip>/api/name-services/dns" -H "accept:
application/hal+json" -H "Content-Type: application/json" -d "{ \"svm\": {
\"uuid\": \"179d3c85-7053-11e8-b9b8-005056b41bd1\" }, \"domains\": [
\"domainA.example.com\" ], \"servers\": [ \"10.10.10.10\" ],
\"timeout\":2, \"attempts\":3}"
```

Specifying the scope of the SVM

```
# The API:
/api/name-services/dns

# The call:
curl -X POST "https://<mgmt-ip>/api/name-services/dns" -H "accept:
application/hal+json" -H "Content-Type: application/json" -d "{ \"svm\": {
\"uuid\": \"179d3c85-7053-11e8-b9b8-005056b41bd1\" }, \"domains\": [
\"domainA.example.com\" ], \"servers\": [ \"10.10.10.10\" ],
\"timeout\":2, \"attempts\":3, \"scope\":\"svm\"}"
```

Updating a DNS configuration

The DNS PATCH endpoint updates the DNS configuration for the specified SVM.

Examples

Updating both the DNS domains and servers

```
# The API:
/api/name-services/dns/{svm.uuid}

# The call:
curl -X PATCH "https://<mgmt-ip>/api/name-services/dns/179d3c85-7053-11e8-
b9b8-005056b41bd1" -H "accept: application/hal+json" -H "Content-Type:
application/json" -d "{ \"domains\": [ \"domainA.example.com\",
\"domainB.example.com\" ], \"servers\": [ \"10.10.10.10\", \"10.10.10.11\"
] }"
```

Updating the DNS servers only

```
# The API:
/api/name-services/dns/{svm.uuid}

# The call:
curl -X PATCH "https://<mgmt-ip>/api/name-services/dns/179d3c85-7053-11e8-
b9b8-005056b41bd1" -H "accept: application/hal+json" -H "Content-Type:
application/json" -d "{ \"servers\": [ \"10.10.10.10\" ] }"
```

Updating the optional fields "timeout", "attempts", and "source_address_match"

```
# The API:
/api/name-services/dns/{svm.uuid}

# The call:
curl -X PATCH "https://<mgmt-ip>/api/name-services/dns/179d3c85-7053-11e8-
b9b8-005056b41bd1" -H "accept: application/hal+json" -H "Content-Type:
application/json" -d "{ \"timeout\":2, \"attempts\":3,
\"source_address_match\":true}"
```

Updating the Dynamic DNS related fields

```
# The API:
/api/name-services/dns/{svm.uuid}

# The call:
curl -X PATCH "https://<mgmt-ip>/api/name-services/dns/179d3c85-7053-11e8-
b9b8-005056b41bd1" -H "accept: application/hal+json" -H "Content-Type:
application/json" -d "{ \"timeout\":2, \"attempts\":3,
\"dynamic_dns.enabled\":\"true\", \"dynamic_dns.time_to_live\":\"20h\"}"
```

Deleting a DNS configuration

The DNS DELETE endpoint deletes the DNS configuration for the specified SVM.

Example

The following example shows a DELETE operation.

```
# The API:
/api/name-services/dns/{svm.uuid}

# The call:
curl -X DELETE "https://<mgmt-ip>/api/name-services/dns/179d3c85-7053-
11e8-b9b8-005056b41bd1" -H "accept: application/hal+json"
```

Retrieve DNS configurations for all SVMs

GET /name-services/dns

Introduced In: 9.6

Retrieves the DNS configurations of all SVMs.

Specify 'scope' as 'svm' to retrieve the DNS configuration of all the data SVMs.

Specify 'scope' as 'cluster' to retrieve the DNS configuration of the cluster.

Advanced properties

- 'tld_query_enabled'
- 'source_address_match'
- 'packet_query_match'
- 'status' property retrieves the status of each name server of the DNS configuration for an SVM.

Related ONTAP commands

- `vserver services name-service dns show`
- `vserver services name-service dns check`
- `vserver services name-service dns dynamic-update show`

Learn more

- [DOC /name-services/dns](#)

Parameters

Name	Type	In	Required	Description
dynamic_dns.enabled	boolean	query	False	Filter by dynamic_dns.enabled • Introduced in: 9.9
dynamic_dns.fqdn	string	query	False	Filter by dynamic_dns.fqdn • Introduced in: 9.9
dynamic_dns.time_to_live	string	query	False	Filter by dynamic_dns.time_to_live • Introduced in: 9.9
dynamic_dns.use_secure	boolean	query	False	Filter by dynamic_dns.use_secure • Introduced in: 9.9
domains	string	query	False	Filter by domains

Name	Type	In	Required	Description
svm.uuid	string	query	False	Filter by svm.uuid
svm.name	string	query	False	Filter by svm.name
servers	string	query	False	Filter by servers

Create DNS domain and server configurations

POST /name-services/dns

Introduced In: 9.6

Creates DNS domain and server configurations for an SVM.

Important notes

- Each SVM can have only one DNS configuration.
- The domain name and the servers fields cannot be empty.
- IPv6 must be enabled if IPv6 family addresses are specified in the `servers` field.
- Configuring more than one DNS server is recommended to avoid a single point of failure.
- The DNS server specified using the `servers` field is validated during this operation.

The validation fails in the following scenarios:

1. The server is not a DNS server.
2. The server does not exist.
3. The server is unreachable.
 - The DNS server validation can be skipped by setting the property "skip_config_validation" to "true".
 - Scope of the SVM can be specified using the "scope" parameter. "svm" scope refers to data SVMs and "cluster" scope refers to clusters.

The following parameters are optional:

- timeout
- attempts
- source_address_match
- packet_query_match
- tld_query_enabled
- skip_config_validation
- scope

Parameters

Name	Type	In	Required	Description
return_records	boolean	query	False	The default is false. If set to true, the records are returned. <ul style="list-style-type: none">• Default value:

Retrieve DNS domain and server configurations

GET /name-services/dns/{svm.uuid}

Introduced In: 9.6

Retrieves DNS domain and server configuration of an SVM. By default, both DNS domains and servers are displayed.

Advanced properties

- 'tld_query_enabled'
- 'source_address_match'
- 'packet_query_match'
- 'status' property retrieves the status of each name server of the DNS configuration for an SVM.

Related ONTAP commands

Update DNS domain and server configurations

PATCH /name-services/dns/{svm.uuid}

Introduced In: 9.6

Updates DNS domain and server configurations of an SVM.

Important notes

- Both DNS domains and servers can be modified.
- The domains and servers fields cannot be empty.
- IPv6 must be enabled if IPv6 family addresses are specified for the `servers` field.
- The DNS server specified using the `servers` field is validated during this operation.

The validation fails in the following scenarios:

1. The server is not a DNS server.
2. The server does not exist.
3. The server is unreachable.
 - The DNS server validation can be skipped by setting the property "skip_config_validation" to "true".
 - Dynamic DNS configuration can be modified.
 - If both DNS and Dynamic DNS parameters are modified, DNS parameters are updated first followed by Dynamic DNS parameters.
If updating Dynamic DNS fails, then the updated DNS configuration is not reverted.

The following parameters are optional:

- timeout
- attempts
- source_address_match
- packet_query_match
- tld_query_enabled
- skip_config_validation
- dynamic_dns.enabled
- dynamic_dns.use_secure
- dynamic_dns.time_to_live

domains	array[string]	<p>A list of DNS domains. Domain names have the following requirements:</p> <ul style="list-style-type: none">• The name must contain only the following characters: A through Z, a through z, 0 through 9, ".", "-", or "_".• The first character of each label, delimited by ".", must be one of the following characters: A through Z or a through z or 0 through 9.• The last character of each label, delimited by ".", must be one of the following characters: A through Z, a through z, or 0 through 9.• The top level domain must contain only the following characters: A through Z, a through z.• The system reserves the following names: "all", "local", and "localhost".
dynamic_dns	dynamic_dns	
packet_query_match	boolean	Indicates whether or not the query section of the reply packet is equal to that of the query packet.

Name	Type	Description
scope	string	Set to "svm" for DNS owned by an SVM, otherwise set to "cluster".
servers	array[string]	The list of IP addresses of the DNS servers. Addresses can be either IPv4 or IPv6 addresses.
skip_config_validation	boolean	Indicates whether or not the validation for the specified DNS configuration is disabled.
source_address_match	boolean	Indicates whether or not the DNS responses are from a different IP address to the IP address the request was sent to.
status	array[status]	Status of all the DNS name servers configured for the specified SVM.
svm	svm	
timeout	integer	Timeout values for queries to the name servers, in seconds.
tld_query_enabled	boolean	Enable or disable top-level domain (TLD) queries.

Example request

```
{
  "_links": {
    "self": {
      "href": "/api/resourcelink"
    }
  },
  "domains": [
    "example.com",
    "example2.example3.com"
  ],
  "dynamic_dns": {
    "fqdn": "example.com",
    "time_to_live": "P2D"
  },
  "scope": "svm",
  "servers": [
    "10.224.65.20",
    "2001:db08:a0b:12f0::1"
  ],
  "status": {
    "code": "6684732",
    "name_server": "10.10.10.10",
    "state": "up"
  },
  "svm": {
    "_links": {
      "self": {
        "href": "/api/resourcelink"
      }
    },
    "name": "svm1",
    "uuid": "02c9e252-41be-11e9-81d5-00a0986138f7"
  }
}
```

Response

Status: 200, Ok

Error

Status: Default

ONTAP Error Response Codes

Error Code	Description
8847360	Only admin or data SVMs allowed
8847361	Exceeded the maximum number of domains allowed. Maximum of six domains only
8847362	Exceeded the maximum number of name servers allowed. Maximum of three name servers only
8847376	FQDN is mandatory if dynamic DNS update is being enabled.
8847380	Secure updates can be enabled only after a CIFS server or an Active Directory account has been created for the SVM.
8847381	A unique FQDN must be specified for each SVM.
8847383	The specified TTL exceeds the maximum supported value of 720 hours.
8847392	Domain name cannot be an IP address
8847393	Top level domain name is invalid
8847394	FQDN name violated the limitations
8847399	One or more of the specified DNS servers do not exist or cannot be reached
8847404	Dynamic DNS is applicable only for data SVMs
8847405	DNS parameters updated successfully; however the update of Dynamic DNS-related parameters has failed.
9240587	FQDN name cannot be empty
9240588	FQDN name is too long. Maximum supported length: 255 characters
9240590	FQDN name is reserved. Following names are reserved: "all", "local" and "localhost"
9240607	One of the FQDN labels is too long. Maximum supported length is 63 characters
9240608	FQDN does not contain a ".". At least one "." is mandatory for an FQDN.
9240607	A label of the FQDN is too long (73 characters). Maximum supported length for each label is 63 characters.

Error Code	Description
23724130	Cannot use an IPv6 name server address because there are no IPv6 LIFs

Name	Type	Description
error	error	

Example error

```
{
  "error": {
    "arguments": {
      "code": "string",
      "message": "string"
    },
    "code": "4",
    "message": "entry doesn't exist",
    "target": "uuid"
  }
}
```

href

Name	Type	Description
href	string	

_links

Name	Type	Description
self	href	

dynamic_dns

Name	Type	Description
enabled	boolean	Enable or disable Dynamic DNS (DDNS) updates for the specified SVM.
fqdn	string	Fully Qualified Domain Name (FQDN) to be used for dynamic DNS updates.
skip_fqdn_validation	boolean	Enable or disable FQDN validation.
time_to_live	string	Time to live value for the dynamic DNS updates, in an ISO-8601 duration formatted string. Maximum Time To Live is 720 hours(P30D in ISO-8601 format) and the default is 24 hours(P1D in ISO-8601 format).
use_secure	boolean	Enable or disable secure dynamic DNS updates for the specified SVM.

status

Status of each of the DNS name server configured for the specified SVM.

Name	Type	Description
code	integer	Code corresponding to the status message. Code is 0 when the state is 'up'.

Name	Type	Description
message	string	Detailed description of the validation state if the state is 'down' or the response time of the DNS server if the state is 'up'.
name_server	string	The IP address of the DNS server. The address can be either an IPv4 or an IPv6 address.
state	string	The validation status of the DNS server.

svm

Name	Type	Description
_links	_links	
name	string	The name of the SVM.
uuid	string	The unique identifier of the SVM.

dns

Name	Type	Description
_links	_links	
attempts	integer	Number of attempts allowed when querying the DNS name servers.

Name	Type	Description
domains	array[string]	<p>A list of DNS domains. Domain names have the following requirements:</p> <ul style="list-style-type: none"> • The name must contain only the following characters: A through Z, a through z, 0 through 9, ".", "-", or "_". • The first character of each label, delimited by ".", must be one of the following characters: A through Z or a through z or 0 through 9. • The last character of each label, delimited by ".", must be one of the following characters: A through Z, a through z, or 0 through 9. • The top level domain must contain only the following characters: A through Z, a through z. • The system reserves the following names: "all", "local", and "localhost".
dynamic_dns	dynamic_dns	
packet_query_match	boolean	Indicates whether or not the query section of the reply packet is equal to that of the query packet.
scope	string	Set to "svm" for DNS owned by an SVM, otherwise set to "cluster".
servers	array[string]	The list of IP addresses of the DNS servers. Addresses can be either IPv4 or IPv6 addresses.
skip_config_validation	boolean	Indicates whether or not the validation for the specified DNS configuration is disabled.

Name	Type	Description
source_address_match	boolean	Indicates whether or not the DNS responses are from a different IP address to the IP address the request was sent to.
status	array[status]	Status of all the DNS name servers configured for the specified SVM.
svm	svm	
timeout	integer	Timeout values for queries to the name servers, in seconds.
tld_query_enabled	boolean	Enable or disable top-level domain (TLD) queries.

error_arguments

Name	Type	Description
code	string	Argument code
message	string	Message argument

error

Name	Type	Description
arguments	array[error_arguments]	Message arguments
code	string	Error code
message	string	Error message
target	string	The target parameter that caused the error.

Manage LDAP server configurations

Name-services LDAP endpoint overview

Overview

LDAP servers are used to centrally maintain user information. LDAP configurations must be set up to lookup information stored in the LDAP directory on the external LDAP servers. This API is used to retrieve

and manage
LDAP server configurations.

Retrieving LDAP information

The LDAP GET endpoint retrieves all of the LDAP configurations in the cluster.

Examples

Retrieving all of the fields for all LDAP configurations

```
# The API:
/api/name-services/ldap

# The call:
curl -X GET "https://<mgmt-ip>/api/name-services/ldap?fields=*" -H
"accept: application/hal+json"

# The response:
{
  "records": [
    {
      "svm": {
        "uuid": "179d3c85-7053-11e8-b9b8-005056b41bd1",
        "name": "vs1",
        "_links": {
          "self": {
            "href": "/api/svm/svms/179d3c85-7053-11e8-b9b8-005056b41bd1"
          }
        }
      },
      "servers": [
        "10.10.10.10",
        "domainB.example.com"
      ],

  }
}
}
```

Retrieving the LDAP server status of a specific SVM

```
# The API:
/api/name-services/ldap/{svm.uuid}

# The call:
curl -X GET "https://<mgmt-ip>/api/name-services/ldap/9e4a2e3b-f66f-11ea-
aec8-0050568e155c?fields=status" -H "accept: application/json"

# The response:
{
  "svm": {
    "uuid": "9e4a2e3b-f66f-11ea-aec8-0050568e155c",
    "name": "vs2"
  },
  "status": {
    "state": "up",
    "message": "Successfully connected to LDAP server \"172.20.192.44\".",
    "code": 0
  }
}
```

Creating an LDAP configuration

The LDAP POST endpoint creates an LDAP configuration for the specified SVM.

Examples

Creating an LDAP configuration with all the fields specified

```
# The API:
/api/name-services/ldap

# The call:
curl -X POST "https://<mgmt-ip>/api/name-services/ldap" -H "accept:
application/hal+json" -H "Content-Type: application/json" -d "{ \"svm\": {
\"uuid\": \"179d3c85-7053-11e8-b9b8-005056b41bd1\" }, \"servers\": [
\"10.10.10.10\", \"domainB.example.com\" ], \"schema\": \"ad_idmu\",
\"port\": 389, \"ldaps_enabled\": false, \"min_bind_level\":
\"anonymous\", \"bind_dn\":
\"cn=Administrators,cn=users,dc=domainA,dc=example,dc=com\",
\"bind_password\": \"abc\", \"base_dn\": \"dc=domainA,dc=example,dc=com\",
\"base_scope\": \"subtree\", \"use_start_tls\": false,
\"session_security\": \"none\", \"referral_enabled\": false,
\"bind_as_cifs_server\": false, \"query_timeout\": 4, \"user_dn\":
\"cn=abc,users,dc=com\", \"user_scope\": \"subtree\", \"group_dn\":
\"cn=abc,users,dc=com\", \"group_scope\": \"subtree\", \"netgroup_dn\":
\"cn=abc,users,dc=com\", \"netgroup_scope\": \"subtree\",
\"netgroup_byhost_dn\": \"cn=abc,users,dc=com\",
\"netgroup_byhost_scope\": \"subtree\", \"is_netgroup_byhost_enabled\":
false, \"group_membership_filter\": \"\", \"skip_config_validation\":
false } "
```

Creating an LDAP configuration with Active Directory domain and preferred Active Directory servers specified

```
# The API:
/api/name-services/ldap

# The call:
curl -X POST "https://<mgmt-ip>/api/name-services/ldap" -H "accept:
application/hal+json" -H "Content-Type: application/json" -d "{ \"svm\": {
\"name\": \"vs2\" }, \"ad_domain\": \"domainA.example.com\",
\"preferred_ad_servers\": [ \"11.11.11.11\" ], \"port\": 389,
\"ldaps_enabled\": false, \"bind_dn\":
\"cn=Administrators,cn=users,dc=domainA,dc=example,dc=com\",
\"bind_password\": \"abc\", \"base_dn\": \"dc=domainA,dc=example,dc=com\",
\"session_security\": \"none\", \"referral_enabled\": false,
\"query_timeout\": 3}"
```

Creating an LDAP configuration with a number of optional fields not specified

```
# The API:
/api/name-services/ldap

# The call:
curl -X POST "https://<mgmt-ip>/api/name-services/ldap" -H "accept:
application/hal+json" -H "Content-Type: application/json" -d "{ \"svm\": {
\"name\": \"vs2\" }, \"servers\": [ \"11.11.11.11\" ], \"port\": 389,
\"bind_dn\": \"cn=Administrators,cn=users,dc=domainA,dc=example,dc=com\",
\"bind_password\": \"abc\", \"base_dn\": \"dc=domainA,dc=example,dc=com\",
\"session_security\": \"none\"}"
```

Updating an LDAP configuration

The LDAP PATCH endpoint updates the LDAP configuration for the specified SVM. The following example shows a PATCH operation:

```
# The API:
/api/name-services/ldap/{svm.uuid}

# The call:
curl -X PATCH "https://<mgmt-ip>/api/name-services/ldap/179d3c85-7053-11e8-b9b8-005056b41bd1" -H "accept: application/json" -H "Content-Type: application/json" -d "{ \"servers\": [ \"55.55.55.55\" ], \"schema\": \"ad_idmu\", \"port\": 636, \"ldaps_enabled\": true, \"use_start_tls\": false, \"referral_enabled\": false }"
```

Deleting an LDAP configuration

The LDAP DELETE endpoint deletes the LDAP configuration for the specified SVM. The following example shows a DELETE operation:

```
# The API:
/api/name-services/ldap/{svm.uuid}

# The call:
curl -X DELETE "https://<mgmt-ip>/api/name-services/ldap/179d3c85-7053-11e8-b9b8-005056b41bd1" -H "accept: application/hal+json"
```

Retrieve an LDAP configuration for all SVMs

GET /name-services/ldap

Introduced In: 9.6

Retrieves the LDAP configurations for all SVMs.

Parameters

Name	Type	In	Required	Description
netgroup_dn	string	query	False	Filter by netgroup_dn <ul style="list-style-type: none"> Introduced in: 9.9

Name	Type	In	Required	Description
session_security	string	query	False	Filter by session_security • Introduced in: 9.7
group_scope	string	query	False	Filter by group_scope • Introduced in: 9.9
schema	string	query	False	Filter by schema • Introduced in: 9.7
bind_dn	string	query	False	Filter by bind_dn • Introduced in: 9.7
base_scope	string	query	False	Filter by base_scope • Introduced in: 9.7
port	integer	query	False	Filter by port • Introduced in: 9.7
preferred_ad_servers	string	query	False	Filter by preferred_ad_servers • Introduced in: 9.7
referral_enabled	boolean	query	False	Filter by referral_enabled • Introduced in: 9.9

Name	Type	In	Required	Description
netgroup_byhost_scope	string	query	False	Filter by netgroup_byhost_scope • Introduced in: 9.9
query_timeout	integer	query	False	Filter by query_timeout • Introduced in: 9.9
is_netgroup_byhost_enabled	boolean	query	False	Filter by is_netgroup_byhost_enabled • Introduced in: 9.9
ldaps_enabled	boolean	query	False	Filter by ldaps_enabled • Introduced in: 9.9
min_bind_level	string	query	False	Filter by min_bind_level • Introduced in: 9.7
ad_domain	string	query	False	Filter by ad_domain • Introduced in: 9.7
status.code	integer	query	False	Filter by status.code • Introduced in: 9.9
status.dn_message	string	query	False	Filter by status.dn_message • Introduced in: 9.9

Name	Type	In	Required	Description
status.state	string	query	False	Filter by status.state • Introduced in: 9.9
status.message	string	query	False	Filter by status.message • Introduced in: 9.9
user_dn	string	query	False	Filter by user_dn • Introduced in: 9.9
user_scope	string	query	False	Filter by user_scope • Introduced in: 9.9
base_dn	string	query	False	Filter by base_dn • Introduced in: 9.7
netgroup_scope	string	query	False	Filter by netgroup_scope • Introduced in: 9.9
is_owner	boolean	query	False	Filter by is_owner • Introduced in: 9.9
use_start_tls	boolean	query	False	Filter by use_start_tls • Introduced in: 9.7
group_membership_filter	string	query	False	Filter by group_membership_filter • Introduced in: 9.9

Name	Type	In	Required	Description
netgroup_byhost_dn	string	query	False	Filter by netgroup_byhost_dn <ul style="list-style-type: none"> • Introduced in: 9.9

Create an LDAP configuration for an SVM

POST /name-services/ldap

Introduced In: 9.6

Creates an LDAP configuration for an SVM.

Important notes

- Each SVM can have one LDAP configuration.
- The LDAP servers and Active Directory domain are mutually exclusive fields. These fields cannot be empty. At any point in time, either the LDAP servers or Active Directory domain must be populated.

- LDAP configuration with Active Directory domain cannot be created on an admin SVM.
- IPv6 must be enabled if IPv6 family addresses are specified.

The following parameters are optional:

- preferred AD servers
- schema
- port
- ldaps_enabled
- min_bind_level
- bind_password
- base_scope
- use_start_tls
- session_security
- referral_enabled
- bind_as_cifs_server
- query_timeout
- user_dn
- user_scope
- group_dn
- group_scope
- netgroup_dn
- netgroup_scope
- netgroup_byhost_dn
- netgroup_byhost_scope
- is_netgroup_byhost_enabled
- group_membership_filter
- skip_config_validation

Configuring more than one LDAP server is recommended to avoid a single point of failure. Both FQDNs and IP addresses are supported for the "servers" field. The Active Directory domain or LDAP servers are validated as part of this operation.

LDAP validation fails in the following scenarios:

1. The server does not have LDAP installed.
2. The server or Active Directory domain is invalid.
3. The server or Active Directory domain is unreachable.

Parameters

Name	Type	In	Required	Description
return_records	boolean	query	False	<p>The default is false. If set to true, the records are returned.</p> <ul style="list-style-type: none"> • Default value:

group_scope	string	Specifies the default search scope for LDAP for group lookups: <ul style="list-style-type: none"> • base - search the named entry only • onelevel - search all entries immediately below the DN • subtree - search the named DN entry and the entire subtree below the DN
is_netgroup_byhost_enabled	boolean	Specifies whether or not netgroup by host querying is enabled.
is_owner	boolean	Specifies whether or not the SVM owns the LDAP client configuration.
ldaps_enabled	boolean	Specifies whether or not LDAPS is enabled.
min_bind_level	string	The minimum bind authentication level. Possible values are: <ul style="list-style-type: none"> • anonymous - anonymous bind • simple - simple bind • sasl - Simple Authentication and Security Layer (SASL) bind
netgroup_byhost_dn	string	Specifies the netgroup Distinguished Name (DN) that is used as the starting point in the LDAP directory tree for netgroup by host lookups.
netgroup_byhost_scope	string	Specifies the default search scope for LDAP for netgroup by host lookups: <ul style="list-style-type: none"> • base - search the named entry only • onelevel - search all entries immediately below the DN • subtree - search the named DN entry and the entire subtree below the DN

Name	Type	Description
netgroup_dn	string	Specifies the netgroup Distinguished Name (DN) that is used as the starting point in the LDAP directory tree for netgroup lookups.
netgroup_scope	string	Specifies the default search scope for LDAP for netgroup lookups: <ul style="list-style-type: none"> • base - search the named entry only • onelevel - search all entries immediately below the DN • subtree - search the named DN entry and the entire subtree below the DN
port	integer	The port used to connect to the LDAP Servers.
preferred_ad_servers	array[string]	
query_timeout	integer	Specifies the maximum time to wait for a query response from the LDAP server, in seconds.
referral_enabled	boolean	Specifies whether or not LDAP referral is enabled.
schema	string	The name of the schema template used by the SVM. <ul style="list-style-type: none"> • AD-IDMU - Active Directory Identity Management for UNIX • AD-SFU - Active Directory Services for UNIX • MS-AD-BIS - Active Directory Identity Management for UNIX • RFC-2307 - Schema based on RFC 2307 • Custom schema
servers	array[string]	

Name	Type	Description
session_security	string	Specifies the level of security to be used for LDAP communications: <ul style="list-style-type: none"> • none - no signing or sealing • sign - sign LDAP traffic • seal - seal and sign LDAP traffic
skip_config_validation	boolean	Indicates whether or not the validation for the specified LDAP configuration is disabled.
status	status	
svm	svm	
use_start_tls	boolean	Specifies whether or not to use Start TLS over LDAP connections.
user_dn	string	Specifies the user Distinguished Name (DN) that is used as the starting point in the LDAP directory tree for user lookups.
user_scope	string	Specifies the default search scope for LDAP for user lookups: <ul style="list-style-type: none"> • base - search the named entry only • onelevel - search all entries immediately below the DN • subtree - search the named DN entry and the entire subtree below the DN

Update the LDAP configuration for an SVM

PATCH /name-services/ldap/{svm.uuid}

Introduced In: 9.6

Updates an LDAP configuration of an SVM.

Important notes

- Both mandatory and optional parameters of the LDAP configuration can be updated.
- The LDAP servers and Active Directory domain are mutually exclusive fields. These fields cannot be empty. At any point in time, either the LDAP servers or Active Directory domain must be populated.
- IPv6 must be enabled if IPv6 family addresses are specified.

Configuring more than one LDAP server is recommended to avoid a single point of failure.

Both FQDNs and IP addresses are supported for the "servers" field.

The Active Directory domain or LDAP servers are validated as part of this operation.

LDAP validation fails in the following scenarios:

1. The server does not have LDAP installed.
2. The server or Active Directory domain is invalid.
3. The server or Active Directory domain is unreachable

Parameters

Name	Type	In	Required	Description
svm.uuid	string	path	True	UUID of the SVM to which this object belongs.

Request Body

Name	Type	Description
_links	_links	

Name	Type	Description
ad_domain	string	This parameter specifies the name of the Active Directory domain used to discover LDAP servers for use by this client. This is mutually exclusive with <code>servers</code> during POST and PATCH.
base_dn	string	Specifies the default base DN for all searches.
base_scope	string	Specifies the default search scope for LDAP queries: <ul style="list-style-type: none"> • base - search the named entry only • onelevel - search all entries immediately below the DN • subtree - search the named DN entry and the entire subtree below the DN
bind_as_cifs_server	boolean	Specifies whether or not CIFS server's credentials are used to bind to the LDAP server.
bind_dn	string	Specifies the user that binds to the LDAP servers.
bind_password	string	Specifies the bind password for the LDAP servers.
group_dn	string	Specifies the group Distinguished Name (DN) that is used as the starting point in the LDAP directory tree for group lookups.
group_membership_filter	string	Specifies the custom filter used for group membership lookups from an LDAP server.

Name	Type	Description
group_scope	string	Specifies the default search scope for LDAP for group lookups: <ul style="list-style-type: none"> • base - search the named entry only • onelevel - search all entries immediately below the DN • subtree - search the named DN entry and the entire subtree below the DN
is_netgroup_byhost_enabled	boolean	Specifies whether or not netgroup by host querying is enabled.
is_owner	boolean	Specifies whether or not the SVM owns the LDAP client configuration.
ldaps_enabled	boolean	Specifies whether or not LDAPS is enabled.
min_bind_level	string	The minimum bind authentication level. Possible values are: <ul style="list-style-type: none"> • anonymous - anonymous bind • simple - simple bind • sasl - Simple Authentication and Security Layer (SASL) bind
netgroup_byhost_dn	string	Specifies the netgroup Distinguished Name (DN) that is used as the starting point in the LDAP directory tree for netgroup by host lookups.
netgroup_byhost_scope	string	Specifies the default search scope for LDAP for netgroup by host lookups: <ul style="list-style-type: none"> • base - search the named entry only • onelevel - search all entries immediately below the DN • subtree - search the named DN entry and the entire subtree below the DN

Name	Type	Description
netgroup_dn	string	Specifies the netgroup Distinguished Name (DN) that is used as the starting point in the LDAP directory tree for netgroup lookups.
netgroup_scope	string	Specifies the default search scope for LDAP for netgroup lookups: <ul style="list-style-type: none"> • base - search the named entry only • onelevel - search all entries immediately below the DN • subtree - search the named DN entry and the entire subtree below the DN
port	integer	The port used to connect to the LDAP Servers.
preferred_ad_servers	array[string]	
query_timeout	integer	Specifies the maximum time to wait for a query response from the LDAP server, in seconds.
referral_enabled	boolean	Specifies whether or not LDAP referral is enabled.
schema	string	The name of the schema template used by the SVM. <ul style="list-style-type: none"> • AD-IDMU - Active Directory Identity Management for UNIX • AD-SFU - Active Directory Services for UNIX • MS-AD-BIS - Active Directory Identity Management for UNIX • RFC-2307 - Schema based on RFC 2307 • Custom schema
servers	array[string]	

Name	Type	Description
session_security	string	Specifies the level of security to be used for LDAP communications: <ul style="list-style-type: none"> • none - no signing or sealing • sign - sign LDAP traffic • seal - seal and sign LDAP traffic
skip_config_validation	boolean	Indicates whether or not the validation for the specified LDAP configuration is disabled.
status	status	
svm	svm	
use_start_tls	boolean	Specifies whether or not to use Start TLS over LDAP connections.
user_dn	string	Specifies the user Distinguished Name (DN) that is used as the starting point in the LDAP directory tree for user lookups.
user_scope	string	Specifies the default search scope for LDAP for user lookups: <ul style="list-style-type: none"> • base - search the named entry only • onelevel - search all entries immediately below the DN • subtree - search the named DN entry and the entire subtree below the DN

Manage name mappings for SVMs

Name-services name-mappings endpoint overview

Overview

Name mapping is used to map CIFS identities to UNIX identities, Kerberos identities to UNIX identities, and UNIX identities to CIFS identities. It needs this information to obtain user credentials and provide proper file access regardless of whether they are connecting from an NFS client or a CIFS client.

The system keeps a set of conversion rules for each Storage Virtual Machine (SVM). Each rule consists of two pieces: a pattern and a replacement. Conversions start at the beginning of the appropriate list and perform a substitution based on the first matching rule. The pattern is a UNIX-style regular expression. The replacement is a string containing escape sequences representing subexpressions from the pattern, as in the UNIX sed

program.

Name mappings are applied in the order in which they occur in the priority list; for example, a name mapping that occurs at position 2 in the priority list is applied before a name mapping that occurs at position 3. Each mapping direction (Kerberos-to-UNIX, Windows-to-UNIX, and UNIX-to-Windows) has its own priority list. You are prevented from creating two name mappings with the same pattern.

Examples

Creating a name-mapping with `client_match` as the ip-address

Use the following API to create a name-mapping. Note the `return_records=true` query parameter is used to obtain the newly created entry in the response.

```
# The API:
POST /api//name-services/name-mappings

# The call:
curl -X POST "https://<mgmt-ip>/api/name-services/name-mappings?return_records=true" -H "accept: application/json" -H "Content-Type: application/json" -d '{"client_match": "10.254.101.111/28", "direction": "win_unix", "index": 1, "pattern": "ENGCIIFS_AD_USER", "replacement": "unix_user1", "svm": { "name": "vs1", "uuid": "f71d3640-0226-11e9-8526-000c290a8c4b" }}'

# The response:
{
  "num_records": 1,
  "records": [
    {
      "svm": {
        "uuid": "f71d3640-0226-11e9-8526-000c290a8c4b",
        "name": "vs1"
      },
      "direction": "win_unix",
      "index": 1,
      "pattern": "ENGCIIFS_AD_USER",
      "replacement": "unix_user1",
      "client_match": "10.254.101.111/28"
    }
  ]
}
```

Creating a name-mapping with `client_match` as the hostname

Use the following API to create a name-mapping. Note the `return_records=true` query parameter is used to obtain the newly created entry in the response.

```

# The API:
POST /api//name-services/name-mappings

# The call:
curl -X POST "https://<mgmt-ip>/api/name-services/name-
mappings?return_records=true" -H "accept: application/json" -H "Content-
Type: applicatio/json" -d "{ \"client_match\": \"google.com\",
\"direction\": \"win_unix\", \"index\": 2, \"pattern\":
\"ENGCIIFS_AD_USER\", \"replacement\": \"unix_user1\", \"svm\": { \"name\":
\"vs1\", \"uuid\": \"f71d3640-0226-11e9-8526-000c290a8c4b\" }}"

# The response:
{
  "num_records": 1,
  "records": [
    {
      "svm": {
        "uuid": "f71d3640-0226-11e9-8526-000c290a8c4b",
        "name": "vs1"
      },
      "direction": "win_unix",
      "index": 2,
      "pattern": "ENGCIIFS_AD_USER",
      "replacement": "unix_user1",
      "client_match": "google.com"
    }
  ]
}

```

Retrieving all name-mapping configurations for all SVMs in the cluster

```
# The API:
GET /api/name-services/name-mappings

# The call:
curl -X GET "https://<mgmt-ip>/api/name-services/name-
mappings?fields=*&return_records=true&return_timeout=15" -H "accept:
application/json"

# The response:
{
  "records": [
    {
      "svm": {
        "uuid": "f71d3640-0226-11e9-8526-000c290a8c4b",
        "name": "vs1"
      },
      "direction": "win_unix",
      "index": 1,
      "pattern": "ENGCIIFS_AD_USER",
      "replacement": "unix_user1",
      "client_match": "10.254.101.111/28"
    },
    {
      "svm": {
        "uuid": "f71d3640-0226-11e9-8526-000c290a8c4b",
        "name": "vs1"
      },
      "direction": "win_unix",
      "index": 2,
      "pattern": "ENGCIIFS_AD_USER",
      "replacement": "unix_user1",
      "client_match": "google.com"
    }
  ],
  "num_records": 2
}
```

Retrieving a name-mapping configuration for a specific SVM, and for the specified direction and index

```
# The API:
GET /api/name-services/name-mappings/{svm.uuid}/{direction}/{index}

# The call:
curl -X GET "https://<mgmt-ip>/api/name-services/name-mappings/f71d3640-0226-11e9-8526-000c290a8c4b/win_unix/1" -H "accept: application/json"

# The response:
{
  "svm": {
    "uuid": "f71d3640-0226-11e9-8526-000c290a8c4b",
    "name": "vs1"
  },
  "direction": "win_unix",
  "index": 1,
  "pattern": "ENGCIFS_AD_USER",
  "replacement": "unix_user1",
  "client_match": "10.254.101.111/28"
}
```

Updating a specific name-mapping configuration

```
# The API:
PATCH /api//name-services/name-mappings/{svm.uuid}/{direction}/{index}

# The call:
curl -X PATCH "https://<mgmt-ip>/api/name-services/name-mappings/f71d3640-0226-11e9-8526-000c290a8c4b/win_unix/1" -H "accept: application/json" -H "Content-Type: application/json" -d "{ \"client_match\": \"10.254.101.222/28\", \"pattern\": \"ENGCIFS_LOCAL_USER\", \"replacement\": \"pcuser\"}"

# swapping a specified namemapping entry by index
curl -X PATCH "https://<mgmt-ip>/api/name-services/name-mappings/f71d3640-0226-11e9-8526-000c290a8c4b/win-unix/3?new_index=1" -H "accept: application/json" -H "Content-Type: application/json" -d "{ \"pattern\": \"ENGCIFS_AD_USER\", \"replacement\": \"unix_user1\"}"
```

Removing a specific name-mapping configuration

```
# The API:
DELETE /api/name-services/name-mappings/{svm.uuid}/{direction}/{index}

# The call:
curl -X DELETE "https://<mgmt-ip>/api/name-services/name-mappings/f71d3640-0226-11e9-8526-000c290a8c4b/win_unix/1" -H "accept: application/json"
```

Retrieve hostname mapping for all SVMs

GET /name-services/name-mappings

Introduced In: 9.6

Retrieves the name mapping configuration for all SVMs.

Parameters

Name	Type	In	Required	Description
index	integer	query	False	Filter by index
pattern	string	query	False	Filter by pattern
svm.uuid	string	query	False	Filter by svm.uuid
svm.name	string	query	False	Filter by svm.name
client_match	string	query	False	Filter by client_match
direction	string	query	False	Filter by direction
replacement	string	query	False	Filter by replacement

Name	Type	In	Required	Description
fields	array[string]	query	False	Specify the fields to return.
max_records	integer	query	False	Limit the number of records returned.
return_records	boolean	query	False	The default is true for GET calls. When set to false, only the number of records is returned. <ul style="list-style-type: none"> • Default value: 1
return_timeout	integer	query	False	The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached. <ul style="list-style-type: none"> • Default value: 1 • Max value: 120 • Min value: 0
order_by	array[string]	query	False	Order results by specified fields and optional [asc

Create hostname mappings for an SVM

POST /name-services/name-mappings

Introduced In: 9.6

Creates name mappings for an SVM.

Required properties

- `svm.uuid` or `svm.name` - Existing SVM in which to create the name mapping.
- `index` - Name mapping's position in the priority list.
- `direction` - Direction of the name mapping.
- `pattern` - Pattern to match to. Maximum length is 256 characters.
- `replacement` - Replacement pattern to match to. Maximum length is 256 characters.

Recommended optional properties

- `client_match` - Hostname or IP address added to match the pattern to the client's workstation IP address.

Related ONTAP commands

- `vserver name-mapping create`
- `vserver name-mapping insert`

Update the name mapping configuration for an SVM

PATCH /name-services/name-mappings/{svm.uuid}/{direction}/{index}

Introduced In: 9.6

Updates the name mapping configuration of an SVM. The positions can be swapped by providing the `new_index` property.

Swapping is not allowed for entries that have `client_match` property configured.

Related ONTAP commands

- `vserver name-mapping insert`
- `vserver name-mapping modify`
- `vserver name-mapping swap`

Manage NIS server configurations

Name-services NIS endpoint overview

Overview

NIS servers are used to authenticate user and client computers. NIS domain name and NIS server information is required to configure NIS.

It is important to note that this API is used to retrieve and manage NIS server configurations for data SVMs only. NIS configuration for the cluster is managed via [/api/security/authentication/cluster/nis](#) .

Retrieving NIS Information

The NIS GET endpoint retrieves all of the NIS configurations for data SVMs.

Examples

Retrieving all fields for all NIS configurations

```
# The API:
/api/name-services/nis

# The call:
curl -X GET "https://<mgmt-ip>/api/name-services/nis?fields=*" -H "accept: application/hal+json"

# The response:
{
  "records": [
    {
      "svm": {
        "uuid": "179d3c85-7053-11e8-b9b8-005056b41bd1",
        "name": "vs1",
        "_links": {
          "self": {
            "href": "/api/svm/svms/179d3c85-7053-11e8-b9b8-005056b41bd1"
          }
        }
      }
    }
  ]
}
```

```

    },
    "domain": "domainA.example.com",
    "servers": [
      "10.10.10.10",
      "example.com"
    ],
    "bound-servers": [
      "10.10.10.10"
    ],
    "_links": {
      "self": {
        "href": "/api/name-services/nis/179d3c85-7053-11e8-b9b8-005056b41bd1"
      }
    }
  },
  {
    "svm": {
      "uuid": "6a52023b-7066-11e8-b9b8-005056b41bd1",
      "name": "vs2",
      "_links": {
        "self": {
          "href": "/api/svm/svms/6a52023b-7066-11e8-b9b8-005056b41bd1"
        }
      }
    },
    "domain": "domainB.example.com",
    "servers": [

      "3.3.3.3",
      "4.4.4.4"
    ],
    "bound-servers": [],
    "_links": {
      "self": {
        "href": "/api/name-services/nis/6a52023b-7066-11e8-b9b8-005056b41bd1"
      }
    }
  }
],
"num_records": 2,
"_links": {
  "self": {
    "href": "/api/name-services/nis?fields=*"
  }
}

```

```
}  
}
```

Retrieving all NIS configurations whose bound servers start with *10*

```
# The API:
/api/name-services/nis

# The call:
curl -X GET "https://<mgmt-ip/api/name-services/nis?bound_servers=10*" -H
"accept: application/hal+json"

# The response:
{
  "records": [
    {
      "svm": {
        "uuid": "179d3c85-7053-11e8-b9b8-005056b41bd1",
        "name": "vs1",
        "_links": {
          "self": {
            "href": "/api/svm/svms/179d3c85-7053-11e8-b9b8-005056b41bd1"
          }
        }
      },
      "bound-servers": [
        "10.10.10.10"
      ],
      "_links": {
        "self": {
          "href": "/api/name-services/nis/6a52023b-7066-11e8-b9b8-005056b41bd1"
        }
      }
    }
  ],
  "num_records": 1,
  "_links": {
    "self": {
      "href": "/api/name-services/nis?bound_servers=10*"
    }
  }
}
```

Retrieving the NIS configuration of a specific SVM

```
# The API:
/api/name-services/nis/{svm.uuid}

# The call:
curl -X GET "https://<mgmt-ip>/api/name-services/nis/179d3c85-7053-11e8-
b9b8-005056b41bd1" -H "accept: application/hal+json"

# The response:
{
  "svm": {
    "uuid": "179d3c85-7053-11e8-b9b8-005056b41bd1",
    "name": "vs1"
  },
  "domain": "domainA.example.com",
  "servers": [
    "10.10.10.10",
    "example.com"
  ],
  "bound_servers": [
    "10.10.10.10"
  ]
}
```

Creating a NIS configuration

The NIS POST endpoint creates a NIS configuration for the specified SVM.

Example

The following example shows a POST operation:

```
# The API:
/api/name-services/nis

# The call:
curl -X POST "https://<mgmt-ip>/api/name-services/nis" -H "accept:
application/json" -H "Content-Type: application/json" -d "{ \"svm\": {
  \"uuid\": \"179d3c85-7053-11e8-b9b8-005056b41bd1\" }, \"domain\":
  \"domainA.example.com\", \"servers\": [ \"10.10.10.10\", \"example.com\"
  ]}"
```

Updating the NIS configuration

The NIS PATCH endpoint updates the NIS configuration for the specified NIS server.

Examples

Updating the domain

```
# The API:
/api/name-services/nis/{svm.uuid}

# The call:
curl -X PATCH "https://<mgmt-ip>/api/name-services/nis/179d3c85-7053-11e8-
b9b8-005056b41bd1" -H "accept: application/json" -H "Content-Type:
application/json" -d "{ \"domain\": \"domainC.example.com\", \"servers\":
[ \"13.13.13.13\" ]}"
```

Updating the server

```
# The API:
/api/name-services/nis/{svm.uuid}

# The call:
curl -X PATCH "https://<mgmt-ip>/api/name-services/nis/179d3c85-7053-11e8-
b9b8-005056b41bd1" -H "accept: application/json" -H "Content-Type:
application/json" -d "{ \"servers\": [ \"14.14.14.14\" ]}"
```

Deleting a NIS configuration

The NIS DELETE endpoint deletes the NIS configuration for the specified SVM.

Example

The following example shows a DELETE operation:

```
# The API:
/api/name-services/nis/{svm.uuid}

# The call:
curl -X DELETE "https://<mgmt-ip>/api/name-services/nis/179d3c85-7053-11e8-b9b8-005056b41bd1" -H "accept: application/hal+json"
```

Retrieve NIS domain configurations of all SVMs

GET /name-services/nis

Introduced In: 9.6

Retrieves NIS domain configurations of all the SVMs. The `bound_servers` field indicates the successfully bound NIS servers. Lookups and authentications fail if there are no bound servers.

Related ONTAP commands

- `vserver services name-service nis-domain show`
- `vserver services name-service nis-domain show-bound`

Create the NIS domain and server configuration for a data SVM

POST `/name-services/nis`

Introduced In: 9.6

Creates an NIS domain and server configuration for a data SVM. NIS configuration for the cluster is managed via [/api/security/authentication/cluster/nis](#) .

Important notes

- Each SVM can have one NIS domain configuration.
- Multiple SVMs can be configured with the same NIS domain. Specify the NIS domain and NIS servers as input. Domain name and servers fields cannot be empty.
- Both FQDNs and IP addresses are supported for the servers field.
- IPv6 must be enabled if IPv6 family addresses are specified in the servers field.
- A maximum of ten NIS servers are supported.

Required properties

- `svm.uuid` or `svm.name` - Existing SVM in which to create the NIS configuration.
- `domain` - NIS domain to which the configuration belongs.
- `servers` - List of NIS server IP addresses.

Related ONTAP commands

- `vserver services name-service nis-domain create`

Learn more

Update the NIS domain and server configuration for an SVM

```
PATCH /name-services/nis/{svm.uuid}
```

Introduced In: 9.6

Updates NIS domain and server configuration of an SVM.

Important notes

- Both NIS domain and servers can be modified.
- Domains and servers cannot be empty.
- Both FQDNs and IP addresses are supported for the servers field.
- If the domain is modified, NIS servers must also be specified.
- IPv6 must be enabled if IPv6 family addresses are specified for the servers field.

Manage UNIX group configurations

Name-services unix-groups endpoint overview

Overview

You can use this API to display local UNIX group information and to control UNIX group configurations.

Retrieving UNIX group information

The UNIX group GET endpoint retrieves all of the local UNIX groups configurations for data SVMs.

Examples

Retrieving all of the fields for all of the UNIX group configurations

The UNIX group GET endpoint retrieves all of the local UNIX groups configurations for data SVMs.

```
# The API:
/api/name-services/unix-groups

# The call:
curl -X GET "https://<mgmt-ip>/api/name-services/unix-groups?fields=*" -H
"accept: application/hal+json"

# The response:
{
  "records": [
    {
      "svm": {
        "uuid": "b009a9e7-4081-b576-7575-ada21efcaf16",
        "name": "vs1",
        "_links": {
          "self": {

        }
      }
    },
  ],
  "num_records": 1,
  "_links": {
    "self": {
      "href": "/api/name-services/unix-groups?name=group1"
    }
  }
}

```

Creating a UNIX group configuration

The UNIX group POST endpoint creates a UNIX group configuration for the specified SVM.

Example

```
# The API:
/api/name-services/unix-groups

# The call:
curl -X POST "https://<mgmt-ip>/api/name-services/unix-groups" -H "accept:
application/hal+json" -H "Content-Type: application/json" -d '{ "svm":
{"uuid": "179d3c85-7053-11e8-b9b8-005056b41bd1"}, "name": "group1", "id":
111}'
```

Updating a UNIX group configuration

The UNIX group PATCH endpoint updates the UNIX group ID of the specified UNIX group and the specified SVM.

Example

Modify the group ID of group1 to 112

```
# The API:
/api/name-services/unix-groups/{svm.uuid}/{name}

# The call:
curl -X PATCH "https://<mgmt-ip>/api/name-services/unix-groups/179d3c85-
7053-11e8-b9b8-005056b41bd1/group1" -H "accept: application/hal+json" -H
"Content-Type: application/json" -d '{ "id": 112}'
```

Deleting a UNIX group configuration

The UNIX group DELETE endpoint deletes the specified UNIX group of the specified SVM.

Example

Delete the group 'group1'

```
# The API:
/api/name-services/unix-groups/{svm.uuid}/{name}

# The call:
curl -X DELETE "https://<mgmt-ip>/api/name-services/unix-groups/179d3c85-
7053-11e8-b9b8-005056b41bd1/group1" -H "accept: application/hal+json"
```

Retrieve UNIX groups for all SVMs

GET /name-services/unix-groups

Introduced In: 9.9

Retrieves the UNIX groups for all of the SVMs. UNIX users who are the members of the group are also displayed.

Related ONTAP commands

- `vserver services name-service unix-group show`

- [DOC /name-services/unix-groups](#)

Parameters

Name	Type	In	Required	Description
users.name	string	query	False	Filter by users.name
name	string	query	False	Filter by name
id	integer	query	False	Filter by id
svm.uuid	string	query	False	Filter by svm.uuid
svm.name	string	query	False	Filter by svm.name
fields	array[string]	query	False	Specify the fields to return.
max_records	integer	query	False	Limit the number of records returned.
return_records	boolean	query	False	The default is true for GET calls. When set to false, only the number of records is returned. <ul style="list-style-type: none">• Default value: 1

Name	Type	In	Required	Description
return_timeout	integer	query	False	<p>The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached.</p> <ul style="list-style-type: none"> • Default value: 1 • Max value: 120 • Min value: 0
order_by	array[string]	query	False	Order results by specified fields and optional [asc

Manage UNIX group users

Name-services unix-groups svm.uuid unix_group.name users endpoint overview

Overview

You can use this API to add or delete UNIX users to a UNIX group of an SVM.

Adding users to a UNIX group

The UNIX group users POST endpoint adds UNIX users to the specified UNIX group and the SVM. Multiple users can be added in a single call using the "records" parameter.

Examples

Adding a single user to the group 'group1'

```
# The API:
/api/name-services/unix-groups/{svm.uuid}/{unix_group.name}/users

# The call:
curl -X POST "https://<mgmt-ip>/api/name-services/unix-groups/179d3c85-7053-11e8-b9b8-005056b41bd1/group1/users" -H "accept: application/hal+json" -H "Content-Type: application/json" -d '{"name": "user4" }'
```

Adding multiple users to the group 'group1' in a single REST call

```
# The API:
/api/name-services/unix-groups/{svm.uuid}/{unix_group.name}/users

# The call:
curl -X POST "https://<mgmt-ip>/api/name-services/unix-groups/179d3c85-7053-11e8-b9b8-005056b41bd1/group1/users" -H "accept: application/hal+json" -H "Content-Type: application/json" -d '{"records": [{"name":"user1"}, {"name":"user2"}, {"name":"user3"}]}'
```

Deleting a user from a group of a specific SVM

Example

Delete the user 'user1' from group 'group1' in SVM 'vs1'

```
= The API:

/api/name-services/unix-groups/{svm.uuid}/{unix_group.name}/users/{name}
```

```
= The call:
```

```
[[IDded7da5dac831311ac7551f3c5aaa240]]
```

```
= Add users to a UNIX group and SVM
```

```
[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-block]#`/name-services/unix-groups/{svm.uuid}/{unix_group.name}/users`#
```

```
*Introduced In:* 9.9
```

Adds users to the specified UNIX group and SVM.

```
== Important notes
```

- * Multiple users can be added in a single call using the "records" parameter.
- * "records" parameter must not be specified when "name" parameter is specified.
- * Specified users are appended to the existing list of users.
- * Duplicate users are ignored.

== Related ONTAP commands

```
* `vserver services name-service unix-group adduser`  
* `vserver services name-service unix-group addusers`

```

```
'''
```

== Creating a UNIX user configuration

The UNIX user POST endpoint creates a UNIX user configuration for the specified SVM.

== Examples

=== Creating a UNIX user configuration with all fields specified

```
'''
```

```
-----
```

```

# The API:
/api/name-services/unix-users

```

```

# The call:
curl -X POST "https://<mgmt-ip>/api/name-services/unix-users" -H "accept: application/json" -d "{ \"full_name\": \"Full user name\", \"id\": 7, \"name\": \"user2\", \"primary_gid\": 10, \"skip_name_validation\": false, \"svm\": { \"name\": \"vs1\", \"uuid\": \"25b363a6-2971-11eb-88e1-

```

```
0050568eefd4\" } }"
```

```
----
```

```
'''
```

=== Creating a UNIX user configuration with only mandatory fields specified

```
'''
```

```
----
```

```
# The API:
```

```
/api/name-services/unix-users
```

```
# The call:
```

```
curl -X POST "https://<mgmt-ip>/api/name-services/unix-users" -H "accept: application/json" -d "{ \"id\": 8, \"name\": \"user9\", \"primary_gid\": 10, \"svm\": { \"name\": \"vs1\", \"uuid\": \"25b363a6-2971-11eb-88e1-0050568eefd4\" } }"
```

```
----
```

```
'''
```

=== Updating a UNIX user configuration

The UNIX user PATCH endpoint updates the UNIX user configuration for the specified user and SVM. The following example shows a PATCH operation:

```
----
```

```
# The API:
```

```
/api/name-services/unix-users/{svm.uuid}/{name}
```

```
# The call:
```

```
curl -X PATCH "https://<mgmt-ip>/api/name-services/unix-users/25b363a6-2971-11eb-88e1-0050568eefd4/user1" -H "accept: application/json" -d "{ \"full_name\": \"Full name\", \"id\": 7, \"primary_gid\": 10 }"
```

```
----
```

```
'''
```

=== Deleting a UNIX user configuration

The UNIX user DELETE endpoint deletes the specified UNIX user for the specified SVM. The following example shows a DELETE operation:

```
-----  
  
# The API:  
/api/name-services/unix-users/{svm.uuid}/{name}  
  
# The call:  
curl -X DELETE "https://<mgmt-ip>/api/name-services/unix-users/25b363a6-  
2971-11eb-88e1-0050568eefd4/user1" -H "accept: application/json"  
  
-----
```

```
'''
```

```

|string
|query
|False
a|Filter by full_name
```

```
|id
|integer
|query
|False
a|Filter by id
```

```
|svm.uuid
|string
|query
|False
a|Filter by svm.uuid
```

```
|svm.name
|string
|query
|False
a|Filter by svm.name
```

```
|name
|string
|query
|False
a|Filter by name
```

```
|fields
|array[string]
|query
|False
a|Specify the fields to return.
```

```
|max_records
|integer
|query
```

```
|False
a|Limit the number of records returned.

|return_records
|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number
of records is returned.

* Default value: 1

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

:leveloffset: -1

:leveloffset: -1

= Networking

:leveloffset: +1

[[ID777859aad4885bd569d65184d5b4bb04]]
= Networking overview

```

== Overview

The ONTAP networking APIs enable reporting on networking information, such as IPspaces, interfaces, routes, ports, service policies and broadcast domains. Some can also be used to manage networking.

'''

== IPspaces

IPspaces enable you to configure a single ONTAP cluster so that it can be accessed by clients from more than one administratively separate network domain, even if those clients are using the same IP address subnet range. This allows for separation of client traffic for privacy and security.

An IPspace defines a distinct IP address space in which storage virtual machines (SVMs) reside. Ports and IP addresses defined for an IPspace are applicable only within that IPspace. A distinct routing table is maintained for each SVM within an IPspace, so that no cross-SVM or cross-IPspace traffic routing occurs.

'''

== Ethernet

=== Broadcast Domains

A broadcast domain is a set of ports which would all receive a broadcast packet that is sent from any of the ports.

By accurately representing the physical network with an ONTAP broadcast domain, ONTAP ensures that IP interfaces are able to migrate to appropriate ports in case of failure. ONTAP also ensures that characteristics, such as MTU, stay matched across all ports of the broadcast domain.

A broadcast domain resides in an IPspace, and can be used by cluster-scoped or SVM-scoped IP interfaces in that IPspace. The scope of the broadcast domain's uniqueness is the IPspace it is in. You must create as many broadcast domains in an IPspace as there are IP subnets with interfaces in that IPspace.

Ports are mapped to an IPspace by assigning the port's broadcast domain.

=== Ports

A port is a physical or virtual Ethernet network device. Physical ports may be combined into Link Aggregation Groups (LAGs, or ifgrps), or divided into Virtual LANs (VLANs).

The GET and PATCH APIs are available for all port types. The POST and DELETE APIs are available for "lag" and "vlan" port types.

A given port can host zero or more IP interfaces.

A port exists in a broadcast domain and all ports within the same broadcast domain must have layer 2 network connectivity to one another. If a port within a broadcast domain goes down, any IP interfaces hosted by that port can fail over to other ports in the same broadcast domain.

'''

== Fibre Channel

=== Interfaces

Fibre Channel (FC) interfaces are the logical endpoints for Fibre Channel network connections to an SVM. A Fibre Channel interface provides Fibre Channel access to storage within the interface's SVM using either Fibre Channel Protocol (FCP) or Non-Volatile Memory Express over Fibre Channel (NVMe over FC).

The Fibre Channel interface REST API allows you to create, delete, update and discover Fibre Channel interfaces and obtain status information for Fibre Channel interfaces.

A Fibre Channel interface is created on a Fibre Channel port that is located on a cluster node. The Fibre Channel port must be specified to identify the location of the interface for a POST or PATCH that relocates an interface. You can identify the port by either supplying the node and port names or the port UUID.

=== Ports

Fibre Channel ports are the physical ports of Fibre Channel adapters on ONTAP cluster nodes that can be connected to Fibre Channel networks to provide Fibre Channel network connectivity. A Fibre Channel port defines the location of a Fibre Channel interface within the ONTAP cluster.

The Fibre Channel port REST API allows you to discover Fibre Channel ports, obtain status information for Fibre Channel ports, and configure Fibre Channel port properties.

=== Learn More

* `_Fibre Channel Logins_` found in both the `_SAN_` and `_NVMe_` sections. Fibre Channel logins represent connections formed by Fibre Channel initiators that have successfully logged in to ONTAP.

'''

== IP

=== Interfaces

An interface (also referred to as a `_LIF_` in ONTAP documentation) represents a network access point to a node in a cluster. In other words, an interface is essentially an IPv4 or IPv6 address with associated attributes.

IP interfaces are configured on ports to send and receive communications over the network. The port that will host the interface can either be explicitly specified using `node` and/or `port` fields or implicitly specified using a broadcast domain.

The IPspace of the interface is required for cluster-scoped interfaces. The SVM owning the interface is required for SVM-scoped interfaces. These interfaces are in the SVM's IPspace.

The service policy of an interface defines what network services are provided by the interface.

=== Routes

Routes indicate which IPv4 or IPv6 gateway to use to communicate with hosts that are not on the local subnet. Typically, an IP interface (or LIF) can only use a gateway if it has the same address family and is in the LIF's subnet.

It is important that every gateway address belongs to a physical or virtual router that has connectivity to the specified destination network.

SVM-scoped routes can only be used by IP interfaces of the specified SVM. Likewise, cluster-scoped routes can only be used by cluster-scoped IP interfaces in the specified IPspace.

=== Service Policies

Service policies are named groupings that define what services are supported by an IP interface. These include both built-in service policies

(for example: default-data-files or default-management) and custom service policies.

Service policies are scoped to either an SVM or IPspace.

'''

= Manage broadcast domains

:leveloffset: +1

[[IDf12db82d478ac5ad4f391b2ecd094927]]

= Network Ethernet broadcast-domains endpoint overview

== Overview

A broadcast domain is a collection of Ethernet ports that have layer 2 connectivity. They are used to determine which Ethernet ports can host interfaces of various types. The broadcast domain REST API allows you to retrieve, create, modify, and delete broadcast domains. The broadcast domain APIs do not manage port membership. To add a port to a broadcast domain or to move a port to a different broadcast domain, use PATCH /network/ethernet/ports/+++<uuid>+++</uuid>+++

== Retrieving network Ethernet broadcast domain information

The broadcast domains GET API retrieves and displays relevant information pertaining to the broadcast domains configured in the cluster. The API retrieves the list of all broadcast domains configured in the cluster, or a specific broadcast domain.

'''

== Examples

=== Retrieving all broadcast domains in the cluster

The following output shows the list of all broadcast domains configured in a cluster.

```

-----

'''

== Creating network Ethernet broadcast domains

You can use the POST API to create broadcast domains.

'''

```

== Example

=== Creating a new broadcast domain

The following example shows how to create a broadcast domain with a name of 'bd1' and an MTU of 1500.

'''

The API:

/api/network/ethernet/broadcast-domains

The call:

```
curl -X POST "https://<mgmt-ip>/api/network/ethernet/broadcast-  
domains?return_records=true" -H "accept: application/hal+json" -d '{  
"name": "bd1", "mtu": 1500 }'
```

The response:

```
{  
  "num_records": 1,  
  "records": [  
    {  
      "name": "bd1",  
      "mtu": 1500,  
      "_links": {  
        "self": {  
          "href": "/api/network/ethernet/broadcast-domains/"  
        }  
      }  
    }  
  ]  
}
```

'''

== Updating network Ethernet broadcast domains

You can use the PATCH API to update the attributes of broadcast domains.

'''

== Examples

```
=== Updating the name and MTU of a specific broadcast domain
```

The following example shows how the PATCH request changes the broadcast domain name to 'bd2' and the broadcast domain MTU to 9000.

```
'''
```

```
----
```

```
# The API:
```

```
/api/network/ethernet/broadcast-domains/{uuid}
```

```
# The call:
```

```
curl -X PATCH "https://<mgmt-ip>/api/network/ethernet/broadcast-  
domains/6cde03b2-f8a2-11e8-8d33-005056bb986f/" -d '{ "name": "bd2", "mtu":  
9000 }'
```

```
{  
}
```

```
----
```

```
'''
```

```
=== Updating the IPspace of a specific broadcast domain
```

The following example shows how the PATCH request changes the IPspace of a broadcast domain to 'ipspace2'.

```
'''
```

```
----
```

```
# The API:
```

```
/api/network/ethernet/broadcast-domains/{uuid}
```

```
# The call:
```

```
curl -X PATCH "https://<mgmt-ip>/api/network/ethernet/broadcast-  
domains/c6fe2541-61f4-11e9-a66e-005056bbe83e" -d '{ "ipspace" : { "name" :  
"ipspace2" } }'
```

```
{  
}
```

```
----
```

```
'''
```

```
== Deleting network Ethernet broadcast domains
```

You can use the DELETE API to delete a broadcast domain from the cluster

configuration.

== Example

=== Deleting a specific broadcast domain

The following DELETE request deletes a broadcast domain.

'''

The API:

/api/network/ethernet/broadcast-domains/{uuid}

The call:

curl -X DELETE "https://<mgmt-ip>/api/network/ethernet/broadcast-domains/6cde03b2-f8a2-11e8-8d33-005056bb986f/"

'''

[[ID68512cb0a7a5a457af875946261be17d]]

= Retrieve broadcast domains for the entire cluster

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-block]#`/network/ethernet/broadcast-domains`#

Introduced In: 9.6

Retrieves a collection of broadcast domains for the entire cluster.

== Related ONTAP commands

* `network port broadcast-domain show`

== Parameters

[cols=5*,options=header]

|===

|Name

```
|Type
|In
|Required
|Description

```

```
|uuid
|string
|query
|False
a|Filter by uuid
```

```
|fields
|array[string]
|query
|False
a|Specify the fields to return.
```

```
|max_records
|integer
|query
|False
a|Limit the number of records returned.
```

```
|return_records
|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number
of records is returned.
```

* Default value: 1

```
|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.
```

```
* Default value: 1
```

```
* Max value: 120
```

```
* Min value: 0
```

```

= Create a new broadcast domain

```
[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-block]#`/network/ethernet/broadcast-domains`#
```

Introduced In: 9.6

Creates a new broadcast domain.

== Required properties

* `name` - Name of the broadcast-domain to create.

* `mtu` - Maximum transmission unit (MTU) of the broadcast domain.

== Recommended optional properties

* `ipspace.name` or `ipspace.uuid` - IPspace the broadcast domain belongs to.

== Default property values

If not specified in POST, the following default property values are assigned:

* `ipspace` - Default

== Related ONTAP commands

* `network port broadcast-domain create`

== Parameters

```

= Manage network Ethernet ports
```

```
:leveloffset: +1
```

```
[[ID5bb5e8c8e3aa134d6724bc867e8f5e75]]
= Network Ethernet ports endpoint overview
```

```
== Overview
```

A port is a physical or virtual Ethernet network device. Physical ports may be combined into Link Aggregation Groups (LAGs or ifgrps), or divided into Virtual LANs (VLANs).

GET (collection), GET (instance), and PATCH APIs are available for all port types. POST and DELETE APIs are available for "lag" (ifgrp) and "vlan" port types.

```
== Retrieving network port information
```

The network ports GET API retrieves and displays relevant information pertaining to the ports configured in the cluster. The API retrieves the list of all ports configured in the cluster, or specifically requested ports. The fields returned in the response vary for different ports and configurations.

```
== Examples
```

```
=== Retrieving all ports in the cluster
```

The following output displays the UUID, name, and port type for all ports configured in a 2-node cluster. The port types are physical, vlan, and lag (ifgrp).

```

=== Retrieving a specific LAG port

The following output displays the response when a specific LAG port is requested. The system returns an error when there is no port with the requested UUID. The "lag.active_ports" field is set only if the state of the port is up. Also, the "speed" field for a LAG port is always set to zero if the state of the port is up. If the state of the port is down, the "speed" field is unset and not reported back.

```

== Creating VLAN and LAG ports

You can use the network ports POST API to create VLAN and LAG ports. If you supply the optional broadcast domain property, the specified broadcast domain will be assigned to the new port immediately. Otherwise, within a few minutes automatic probing will determine the correct broadcast domain and will assign it to the port. During that period of time, the port will not be capable of hosting interfaces.

'''

```
== Examples
```

```
=== Creating a VLAN port
```

The following output displays the record returned after the creation of a VLAN port on "e0e" and VLAN tag "100".

```
'''
```

'''

== Updating ports

You can use the network ports PATCH API to update the attributes of ports.

'''

== Examples

=== Updating the broadcast domain of a port

The following PATCH request removes the port from the current broadcast domain and adds it to the specified broadcast domain.

'''

The API:

```
/api/network/ethernet/ports/{uuid}
```

The call:

```
curl -X PATCH "https://<mgmt-ip>/api/network/ethernet/ports/6867efaf-d702-11e8-994f-005056bbc994" -H "accept: application/hal+json" -H "Content-Type: application/json" -d "{ \"broadcast_domain\": { \"name\": \"Default\", \"ipSpace\": { \"name\": \"Default\" } } }"
```

'''

=== Updating the admin status of a port

The following PATCH request brings the specified port down.

'''

The API:

```
/api/network/ethernet/ports/{uuid}
```

The call:

```
curl -X PATCH "https://<mgmt-ip>/api/network/ethernet/ports/51d3ab39-d86d-11e8-aca6-005056bbc994" -H "accept: application/hal+json" -H "Content-Type: application/json" -d '{"enabled": "false"}'
```

'''

=== Repairing a port

The following PATCH request repairs a port. Only ports that have reachability as "repairable" can be repaired. The "reachability" parameter cannot be patched in the same request as other parameters that might affect the target port's reachability status.

'''

The API:

```
/api/network/ethernet/ports/{uuid}
```

The call:

```
curl -X PATCH "https://<mgmt-ip>/api/network/ethernet/ports/51d3ab39-d86d-11e8-aca6-005056bbc994" -H "accept: application/hal+json" -H "Content-Type: application/json" -d '{"reachability": "ok"}'
```

'''

== Deleting ports

You can use the network ports DELETE API to delete VLAN and LAG ports in the cluster. Note that physical ports cannot be deleted. Deleting a port also removes the port from the broadcast domain.

'''

== Example

=== Deleting a VLAN port

The network ports DELETE API is used to delete a VLAN port.

'''

The API:

/api/network/ethernet/ports/{uuid}

The call:

```
curl -X DELETE "https://<mgmt-ip>/api/network/ethernet/ports/6867efaf-
d702-11e8-994f-005056bbc994" -H "accept: application/hal+json" -H
"Content-Type: application/json"
```

'''

```
[[IDa69b9c5163940604516b11f9c5cec8bf]]
```

= Retrieve ports

```
[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/network/ethernet/ports`#
```

Introduced In: 9.6

Retrieves a collection of ports (physical, VLAN and LAG) for an entire cluster.

== Related ONTAP commands

* `network port show`

* `network port ifgrp show`

* `network port vlan show`

== Parameters

```

```

|_links
|link:#_links[_links]
a|

```

```

|duration
|string
a|The duration over which this sample is calculated. The time durations
are represented in the ISO-8601 standard format. Samples can be calculated
over the following durations:

```

```

|status
|string

```

a|Errors associated with the sample. For example, if the aggregation of data over multiple nodes fails, then any partial errors might return "ok" on success or "error" on an internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "inconsistent_old_data" is returned when one or more nodes do not have the latest data.

|throughput

|link:#throughput[throughput]

a|The rate of throughput bytes per second observed at the port object.

|timestamp

|string

a|The timestamp of the performance data.

throughput_raw
```

Throughput bytes observed at the port object. This can be used along with delta time to calculate the rate of throughput bytes per unit of time.

```
[cols=3*,options=header]
|===
|Name
|Type
|Description

|read
|integer
a|Performance metric for read I/O operations.
```

```
|total
|integer
a|Performance metric aggregated over all types of I/O operations.
```

```
|write
|integer
a|Performance metric for write I/O operations.
```

```
|===
```

```
[#statistics]
[.api-collapsible-fifth-title]
statistics
```

The real time I/O statistics for the port.

```
[cols=3*,options=header]
|===
|Name
|Type
|Description

|device
|link:#device[device]
```

a|Device-related counters for the port object. These counters are applicable at the lowest layer of the networking stack. These values can be used to calculate both transmit and receive packet and error rates by comparing two samples taken at different times and calculating the increase in counter value divided by the elapsed time between the two samples.

|status

|string

a|Errors associated with the sample. For example, if the aggregation of data over multiple nodes fails, then any partial errors might return "ok" on success or "error" on an internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "inconsistent_old_data" is returned when one or more nodes do not have the latest data.

|throughput_raw

|link:#throughput_raw[throughput_raw]

a|Throughput bytes observed at the port object. This can be used along with delta time to calculate the rate of throughput bytes per unit of time.

|timestamp

|string

a|The timestamp of the throughput_raw performance data.

|===

[#base_port]

[.api-collapsible-fifth-title]

base_port

Port UUID along with readable names. Either the UUID or both names may be supplied on input.

```

```
= Create a new VLAN or LAG
```

```
[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-block]#`/network/ethernet/ports`#
```

```
*Introduced In:* 9.6
```

```
Creates a new VLAN (such as node1:e0a-100) or LAG (ifgrp, such as node2:a0a).
```

```
== Required properties
```

```
* `node` - Node the port will be created on.
```

```
* `type` - Defines if a VLAN or LAG will be created:
```

```
*** VLAN
```

```
***** `vlan.base_port` - Physical port or LAG the VLAN will be created on.
```

```
***** `vlan.tag` - Tag used to identify VLAN on the base port.
```

```
*** LAG
```

```
***** `lag.mode` - Policy for the LAG that will be created.
```

```
***** `lag.distribution_policy` - Indicates how the packets are distributed between ports.
```

```
***** `lag.member_ports` - Set of ports the LAG consists of.
```

== Optional properties

* `broadcast_domain` - The layer-2 broadcast domain the port is associated with. The port will be placed in a broadcast domain if it is not specified. It may take several minutes for the broadcast domain to be assigned. During that period the port cannot host interfaces.

== Related ONTAP commands

* `network port ifgrp create`
* `network port vlan create`

== Parameters

[cols=5*,options=header]

ONTAP Error Response Codes

```
|====
| Error Code | Description
| 1376361
| Port is already a member of a LAG.
| 1966189
| Port is the home port or current port of an interface.
| 1967083
| The specified type is not valid.
| 1967084
| The specified node UUID is not valid.
| 1967085
| The specified node name is not valid.
| 1967086
| Node name and UUID must match if both are provided.
| 1967087
```

| The specified broadcast domain UUID is not valid.

| 1967088
| The specified broadcast domain name does not exist in the specified IPspace.

| 1967089
| The specified broadcast domain UUID, name, and IPspace name do not match.

| 1967090
| The specified VLAN base port UUID is not valid.

| 1967091
| The specified VLAN base port name and node name are not valid.

| 1967092
| The specified node does not match the node specified for the VLAN base port.

| 1967093
| The specified VLAN base port UUID, name, and VLAN base port node name do not match.

| 1967094
| The specified LAG member port UUID is not valid.

| 1967095
| The specified LAG member port name and node name combination is not valid.

| 1967096
| The specified node does not match the specified LAG member port node.

| 1967097
| The specified LAG member ports UUID, name, and node name do not match.

| 1967098
| VLAN POST operation has failed because admin status could not be set for the specified port.

| 1967099
| Partial success of the VLAN POST operation. Verify the state of the created VLAN for more information.

| 1967100
| LAG POST operation failed because admin status could not be set.

```
| 1967101
| Partial success of the LAG POST operation. Verify the state of the
created LAG for more information.

| 1967102
| POST operation might have left the configuration in an inconsistent
state. Check the configuration.

| 1967148
| Failure to remove port from broadcast domain.

| 1967149
| Failure to add port to broadcast domain.

| 1967175
| VLANs cannot be created on ports in the Cluster IPspace.

|link:#_links[_links]
```

```
a|
```

```
|duration
```

```
|string
```

```
a|The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:
```

```
|status
```

```
|string
```

```
a|Errors associated with the sample. For example, if the aggregation of data over multiple nodes fails, then any partial errors might return "ok" on success or "error" on an internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "inconsistent_old_data" is returned when one or more nodes do not have the
```

latest data.

|throughput

|link:#throughput[throughput]

a|The rate of throughput bytes per second observed at the port object.

|timestamp

|string

a|The timestamp of the performance data.

```
|===
```

```
|Name  
|Type  
|Description
```

```
|_links
|link:#_links[_links]
a|
```

```
|duration
|string
a|The duration over which this sample is calculated. The time durations
are represented in the ISO-8601 standard format. Samples can be calculated
over the following durations:
```

```
|status
|string
a|Errors associated with the sample. For example, if the aggregation of
data over multiple nodes fails, then any partial errors might return "ok"
on success or "error" on an internal uncategorized failure. Whenever a
sample collection is missed but done at a later time, it is back filled to
the previous 15 second timestamp and tagged with "backfilled_data".
"inconsistent_delta_time" is encountered when the time between two
collections is not the same for all nodes. Therefore, the aggregated value
might be over or under inflated. "Negative_delta" is returned when an
expected monotonically increasing value has decreased in value.
"inconsistent_old_data" is returned when one or more nodes do not have the
latest data.
```

```
|throughput
|link:#throughput[throughput]
a|The rate of throughput bytes per second observed at the port object.
```

```
|timestamp
|string
a|The timestamp of the performance data.
```

```
|===
```

```

```
| Error Code | Description
```

```
| 1376361
```

```
| Port is already a member of a LAG.
```

```
| 1377562
```

```
| Port cannot be used because it is currently the home port or current  
port of an interface.
```

```
| 1377563
```

```
| Port is already a member of a LAG.
```

```
| 1967087
```

```
| The specified broadcast domain UUID is not valid.
```

```
| 1967088
| The specified broadcast domain name does not exist in the specified
IPspace.

| 1967089
| The specified broadcast domain UUID, name and IPspace name do not match.

| 1967094
| The specified LAG member port UUID is not valid.

| 1967095
| The specified LAG member port name and node name combination is not
valid.

| 1967096
| The specified node does not match the specified LAG member port node.

| 1967097
| The specified LAG member ports UUID, name, and node name do not match.

| 1967148
| Failure to remove port from broadcast domain.

| 1967149
| Failure to add port to broadcast domain.

| 1967184
| The reachability parameter cannot be patched in the same request as
other parameters that might affect the target port's reachability status.

| 1967185
| The port cannot be repaired because the port is deemed as non-
repairable.

| 1967186
| Invalid value for the reachability parameter.

| 1967580
| This command is not supported as the effective cluster version is
earlier than 9.8.

| 1967582
| The reachability parameter is not supported on this cluster.

|_links
|link:#_links[_links]
a|

|duration
|string
a|The duration over which this sample is calculated. The time durations
are represented in the ISO-8601 standard format. Samples can be calculated
over the following durations:

|status
|string
a|Errors associated with the sample. For example, if the aggregation of
data over multiple nodes fails, then any partial errors might return "ok"
on success or "error" on an internal uncategorized failure. Whenever a
sample collection is missed but done at a later time, it is back filled to
the previous 15 second timestamp and tagged with "backfilled_data".
"inconsistent_delta_time" is encountered when the time between two
collections is not the same for all nodes. Therefore, the aggregated value
might be over or under inflated. "Negative_delta" is returned when an
expected monotonically increasing value has decreased in value.
"inconsistent_old_data" is returned when one or more nodes do not have the
latest data.

|throughput
|link:#throughput[throughput]
a|The rate of throughput bytes per second observed at the port object.

|timestamp
|string
a|The timestamp of the performance data.

|Description  
  
|discards  
|integer  
a|Total number of discarded packets.
```

```
|errors  
|integer  
a|Number of packet errors.
```

```
|packets  
|integer  
a|Total packet count.
```

```
|===
```

```
[#device]  
[.api-collapsible-fifth-title]  
device
```

Device-related counters for the port object. These counters are applicable at the lowest layer of the networking stack. These values can be used to calculate both transmit and receive packet and error rates by comparing two samples taken at different times and calculating the increase in counter value divided by the elapsed time between the two samples.

```
[cols=3*,options=header]
```

```
|===  
|Name  
|Type  
|Description  
  
|link_down_count_raw  
|integer  
a|The number of link state changes from up to down seen on the device.
```

```

|Description
```

```
|device
```

```
|link:#device[device]
```

a|Device-related counters for the port object. These counters are applicable at the lowest layer of the networking stack. These values can be used to calculate both transmit and receive packet and error rates by comparing two samples taken at different times and calculating the increase in counter value divided by the elapsed time between the two samples.

```
|status
```

```
|string
```

a|Errors associated with the sample. For example, if the aggregation of data over multiple nodes fails, then any partial errors might return "ok" on success or "error" on an internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "inconsistent_old_data" is returned when one or more nodes do not have the latest data.

```
|throughput_raw
```

```
|link:#throughput_raw[throughput_raw]
```

a|Throughput bytes observed at the port object. This can be used along with delta time to calculate the rate of throughput bytes per unit of time.

```
|timestamp
```

```
|string
a|The timestamp of the throughput_raw performance data.
```

```
|===
```

```

= Retrieve historical port performance metrics

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/network/ethernet/ports/{uuid}/metrics`#

*Introduced In:* 9.8

Retrieves historical performance metrics for a port.

== Parameters

[cols=5*,options=header]
|===

```

```
|Name
|Type
|In
|Required
|Description

|throughput.total
|integer
|query
|False
a|Filter by throughput.total

|throughput.read
|integer
|query
|False
a|Filter by throughput.read

|throughput.write
|integer
|query
|False
a|Filter by throughput.write

|duration
|string
|query
|False
a|Filter by duration

|status
|string
|query
|False
a|Filter by status

|timestamp
|string
|query
|False
a|Filter by timestamp
```

```
|uuid
|string
|path
|True
a|Unique identifier of the port.
```

```
|interval
|string
|query
|False
a|The time range for the data. Examples can be 1h, 1d, 1m, 1w, 1y.
The period for each time range is as follows:
```

- * 1h: Metrics over the most recent hour sampled over 15 seconds.
- * 1d: Metrics over the most recent day sampled over 5 minutes.
- * 1w: Metrics over the most recent week sampled over 30 minutes.
- * 1m: Metrics over the most recent month sampled over 2 hours.
- * 1y: Metrics over the most recent year sampled over a day.
- * Default value: 1
- * enum: ["1h", "1d", "1w", "1m", "1y"]

```
|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.
```

- * Default value: 1
- * Max value: 120
- * Min value: 0

```
|fields
|array[string]
|query
|False
a|Specify the fields to return.
```

```
|max_records
```

```
|integer
|query
|False
a|Limit the number of records returned.

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

|return_records
|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number
of records is returned.

* Default value: 1

|duration
|string
a|The duration over which this sample is calculated. The time durations
are represented in the ISO-8601 standard format. Samples can be calculated
over the following durations:

```

```
|status
|string
a|Errors associated with the sample. For example, if the aggregation of
data over multiple nodes fails, then any partial errors might return "ok"
on success or "error" on an internal uncategorized failure. Whenever a
sample collection is missed but done at a later time, it is back filled to
the previous 15 second timestamp and tagged with "backfilled_data".
"inconsistent_delta_time" is encountered when the time between two
collections is not the same for all nodes. Therefore, the aggregated value
might be over or under inflated. "Negative_delta" is returned when an
expected monotonically increasing value has decreased in value.
"inconsistent_old_data" is returned when one or more nodes do not have the
latest data.
```

```
|throughput

:leveloffset: -1

= Retrieve network Ethernet switch ports

```

```
:leveloffset: +1
```

```
[[ID44e7e951c13af3f0fa62c9c7325f7334]]  
= Network Ethernet switch ports endpoint overview
```

```
== Overview
```

This API can be used to get the port information for an ethernet switch used in a cluster or storage networks. This API supports GET only. The GET operation returns a list of ports with status and configuration information.

```
== Examples
```

```
=== Retrieving the ports for ethernet switches
```

The following example retrieves the ethernet switch ports for all the ethernet switches used for cluster and/or storage networks. Note that if the `_fields=*` parameter is not specified, the fields `in-octets`, `in-errors`, `in-discards`, `out-octets`, `out-errors`, `out-discards`, `interface-number`, `unique-name`, `mac-address` are not returned. Filters can be added on the fields to limit the results.

```
[,JSON]
```

```

[[ID9ac23d8c235f4calc7b7d7c1587229a7]]
= Retrieve Ethernet switch ports

```

```

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/network/ethernet/switch/ports`#

```

Introduced In: 9.8

Retrieves the ethernet switch ports.

== Related ONTAP commands

[[ID2b3d31eaa056218a056388895692db69]]
```

```
= Network Ethernet switches endpoint overview
```

```
== Overview
```

This API can be used to get information about the ethernet switches used for cluster and/or storage networks. This API support GET and PATCH calls. The GET operation returns a list of discovered switches with status and configuration information. The PATCH can be used to modify state of the switch.

```
== Examples
```

```
=== Retrieving the ethernet switches for a cluster
```

The following example retrieves the ONTAP switches from the cluster. Note that if the `_fields=*` parameter is not specified, the fields `snmp.version`, `snmp.credential`, `model`, `sw-version`, `reason`, `version-source`, `monitoring.enable`, `monitoring.subsystem.type` and `monitoring.subsystem.poll_interval` are not returned. Filters can be added on the fields to limit the results.

```

|Required
|Description

|name
|string
|path
|True
a|Switch Name

|return_timeout
|integer
|query
|False

```

a|The number of seconds to allow the call to execute before returning. When doing a POST, PATCH, or DELETE operation on a single record, the default is 0 seconds. This means that if an asynchronous operation is started, the server immediately returns HTTP code 202 (Accepted) along with a link to the job. If a non-zero value is specified for POST, PATCH, or DELETE operations, ONTAP waits that length of time to see if the job completes so it can return something other than 202.

= Manage FC network interfaces

:leveloffset: +1

[[ID14a5f2328da063a01e344074a014d77a]]
= Network FC interfaces endpoint overview
```

== Overview

Fibre Channel (FC) interfaces are the logical endpoints for FC network connections to an SVM. An FC interface provides FC access to storage within the interface SVM using either Fibre Channel Protocol or NVMe over FC (NVMe/FC).

The Fibre Channel interface REST API allows you to create, delete, update, and discover FC interfaces, and obtain status information for FC interfaces.

An FC interface is created on an FC port which is located on a cluster node. The FC port must be specified to identify the location of the interface for a POST or PATCH request that relocates an interface. You can identify the port by supplying either the node and port names or the port UUID.

== Performance monitoring

Performance of an FC interface can be monitored by observing the ``metric.+++`` and ``statistics.+++`` properties. These properties show the performance of an FC interface in terms of IOPS, latency, and throughput. The ``metric.+++`` properties denote an average, whereas ``statistics.+++`` properties denote a real-time monotonically increasing value aggregated across all nodes.

== Examples

=== Creating an FC interface using the port node and name to identify the location

This example uses the `return_records` query parameter to retrieve the newly created FC interface in the POST response.

The API:

POST /api/network/fc/interfaces

The call:

```
curl -X POST 'https://<mgmt-  
ip>/api/network/fc/interfaces?return_records=true' -H 'accept:  
application/hal+json' -d '{ "svm": { "name": "svm1" }, "name": "lif1",  
"location": { "home_port": { "name": "0a", "home_node": { "name": "node1"  
} } }, "data_protocol": "fc" }'
```

The response:

```
{  
  "num_records": 1,  
  "records": [  
    {  
      "svm": {  
        "uuid": "cf300f5c-db83-11e8-bd46-005056bba0e0",  
        "name": "svm1",  
        "_links": {  
          "self": {  
            "href": "/api/svm/svms/cf300f5c-db83-11e8-bd46-005056bba0e0"  
          }  
        }  
      },  
      "uuid": "f6045b92-dec7-11e8-a733-005056bba0e0",

}
----

'''

== Disabling an FC interface

When updating certain properties or deleting an FC interface, the
interface must first be disabled using the following:

----

# The API:
PATCH /api/network/fc/interfaces/{uuid}

# The call:
curl -X PATCH 'https://<mgmt-ip>/api/network/fc/interfaces/f6045b92-dec7-
11e8-a733-005056bba0e0' -H 'accept: application/hal+json' -d '{ "enabled":
false }'
----

'''

=== Moving an FC interface to a new node and port

To move an FC interface to another node or port, the destination FC port
must be specified in a PATCH request. Either the port UUID or node and
port names can be used to identify the port.

Note that only FC interfaces configured for the FC Protocol can be moved.
FC interfaces configured for NVMe/FC cannot be moved. The interface must
also be set to the disabled state before being moved.

----

# The API:
PATCH /api/network/fc/interfaces/{uuid}

# The call:
curl -X PATCH 'https://<mgmt-ip>/api/network/fc/interfaces/f6045b92-dec7-
11e8-a733-005056bba0e0' -H 'accept: application/hal+json' -d '{
"location": { "home_port": { "uuid": "a1dc7aa5-db83-11e8-9ef7-
005056bbbbcc" } } }'
----

'''

```

=== Deleting an FC interface

The FC interface must be disabled before being deleted.

The API:

```
DELETE /api/network/fc/interfaces/{uuid}
```

The call:

```
curl -X DELETE 'https://<mgmt-ip>/api/network/fc/interfaces/f6045b92-dec7-11e8-a733-005056bba0e0' -H 'accept: application/hal+json'
```

```
[[IDd033ffb36242273f7d2cd62bc560330c]]
```

= Retrieve FC interfaces

```
[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-block]#`/network/fc/interfaces`#
```

Introduced In: 9.6

Retrieves FC interfaces.

a|Limit the number of records returned.

|return_records

|boolean

|query

|False

a|The default is true for GET calls. When set to false, only the number of records is returned.

* Default value: 1

|return_timeout

|integer

|query

|False

a|The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached.

* Default value: 1

* Max value: 120

* Min value: 0

|order_by

|array[string]

|query

|False

a|Order results by specified fields and optional [asc|desc] direction. Default direction is 'asc' for ascending.

[#location]
```

```
[.api-collapsible-fifth-title]
```

```
location
```

The location of the FC interface is defined by the location of its port. An FC port is identified by its UUID, or a combination of its node name and port name. Either the UUID or the node name and port name are required for POST. To move an interface, supply either the UUID or the node name and port name in a PATCH.

The location of an FC interface can be set using "location.home_node" and "location.home_port" during a POST or PATCH. "location.node" and "location.port" refer to the current location of the FC interface. This can be different from "location.home_node" and "location.home_port" in instances where the FC interface failed over due to an offline node.

|Description

|_links
|link:#_links[_links]
a|

|duration
|string
a|The duration over which this sample is calculated. The time durations
are represented in the ISO-8601 standard format. Samples can be calculated
over the following durations:

|iops
|link:#iops[iops]
a|The rate of I/O operations observed at the storage object.

|latency
|link:#latency[latency]
a|The round trip latency in microseconds observed at the storage object.

|status
|string
a|Any errors associated with the sample. For example, if the aggregation
of data over multiple nodes fails then any of the partial errors might be
returned, "ok" on success, or "error" on any internal uncategorized
failure. Whenever a sample collection is missed but done at a later time,
it is back filled to the previous 15 second timestamp and tagged with
"backfilled_data". "Inconsistent_delta_time" is encountered when the time
between two collections is not the same for all nodes. Therefore, the
aggregated value might be over or under inflated. "Negative_delta" is
returned when an expected monotonically increasing value has decreased in
value. "Inconsistent_old_data" is returned when one or more nodes do not
have the latest data.

|throughput
|link:#throughput[throughput]
a|The rate of throughput bytes per second observed at the storage object.

|timestamp
|string
```

a|The timestamp of the performance data.

|===

```
[#iops_raw]

```
[#fc_interface]
```

```
[.api-collapsible-fifth-title]
```

```
fc_interface
```

A Fibre Channel (FC) interface is the logical endpoint for FC network connections to an SVM. An FC interface provides FC access to storage within the interface SVM using either Fibre Channel Protocol or NVMe over Fibre Channel (NVMe/FC).

An FC interface is created on an FC port which is located on a cluster node. The FC port must be specified to identify the location of the interface for a POST or PATCH operation that relocates an interface. You can identify the port by supplying either the node and port names or the port UUID.

```
[cols=3*,options=header]

```
|comment
```

```
|string
```

```
a|A user configurable comment. Optional in POST; valid in PATCH. To clear a prior comment, set the property to an empty string in PATCH.
```

|data_protocol

|string

a|The data protocol for which the FC interface is configured. Required in POST.

|enabled

|boolean

a|The administrative state of the FC interface. The FC interface can be disabled to block all FC communication with the SVM through this interface. Optional in POST and PATCH; defaults to `_true_` (enabled) in POST.

|location

|link:#location[location]

a|The location of the FC interface is defined by the location of its port. An FC port is identified by its UUID, or a combination of its node name and port name. Either the UUID or the node name and port name are required for POST. To move an interface, supply either the UUID or the node name and port name in a PATCH.

The location of an FC interface can be set using "location.home_node" and "location.home_port" during a POST or PATCH. "location.node" and "location.port" refer to the current location of the FC interface. This can be different from "location.home_node" and "location.home_port" in instances where the FC interface failed over due to an offline node.

|metric

|link:#metric[metric]

a|Performance numbers, such as IOPS latency and throughput

|name

|string

a|The name of the FC interface. Required in POST; optional in PATCH.

|port_address

|string

a|The port address of the FC interface. Each FC port in an FC switched fabric has its own unique FC port address for routing purposes. The FC port address is assigned by a switch in the fabric when that port logs in to the fabric. This property refers to the address given by a switch to the FC interface when the SVM performs a port login (PLOGI).

This is useful for obtaining statistics and diagnostic information from FC switches.

This is a hexadecimal encoded numeric value.

|state
|string

a|The current operational state of the FC interface. The state is set to `_down_` if the interface is not enabled.

If the node hosting the port is down or unavailable, no state value is returned.

|statistics
|link:#statistics[statistics]

a|These are raw performance numbers, such as IOPS latency and throughput. These numbers are aggregated across all nodes in the cluster and increase with the uptime of the cluster.

|svm
|link:#svm[svm]
a|

|uuid
|string

a|The unique identifier of the FC interface. Required in the URL.

|wwnn
|string

a|The world wide node name (WWNN) of the FC interface SVM. The WWNN is generated by ONTAP when Fibre Channel Protocol or the NVMe service is created for the FC interface SVM.

* example: 20:00:00:50:56:b4:13:01

* readOnly: 1

* Introduced in: 9.6

|wwpn
|string

a|The world wide port name (WWPN) of the FC interface. The WWPN is generated by ONTAP when the FC interface is created.

```
* example: 20:00:00:50:56:b4:13:a8
* readOnly: 1

= Create an FC interface

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/network/fc/interfaces`#

*Introduced In:* 9.6

Creates an FC interface.

== Required properties

* `svm.uuid` or `svm.name` - Existing SVM in which to create the FC
interface.
* `name` - Name of the FC interface.
* `location.port.uuid` or both `location.port.name` and
`location.port.node.name` - FC port on which to create the FC interface.
* `data_protocol` - Data protocol for the FC interface.

== Default property values

If not specified in POST, the following default property values are
assigned.

* `enabled` - _true_

```

== Related ONTAP commands

* `network interface create`

== Learn more

* xref:{relative_path}network_fc_interfaces_endpoint_overview.html[DOC
/network/fc/interfaces]

== Parameters

ONTAP Error Response Codes

|===

| Error Code | Description

| 1966140

| An interface with the same name already exists.

| 1966217

| The specified port is not valid on the node provided.

| 2621462

| The supplied SVM does not exist.

| 2621706

| The specified `svm.uuid` and `svm.name` do not refer to the same SVM.

| 2621707

| No SVM was specified. Either `svm.name` or `svm.uuid` must be supplied.

| 5373966

| A Fibre Channel interface with the `_fcp_` protocol cannot be created in an SVM that is configured for NVMe.

| 5374102

| The specified Fibre Channel interface cannot be created because the Fibre Channel adapter is down. Bring the adapter up and try again.

| 5374871

| The Fibre Channel port identified by the specified UUID does not refer to the same port as that identified by the specified node name and/or port name.

| 5374872
| If either ``location.port.node.name`` or ``location.port.name`` is supplied,
both properties must be supplied.

| 5374873
| The Fibre Channel port must be specified using either
``location.port.uuid`` or ``location.port.node.name`` and
``location.port.name``.

| 72089652
| An NVMe service must be created before creating a Fibre Channel
interface using the NVMe over FC data protocol.

| 72089672
| The specified Fibre Channel port does not support the NVMe over FC data
protocol.

| 72089900
| A Fibre Channel interface with the `_fc_nvme_` protocol cannot be created
in an SVM that is configured for a SAN protocol.

|duration
|string
a|The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:

|iops
|link:#iops[iops]
a|The rate of I/O operations observed at the storage object.

|latency
|link:#latency[latency]
a|The round trip latency in microseconds observed at the storage object.

|status
|string
a|Any errors associated with the sample. For example, if the aggregation of data over multiple nodes fails then any of the partial errors might be returned, "ok" on success, or "error" on any internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.

|throughput
|link:#throughput[throughput]
a|The rate of throughput bytes per second observed at the storage object.

|timestamp
|string
a|The timestamp of the performance data.

|===

[#iops_raw]

```
[.api-collapsible-fifth-title]

```
|uuid
|string
a|The unique identifier of the SVM.
```

```
|===
```

```
[#fc_interface]
[.api-collapsible-fifth-title]
fc_interface
```

A Fibre Channel (FC) interface is the logical endpoint for FC network connections to an SVM. An FC interface provides FC access to storage within the interface SVM using either Fibre Channel Protocol or NVMe over Fibre Channel (NVMe/FC).

An FC interface is created on an FC port which is located on a cluster node. The FC port must be specified to identify the location of the interface for a POST or PATCH operation that relocates an interface. You can identify the port by supplying either the node and port names or the port UUID.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
|Type
|Description
```

```
|_links
|link:#_links[_links]
a|
```

```
|comment
```

```
|string
```

```
a|A user configurable comment. Optional in POST; valid in PATCH. To clear a prior comment, set the property to an empty string in PATCH.
```

```
|data_protocol
```

```
|string
```

```
a|The data protocol for which the FC interface is configured. Required in POST.
```

```
|enabled
```

|boolean

a|The administrative state of the FC interface. The FC interface can be disabled to block all FC communication with the SVM through this interface. Optional in POST and PATCH; defaults to `_true_` (enabled) in POST.

|location

|link:#location[location]

a|The location of the FC interface is defined by the location of its port. An FC port is identified by its UUID, or a combination of its node name and port name. Either the UUID or the node name and port name are required for POST. To move an interface, supply either the UUID or the node name and port name in a PATCH.

The location of an FC interface can be set using "location.home_node" and "location.home_port" during a POST or PATCH. "location.node" and "location.port" refer to the current location of the FC interface. This can be different from "location.home_node" and "location.home_port" in instances where the FC interface failed over due to an offline node.

|metric

|link:#metric[metric]

a|Performance numbers, such as IOPS latency and throughput

|name

|string

a|The name of the FC interface. Required in POST; optional in PATCH.

|port_address

|string

a|The port address of the FC interface. Each FC port in an FC switched fabric has its own unique FC port address for routing purposes. The FC port address is assigned by a switch in the fabric when that port logs in to the fabric. This property refers to the address given by a switch to the FC interface when the SVM performs a port login (PLOGI).

This is useful for obtaining statistics and diagnostic information from FC switches.

This is a hexadecimal encoded numeric value.

|state

|string

a|The current operational state of the FC interface. The state is set to `_down_` if the interface is not enabled.

If the node hosting the port is down or unavailable, no state value is returned.

|statistics

|link:#statistics[statistics]

a|These are raw performance numbers, such as IOPS latency and throughput. These numbers are aggregated across all nodes in the cluster and increase with the uptime of the cluster.

|svm

|link:#svm[svm]

a|

|uuid

|string

a|The unique identifier of the FC interface. Required in the URL.

|wwnn

|string

a|The world wide node name (WWNN) of the FC interface SVM. The WWNN is generated by ONTAP when Fibre Channel Protocol or the NVMe service is created for the FC interface SVM.

* example: 20:00:00:50:56:b4:13:01

* readOnly: 1

* Introduced in: 9.6

|wwpn

|string

a|The world wide port name (WWPN) of the FC interface. The WWPN is generated by ONTAP when the FC interface is created.

* example: 20:00:00:50:56:b4:13:a8

* readOnly: 1

* Introduced in: 9.6

If the node hosting the port is down or unavailable, no state value is returned.

|statistics

|link:#statistics[statistics]

a|These are raw performance numbers, such as IOPS latency and throughput. These numbers are aggregated across all nodes in the cluster and increase with the uptime of the cluster.

|svm

|link:#svm[svm]

a|

|uuid

|string

a|The unique identifier of the FC interface. Required in the URL.

|wwnn

|string

a|The world wide node name (WWNN) of the FC interface SVM. The WWNN is generated by ONTAP when Fibre Channel Protocol or the NVMe service is created for the FC interface SVM.

* example: 20:00:00:50:56:b4:13:01

* readOnly: 1

* Introduced in: 9.6

|wwpn

|string

a|The world wide port name (WWPN) of the FC interface. The WWPN is generated by ONTAP when the FC interface is created.

* example: 20:00:00:50:56:b4:13:a8

* readOnly: 1

* Introduced in: 9.6

|Name
|Type
|Description

|_links
|link:#_links[_links]
a|

|duration
|string
a|The duration over which this sample is calculated. The time durations
are represented in the ISO-8601 standard format. Samples can be calculated
over the following durations:

|iops
|link:#iops[iops]
a|The rate of I/O operations observed at the storage object.

|latency
|link:#latency[latency]
a|The round trip latency in microseconds observed at the storage object.

|status
|string
a|Any errors associated with the sample. For example, if the aggregation
of data over multiple nodes fails then any of the partial errors might be
returned, "ok" on success, or "error" on any internal uncategorized
failure. Whenever a sample collection is missed but done at a later time,
it is back filled to the previous 15 second timestamp and tagged with
"backfilled_data". "Inconsistent_delta_time" is encountered when the time
between two collections is not the same for all nodes. Therefore, the
aggregated value might be over or under inflated. "Negative_delta" is
returned when an expected monotonically increasing value has decreased in
value. "Inconsistent_old_data" is returned when one or more nodes do not
have the latest data.

|throughput
|link:#throughput[throughput]
a|The rate of throughput bytes per second observed at the storage object.

|timestamp

```

```
|string
a|The timestamp of the performance data.
```

```
|===
```

```
[#iops_raw]
[.api-collapsible-fifth-title]
iops_raw
```

The number of I/O operations observed at the storage object. This should be used along with delta time to calculate the rate of I/O operations per unit of time.

```

```
|_links
```

```
|link:#_links[_links]
```

```
a|
```

```
|comment
```

```
|string
```

```
a|A user configurable comment. Optional in POST; valid in PATCH. To clear a prior comment, set the property to an empty string in PATCH.
```

```
|data_protocol
```

```
|string
```

```
a|The data protocol for which the FC interface is configured. Required in POST.
```

|enabled

|boolean

a|The administrative state of the FC interface. The FC interface can be disabled to block all FC communication with the SVM through this interface. Optional in POST and PATCH; defaults to `_true_` (enabled) in POST.

|location

|link:#location[location]

a|The location of the FC interface is defined by the location of its port. An FC port is identified by its UUID, or a combination of its node name and port name. Either the UUID or the node name and port name are required for POST. To move an interface, supply either the UUID or the node name and port name in a PATCH.

The location of an FC interface can be set using "location.home_node" and "location.home_port" during a POST or PATCH. "location.node" and "location.port" refer to the current location of the FC interface. This can be different from "location.home_node" and "location.home_port" in instances where the FC interface failed over due to an offline node.

|metric

|link:#metric[metric]

a|Performance numbers, such as IOPS latency and throughput

|name

|string

a|The name of the FC interface. Required in POST; optional in PATCH.

|port_address

|string

a|The port address of the FC interface. Each FC port in an FC switched fabric has its own unique FC port address for routing purposes. The FC port address is assigned by a switch in the fabric when that port logs in to the fabric. This property refers to the address given by a switch to the FC interface when the SVM performs a port login (PLOGI).

This is useful for obtaining statistics and diagnostic information from FC switches.

This is a hexadecimal encoded numeric value.

```
|state
|string
a|The current operational state of the FC interface. The state is set to
_down_ if the interface is not enabled.
```

If the node hosting the port is down or unavailable, no state value is returned.

```
|statistics
|link:#statistics[statistics]
a|These are raw performance numbers, such as IOPS latency and throughput.
These numbers are aggregated across all nodes in the cluster and increase
with the uptime of the cluster.
```

```
|svm
|link:#svm[svm]
a|
```

```
|uuid
|string
a|The unique identifier of the FC interface. Required in the URL.
```

```
|wwnn
|string
a|The world wide node name (WWNN) of the FC interface SVM. The WWNN is
generated by ONTAP when Fibre Channel Protocol or the NVMe service is
created for the FC interface SVM.
```

```
* example: 20:00:00:50:56:b4:13:01
* readOnly: 1
* Introduced in: 9.6
```

```
|wwpn
|string
a|The world wide port name (WWPN) of the FC interface. The WWPN is
generated by ONTAP when the FC interface is created.
```

```
* example: 20:00:00:50:56:b4:13:a8
* readOnly: 1
* Introduced in: 9.6
```

ONTAP Error Response Codes

|===

| Error Code | Description

| 1966140

| An interface with the same name already exists.

```
| 1966217
| The specified port is not valid on the node provided.

| 1966238
| The node or port of an active SAN data interface cannot be changed.

| 1966702
| The destination node is not healthy.

| 5374579
| The SAN Kernel Agent on the node is unavailable.

| 5374870
| A partial failure occurred; renaming the interface failed. Correct the
error and resubmit the request.

| 5374871
| The Fibre Channel port identified by the specified UUID does not refer
to the same port as that identified by the specified node name and/or port
name.

| 5374872
| If either `location.port.node.name` or `location.port.name` is supplied,
both properties must be supplied.

| 72089674
| You cannot move a Fibre Channel interface configured for the NVMe over
FC data protocol.

[#location]
```

```
[.api-collapsible-fifth-title]
```

```
location
```

The location of the FC interface is defined by the location of its port. An FC port is identified by its UUID, or a combination of its node name and port name. Either the UUID or the node name and port name are required for POST. To move an interface, supply either the UUID or the node name and port name in a PATCH.

The location of an FC interface can be set using "location.home_node" and "location.home_port" during a POST or PATCH. "location.node" and "location.port" refer to the current location of the FC interface. This can be different from "location.home_node" and "location.home_port" in instances where the FC interface failed over due to an offline node.

|Name
|Type
|Description

|_links
|link:#_links[_links]
a|

|duration
|string
a|The duration over which this sample is calculated. The time durations
are represented in the ISO-8601 standard format. Samples can be calculated
over the following durations:

|iops
|link:#iops[iops]
a|The rate of I/O operations observed at the storage object.

|latency
|link:#latency[latency]
a|The round trip latency in microseconds observed at the storage object.

|status
|string
a|Any errors associated with the sample. For example, if the aggregation
of data over multiple nodes fails then any of the partial errors might be
returned, "ok" on success, or "error" on any internal uncategorized
failure. Whenever a sample collection is missed but done at a later time,
it is back filled to the previous 15 second timestamp and tagged with
"backfilled_data". "Inconsistent_delta_time" is encountered when the time
between two collections is not the same for all nodes. Therefore, the
aggregated value might be over or under inflated. "Negative_delta" is
returned when an expected monotonically increasing value has decreased in
value. "Inconsistent_old_data" is returned when one or more nodes do not
have the latest data.

|throughput
|link:#throughput[throughput]
a|The rate of throughput bytes per second observed at the storage object.

|timestamp

```

```
|string
a|The timestamp of the performance data.
```

```
|===
```

```
[#iops_raw]
[.api-collapsible-fifth-title]
iops_raw
```

The number of I/O operations observed at the storage object. This should be used along with delta time to calculate the rate of I/O operations per unit of time.

|===
```

```
[#fc_interface]
```

```
[.api-collapsible-fifth-title]
```

```
fc_interface
```

A Fibre Channel (FC) interface is the logical endpoint for FC network connections to an SVM. An FC interface provides FC access to storage within the interface SVM using either Fibre Channel Protocol or NVMe over Fibre Channel (NVMe/FC).

An FC interface is created on an FC port which is located on a cluster node. The FC port must be specified to identify the location of the interface for a POST or PATCH operation that relocates an interface. You can identify the port by supplying either the node and port names or the port UUID.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|Description
```

```
|_links
```

```
|link:#_links[_links]
```

```
a|
```

```
|comment
```

```
|string
```

```
a|A user configurable comment. Optional in POST; valid in PATCH. To clear a prior comment, set the property to an empty string in PATCH.
```

|data_protocol

|string

a|The data protocol for which the FC interface is configured. Required in POST.

|enabled

|boolean

a|The administrative state of the FC interface. The FC interface can be disabled to block all FC communication with the SVM through this interface. Optional in POST and PATCH; defaults to `_true_` (enabled) in POST.

|location

|link:#location[location]

a|The location of the FC interface is defined by the location of its port. An FC port is identified by its UUID, or a combination of its node name and port name. Either the UUID or the node name and port name are required for POST. To move an interface, supply either the UUID or the node name and port name in a PATCH.

The location of an FC interface can be set using "location.home_node" and "location.home_port" during a POST or PATCH. "location.node" and "location.port" refer to the current location of the FC interface. This can be different from "location.home_node" and "location.home_port" in instances where the FC interface failed over due to an offline node.

|metric

|link:#metric[metric]

a|Performance numbers, such as IOPS latency and throughput

|name

|string

a|The name of the FC interface. Required in POST; optional in PATCH.

|port_address

|string

a|The port address of the FC interface. Each FC port in an FC switched fabric has its own unique FC port address for routing purposes. The FC port address is assigned by a switch in the fabric when that port logs in to the fabric. This property refers to the address given by a switch to the FC interface when the SVM performs a port login (PLOGI).

This is useful for obtaining statistics and diagnostic information from FC switches.

This is a hexadecimal encoded numeric value.

|state

|string

a|The current operational state of the FC interface. The state is set to `_down_` if the interface is not enabled.

If the node hosting the port is down or unavailable, no state value is returned.

|statistics

|link:#statistics[statistics]

a|These are raw performance numbers, such as IOPS latency and throughput. These numbers are aggregated across all nodes in the cluster and increase with the uptime of the cluster.

|svm

|link:#svm[svm]

a|

|uuid

|string

a|The unique identifier of the FC interface. Required in the URL.

|wwnn

|string

a|The world wide node name (WWNN) of the FC interface SVM. The WWNN is generated by ONTAP when Fibre Channel Protocol or the NVMe service is created for the FC interface SVM.

* example: 20:00:00:50:56:b4:13:01

* readOnly: 1

* Introduced in: 9.6

|wwpn

|string

a|The world wide port name (WWPN) of the FC interface. The WWPN is generated by ONTAP when the FC interface is created.

```
* example: 20:00:00:50:56:b4:13:a8
* readOnly: 1
* Introduced in: 9.6
```

|False  
a|Filter by throughput.total
```

```
|throughput.read  
|integer  
|query  
|False  
a|Filter by throughput.read
```

```
|throughput.write  
|integer  
|query  
|False  
a|Filter by throughput.write
```

```
|status  
|string  
|query  
|False  
a|Filter by status
```

```
|uuid
|string
|path
|True
a|Unique identifier of the FC interface.
```

```
|interval
|string
|query
|False
a|The time range for the data. Examples can be 1h, 1d, 1m, 1w, 1y.
The period for each time range is as follows:
```

- * 1h: Metrics over the most recent hour sampled over 15 seconds.
- * 1d: Metrics over the most recent day sampled over 5 minutes.
- * 1w: Metrics over the most recent week sampled over 30 minutes.
- * 1m: Metrics over the most recent month sampled over 2 hours.
- * 1y: Metrics over the most recent year sampled over a day.
- * Default value: 1
- * enum: ["1h", "1d", "1w", "1m", "1y"]

```
|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.
```

- * Default value: 1
- * Max value: 120
- * Min value: 0

```
|fields
|array[string]
|query
|False
a|Specify the fields to return.
```

```
|max_records
```

```
|integer

```
|duration
|string
a|The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:
```

```
|iops
|link:#iops[iops]
a|The rate of I/O operations observed at the storage object.
```

```
|latency
|link:#latency[latency]
a|The round trip latency in microseconds observed at the storage object.
```

```
|status
|string
a|Any errors associated with the sample. For example, if the aggregation of data over multiple nodes fails then any of the partial errors might be returned, "ok" on success, or "error" on any internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.
```

```
|throughput
|link:#throughput[throughput]
a|The rate of throughput bytes per second observed at the storage object.
```

```
|timestamp
|string
a|The timestamp of the performance data.
```

```
|uuid
|string
a|The unique identifier of the FC interface.
```

[[ID37dfbe299c51e03ca24e2a76d8315c2d]]
```

```
= Network FC ports endpoint overview
```

```
== Overview
```

Fibre Channel (FC) ports are the physical ports of FC adapters on ONTAP cluster nodes that can be connected to FC networks to provide FC network connectivity. An FC port defines the location of an FC interface within the ONTAP cluster.

The Fibre Channel port REST API allows you to discover FC ports, obtain status information for FC ports, and configure FC port properties. POST and DELETE requests are not supported. You must physically add and remove FC adapters to ONTAP nodes to create and remove ports from the ONTAP cluster.

```
== Performance monitoring
```

Performance of an FC port can be monitored by observing the ``metric.+++`` and ``statistics.+++`` properties. These properties show the performance of an FC port in terms of IOPS, latency, and throughput. The ``metric.+++`` properties denote an average, whereas ``statistics.+++`` properties denote a real-time monotonically increasing value aggregated across all nodes.

```
== Examples
```

```
=== Retrieving all FC ports
```

```
----
```

```
# The API:
```

```
GET /api/network/fc/ports
```

```
# The call:
```

```
curl -X GET "https://<mgmt-ip>/api/network/fc/ports" -H "accept:
```

```
application/hal+json"
```

```
# The response:
```

```

|fields

|array[string]

|query

|False

a|Specify the fields to return.

|max_records

|integer

|query

|False

a|Limit the number of records returned.

|return_records

|boolean

|query

|False

a|The default is true for GET calls. When set to false, only the number of records is returned.

* Default value: 1

|return_timeout

|integer

|query

|False

a|The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached.

* Default value: 1

* Max value: 120

* Min value: 0

|order_by

|array[string]

|query

|False

a|Order results by specified fields and optional [asc|desc] direction. Default direction is 'asc' for ascending.

[#fabric]
```

```
[.api-collapsible-fifth-title]
```

```
fabric
```

Properties of the fabric to which the FC port is attached.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|Description
```

```
|connected
```

```
|boolean
```

```
a|Reports if the physical port has established a connection with the FC fabric.
```

```
|connected_speed
```

```
|integer
```

```
a|The negotiated data rate between the target FC port and the fabric in gigabits per second.
```

```
|name
```

|string

a|The name of the fabric to which the port is connected. This is only available when the FC port is connected to a fabric.

There is an added cost to retrieving this property's value. It is not populated for either a collection GET or an instance GET unless it is explicitly requested using the `fields` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

|port_address

|string

a|The FC port address of the host bus adapter (HBA) physical port.

Each FC port in an FC switched fabric has its own unique FC port address for routing purposes. The FC port address is assigned by a switch in the fabric when that port logs in to the fabric. This property refers to the FC port address given to the physical host bus adapter (HBA) port when the port performs a fabric login (FLOGI).

This is useful for obtaining statistics and diagnostic information from FC switches.

This is a six-digit hexadecimal encoded numeric value.

|switch_port

|string

a|The switch port to which the FC port is connected.

|===

[#iops]

[.api-collapsible-fifth-title]

iops

The rate of I/O operations observed at the storage object.

[cols=3*,options=header]

|===

|Name

|Type

|Description

```
|other
|integer
a|Performance metric for other I/O operations. Other I/O operations can be
metadata operations, such as directory lookups and so on.
```

```
|read
|integer
a|Performance metric for read I/O operations.
```

```
|total
|integer
a|Performance metric aggregated over all types of I/O operations.
```

```
|write
|integer
a|Performance metric for write I/O operations.
```

```
|===
```

```
[#latency]
[.api-collapsible-fifth-title]
latency
```

The round trip latency in microseconds observed at the storage object.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
|Type
|Description
```

```
|other
|integer
a|Performance metric for other I/O operations. Other I/O operations can be
metadata operations, such as directory lookups and so on.
```

```
|read
|integer
a|Performance metric for read I/O operations.
```

```
|total
|integer
a|Performance metric aggregated over all types of I/O operations.
```

```
|write
|integer
a|Performance metric for write I/O operations.
```

```
|===
```

```
[#throughput]
[.api-collapsible-fifth-title]
throughput
```

The rate of throughput bytes per second observed at the storage object.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
|Type
|Description
```

```
|read
|integer
a|Performance metric for read I/O operations.
```

```
|total

```
|Description
```

```
|_links
```

```
|link:#_links[_links]
```

```
a|
```

```
|duration
```

```
|string
```

a|The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:

```
|iops
```

```
|link:#iops[iops]
```

a|The rate of I/O operations observed at the storage object.

```
|latency
```

```
|link:#latency[latency]
```

a|The round trip latency in microseconds observed at the storage object.

```
|status
```

```
|string
```

a|Any errors associated with the sample. For example, if the aggregation of data over multiple nodes fails then any of the partial errors might be returned, "ok" on success, or "error" on any internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.

```
|throughput
|link:#throughput[throughput]
a|The rate of throughput bytes per second observed at the storage object.
```

```
|timestamp
|string
a|The timestamp of the performance data.
```

```
|===

```

```
|===
```

```
[#statistics]
```

```
[.api-collapsible-fifth-title]
```

```
statistics
```

These are raw performance numbers, such as IOPS latency and throughput. These numbers are aggregated across all nodes in the cluster and increase with the uptime of the cluster.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
|Description

|iops_raw
|link:#iops_raw[iops_raw]
a|The number of I/O operations observed at the storage object. This should
be used along with delta time to calculate the rate of I/O operations per
unit of time.

|latency_raw
|link:#latency_raw[latency_raw]
a|The raw latency in microseconds observed at the storage object. This
should be divided by the raw IOPS value to calculate the average latency
per I/O operation.

|status
|string
a|Any errors associated with the sample. For example, if the aggregation
of data over multiple nodes fails then any of the partial errors might be
returned, "ok" on success, or "error" on any internal uncategorized
failure. Whenever a sample collection is missed but done at a later time,
it is back filled to the previous 15 second timestamp and tagged with
"backfilled_data". "Inconsistent_delta_time" is encountered when the time
between two collections is not the same for all nodes. Therefore, the
aggregated value might be over or under inflated. "Negative_delta" is
returned when an expected monotonically increasing value has decreased in
value. "Inconsistent_old_data" is returned when one or more nodes do not
have the latest data.

|throughput_raw
|link:#throughput_raw[throughput_raw]
a|Throughput bytes observed at the storage object. This should be used
along with delta time to calculate the rate of throughput bytes per unit
of time.

|timestamp
|string
a|The timestamp of the performance data.

fabric

Properties of the fabric to which the FC port is attached.

[cols=3*,options=header]
|===
|Name
|Type

```

|Description

|connected

|boolean

a|Reports if the physical port has established a connection with the FC fabric.

|connected_speed

|integer

a|The negotiated data rate between the target FC port and the fabric in gigabits per second.

|name

|string

a|The name of the fabric to which the port is connected. This is only available when the FC port is connected to a fabric.

There is an added cost to retrieving this property's value. It is not populated for either a collection GET or an instance GET unless it is explicitly requested using the `fields` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

|port_address

|string

a|The FC port address of the host bus adapter (HBA) physical port.

Each FC port in an FC switched fabric has its own unique FC port address for routing purposes. The FC port address is assigned by a switch in the fabric when that port logs in to the fabric. This property refers to the FC port address given to the physical host bus adapter (HBA) port when the port performs a fabric login (FLOGI).

This is useful for obtaining statistics and diagnostic information from FC switches.

This is a six-digit hexadecimal encoded numeric value.

|switch_port

|string

a|The switch port to which the FC port is connected.

```
|duration
|string
a|The duration over which this sample is calculated. The time durations
are represented in the ISO-8601 standard format. Samples can be calculated
over the following durations:
```

```
|iops
|link:#iops[iops]
a|The rate of I/O operations observed at the storage object.
```

```
|latency
|link:#latency[latency]
a|The round trip latency in microseconds observed at the storage object.
```

```
|status
|string
a|Any errors associated with the sample. For example, if the aggregation
of data over multiple nodes fails then any of the partial errors might be
returned, "ok" on success, or "error" on any internal uncategorized
failure. Whenever a sample collection is missed but done at a later time,
it is back filled to the previous 15 second timestamp and tagged with
"backfilled_data". "Inconsistent_delta_time" is encountered when the time
between two collections is not the same for all nodes. Therefore, the
aggregated value might be over or under inflated. "Negative_delta" is
returned when an expected monotonically increasing value has decreased in
value. "Inconsistent_old_data" is returned when one or more nodes do not
have the latest data.
```

```

```

```
|Type
```

```
|Description
```

```
|connected
```

```
|boolean
```

```
a|Reports if the physical port has established a connection with the FC fabric.
```

|connected_speed

|integer

a|The negotiated data rate between the target FC port and the fabric in gigabits per second.

|name

|string

a|The name of the fabric to which the port is connected. This is only available when the FC port is connected to a fabric.

There is an added cost to retrieving this property's value. It is not populated for either a collection GET or an instance GET unless it is explicitly requested using the `fields` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

|port_address

|string

a|The FC port address of the host bus adapter (HBA) physical port.

Each FC port in an FC switched fabric has its own unique FC port address for routing purposes. The FC port address is assigned by a switch in the fabric when that port logs in to the fabric. This property refers to the FC port address given to the physical host bus adapter (HBA) port when the port performs a fabric login (FLOGI).

This is useful for obtaining statistics and diagnostic information from FC switches.

This is a six-digit hexadecimal encoded numeric value.

|switch_port

|string

a|The switch port to which the FC port is connected.

|===

[#iops]

[.api-collapsible-fifth-title]

iops

The rate of I/O operations observed at the storage object.

```

```

```
|integer
```

```
a|Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.
```

```
|read
```

```
|integer
```

```
a|Performance metric for read I/O operations.
```

```
|total
```

```
|integer
```

```
a|Performance metric aggregated over all types of I/O operations.
```

```
|write
```

```
|integer
```

```
a|Performance metric for write I/O operations.
```

```
|===
```

```
[#latency]
```

```
[.api-collapsible-fifth-title]
```

```
latency
```

The round trip latency in microseconds observed at the storage object.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|Description
```

```
|other
|integer
a|Performance metric for other I/O operations. Other I/O operations can be
metadata operations, such as directory lookups and so on.
```

```
|read
|integer
a|Performance metric for read I/O operations.
```

```
|total
|integer
a|Performance metric aggregated over all types of I/O operations.
```

```
|write
|integer
a|Performance metric for write I/O operations.
```

```
|===
```

```
[#throughput]
[.api-collapsible-fifth-title]
throughput
```

The rate of throughput bytes per second observed at the storage object.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
|Type
|Description
```

```
|read
|integer
a|Performance metric for read I/O operations.
```

```

```
|Name
|Type
|Description
```

```
|_links
|link:#_links[_links]
a|
```

```
|duration
```

```
|string
```

a|The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:

```
|iops
```

```
|link:#iops[iops]
```

a|The rate of I/O operations observed at the storage object.

```
|latency
```

```
|link:#latency[latency]
```

a|The round trip latency in microseconds observed at the storage object.

```
|status
```

```
|string
```

a|Any errors associated with the sample. For example, if the aggregation of data over multiple nodes fails then any of the partial errors might be returned, "ok" on success, or "error" on any internal uncategorized

failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.

|throughput

|link:#throughput[throughput]

a|The rate of throughput bytes per second observed at the storage object.

|timestamp

|string

a|The timestamp of the performance data.

```

```
|uuid
|string
|path
|True
a|Unique identifier of the FC port.
```

```
|interval
|string
|query
|False
a|The time range for the data. Examples can be 1h, 1d, 1m, 1w, 1y.
The period for each time range is as follows:
```

- * 1h: Metrics over the most recent hour sampled over 15 seconds.
- * 1d: Metrics over the most recent day sampled over 5 minutes.
- * 1w: Metrics over the most recent week sampled over 30 minutes.
- * 1m: Metrics over the most recent month sampled over 2 hours.
- * 1y: Metrics over the most recent year sampled over a day.
- * Default value: 1
- * enum: ["1h", "1d", "1w", "1m", "1y"]

```
|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.
```

```
* Default value: 1
* Max value: 120
* Min value: 0

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

|return_records
|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number
of records is returned.

* Default value: 1

```
a|
```

```
|duration
```

|string
a|The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:

|iops
|link:#iops[iops]
a|The rate of I/O operations observed at the storage object.

|latency
|link:#latency[latency]
a|The round trip latency in microseconds observed at the storage object.

|status
|string
a|Any errors associated with the sample. For example, if the aggregation of data over multiple nodes fails then any of the partial errors might be returned, "ok" on success, or "error" on any internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.

|throughput
|link:#throughput[throughput]
a|The rate of throughput bytes per second observed at the storage object.

|timestamp
|string
a|The timestamp of the performance data.

|uuid
|string
a|The unique identifier of the FC port.

:leveloffset: -1

= Manage HTTP proxy configuration

:leveloffset: +1

[[ID60976a8edafeba2167efb5fee341ae73]]
= Network http-proxy endpoint overview

== Overview

Configuration of an HTTP proxy for an SVM or a Cluster IPspace.

== Retrieve HTTP proxy information

The HTTP proxy GET operation retrieves all configurations for an SVM or a
Cluster IPspace via '/api/cluster'.

== Examples

=== Retrieving all fields for all HTTP proxy configurations

----

# The API:
/api/network/http-proxy

```

```

# The call:
curl -X GET "https://<mgmt-ip>/api/network/http-
proxy?fields=*&return_records=true&return_timeout=15" -H "accept:
application/json"

# The response:
{
"records": [
  {
    "uuid": "4133a1fc-7228-11e9-b40c-005056bb4f0c",
    "svm": {
      "name": "vs1",
      "uuid": "4133a1fc-7228-11e9-b40c-005056bb4f0c"
    },
    "server": "server1.example.com",
    "port": 3128,
    "authentication_enabled": false
  },
  {
    "uuid": "96219ce3-7214-11e9-828c-005056bb4f0c",
    "svm": {
      "name": "cluster-1",
      "uuid": "96219ce3-7214-11e9-828c-005056bb4f0c"
    },
    "ipspace": {
      "uuid": "7433520f-7214-11e9-828c-005056bb4f0c",
      "name": "Default"
    },
    "server": "1.1.1.",
    "port": 3128,
    "authentication_enabled": true
  }
],
"num_records": 2
}
----

=== Retrieving the HTTP proxy configuration for a specific SVM

----

# The API:
/api/network/http-proxy/{uuid}

# The call:
curl -X GET "https://<mgmt-ip>/api/network/http-proxy/96219ce3-7214-11e9-

```

```
828c-005056bb4f0c" -H "accept: application/json"
```

```
# The response
```

```
{  
"uuid": "96219ce3-7214-11e9-828c-005056bb4f0c",  
"svm": {  
  "name": "cluster-1",  
  "uuid": "96219ce3-7214-11e9-828c-005056bb4f0c"  
},  
"ipspace": {  
  "uuid": "7433520f-7214-11e9-828c-005056bb4f0c",  
  "name": "Default"  
},  
"server": "1.1.1.1",  
"port": 3128,  
"authentication_enabled": false  
}
```

```
----
```

```
== Creating an HTTP proxy configuration
```

You can use the HTTP proxy POST operation to create an HTTP proxy configuration for the specified SVM.

```
== Examples
```

```
=== Creating an HTTP proxy configuration for a particular SVM
```

```
----
```

```
# The API:
```

```
/api/network/http-proxy
```

```
# The call:
```

```
curl -X POST "https://<mgmt-ip>/api/network/http-proxy" -H "accept:  
application/json" -H "Content-Type: application/json" -d "{  \"port\":  
3128,  \"server\": \"1.1.1.1\",  \"svm\": {  \"name\": \"cluster-1\"  
}}"
```

```
----
```

```
=== Creating an HTTP proxy configuration for a particular IPspace
```

```
----
```

```
# The API:
```

```
/api/network/http-proxy
```

```

# The call:
curl -X POST "https://<mgmt-ip>/api/network/http-proxy" -H "accept:
application/json" -H "Content-Type: application/json" -d "{ \"ipSpace\":
{ \"name\": \"Default\" }, \"port\": 3128, \"server\": \"1.1.1.1\"}"
-----

== Creating an HTTP proxy configuration with authentication enabled

-----

# The API:
/api/network/http-proxy

# The call:
curl -X POST "https://<mgmt-ip>/api/network/http-proxy" -H "accept:
application/json" -H "Content-Type: application/json" -d "{ \"ipSpace\":
{ \"name\": \"Default\" }, \"port\": 3128, \"server\": \"1.1.1.1\",
\"authentication_enabled\":true, \"username\":\"test\",
\"password\":\"test\"}"
-----

== Update an HTTP proxy configuration for a specified SVM

You can use the HTTP proxy PATCH operation to update the HTTP proxy
configuration for the specified SVM.

== Example

The following example shows how a PATCH operation is used to update an
HTTP proxy configuration for a specific SVM:

-----

# The API:
/api/network/http-proxy/{uuid}

# The call:
curl -X PATCH "https://<mgmt-ip>/api/network/http-proxy/96219ce3-7214-
11e9-828c-005056bb4f0c" -H "accept: application/json" -H "Content-Type:
application/json" -d "{ \"port\": 3128, \"server\":
\"server2.example.com\"}"
-----

== Delete an HTTP proxy configuration for a specified SVM

You can use the HTTP proxy DELETE operation to delete the HTTP proxy
configuration for the specified SVM.

```

== Example

The following example shows how a DELETE operation is used to delete an HTTP proxy configuration for a specific SVM:

The API:

```
/api/network/http-proxy/{uuid}
```

The call:

```
curl -X DELETE "https://<mgmt-ip>/api/network/http-proxy/96219ce3-7214-11e9-828c-005056bb4f0c" -H "accept: application/json"
```

```
[[IDcc2e616c5aeb81d073591fe977a457ed]]
```

= Retrieve HTTP proxy configurations for all SVMs and cluster IPspaces

```
[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-block]#`/network/http-proxy`#
```

Introduced In: 9.7

Retrieves the HTTP proxy configurations of all the SVMs and Cluster IPspaces.

== Related ONTAP commands

* `vserver http-proxy show`

```
= Create an HTTP proxy configuration for an SVM or cluster IPspace
```

```
[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-block]#`/network/http-proxy`#
```

Introduced In: 9.7

Creates an HTTP proxy configuration for an SVM or a Cluster IPspace.
Important notes:

* IPv6 must be enabled if IPv6 family addresses are specified in the "server" field.

* The server and the port combination specified using the "server" and "port" fields is validated during this operation. The validation will fail in the following scenarios:

*** The HTTP proxy service is not configured on the server.

*** The HTTP proxy service is not running on the specified port.

*** The server is unreachable.

== Required properties

* SVM-scoped HTTP proxy

*** `svm.uuid` or `svm.name` - Existing SVM in which to create the HTTP proxy.

* Cluster-scoped HTTP proxy

*** `ipspace.uuid` or `ipspace.name` - Existing Cluster IPspace in which to create the HTTP proxy.

* `server` - HTTP proxy server FQDN or IP address.

* `port` - HTTP proxy server port.

== Optional properties

* `authentication_enabled` - Specifies if authentication is required for the HTTP proxy server.

* `username` - Username used to authenticate with the HTTP proxy server.

* `password` - Password used to authenticate with the HTTP proxy server.

== Related ONTAP commands

* `vserver http-proxy create`

== Parameters

|authentication_enabled

|boolean

a|Specifies whether or not authentication with the HTTP proxy server is enabled.

|ipSPACE

|link:#ipSPACE[ipSPACE]

a|Applies to both SVM and cluster-scoped objects. Either the UUID or name is supplied on input.

```
|password
|string
a|Password to authenticate with the HTTP proxy server when
authentication_enabled is set to "true".

|port
|integer
a|The port number on which the HTTP proxy service is configured on the
proxy server.

|scope
|string
a|Set to "`svm`" for HTTP proxy owned by an SVM. Otherwise, set to
"cluster".

|server
|string
a|Fully qualified domain name (FQDN) or IP address of the HTTP proxy
server.

|svm
|link:#svm[svm]
a|

|username
|string
a|Username to authenticate with the HTTP proxy server when
authentication_enabled is set to "true".

|uuid
|string
a|The UUID that uniquely identifies the HTTP proxy.

[[ID22c64fb7c7afd3fabb17463206596dba]]
```

```
= Update proxy server, port, username, and password parameters
```

```
[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-  
block]#`/network/http-proxy/{uuid}`#
```

```
*Introduced In:* 9.7
```

Updates the proxy server, port, username, and password parameters.

Important notes:

- * IPv6 must be enabled if IPv6 family addresses are specified in the "server" field.

- * The server and the port combination specified using the "server" and "port" fields is validated during this operation. The validation will fail in the following scenarios:

- *** The HTTP proxy service is not configured on the server.

- *** The HTTP proxy service is not running on the specified port.

- *** The server is unreachable.

== Related ONTAP commands

- * `vserver http-proxy modify`

|authentication_enabled
|boolean
a|Specifies whether or not authentication with the HTTP proxy server is
enabled.

|ipSPACE
|link:#ipSPACE[ipSPACE]
a|Applies to both SVM and cluster-scoped objects. Either the UUID or name
is supplied on input.

|password
|string
a|Password to authenticate with the HTTP proxy server when
authentication_enabled is set to "true".

|port
|integer
a|The port number on which the HTTP proxy service is configured on the
proxy server.

|scope
|string
a|Set to "`svm`" for HTTP proxy owned by an SVM. Otherwise, set to
"cluster".

```

```
|server
|string
a|Fully qualified domain name (FQDN) or IP address of the HTTP proxy
server.
```

```
|svm

:leveloffset: -1

= Manage BGP peer groups

:leveloffset: +1

[[IDd04d136c8edc7f5eebf6cb586be034a9]]

```

= Network IP BGP peer-groups endpoint overview

== Overview

The following operations are supported:

- * Creation: POST network/ip/bgp/peer-groups
- * Collection Get: GET network/ip/bgp/peer-groups
- * Instance Get: GET network/ip/bgp/peer-groups/{uuid}
- * Instance Patch: PATCH network/ip/bgp/peer-groups/{uuid}
- * Instance Delete: DELETE network/ip/bgp/peer-groups/{uuid}

== Retrieving network BGP sessions information

The IP BGP peer-groups GET API retrieves and displays relevant information pertaining to the BGP peer-groups configured in the cluster. The response can contain a list of multiple BGP peer-groups or a specific peer-group. Each BGP peer-group represents a BGP session configured between a local interface and a peer router.

== Examples

=== Retrieving all BGP peer-groups in the cluster

The following example shows the list of all BGP peer-groups configured in a cluster.

```
'''
```

```
----
```

```
# The API:
```

```
/api/network/ip/bgp/peer-groups
```

```
# The call:
```

```
curl -X GET "https://<mgmt-ip>/api/network/ip/bgp/peer-groups" -H "accept: application/hal+json"
```

```
# The response:
```

```
{  
  "records": [  
    {  
      "uuid": "5f22ae9d-87b2-11e9-a3a6-005056bb81a4",  
      "name": "pg1",  
      "_links": {
```

```

    "self": {
      "href": "/api/network/ip/bgp/peer-groups/5f22ae9d-87b2-11e9-a3a6-005056bb81a4"
    }
  },
  {

'''

== Creating a BGP peer-group

The BGP peer-group POST API is used to create a peer-group as shown in the following examples.

'''

== Examples

=== Creating a BGP peer-group with an existing interface

The following example shows how to create a BGP peer-group between an existing interface "bgp1" and peer router with the address "10.10.10.10". The local interface "bgp1" needs to support the management-bgp service, otherwise the system returns an error.

'''

The API:

```
/api/network/ip/bgp/peer-groups
```

The call:

```
curl -X POST "https://<mgmt-ip>/api/network/ip/bgp/peer-
groups?return_records=true" -d '{"name": "newPg", "ip.space.name": "Default",
"local.interface.name": "bgp1", "peer.address": "10.10.10.10"}'
```

The response:

```
{
"num_records": 1,
"records": [
  {
    "uuid": "e3faacc6-87cb-11e9-a3a6-005056bb81a4",
```

```

    "name": "newPg",
    "ipspace": {
      "name": "Default"
    },
    "local": {
      "interface": {
        "name": "bgp1"
      }
    },
    "peer": {
      "address": "10.10.10.10"
    },
    "_links": {
      "self": {
        "href": "/api/network/ip/bgp/peer-groups/e3faacc6-87cb-11e9-a3a6-005056bb81a4"
      }
    }
  }
]
}

```

'''

=== Creating a BGP peer-group and provisioning a new local interface

The following example shows how to create a BGP peer-group with any local interface. If the local interface doesn't exist, the system will create it first before creating the peer-group.

'''

The API:

/api/network/ip/bgp/peer-groups

The call:

```

curl -X POST "https://<mgmt-ip>/api/network/ip/bgp/peer-groups?return_records=true" -d '{"name": "newPg1",
"ipspace.name": "Default", "local": {"interface": {"name": "newlif"}, "ip": {"address": "9.9.9.9", "netmask": "24"}, "port": {"name": "e0f", "node": {"name": "node1"}}}, "peer.address": "10.10.10.10"}'

```

The response:

```

{
  "num_records": 1,
  "records": [
    {
      "uuid": "c292f069-8872-11e9-a3a6-005056bb81a4",
      "name": "newPg1",
      "ipspace": {
        "name": "Default"
      },
      "local": {
        "interface": {
          "name": "newlif"
        },
        "port": {
          "name": "e0f",
          "node": {
            "name": "node1"
          }
        }
      },
      "peer": {
        "address": "10.10.10.10"
      },
      "_links": {
        "self": {
          "href": "/api/network/ip/bgp/peer-groups/c292f069-8872-11e9-a3a6-005056bb81a4"
        }
      }
    }
  ]
}

```

'''

== Updating BGP peer-groups

The BGP peer-groups PATCH API is used to update attributes of a peer-group.

'''

== Examples

=== Updating the peer router address

The following example shows how the PATCH request changes the peer router IP address.

'''

The API:

/api/network/ip/bgp/peer-groups/{uuid}

The call:

```
curl -X PATCH "https://<mgmt-ip>/api/network/ip/bgp/peer-groups/80d271c9-1f43-11e9-803e-005056a7646a" -H "accept: application/hal+json" -d
```

```
'{"peer.address": "10.10.10.20" }'
```

```
{
```

```
}
```

'''

=== Updating the peer-group to a new name

The following example shows how the PATCH request renames the peer-group.

'''

The API:

/api/network/ip/bgp/peer-groups/{uuid}

The call:

```
curl -X PATCH "https://<mgmt-ip>/api/network/ip/bgp/peer-groups/80d271c9-1f43-11e9-803e-005056a7646a" -H "accept: application/hal+json" -d
```

```
'{"name": "NewName"}'
```

```
{
```

```
}
```

'''

=== Deleting BGP peer-groups

The BGP peer-groups DELETE API is used to delete an BGP peer-group.

'''

== Example

=== Deleting a BGP peer-group

The following DELETE request deletes a BGP peer-group.

'''

The API:

/api/network/ip/bgp/peer-group/{uuid}

The call:

```
curl -X DELETE "https://<mgmt-ip>/api/network/ip/bgp/peer-groups/80d271c9-1f43-11e9-803e-005056a7646a"
```

```
{
}
```

'''

|query
```

```
|False
a|Filter by local.interface.uuid

|name
|string
|query
|False
a|Filter by name

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_records
|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number
of records is returned.

* Default value: 1

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0
```

```
|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

[[ID32fc5ffa540392a67ea07e644578618a]]
= Create a new BGP peer group for VIP
```

```
[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/network/ip/bgp/peer-groups`#
```

```
*Introduced In:* 9.7
```

Creates a new BGP peer group for VIP. Multipath-routing is turned on cluster-wide automatically if the peer group being created results in multiple paths being available for an existing or future VIP interface.

```
== Required properties
```

```
* `name` - Name of the peer-group to create.
```

```
* `ipspace.name` or `ipspace.uuid`
```

```
*** Required with local.interface.name to identify a local interface
```

```
*** Optional when local.interface.uuid is specified
```

```
* `local.interface.uuid` or `local.interface.name`
```

```
*** Required when specifying an existing local interface.
```

```
* `local.interface.name`, `local.ip` and `local.port`
```

```
*** Required to create a new local interface.
```

```
* `peer.address` - IP address of the peer router
```

```
== Default property values
```

If not specified in POST, the following default property values are assigned:

* `is_next_hop` - `_false_`

== Related ONTAP commands

* `network bgp peer-group create`

== Parameters

[cols=5*,options=header]

|===

|Name

|Type

|In

|Required

|Description

|return_records

|boolean

|query

|False

a|The default is false. If set to true, the records are returned.

ONTAP Error Response Codes

|===

| Error Code | Description

| 1376963

| Duplicate IP address is specified.

| 1966133

| Since masking an address with a netmask represents an entire IP subnet, the masked and unmasked IP addresses cannot be the same.

| 1966267

| IPv6 addresses must have a prefix length of 64.

| 1966269

| IPv4 addresses must have a netmask length between 1 and 32.

| 1967082

| IPspace name and UUID must match if both are given.

| 1967155

| The specified local.port.name does not match the location.port.name for the specified local.interface.

| 1967156

| The specified local.port.node.name does not match the location.port.node.name for the specified local.interface.

| 1967157

| The specified local.port.uuid does not match the location.port.uuid for the specified local.interface.

| 1967158

| The specified local.interface.name does not exist in the associated IPspace. local.ip.address and local.ip.netmask are required to create a new LIF.

| 1967159

| local.interface does not support management-bgp service.

| 1967160

| The specified local.interface.name does not match the specified interface name of local.interface.uuid.

| 1967161

| The specified local.interface.uuid does not exist in the specified

IPspace.

| 1967162

| Either local.interface or local.ip and local.port are required to specify a local LIF.

| 1967163

| The specified local.port.name does not match the specified port name of local.port.uuid.

| 1967164

| The specified local.port.node.name does not match the specified node name of local.port.uuid.

| 1967165

| The specified local.port does not exist.

| 1967166

| ipspace.uuid or ipspace.name must be provided with local.interface.name together to identify a LIF.

| 1967167

| Internal error. Failed to update BGP configuration for node. Retry the command, if necessary.

| 1967168

| Internal error. Failed to create a VIP port for IPspace on node. Retry the command, if necessary.

| 1967169

| Internal error. BGP configuration changed during the operation. Retry the command, if necessary.

| 1967170

| Internal error. VIP port configuration changed during the operation. Retry the command, if necessary.

| 1967171

| Internal error. Fail to access or update BGP peer group. Retry the command, if necessary.

| 1967172

| Peer group could not be updated because IPspace does not exist. Retry the command, if necessary.

| 1967173

| The specified local.ip.address does not match the address for the

specified local.interface.

| 1967174

| The specified local.ip.netmask does not match the netmask for the specified local.interface.

| 1967176

| The specified local.interface.name does not exist in the associated IPspace. local.port.name, local.port.node.name, or local.port.uuid is required to create a new LIF.

| 1967177

| Internal error. Failed to access the local interface. Retry the command, if necessary.

| 1967178

| The IPv6 address specified with local.ip.address is not supported because it is link-local, multicast, v4-compatible, v4-mapped, loopback or "::".

| 1967179

| The IPv4 address specified with local.ip.address is not supported because it is multicast, loopback or 0.0.0.0.

| 1967187

| Configuring 4 bytes peer.asn requires an effective cluster version of 9.9.1 or later.

| 1967188

| Configuring peer address as a next hop requires an effective cluster version of 9.9.1 or later.

| 1967189

| The parameter peer.asn can't be zero.

| 53281985

| Internal error. Failed to update BGP peer group because BGP LIF moved during the operation. Wait a few minutes and try the command again.

| 53282006

| BGP peer group could not be updated to use a peer address because the value provided is not a valid peer address. If necessary, try the command again with a routable host address.

| 53282007

| BGP peer group could not be updated to use a peer address because the address represents a different address family to the address of the

associated BGP LIF. If necessary, try the command again with a matching address family.

```
| 53282018
| Failed to create BGP peer group because an existing peer group has
| already established a BGP session between LIF and peer address. If
| necessary, try the command again with a different BGP LIF or a different
| peer address.

== Response
```

Status: 200, Ok

```
== Error
```

Status: Default

ONTAP Error Response Codes

```
|===
```

```
| Error Code | Description
```

```
| 1967171
```

```
| Internal error. Fail to access or update BGP peer group. Retry the  
command, if necessary.
```

```
| 1967188
| Configuring peer address as a next hop requires an effective cluster
version of 9.9.1 or later.

| 53281998
| Failed to rename the BGP peer group because that name is already
assigned to a different peer group in the IPspace.

| 53282006
| BGP peer group could not be updated to use a peer address because the
value provided is not a valid peer address. If necessary, try the command
again with a routable host address.

| 53282007
| BGP peer group could not be updated to use a peer address because the
address represents a different address family to the address of the
associated BGP LIF. If necessary, try the command again with a matching
address family.

| 53282018
| Failed to create BGP peer group because an existing peer group has
already established a BGP session between LIF and peer address. If
necessary, try the command again with a different BGP LIF or a different
peer address.

```

```
[[ID3a6986045d1649e92f04454bce08bb46]]
```

```
= Network IP interfaces endpoint overview
```

```
== Overview
```

The following operations are supported:

- * Creation: POST network/ip/interfaces
- * Collection Get: GET network/ip/interfaces
- * Instance Get: GET network/ip/interfaces/{uuid}
- * Instance Patch: PATCH network/ip/interfaces/{uuid}
- * Instance Delete: DELETE network/ip/interfaces/{uuid}

```
== Retrieving network interface information
```

The IP interfaces GET API retrieves and displays relevant information pertaining to the interfaces configured in the cluster. The response can contain a list of multiple interfaces or a specific interface. The fields returned in the response vary for different interfaces and configurations.

```
== Examples
```

```
=== Retrieving all interfaces in the cluster
```

The following example shows the list of all interfaces configured in a cluster.

```

|Name
|Type
|Description
```

```
|_links
```

```
|link:#_links[_links]
a|
```

```
|duration
```

```
|string
```

a|The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:

```
|status
```

```
|string
```

a|Errors associated with the sample. For example, if the aggregation of data over multiple nodes fails, then any partial errors might return "ok" on success or "error" on an internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "inconsistent_old_data" is returned when one or more nodes do not have the latest data.

```
|throughput
```

```
|link:#throughput[throughput]
a|The rate of throughput bytes per second observed at the interface.
```

```
|timestamp
|string
a|The timestamp of the performance data.
```

```
= Create a new cluster-scoped or SVM-scoped interface
```

```
[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-  
block]#`/network/ip/interfaces`#
```

```
*Introduced In:* 9.6
```

```
Creates a new Cluster-scoped or SVM-scoped interface.
```

```
== Required properties
```

```
* `name` - Name of the interface to create.
```

```
* `ip.address` - IP address for the interface.
```

```
* `ip.netmask` - IP subnet of the interface.
```

```
* `ip.space.name` or `ip.space.uuid`
```

```
*** Required for Cluster-scoped interfaces.
```

```
*** Optional for SVM-scoped interfaces.
```

```
* `svm.name` or `svm.uuid`
```

```
*** Required for an SVM-scoped interface.
```

```
*** Invalid for a Cluster-scoped interface.
```

```
* `location.home_port` or `location.home_node` or  
`location.broadcast_domain` - One of these properties must be set to a  
value to define where the interface will be located.
```

```
== Recommended property values
```

```
* `service_policy`
```

```
*** `for SVM scoped interfaces`
```

```
***** `_default-data-files_` for interfaces carrying file-oriented NAS data  
traffic
```

```
***** `_default-data-blocks_` for interfaces carrying block-oriented SAN  
data traffic
```

```
***** `_default-management_` for interfaces carrying SVM management requests
```

```
*** `for Cluster scoped interfaces`
```

```
***** `_default-intercluster_` for interfaces carrying cluster peering  
traffic
```

```
***** `_default-management_` for interfaces carrying system management  
requests
```

```
***** `_default-route-announce_` for interfaces carrying BGP peer  
connections
```

```
== Default property values
```

```
If not specified in POST, the following default property values are  
assigned:
```

```
* `scope`
```

```
*** `_svm_` if svm parameter is specified.
```

```
*** `_cluster_` if svm parameter is not specified
```

```
* `enabled` - `_true_`
```

```

* `location.auto_revert` - _true_
* `service_policy`

*** _default-data-files_ if scope is `svm`

*** _default-management_ if scope is `cluster` and IPspace is not
`Cluster`

*** _default-cluster_ if scope is `svm` and IPspace is `Cluster`

* `failover` - Selects the least restrictive failover policy supported by
all the services in the service policy.
* `ddns_enabled`

*** _true_ if the interface supports _data_nfs_ or _data_cifs_ services

*** _false_ otherwise

== Request Body

```

```

[cols=3*,options=header]
|===
|Name
|Type
|Description

|_links
|link:#_links[_links]
a|

|ddns_enabled
|boolean
a|Indicates whether or not dynamic DNS updates are enabled. Defaults to
true if the interface supports "data_nfs" or "data_cifs" services,
otherwise false.

|dns_zone
|string
a|Fully qualified DNS zone name

|enabled
|boolean
a|The administrative state of the interface.

|ip
|link:#ip_info[ip_info]
a|IP information

|ipspace
|link:#ipspace[ipspace]
a|Either the UUID or name must be supplied on POST for cluster-scoped
objects.

|location
|link:#location[location]
a|Current or home location can be modified. Specifying a port implies a
node. Specifying a node allows an appropriate port to be automatically
selected. Ports are not valid and not shown for VIP interfaces. For POST,
broadcast_domain can be specified alone or with home_node. For PATCH, set
is_home to true to revert a LIF back to its home port.

```

```
|metric
|link:#metric[metric]
a|The most recent sample of I/O metrics for the interface.

|name
|string
a|Interface name

|scope
|string
a|Set to "svm" for interfaces owned by an SVM. Otherwise, set to
"cluster".

|service_policy
|link:#service_policy[service_policy]
a|

|services
|array[string]
a|The services associated with the interface.

|state
|string
a|The operational state of the interface.

|statistics
|link:#statistics[statistics]
a|The real time I/O statistics for the interface.

|svm
|link:#svm[svm]
a|Applies only to SVM-scoped objects. Either the UUID or name must be
supplied on POST.

|uuid
|string
a|The UUID that uniquely identifies the interface.
```

```
|vip
|boolean
a|True for a VIP interface, whose location is announced via BGP.
```

```

== Response

Status: 201, Created

== Error

Status: Default

ONTAP Error Response Codes

===	Error Code	Description
	1376656	Cluster interfaces must be in the same subnet. Verify the address and netmask are set to the correct values.
	1376663	All LIFs from a single DNS zone must be in the same SVM.
	1376963	Duplicate IP address.
	1966138	The same IP address may not be used for both a mgmt interface and a gateway address.
	1966140	An interface with the same name already exists.
	1966141	Invalid DNS zone name.
	1966142	Only data LIFs can be assigned a DNS zone.
	1966267	IPv6 addresses must have a prefix length between 1 and 127.
	1966269	IPv4 addresses must have a prefix length between 1 and 32.
	1966476	DNS Update is supported only on data LIFs.

| 1966477
| DNS Update is supported only on LIFs configured with the NFS or CIFS protocol.

| 1966987
| The Vserver Broadcast-Domain Home-Node and Home-Port combination is not valid.

| 1967081
| The specified SVM must exist in the specified IPspace.

| 1967082
| The specified ipspace.name does not match the IPspace name of ipspace.uuid.

| 1967102
| POST operation might have left configuration in an inconsistent state. Check the configuration.

| 1967106
| The specified location.home_port.name does not match the specified port name of location.home_port.uuid.

| 1967107
| The location.home_port.uuid specified is not valid.

| 1967108
| The specified location.home_node.name does not match the node name of location.home_node.uuid.

| 1967109
| The specified location.home_port.node.name does not match the node name of location.home_node.uuid.

| 1967110
| The specified location.home_port.node.name does not match location.home_node.name.

| 1967111
| Home node must be specified by at least one location.home_node, location.home_port, or location.broadcast_domain field.

| 1967112
| The specified location.home_node.name does not match the node name of location.home_port.uuid.

| 1967120

| The specified service_policy.name does not match the specified service policy name of service_policy.uuid.

| 1967121

| Invalid service_policy.uuid specified.

| 1967122

| The specified location.broadcast_domain.name does not match the specified broadcast domain name of location.broadcast_domain.uuid.

| 1967123

| The specified IPspace does not match the IPspace name of location.broadcast_domain.uuid.

| 1967124

| The location.broadcast_domain.uuid specified is not valid.

| 1967127

| svm.uuid or svm.name must be provided if scope is "svm".

| 1967128

| ipspace.uuid or ipspace.name must be provided if scope is "cluster".

| 1967129

| The specified location.home_port.uuid is not valid.

| 1967130

| The specified location.home_port.name is not valid.

| 1967131

| The specified location.home_port.uuid and location.home_port.name are not valid.

| 1967135

| The specified location.broadcast_domain.uuid is not valid.

| 1967136

| The specified location.broadcast_domain.name (and ipspace name) is not valid.

| 1967137

| The specified location.broadcast_domain.uuid and location.broadcast_domain.name (and IPspace name) are not valid.

| 1967145

| The specified location.failover is not valid.

```
| 1967146
| The specified svm.name is not valid.

| 1967147
| The specified svm.uuid is not valid.

| 1967153
| No suitable port exists on location.home_node to host the interface.

| 1967154
| Interfaces cannot be created on ports that are down. If a broadcast
domain is specified, ensure that it contains at least one port that is
operationally up.

| 1967381
| Post VIP interfaces requires an effective cluster version of 9.7 or
later.

| 1967382
| VIP interfaces only reside in SVM scope.

| 1967383
| Neither location.home_port.uuid or location.home_port.name should be set
with vip=true.

| 1967384
| Failed to create VIP interface because the home node does not have
active BGP sessions to support Virtual IP (VIP) traffic.

| 1967385
| VIP interfaces with an IPv4 address must use ip.netmask=32. VIP
interfaces with an IPv6 address must use ip.netmask=128.

| 1967387
| The specified IP address is in use by a subnet in this IPspace.

| 1967391
| Setting the DNS zone requires an effective cluster version of 9.9.1 or
later.

| 1967392
| Setting the DDNS enable parameter requires an effective cluster version
of 9.9.1 or later.

| 5373966
| An iSCSI interface cannot be created in an SVM configured for NVMe.
```

```

| 53281065
| The service_policy does not exist in the SVM.

| 53281086
| LIF would exceed the maximum number of supported intercluster LIFs in
IPspace.

|Description

```

```
|_links
```

```
|link:#_links[_links]
```

```
a|
```

```
|duration
```

```
|string
```

a|The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:

```
|status
```

```
|string
a|Errors associated with the sample. For example, if the aggregation of
data over multiple nodes fails, then any partial errors might return "ok"
on success or "error" on an internal uncategorized failure. Whenever a
sample collection is missed but done at a later time, it is back filled to
the previous 15 second timestamp and tagged with "backfilled_data".
"inconsistent_delta_time" is encountered when the time between two
collections is not the same for all nodes. Therefore, the aggregated value
might be over or under inflated. "Negative_delta" is returned when an
expected monotonically increasing value has decreased in value.
"inconsistent_old_data" is returned when one or more nodes do not have the
latest data.
```

```
|throughput
|link:#throughput[throughput]
a|The rate of throughput bytes per second observed at the interface.
```

```
|timestamp

a|

|services
|array[string]
a|The services associated with the interface.

|state
|string
a|The operational state of the interface.

```
|statistics
|link:#statistics[statistics]
a|The real time I/O statistics for the interface.

|svm
|link:#svm[svm]
a|Applies only to SVM-scoped objects. Either the UUID or name must be
supplied on POST.

|uuid
|string
a|The UUID that uniquely identifies the interface.

|vip
|boolean
a|True for a VIP interface, whose location is announced via BGP.
```

```

```
== Error
```

Status: Default

ONTAP Error Response Codes

```
|===
```

```
| Error Code | Description
```

```
| 1376963
```

```
| Duplicate IP address.
```

```
| 1376997
```

```
| Interface failed to migrate because the node hosting the port is not healthy.
```

```
| 1376998
```

```
| The specified location.node does not own any ports in the same broadcast domain as the home port of the interface.
```

```
| 1377607
```

```
| The specified location.port is not in the same broadcast domain as the home port of the interface.
```

```
| 1966138
```

```
| The same IP address may not be used for both a mgmt interface and a
```

gateway address.

| 1966141

| Invalid DNS zone name.

| 1966142

| Only data LIFs can be assigned a DNS zone.

| 1966267

| IPv6 addresses must have a prefix length between 1 and 127.

| 1966269

| IPv4 addresses must have a prefix length between 1 and 32.

| 1967106

| The specified location.home_port.name does not match the specified port name of location.home_port.uuid.

| 1967107

| The specified location.home_port.uuid is not valid.

| 1967111

| A home node must be specified by at least one location.home_node, location.home_port, or location.broadcast_domain field.

| 1967113

| The specified location.port.name does not match the port name of location.port.uuid.

| 1967114

| The specified location.port.uuid is not valid.

| 1967115

| The specified location.node.name does not match the node name of location.node.uuid.

| 1967116

| The specified location.port.node.name does not match the node name of location.node.uuid.

| 1967117

| The specified location.port.node.name does not match location.node.name.

| 1967118

| A node must be specified by at least one location.node or location.port field.

```
| 1967119
| The specified location.node.name does not match the node name of
location.port.uuid.

| 1967120
| The specified service_policy.name does not match the specified service
policy name of service_policy.uuid.

| 1967121
| The specified service_policy.uuid is not valid.

| 1967125
| You cannot patch the "location.node" or "location.port" fields to
migrate interfaces using the iSCSI data protocol. Instead perform the
following PATCH operations on the interface: set the "enabled" field to
"false"; change one or more "location.home_port" fields to migrate the
interface; and then set the "enabled" field to "true".

| 1967129
| The specified location.home_port.uuid is not valid.

| 1967130
| The specified location.home_port.name is not valid.

| 1967131
| The specified location.home_port.uuid and location.home_port.name are
not valid.

| 1967132
| The specified location.port.uuid is not valid.

| 1967133
| The specified location.port.name is not valid.

| 1967134
| The specified location.port.uuid and location.port.name are not valid.

| 1967138
| Cannot patch port for a VIP interface. The specified parameter
location.port.uuid is not valid.

| 1967139
| Cannot patch port for a VIP interface. The specified parameter
location.port.name is not valid.

| 1967140
| Cannot patch port for a VIP interface. The specified parameters
```

location.port.uuid and location.port.name are not valid.

| 1967141

| Cannot patch home_port for a VIP interface. The specified parameter location.home_port.uuid is not valid.

| 1967142

| Cannot patch home_port for a VIP interface. The specified parameter location.home_port.name is not valid.

| 1967143

| Cannot patch home_port for a VIP interface. The specified parameters location.home_port.uuid and location.home_port.name are not valid.

| 1967145

| The specified location.failover is not valid.

| 1967153

| No suitable port exists on location.home_node to host the interface.

| 1967380

| Cannot patch home_port for a VIP interface. The specified parameter location.home_port.node.name is not valid. Consider using location.home_node.name instead.

| 1967386

| Cannot patch port for a VIP interface. The specified parameter location.port.node.name is not valid. Consider using location.node.name instead.

| 1967387

| The specified IP address is in use by a subnet in this IPspace.

| 1967389

| Cannot patch a LIF revert. The specified parameter location.is_home

| 1967390

| Cannot patch a LIF revert as it requires an effective cluster version of 9.9.1 or later.

| 1967391

| Patching the DNS zone requires an effective cluster version of 9.9.1 or later.

| 1967392

| Patching the DDNS enable parameter requires an effective cluster version of 9.9.1 or later.

```

| 53281065
| The service_policy does not exist in the SVM.

| 53281086
| LIF would exceed the maximum number of supported intercluster LIFs in
IPspace.

```

```

|===
|Name
|Type
|Description

|_links
|link:#_links[_links]
a|

|duration
|string
a|The duration over which this sample is calculated. The time durations
are represented in the ISO-8601 standard format. Samples can be calculated
over the following durations:

|status
|string
a|Errors associated with the sample. For example, if the aggregation of
data over multiple nodes fails, then any partial errors might return "ok"
on success or "error" on an internal uncategorized failure. Whenever a
sample collection is missed but done at a later time, it is back filled to
the previous 15 second timestamp and tagged with "backfilled_data".
"inconsistent_delta_time" is encountered when the time between two
collections is not the same for all nodes. Therefore, the aggregated value
might be over or under inflated. "Negative_delta" is returned when an
expected monotonically increasing value has decreased in value.
"inconsistent_old_data" is returned when one or more nodes do not have the
latest data.

|throughput
|link:#throughput[throughput]
a|The rate of throughput bytes per second observed at the interface.

|timestamp
|string
a|The timestamp of the performance data.

```
|ddns_enabled
|boolean
a|Indicates whether or not dynamic DNS updates are enabled. Defaults to
true if the interface supports "data_nfs" or "data_cifs" services,
otherwise false.

|dns_zone
|string
a|Fully qualified DNS zone name

|enabled
|boolean
a|The administrative state of the interface.

|ip
|link:#ip_info[ip_info]
a|IP information

|ipspace
|link:#ipspace[ipspace]
a|Either the UUID or name must be supplied on POST for cluster-scoped
objects.

|location
|link:#location[location]
a|Current or home location can be modified. Specifying a port implies a
node. Specifying a node allows an appropriate port to be automatically
selected. Ports are not valid and not shown for VIP interfaces. For POST,
broadcast_domain can be specified alone or with home_node. For PATCH, set
is_home to true to revert a LIF back to its home port.

|metric
|link:#metric[metric]
a|The most recent sample of I/O metrics for the interface.

|name
|string
a|Interface name
```

```
|scope
|string
a|Set to "svm" for interfaces owned by an SVM. Otherwise, set to
"cluster".

|service_policy
|link:#service_policy[service_policy]
a|

|services
|array[string]
a|The services associated with the interface.

|state
|string
a|The operational state of the interface.

|statistics
|link:#statistics[statistics]
a|The real time I/O statistics for the interface.

|svm
|link:#svm[svm]
a|Applies only to SVM-scoped objects. Either the UUID or name must be
supplied on POST.

|uuid
|string
a|The UUID that uniquely identifies the interface.

|vip
|boolean
a|True for a VIP interface, whose location is announced via BGP.

```

```
|query
|False
a|Filter by throughput.write

|duration
|string
|query
|False
a|Filter by duration

|status
|string
|query
|False
a|Filter by status

|uuid
|string
|path
|True
a|Unique identifier of the interface.

|interval
|string
|query
|False
a|The time range for the data. Examples can be 1h, 1d, 1m, 1w, 1y.
The period for each time range is as follows:

* 1h: Metrics over the most recent hour sampled over 15 seconds.
* 1d: Metrics over the most recent day sampled over 5 minutes.
* 1w: Metrics over the most recent week sampled over 30 minutes.
* 1m: Metrics over the most recent month sampled over 2 hours.
* 1y: Metrics over the most recent year sampled over a day.
* Default value: 1
* enum: ["1h", "1d", "1w", "1m", "1y"]

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
```

When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached.

* Default value: 1

* Max value: 120

* Min value: 0

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction. Default direction is 'asc' for ascending.

|return_records
|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number of records is returned.

* Default value: 1

a|

|duration
|string
a|The duration over which this sample is calculated. The time durations
are represented in the ISO-8601 standard format. Samples can be calculated
over the following durations:

|status
|string
a|Errors associated with the sample. For example, if the aggregation of
data over multiple nodes fails, then any partial errors might return "ok"
on success or "error" on an internal uncategorized failure. Whenever a
sample collection is missed but done at a later time, it is back filled to
the previous 15 second timestamp and tagged with "backfilled_data".
"inconsistent_delta_time" is encountered when the time between two
collections is not the same for all nodes. Therefore, the aggregated value
might be over or under inflated. "Negative_delta" is returned when an
expected monotonically increasing value has decreased in value.
"inconsistent_old_data" is returned when one or more nodes do not have the
latest data.

|throughput
|link:#throughput[throughput]
a|The rate of throughput bytes per second observed at the interface.

|timestamp
|string
a|The timestamp of the performance data.

```
= Network IP routes endpoint overview
```

```
== Overview
```

This endpoint supports the following operations: GET (collection and instance), POST, and DELETE.

```
'''
```

```
== Retrieving network routes
```

You can use the IP routes GET API to retrieve and display relevant information pertaining to the routes configured in the cluster. The API retrieves the list of all routes configured in the cluster, or a specific route. The fields that are returned in the response will differ with the configuration.

```
== Examples
```

```
=== Retrieving all routes in the cluster
```

The following output shows the list of all routes configured in a cluster.

```
'''
```

```
----
```

```

a|Limit the number of records returned.

|return_records
|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number of records is returned.

* Default value: 1

|return_timeout

```
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

[[ID46c00ddd450e9c1353bf3ccb5f017db4]]
= Create a cluster-scoped or SVM-scoped static route

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/network/ip/routes`#

*Introduced In:* 9.6

Creates a Cluster-scoped or SVM-scoped static route.

== Required properties

* `gateway` - IP address to route packets to.
* SVM-scoped routes

*** `svm.name` or `svm.uuid` - SVM that route is applied to.

* cluster-scoped routes

*** There are no additional required fields for Cluster-scoped routes.

== Default property values

If not specified in POST, the following default property values are
assigned:

* `destination` - _0.0.0.0/0_ for IPv4 or _::/0_ for IPv6.
* `ipspace.name`

*** _Default_ for Cluster-scoped routes.

*** Name of the SVM's IPspace for SVM-scoped routes.

= Retrieve details for an IP route

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-block]#`/network/ip/routes/{uuid}`#

Introduced In: 9.6

Retrieves the details of a specific IP route.

== Related ONTAP commands

* `network route show`

* `network route show-lifs`

== Parameters

[cols=5*,options=header]

|====

|Name

|Type

|In

|Required

|Description

|uuid

|string

|path

|True

a|Route UUID

|fields

|array[string]

|query

|False

a|Specify the fields to return.

|====

== Response

Status: 200, Ok

```

```

```
[[ID50d4aa27c4d5e2650aeb523771462039]]
```

```
= Network IP service-policies endpoint overview
```

```
== Overview
```

Service policies are named groupings that define what services are supported by an IP interface.

The following operations are supported:

```
*** Creation: POST network/ip/service-policies
```

```
*** Collection Get: GET network/ip/service-policies
```

```
*** Instance Get: GET network/ip/service-policies/{uuid}
```

```
*** Instance Patch: PATCH network/ip/service-policies/{uuid}
```

```
*** Instance Delete: DELETE network/ip/service-polices/{uuid}
```

```
== Examples
```

```
=== Retrieving all service policies in the cluster
```

The following output shows the collection of all service policies configured in a 2-node cluster. By default (without 'field=*' parameter), only the UUID and name fields are shown for each entry.

```
'''
```

'''

== Creating service policies

You can use this API to create an SVM-scoped service policy by specifying the associated SVM, or a cluster-scoped service policy by specifying the associated IPspace. If the scope is not specified, it is inferred from the presence of the IPspace or SVM.

Cluster scoped service policies will operate on the IPspace "Default" unless IPspace is explicitly specified.

== Examples

=== Creating a cluster-scoped service policy

The following output displays the response when creating a service policy with a scope of "cluster" and an IPspace of "Default".

'''

```

# The API:
/api/network/ip/service-policies

# The call:
curl -X POST "https://<mgmt-ip>/api/network/ip/service-
policies?return_records=true" -H "accept: application/json" -d '{ "name":

=== Updating the name of a service policy

The following example displays the command used to update the name of a service policy scoped to a specific "svm". The system returns an error when there is no service policy associated with the UUID or the service policy cannot be

renamed.

'''

The API:

/api/network/ip/service-policies/{uuid}

The call:

```
curl -X PATCH "https://<mgmt-ip>/api/network/ip/service-policies/734eaf57-
d2fe-11e9-9284-005056acaad4" -d "{ \"name\": \"new-name\" }" -H "accept:
application/hal+json"
```

'''

=== Updating the services for a service policy

The following example displays the command used to update the services a service policy contains.

The specified services replace the existing services. To retain existing services, they must be included in the PATCH request.

The system returns an error when there is no service policy associated with the UUID or the services cannot be applied.

'''

The API:

/api/network/ip/service-policies/{uuid}

The call:

```
curl -X PATCH "https://<mgmt-ip>/api/network/ip/service-policies/734eaf57-
d2fe-11e9-9284-005056acaad4" -d "{ \"services\": [ \"data-nfs\", \"data-
cifs\" ] }" -H "accept: application/hal+json"
```

'''

=== Deleting a service policy

The following output displays the response for deleting a service policy.

'''

```
-----  
  
# The API:

= Create a service policy for network interfaces

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-block]#`/network/ip/service-policies`#

Introduced In: 9.8

Creates a service policy for network interfaces.

== Required properties

* `name` - Name of the service policy to create.

* `ipSPACE.name` or `ipSPACE.uuid`

*** Required for cluster-scoped service policies.

*** Optional for SVM-scoped service policies.

* `svm.name` or `svm.uuid`

*** Required for SVM-scoped service policies.

*** Not valid for cluster-scoped service policies.

== Default property values

If not specified in POST, the following default property values are assigned:

* `scope`

*** svm if the svm parameter is specified

*** cluster if the svm parameter is not specified

== Parameters

[cols=5*,options=header]

|====

|Name

```

|Type
|In
|Required
|Description

|return_records
|boolean
|query
|False
a|The default is false. If set to true, the records are returned.

* Default value:

```
= Network ipspaces endpoint overview
```

```
== Overview
```

An IPspace is an addressing domain within which each IP address is unique. The same address may appear in a different IPspace, but the matching addresses are considered to be distinct. SVMs and broadcast domains, and therefore IP interfaces and Ethernet ports, are associated with a single IPspace. This endpoint supports the following operations: GET (collection and instance), POST, PATCH, and DELETE.

```
== Retrieving IPspace information
```

You can use the IPspaces GET API to retrieve all IPspaces configured in the cluster, including built-in and custom IPspaces, and specifically requested IPspaces.

```
== Examples
```

```
=== Retrieving a list of the IPspaces in the cluster
```

The following example returns the requested list of IPspaces configured in the cluster.

```
----
```

```
# The API:
```

```
/api/network/ipspaces
```

```
# The call:
```

```
curl -X GET "https://<mgmt-ip>/api/network/ipspaces?fields=*" -H "accept:
```

```
application/hal+json"
```

```
# The response:
```

```
{  
  "records": [  
    {  
      "uuid": "dcc7e79c-5acc-11e8-b9de-005056b42b32",  
      "name": "Default",  
      "_links": {  
        "self": {  
          "href": "/api/network/ipspaces/dcc7e79c-5acc-11e8-b9de-  
005056b42b32"  
        }  
      }  
    },  
    {  
      "uuid": "dfd3c1b2-5acc-11e8-b9de-005056b42b32",  
      "name": "Cluster",  
      "_links": {  
        "self": {  
          "href": "/api/network/ipspaces/dfd3c1b2-5acc-11e8-b9de-  
005056b42b32"  
        }  
      }  
    },  
    {  
      "uuid": "dedeclbe-5aec-1eee-beee-0eee56be2b3e",  
      "name": "IpSPACE1",  
      "_links": {  
        "self": {  
          "href": "/api/network/ipspaces/dedeclbe-5aec-1eee-beee-  
0eee56be2b3e"  
        }  
      }  
    }  
  ],  
  "num_records": 3,  
  "_links": {  
    "self": {  
      "href": "/api/network/ipspaces?fields=*"  
    }  
  }  
}  
-----  
...  
...  
...
```

=== Retrieving a specific IPspace in the cluster

The following example returns the specific IPspace requested. The system returns an error if there is no IPspace with the requested UUID.

'''

The API:

/api/network/ipspaces/{uuid}

The call:

```
curl -X GET "https://<mgmt-ip>/api/network/ipspaces/dfd3c1b2-5acc-11e8-b9de-005056b42b32?fields=*" -H "accept: application/hal+json"
```

The response:

```
{
  "uuid": "dcc7e79c-5acc-11e8-b9de-005056b42b32",
  "name": "Default",
  "_links": {
    "self": {
      "href": "/api/network/ipspaces/dcc7e79c-5acc-11e8-b9de-005056b42b32"
    }
  }
}
```

'''

== Creating IPspaces

You can use the network IPspaces POST API to create IPspaces.

'''

== Example

=== Creating an IPspace

The following output displays the record returned after the creation of an IPspace with the name "ipspacel1".

'''

```

# The API:
/api/network/ipspaces

# The call:
curl -X POST "https://<mgmt-ip>/api/network/ipspaces?return_records=true"
-H "accept: application/hal+json" -d "{ \"name\": \"ipspace2\"}"

# The response:
{
  "num_records": 1,
  "records": [
    {
      "uuid": "4165655e-0528-11e9-bd68-005056bb046a",
      "name": "ipspace2",
      "_links": {
        "self": {
          "href": "/api/network/ipspaces/4165655e-0528-11e9-bd68-
005056bb046a"
        }
      }
    }
  ]
}
-----

'''

== Updating IPspaces

You can use the IPspaces PATCH API to update the attributes of the
IPspace.

'''

== Example

=== Updating the name of an IPspace

The following PATCH request is used to update the name of the IPspace from
"ipspace2" to "ipspace20".

'''

-----

# The API:

```

```
/api/network/ipspaces/{uuid}
```

```
# The call:
```

```
curl -X PATCH "https://<mgmt-ip>/api/network/ipspaces/4165655e-0528-11e9-  
bd68-005056bb046a" -H "accept: application/hal+json" -d "{ \"name\":  
\"ipspace20\"}"
```

```
-----
```

```
'''
```

```
== Deleting IPspaces
```

You can use the IPspaces DELETE API to delete an IPspace.

```
'''
```

```
== Example
```

```
=== Deleting an IPspace
```

The following DELETE request is used to delete an IPspace.

```
'''
```

```
-----
```

```
# The API:
```

```
/api/network/ipspaces/{uuid}
```

```
# The call:
```

```
curl -X DELETE "https://<mgmt-ip>/api/network/ipspaces/4165655e-0528-11e9-  
bd68-005056bb046a" -H "accept: application/hal+json" -H "Content-Type:  
application/json"
```

```
-----
```

```
'''
```

```
[[ID248ef60e501b0725d3fac47086359049]]
```

```
= Retrieve IPspaces for a cluster
```

```
[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-  
block]#`/network/ipspaces`#
```

Introduced In: 9.6

Retrieves a collection of IPspaces for the entire cluster.

[[ID27d406817b80af7e1809eaa97a49d4f9]]
```

```
= Protocols S3 buckets endpoint overview
```

```
== Overview
```

An S3 bucket is a container of objects. Each bucket defines an object namespace. S3 server requests specify objects using a bucket-name and object-name pair. An object consists of data, along with optional metadata and access controls, that is accessible using a name. An object resides within a bucket. There can be more than one bucket in an S3 server. Buckets that are created for the server are associated with an S3 user that is created on the S3 server.

```
== Examples
```

```
=== Retrieving all fields for all S3 buckets of a cluster
```

```
----
```

```
# The API:

= Retrieve all S3 buckets for all SVMs

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/protocols/s3/buckets`#

*Introduced In:* 9.7

Retrieves all S3 buckets for all SVMs. Note that in order to retrieve S3
bucket policy conditions, the 'fields' option should be set to '**'.

== Related ONTAP commands

* `vserver object-store-server bucket show`
* `vserver object-store-server bucket policy statement show`
* `vserver object-store-server bucket policy-statement-condition show`

```

```
|size
|integer
|query
|False
```

a|Filter by size

|fields

|array[string]

|query

|False

a|Specify the fields to return.

|max_records

|integer

|query

|False

a|Limit the number of records returned.

|return_records

|boolean

|query

|False

a|The default is true for GET calls. When set to false, only the number of records is returned.

* Default value: 1

|return_timeout

|integer

|query

|False

a|The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached.

* Default value: 1

* Max value: 120

* Min value: 0

|order_by

|array[string]

|query

|False

a|Order results by specified fields and optional [asc|desc] direction. Default direction is 'asc' for ascending.

```
[#policy]
[.api-collapsible-fifth-title]
policy
```

A policy is an object associated with a bucket. It defines resource (bucket, folder, or object) permissions. These policies get evaluated when an S3 user makes a request by executing a specific command. The user must be part of the principal (user or group) specified in the policy. Permissions in the policies determine whether the request is allowed or denied.

[[ID29a3675b9c6b0d6fc94567edded5a60f]]
= Create the S3 bucket configuration for an SVM

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/protocols/s3/buckets`#

*Introduced In:* 9.8

```

Creates the S3 bucket configuration of an SVM.

== Important notes

- * Each SVM can have one or more bucket configurations.
- * Aggregate lists should be specified explicitly. If not specified, then the bucket is auto-provisioned as a FlexGroup volume.
- * Constituents per aggregate specifies the number of components (or FlexVol volumes) per aggregate. Is specified only when an aggregate list is explicitly defined.
- * An access policy can be created along with a bucket create. If creating an access policy fails, bucket configurations are saved and the access policy can be created using the PATCH endpoint.
- * "qos_policy" can be specified if a bucket needs to be attached to a QoS group policy during creation time.

== Required properties

- * `svm.uuid or svm.name` - Existing SVM in which to create the bucket configuration.
- * `name` - Bucket name that is to be created.

== Recommended optional properties

- * `aggregates` - List of aggregates for the FlexGroup volume on which the bucket is hosted on.
- * `constituents_per_aggregate` - Number of constituents per aggregate.
- * `size` - Specifying the bucket size is recommended.
- * `policy` - Specifying a policy enables users to perform operations on buckets; specifying the resource permissions is recommended.
- * `qos_policy` - A QoS policy for buckets.

== Default property values

- * `size` - 800MB
- * `comment` - ""
- * `aggregates` - No default value.
- * `constituents_per_aggregate` - 4 , if an aggregates list is specified. Otherwise, no default value.
- * `policy.statements.actions` - GetObject, PutObject, DeleteObject, ListBucket, ListBucketMultipartUploads, ListMultipartUploadParts, GetObjectTagging, PutObjectTagging, DeleteObjectTagging.
- * `policy.statements.principals` - all S3 users and groups in the SVM.
- * `policy.statements.resources` - all objects in the bucket.
- * `policy.statements.conditions` - list of bucket policy conditions.

== Related ONTAP commands

```
* `vserver object-store-server bucket create`  
* `vserver object-store-server bucket policy statement create`
```

/protocols/s3/buckets]
```

== Parameters

[cols=5*,options=header]

|===

Name
Type
In
Required
Description

return_timeout

integer

query

False

a|The number of seconds to allow the call to execute before returning. When doing a POST, PATCH, or DELETE operation on a single record, the default is 0 seconds. This means that if an asynchronous operation is started, the server immediately returns HTTP code 202 (Accepted) along with a link to the job. If a non-zero value is specified for POST, PATCH, or DELETE operations, ONTAP waits that length of time to see if the job completes so it can return something other than 202.

* Default value: 1

* Max value: 120

* Min value: 0

return_records

boolean

query

False

a|The default is false. If set to true, the records are returned.

* Default value:

```

|policy

|link:#policy[policy]

a|A policy is an object associated with a bucket. It defines resource (bucket, folder, or object) permissions. These policies get evaluated when an S3 user makes a request by executing a specific command. The user must be part of the principal (user or group) specified in the policy. Permissions in the policies determine whether the request is allowed or denied.

|qos_policy

|link:#qos_policy[qos_policy]

a|Specifies "qos_policy.max_throughput_iops" and/or "qos_policy.max_throughput_mbps" or "qos_policy.min_throughput_iops". Specifies "min_throughput_iops" is only supported on volumes hosted on a node that is flash optimized. A pre-created QoS policy can also be used by specifying "qos_policy.name" or "qos_policy.uuid" properties. Setting or assigning a QoS policy to a bucket is not supported if its containing volume or SVM already has a QoS policy attached.

|size

|integer

a|Specifies the bucket size in bytes; ranges from 80MB to 64TB.

|storage_service_level

|string

a|Specifies the storage service level of the FlexGroup volume on which the bucket should be created. Valid values are "value", "performance" or "extreme".

|svm

|link:#svm[svm]

a|

|uuid

|string

a|Specifies the unique identifier of the bucket.

|volume

|link:#volume[volume]

a|Specifies the FlexGroup volume name and UUID where the bucket is hosted.

|array[string]

a|An array of delimiters that are compared with the delimiter value specified at the time of execution of an S3-based command, using the condition operator specified.

|max_keys

|array[integer]

a|An array of maximum keys that are allowed or denied to be retrieved using an S3 list operation, based on the condition operator specified.

|operator

|string

a|Condition operator that is applied to the specified condition key.

|prefixes

|array[string]

a|An array of prefixes that are compared with the input prefix value specified at the time of execution of an S3-based command, using the condition operator specified.

|source_ips

|array[string]

a|An array of IP address ranges that are compared with the IP address of a source command at the time of execution of an S3-based command, using the condition operator specified.

|usernames

|array[string]

a|An array of usernames that a current user in the context is evaluated against using the condition operators.

[#policy]
```

```
[.api-collapsible-fifth-title]
```

policy

A policy is an object associated with a bucket. It defines resource (bucket, folder, or object) permissions. These policies get evaluated when an S3 user makes a request by executing a specific command. The user must be part of the principal (user or group) specified in the policy. Permissions in the policies determine whether the request is allowed or denied.

a|Specifies bucket access policy statement.
```

```
|===
```

```
[#qos_policy]
```

```
[.api-collapsible-fifth-title]
```

```
qos_policy
```

Specifies "qos_policy.max_throughput_iops" and/or "qos_policy.max_throughput_mbps" or "qos_policy.min_throughput_iops". Specifies "min_throughput_iops" is only supported on volumes hosted on a node that is flash optimized. A pre-created QoS policy can also be used by specifying "qos_policy.name" or "qos_policy.uuid" properties. Setting or assigning a QoS policy to a bucket is not supported if its containing volume or SVM already has a QoS policy attached.

|===

[#s3_bucket]

[.api-collapsible-fifth-title]

s3_bucket

A bucket is a container of objects. Each bucket defines an object namespace. S3 requests specify objects using a bucket-name and object-name pair. An object resides within a bucket.

[cols=3*,options=header]

|===

|Name

|Type

|Description

|aggregates

|array[link:#aggregates[aggregates]]

a|A list of aggregates for FlexGroup volume constituents where the bucket is hosted. If this option is not specified, the bucket is auto-provisioned as a FlexGroup volume.

|comment

|string

a|Can contain any additional information about the bucket being created or modified.

|constituents_per_aggregate

|integer

a|Specifies the number of constituents or FlexVol volumes per aggregate. A FlexGroup volume consisting of all such constituents across all specified aggregates is created. This option is used along with the aggregates option and cannot be used independently.

|encryption

|link:#encryption[encryption]

a|

|logical_used_size

|integer

a|Specifies the bucket logical used size up to this point.

|name

|string

a|Specifies the name of the bucket. Bucket name is a string that can only contain the following combination of ASCII-range alphanumeric characters 0-9, a-z, ".", and "-".

|policy

|link:#policy[policy]

a|A policy is an object associated with a bucket. It defines resource (bucket, folder, or object) permissions. These policies get evaluated when an S3 user makes a request by executing a specific command. The user must be part of the principal (user or group) specified in the policy. Permissions in the policies determine whether the request is allowed or denied.

|qos_policy

|link:#qos_policy[qos_policy]

a|Specifies "qos_policy.max_throughput_iops" and/or "qos_policy.max_throughput_mbps" or "qos_policy.min_throughput_iops". Specifies "min_throughput_iops" is only supported on volumes hosted on a node that is flash optimized. A pre-created QoS policy can also be used by specifying "qos_policy.name" or "qos_policy.uuid" properties. Setting or assigning a QoS policy to a bucket is not supported if its containing volume or SVM already has a QoS policy attached.

|size

|integer

a|Specifies the bucket size in bytes; ranges from 80MB to 64TB.

|storage_service_level

|string

a|Specifies the storage service level of the FlexGroup volume on which the bucket should be created. Valid values are "value", "performance" or "extreme".

```

|svm
|link:#svm[svm]
a|

|uuid
|string
a|Specifies the unique identifier of the bucket.

|volume
|link:#volume[volume]
a|Specifies the FlexGroup volume name and UUID where the bucket is hosted.

= Update the S3 bucket configuration for an SVM
```

```
[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-block]#`/protocols/s3/buckets/{svm.uuid}/{uuid}`#
```

Introduced In: 9.8

Updates the S3 bucket configuration of an SVM.

== Important notes

* The following fields can be modified for a bucket:

*** `comment` - Any information related to the bucket.

*** `size` - Bucket size.

*** `policy` - An access policy for resources (buckets and objects) that defines their permissions. New policies are created after existing policies are deleted. To retain any of the existing policy statements, you need to specify those statements again. Also, policy conditions can be specified as part of a bucket policy.

*** `qos_policy` - A QoS policy for buckets.

== Related ONTAP commands

* `vserver object-store-server bucket modify`

* `vserver object-store-server bucket policy statement modify`

* `vserver object-store-server bucket policy-statement-condition modify`

== Parameters

[cols=5*,options=header]

|===

|Name

|Type

|In

|Required

|Description

|uuid

```
|string
|path
|True
a|The unique identifier of the bucket.
```

```
|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When doing a POST, PATCH, or DELETE operation on a single record, the
default is 0 seconds. This means that if an asynchronous operation is
started, the server immediately returns HTTP code 202 (Accepted) along
with a link to the job. If a non-zero value is specified for POST, PATCH,
or DELETE operations, ONTAP waits that length of time to see if the job
completes so it can return something other than 202.
```

```
* Default value: 1
* Max value: 120
* Min value: 0
```

```
|svm.uuid
|string
|path
|True
a|UUID of the SVM to which this object belongs.
```

```
|===
```

```
== Request Body
```

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
|Type
|Description
```

```
|aggregates
```

```
|array[link:#aggregates[aggregates]]
```

```
a|A list of aggregates for FlexGroup volume constituents where the bucket
is hosted. If this option is not specified, the bucket is auto-provisioned
as a FlexGroup volume.
```

|comment
|string
a|Can contain any additional information about the bucket being created or modified.

|constituents_per_aggregate
|integer
a|Specifies the number of constituents or FlexVol volumes per aggregate. A FlexGroup volume consisting of all such constituents across all specified aggregates is created. This option is used along with the aggregates option and cannot be used independently.

|encryption
|link:#encryption[encryption]
a|

|logical_used_size
|integer
a|Specifies the bucket logical used size up to this point.

|name
|string
a|Specifies the name of the bucket. Bucket name is a string that can only contain the following combination of ASCII-range alphanumeric characters 0-9, a-z, ".", and "-".

|policy
|link:#policy[policy]
a|A policy is an object associated with a bucket. It defines resource (bucket, folder, or object) permissions. These policies get evaluated when an S3 user makes a request by executing a specific command. The user must be part of the principal (user or group) specified in the policy. Permissions in the policies determine whether the request is allowed or denied.

|qos_policy
|link:#qos_policy[qos_policy]
a|Specifes "qos_policy.max_throughput_iops" and/or "qos_policy.max_throughput_mbps" or "qos_policy.min_throughput_iops". Specifes "min_throughput_iops" is only supported on volumes hosted on a node that is flash optimized. A pre-created QoS policy can also be used by

specifying "qos_policy.name" or "qos_policy.uuid" properties. Setting or assigning a QoS policy to a bucket is not supported if its containing volume or SVM already has a QoS policy attached.

|size

|integer

a|Specifies the bucket size in bytes; ranges from 80MB to 64TB.

|storage_service_level

|string

a|Specifies the storage service level of the FlexGroup volume on which the bucket should be created. Valid values are "value", "performance" or "extreme".

|svm

|link:#svm[svm]

a|

|uuid

|string

a|Specifies the unique identifier of the bucket.

|volume

|link:#volume[volume]

a|Specifies the FlexGroup volume name and UUID where the bucket is hosted.

|string
a|Unique identifier for the volume. This corresponds to the instance-uuid that is exposed in the CLI and ONTAPI. It does not change due to a volume move.
```

```
* example: 028baa66-41bd-11e9-81d5-00a0986138f7
* Introduced in: 9.6
```

```
|===
```

```
[#s3_bucket]
[.api-collapsible-fifth-title]
s3_bucket
```

A bucket is a container of objects. Each bucket defines an object namespace. S3 requests specify objects using a bucket-name and object-name pair. An object resides within a bucket.

```
[cols=3*,options=header]
|===
|Name
```

```

|Type
|Description

|aggregates
|array[link:#aggregates[aggregates]]
a|A list of aggregates for FlexGroup volume constituents where the bucket
is hosted. If this option is not specified, the bucket is auto-provisioned
as a FlexGroup volume.

|comment
|string
a|Can contain any additional information about the bucket being created or
modified.

|constituents_per_aggregate
|integer
a|Specifies the number of constituents or FlexVol volumes per aggregate. A
FlexGroup volume consisting of all such constituents across all specified
aggregates is created. This option is used along with the aggregates
option and cannot be used independently.

|encryption
|link:#encryption[encryption]
a|

|logical_used_size
|integer
a|Specifies the bucket logical used size up to this point.

|name
|string
a|Specifies the name of the bucket. Bucket name is a string that can only
contain the following combination of ASCII-range alphanumeric characters
0-9, a-z, ".", and "-".

|policy
|link:#policy[policy]
a|A policy is an object associated with a bucket. It defines resource
(bucket, folder, or object) permissions. These policies get evaluated when
an S3 user makes a request by executing a specific command. The user must
be part of the principal (user or group) specified in the policy.
Permissions in the policies determine whether the request is allowed or

```

denied.

|qos_policy

|link:#qos_policy[qos_policy]

a|Specifies "qos_policy.max_throughput_iops" and/or

"qos_policy.max_throughput_mbps" or "qos_policy.min_throughput_iops".

Specifies "min_throughput_iops" is only supported on volumes hosted on a node that is flash optimized. A pre-created QoS policy can also be used by specifying "qos_policy.name" or "qos_policy.uuid" properties. Setting or assigning a QoS policy to a bucket is not supported if its containing volume or SVM already has a QoS policy attached.

|size

|integer

a|Specifies the bucket size in bytes; ranges from 80MB to 64TB.

|storage_service_level

|string

a|Specifies the storage service level of the FlexGroup volume on which the bucket should be created. Valid values are "value", "performance" or "extreme".

|svm

|link:#svm[svm]

a|

|uuid

|string

a|Specifies the unique identifier of the bucket.

|volume

|link:#volume[volume]

a|Specifies the FlexGroup volume name and UUID where the bucket is hosted.

|===

[#job_link]

[.api-collapsible-fifth-title]

job_link

```

[cols=3*,options=header]
|===
|Name
|Type
|Description

|_links
|link:#_links[_links]
a|

|uuid
|string
a|The UUID of the asynchronous job that is triggered by a POST, PATCH, or
DELETE operation.

|===

:leveloffset: -1

= Manage protocols S3 services

:leveloffset: +1

[[ID008d6bef1a7991d00f072386812cde16]]
= Protocols S3 services endpoint overview

== Overview
```

An S3 server is an object store server that is compatible with the Amazon S3 protocol. In the initial version, only a subset of the protocol features necessary to support Fabric Pool capacity tier usecases are implemented. S3 server allows you to store objects in ONTAP using Amazon S3 protocol. This feature can be used as a target object store server for ONTAP FabricPools.

== Performance monitoring

Performance of the SVM can be monitored by the ``metric.+++`` and ``statistics.+++`` properties. These show the performance of the SVM in terms of IOPS, latency and throughput. The ``metric.+++`` properties denote an average whereas ``statistics.+++`` properties denote a real-time monotonically increasing value aggregated across all nodes.

== Examples

=== Retrieving all of the S3 configurations

The API:

/api/protocols/s3/services

The call:

```
curl -X GET "https://<mgmt-  
ip>/api/protocols/s3/services?fields=*&return_records=true&return_timeout=  
15" -H "accept: application/json"
```

The response:

```
{  
  "records": [  
    {  
      "svm": {  
        "uuid": "cf90b8f2-8071-11e9-8190-0050568eae21",  
        "name": "vs2"  
      },  
      "name": "s1",  
      "comment": "S3 server",  
      "enabled": false,  
    },

= Retrieve S3 server configuration for all SVMs
```

```
[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/protocols/s3/services`#
```

Introduced In: 9.7

Retrieves the S3 server configuration for all SVMs. Note that in order to retrieve S3 bucket policy conditions, 'fields' option should be set to '***'.

== Expensive properties

There is an added cost to retrieving values for these properties. They are not included by default in GET results and must be explicitly requested using the `fields` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

```
* `statistics.+++`
* `metric.+++`
```

== Related ONTAP commands

```
* `vserver object-store-server show`
```

|query
```

```
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_records
|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number
of records is returned.

* Default value: 1

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

|delimiters

|array[string]

a|An array of delimiters that are compared with the delimiter value specified at the time of execution of an S3-based command, using the condition operator specified.

|max_keys

|array[integer]

a|An array of maximum keys that are allowed or denied to be retrieved using an S3 list operation, based on the condition operator specified.

|operator

|string

a|Condition operator that is applied to the specified condition key.

|prefixes

|array[string]

a|An array of prefixes that are compared with the input prefix value specified at the time of execution of an S3-based command, using the condition operator specified.

|source_ips

|array[string]

a|An array of IP address ranges that are compared with the IP address of a source command at the time of execution of an S3-based command, using the condition operator specified.

|usernames

|array[string]

a|An array of usernames that a current user in the context is evaluated against using the condition operators.

|===

[#s3_bucket_policy_statement]

a|Specifies the statement identifier used to differentiate between
statements.

```

```

|===

```

```

[#policy]
[.api-collapsible-fifth-title]
policy

```

A policy is an object associated with a bucket. It defines resource (bucket, folder, or object) permissions. These policies get evaluated when an S3 user makes a request by executing a specific command. The user must be part of the principal (user or group) specified in the policy. Permissions in the policies determine whether the request is allowed or denied.

```

```

|statements
|array[link:#s3_bucket_policy_statement[s3_bucket_policy_statement]]
a|Specifies bucket access policy statement.

```

```

|===

```

```

[#qos_policy]
[.api-collapsible-fifth-title]
qos_policy

```

Specifies "qos_policy.max_throughput_iops" and/or "qos_policy.max_throughput_mbps" or "qos_policy.min_throughput_iops".

Specifies "min_throughput_iops" is only supported on volumes hosted on a node that is flash optimized. A pre-created QoS policy can also be used by specifying "qos_policy.name" or "qos_policy.uuid" properties. Setting or assigning a QoS policy to a bucket is not supported if its containing volume or SVM already has a QoS policy attached.

```

```
a|Specifies the maximum throughput in Megabytes per sec, 0 means none. This is mutually exclusive with name and UUID during POST and PATCH.
```

```
|min_throughput_iops
```

```
|integer
```

```
a|Specifies the minimum throughput in IOPS, 0 means none. Setting "min_throughput" is supported on AFF platforms only, unless FabricPool tiering policies are set. This is mutually exclusive with name and UUID during POST and PATCH.
```

```
|min_throughput_mbps
```

```
|integer
```

```
a|Specifies the minimum throughput in Megabytes per sec, 0 means none. This is mutually exclusive with name and UUID during POST and PATCH.
```

```
|name
```

```
|string
```

```
a|The QoS policy group name. This is mutually exclusive with UUID and other QoS attributes during POST and PATCH.
```

```
|uuid
|string
a|The QoS policy group UUID. This is mutually exclusive with name and
other QoS attributes during POST and PATCH.
```

```

```
[#svm]
[.api-collapsible-fifth-title]
svm
```

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
|Type
|Description
```

```
|_links
|link:#_links[_links]
a|
```

```
|name
|string
a|The name of the SVM.
```

```
|uuid
|string
a|The unique identifier of the SVM.
```

```
|===
```

```
[#volume]
[.api-collapsible-fifth-title]
volume
```

Specifies the FlexGroup volume name and UUID where the bucket is hosted.

```
[cols=3*,options=header]
```

```
|===
```

```

|Name
|Type
|Description

|_links
|link:#_links[_links]
a|

|name
|string
a|The name of the volume.

|uuid
|string
a|Unique identifier for the volume. This corresponds to the instance-uuid
that is exposed in the CLI and ONTAPI. It does not change due to a volume
move.

* example: 028baa66-41bd-11e9-81d5-00a0986138f7
* Introduced in: 9.6

```

```
|===
```

```

[#s3_bucket]
[.api-collapsible-fifth-title]
s3_bucket

```

A bucket is a container of objects. Each bucket defines an object namespace. S3 requests specify objects using a bucket-name and object-name pair. An object resides within a bucket.

```
[cols=3*,options=header]
```

```
|===
```

```

|Name
|Type
|Description

```

```

|aggregates
|array[link:#aggregates[aggregates]]
a|A list of aggregates for FlexGroup volume constituents where the bucket
is hosted. If this option is not specified, the bucket is auto-provisioned
as a FlexGroup volume.

```

|comment
|string
a|Can contain any additional information about the bucket being created or modified.

|constituents_per_aggregate
|integer
a|Specifies the number of constituents or FlexVol volumes per aggregate. A FlexGroup volume consisting of all such constituents across all specified aggregates is created. This option is used along with the aggregates option and cannot be used independently.

|encryption
|link:#encryption[encryption]
a|

|logical_used_size
|integer
a|Specifies the bucket logical used size up to this point.

|name
|string
a|Specifies the name of the bucket. Bucket name is a string that can only contain the following combination of ASCII-range alphanumeric characters 0-9, a-z, ".", and "-".

|policy
|link:#policy[policy]
a|A policy is an object associated with a bucket. It defines resource (bucket, folder, or object) permissions. These policies get evaluated when an S3 user makes a request by executing a specific command. The user must be part of the principal (user or group) specified in the policy. Permissions in the policies determine whether the request is allowed or denied.

|qos_policy
|link:#qos_policy[qos_policy]
a|Specifes "qos_policy.max_throughput_iops" and/or "qos_policy.max_throughput_mbps" or "qos_policy.min_throughput_iops". Specifes "min_throughput_iops" is only supported on volumes hosted on a node that is flash optimized. A pre-created QoS policy can also be used by

specifying "qos_policy.name" or "qos_policy.uuid" properties. Setting or assigning a QoS policy to a bucket is not supported if its containing volume or SVM already has a QoS policy attached.

|size

|integer

a|Specifies the bucket size in bytes; ranges from 80MB to 64TB.

|storage_service_level

|string

a|Specifies the storage service level of the FlexGroup volume on which the bucket should be created. Valid values are "value", "performance" or "extreme".

|svm

|link:#svm[svm]

a|

|uuid

|string

a|Specifies the unique identifier of the bucket.

|volume

|link:#volume[volume]

a|Specifies the FlexGroup volume name and UUID where the bucket is hosted.

|===

[#certificate]

[.api-collapsible-fifth-title]

certificate

Specifies the certificate that will be used for creating HTTPS connections to the S3 server.

```
a|
```

```
|duration
|string
a|The duration over which this sample is calculated. The time durations
are represented in the ISO-8601 standard format. Samples can be calculated
over the following durations:

|iops
|link:#iops[iops]
a|The rate of I/O operations observed at the storage object.

|latency
|link:#latency[latency]
a|The round trip latency in microseconds observed at the storage object.

|status
|string
a|Any errors associated with the sample. For example, if the aggregation
of data over multiple nodes fails then any of the partial errors might be
returned, "ok" on success, or "error" on any internal uncategorized
failure. Whenever a sample collection is missed but done at a later time,
it is back filled to the previous 15 second timestamp and tagged with
"backfilled_data". "Inconsistent_delta_time" is encountered when the time
between two collections is not the same for all nodes. Therefore, the
aggregated value might be over or under inflated. "Negative_delta" is
returned when an expected monotonically increasing value has decreased in
value. "Inconsistent_old_data" is returned when one or more nodes do not
have the latest data.

|throughput
|link:#throughput[throughput]
a|The rate of throughput bytes per second observed at the storage object.

|timestamp
|string
a|The timestamp of the performance data.

|===

[#iops_raw]
[.api-collapsible-fifth-title]
```

```
iops_raw
```

The number of I/O operations observed at the storage object. This should be used along with delta time to calculate the rate of I/O operations per unit of time.

```

[[IDf97b9be997492176f20e73359767e7bd]]
= Create S3 server, users, and buckets configurations

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/protocols/s3/services`#

*Introduced In:* 9.7

Creates an S3 server, users, and buckets configurations.

== Important notes

* Each SVM can have one S3 server configuration.
* One or more buckets and users can also be created using this end-point.
* If creating a user configuration fails, buckets are not created either

```

and already created users are not saved.

* If creating a bucket configuration fails, all buckets already created are saved with no new buckets created.

== Required properties

* `svm.uuid` - Existing SVM in which to create an S3 server configuration.

== Recommended optional properties

* `enabled` - Specifies the state of the server created.

* `comment` - Any information related to the server created.

== Default property values

* `comment` - ""

* `enabled` - `_true_`

== Related ONTAP commands

* ``vserver object-store-server create``

* ``vserver object-store-server bucket create``

* ``vserver object-store-server bucket policy statement create``

* ``vserver object-store-server bucket policy-statement-condition create``

* ``vserver object-store-server user create``

== Learn more

* `xref:{relative_path}protocols_s3_services_endpoint_overview.html[DOC /protocols/s3/services]`

== Parameters

== Error

```

Status: Default

ONTAP Error Response Codes

```

|===
| Error Code | Description

| 2621706
| The specified SVM UUID is incorrect for the specified SVM name.

| 92405789
| The specified object server name contains invalid characters or not a
fully qualified domain name. Valid characters for an object store server
name are 0-9, A-Z, a-z, ".", and "-".

| 92405790
| Object store server names must have between 1 and 15 characters.

| 92405839
| Creating an object store server requires an effective cluster version of
data ONTAP 9.7.0 or later. Upgrade all the nodes to 9.7.0 or later and try
the operation again.

| 92405853
| Failed to create the object store server because Cloud Volumes ONTAP

```

does not support object store servers.

| 92405863

| An error occurs when creating an S3 user or bucket. The reason for failure is detailed in the error message. Follow the error codes specified for the user or bucket endpoints to see details for the failure.

| 92405884

| An object store server can only be created on a data SVM. An object store server can also be created on a system SVM on a mixed platform cluster.

```
|statements
|array[link:#s3_bucket_policy_statement[s3_bucket_policy_statement]]
a|Specifies bucket access policy statement.
```

```
|===
```

```
[#qos_policy]
[.api-collapsible-fifth-title]
qos_policy
```

Specifies "qos_policy.max_throughput_iops" and/or "qos_policy.max_throughput_mbps" or "qos_policy.min_throughput_iops". Specifies "min_throughput_iops" is only supported on volumes hosted on a node that is flash optimized. A pre-created QoS policy can also be used by specifying "qos_policy.name" or "qos_policy.uuid" properties. Setting or assigning a QoS policy to a bucket is not supported if its containing volume or SVM already has a QoS policy attached.

|===
```

```
[#s3_bucket]
```

```
[.api-collapsible-fifth-title]
```

```
s3_bucket
```

A bucket is a container of objects. Each bucket defines an object namespace. S3 requests specify objects using a bucket-name and object-name pair. An object resides within a bucket.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|Description
```

```
|aggregates
```

```
|array[link:#aggregates[aggregates]]
```

```
a|A list of aggregates for FlexGroup volume constituents where the bucket
```

is hosted. If this option is not specified, the bucket is auto-provisioned as a FlexGroup volume.

|comment

|string

a|Can contain any additional information about the bucket being created or modified.

|constituents_per_aggregate

|integer

a|Specifies the number of constituents or FlexVol volumes per aggregate. A FlexGroup volume consisting of all such constituents across all specified aggregates is created. This option is used along with the aggregates option and cannot be used independently.

|encryption

|link:#encryption[encryption]

a|

|logical_used_size

|integer

a|Specifies the bucket logical used size up to this point.

|name

|string

a|Specifies the name of the bucket. Bucket name is a string that can only contain the following combination of ASCII-range alphanumeric characters 0-9, a-z, ".", and "-".

|policy

|link:#policy[policy]

a|A policy is an object associated with a bucket. It defines resource (bucket, folder, or object) permissions. These policies get evaluated when an S3 user makes a request by executing a specific command. The user must be part of the principal (user or group) specified in the policy. Permissions in the policies determine whether the request is allowed or denied.

|qos_policy

|link:#qos_policy[qos_policy]

a|Specifes "qos_policy.max_throughput_iops" and/or

"qos_policy.max_throughput_mbps" or "qos_policy.min_throughput_iops". Specifies "min_throughput_iops" is only supported on volumes hosted on a node that is flash optimized. A pre-created QoS policy can also be used by specifying "qos_policy.name" or "qos_policy.uuid" properties. Setting or assigning a QoS policy to a bucket is not supported if its containing volume or SVM already has a QoS policy attached.

|size
|integer
a|Specifies the bucket size in bytes; ranges from 80MB to 64TB.

|storage_service_level
|string
a|Specifies the storage service level of the FlexGroup volume on which the bucket should be created. Valid values are "value", "performance" or "extreme".

|svm
|link:#svm[svm]
a|

|uuid
|string
a|Specifies the unique identifier of the bucket.

|volume
|link:#volume[volume]
a|Specifies the FlexGroup volume name and UUID where the bucket is hosted.

```

```
|duration
```

```
|string
```

```
a|The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:
```

```
|iops
```

```
|link:#iops[iops]
```

```
a|The rate of I/O operations observed at the storage object.
```

```
|latency
```

```
|link:#latency[latency]
```

```
a|The round trip latency in microseconds observed at the storage object.
```

```
|status
```

```
|string
```

```
a|Any errors associated with the sample. For example, if the aggregation of data over multiple nodes fails then any of the partial errors might be returned, "ok" on success, or "error" on any internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.
```

```
|throughput
```

```
|link:#throughput[throughput]
```

```
a|The rate of throughput bytes per second observed at the storage object.
```

[[ID52932e2a8a05971b44c0c2e186a0eda1]]
= Delete the S3 server configuration for an SVM

[.api-doc-operation .api-doc-operation-delete]#DELETE# [.api-doc-code-
block]#`/protocols/s3/services/{svm.uuid}`#

```

Introduced In: 9.7

Deletes the S3 server configuration of an SVM. If the 'delete_all' parameter is set to false, only the S3 server is deleted. Otherwise S3 users and buckets present on the SVM are also deleted. Note that only empty buckets can be deleted. This endpoint returns the S3 server delete job-uuid in response. To monitor the job status follow `/api/cluster/jobs/+++<job-uuid>+++.`

== Related ONTAP commands

* ``vserver object-store-server delete``

== Learn more

* `xref:{relative_path}protocols_s3_services_endpoint_overview.html` [DOC /protocols/s3/services]

```
|string
```

```
a|The name of the volume.
```

```
|uuid
|string
a|Unique identifier for the volume. This corresponds to the instance-uuid that is exposed in the CLI and ONTAPI. It does not change due to a volume move.
```

```
* example: 028baa66-41bd-11e9-81d5-00a0986138f7
```

```
* Introduced in: 9.6
```

```
|===
```

```
[#s3_bucket]
[.api-collapsible-fifth-title]
s3_bucket
```

A bucket is a container of objects. Each bucket defines an object namespace. S3 requests specify objects using a bucket-name and object-name pair. An object resides within a bucket.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
|Type
|Description
```

```
|aggregates
```

```
|array[link:#aggregates[aggregates]]
```

```
a|A list of aggregates for FlexGroup volume constituents where the bucket is hosted. If this option is not specified, the bucket is auto-provisioned as a FlexGroup volume.
```

```
|comment
```

```
|string
```

```
a|Can contain any additional information about the bucket being created or modified.
```

```
|constituents_per_aggregate
```

```
|integer
```

```
a|Specifies the number of constituents or FlexVol volumes per aggregate. A FlexGroup volume consisting of all such constituents across all specified aggregates is created. This option is used along with the aggregates option and cannot be used independently.
```

|encryption
|link:#encryption[encryption]
a|

|logical_used_size
|integer
a|Specifies the bucket logical used size up to this point.

|name
|string
a|Specifies the name of the bucket. Bucket name is a string that can only contain the following combination of ASCII-range alphanumeric characters 0-9, a-z, ".", and "-".

|policy
|link:#policy[policy]
a|A policy is an object associated with a bucket. It defines resource (bucket, folder, or object) permissions. These policies get evaluated when an S3 user makes a request by executing a specific command. The user must be part of the principal (user or group) specified in the policy. Permissions in the policies determine whether the request is allowed or denied.

|qos_policy
|link:#qos_policy[qos_policy]
a|Specifies "qos_policy.max_throughput_iops" and/or "qos_policy.max_throughput_mbps" or "qos_policy.min_throughput_iops". Specifies "min_throughput_iops" is only supported on volumes hosted on a node that is flash optimized. A pre-created QoS policy can also be used by specifying "qos_policy.name" or "qos_policy.uuid" properties. Setting or assigning a QoS policy to a bucket is not supported if its containing volume or SVM already has a QoS policy attached.

|size
|integer
a|Specifies the bucket size in bytes; ranges from 80MB to 64TB.

|storage_service_level
|string
a|Specifies the storage service level of the FlexGroup volume on which the

bucket should be created. Valid values are "value", "performance" or "extreme".

```
|svm
|link:#svm[svm]
a|
```

```
|uuid
|string
a|Specifies the unique identifier of the bucket.
```

```
|volume
|link:#volume[volume]
a|Specifies the FlexGroup volume name and UUID where the bucket is hosted.
```

```
|===
```

```
[#certificate]
[.api-collapsible-fifth-title]
certificate
```

Specifies the certificate that will be used for creating HTTPS connections to the S3 server.

```
|_links
```

```
|link:#_links[_links]
```

```
a|
```

```
|duration
```

```
|string
```

a|The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:

```
|iops
```

```
|link:#iops[iops]
```

a|The rate of I/O operations observed at the storage object.

```
|latency
```

```
|link:#latency[latency]
```

```
a|The round trip latency in microseconds observed at the storage object.
```

```
|status
```

```
|string
```

```
a|Any errors associated with the sample. For example, if the aggregation of data over multiple nodes fails then any of the partial errors might be returned, "ok" on success, or "error" on any internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.
```

```
|throughput
```

```
|link:#throughput[throughput]
```

```
a|The rate of throughput bytes per second observed at the storage object.
```

```
|timestamp
```

```
|string
```

```
a|The timestamp of the performance data.
```

```
|===
```

```
[#iops_raw]
```

```
[.api-collapsible-fifth-title]
```

```
iops_raw
```

The number of I/O operations observed at the storage object. This should be used along with delta time to calculate the rate of I/O operations per unit of time.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
```

[#s3_bucket_policy_condition]
[.api-collapsible-fifth-title]
s3_bucket_policy_condition

Information about policy conditions based on various condition operators
and condition keys.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|delimiters
|array[string]
a|An array of delimiters that are compared with the delimiter value
specified at the time of execution of an S3-based command, using the
condition operator specified.

```

|max_keys
|array[integer]
a|An array of maximum keys that are allowed or denied to be retrieved using an S3 list operation, based on the condition operator specified.

|operator
|string
a|Condition operator that is applied to the specified condition key.

|prefixes
|array[string]
a|An array of prefixes that are compared with the input prefix value specified at the time of execution of an S3-based command, using the condition operator specified.

|source_ips
|array[string]
a|An array of IP address ranges that are compared with the IP address of a source command at the time of execution of an S3-based command, using the condition operator specified.

|usernames
|array[string]
a|An array of usernames that a current user in the context is evaluated against using the condition operators.

|===

[#s3_bucket_policy_statement]
[.api-collapsible-fifth-title]
s3_bucket_policy_statement

Specifies information about a single access permission.

[cols=3*,options=header]

|===

|Name

|Type

|Description

```
|actions
|array[string]
a|

|conditions
|array[link:#s3_bucket_policy_condition[s3_bucket_policy_condition]]
a|Specifies bucket policy conditions.
```

```
|effect
|string
a|Specifies whether access is allowed or denied when a user requests the specific action. If access (to allow) is not granted explicitly to a resource, access is implicitly denied. Access can also be denied explicitly to a resource, in order to make sure that a user cannot access it, even if a different policy grants access.
```

```

a|Specifies the statement identifier used to differentiate between statements.
```

```
|===
```

```
[#policy]
[.api-collapsible-fifth-title]
policy
```

A policy is an object associated with a bucket. It defines resource (bucket, folder, or object) permissions. These policies get evaluated when an S3 user makes a request by executing a specific command. The user must be part of the principal (user or group) specified in the policy. Permissions in the policies determine whether the request is allowed or denied.

```
[cols=3*,options=header]
|===
|Name
|Type
|Description

|statements
|array[link:#s3_bucket_policy_statement[s3_bucket_policy_statement]]
a|Specifies bucket access policy statement.
```

```
|===
```

```
[#qos_policy]
[.api-collapsible-fifth-title]
qos_policy
```

Specifies "qos_policy.max_throughput_iops" and/or "qos_policy.max_throughput_mbps" or "qos_policy.min_throughput_iops". Specifies "min_throughput_iops" is only supported on volumes hosted on a node that is flash optimized. A pre-created QoS policy can also be used by specifying "qos_policy.name" or "qos_policy.uuid" properties. Setting or assigning a QoS policy to a bucket is not supported if its containing volume or SVM already has a QoS policy attached.

```

```
|max_throughput_iops
|integer
a|Specifies the maximum throughput in IOPS, 0 means none. This is mutually exclusive with name and UUID during POST and PATCH.
```

```
|max_throughput_mbps
|integer
a|Specifies the maximum throughput in Megabytes per sec, 0 means none. This is mutually exclusive with name and UUID during POST and PATCH.
```

```
|min_throughput_iops
|integer
a|Specifies the minimum throughput in IOPS, 0 means none. Setting
"min_throughput" is supported on AFF platforms only, unless FabricPool
tiering policies are set. This is mutually exclusive with name and UUID
during POST and PATCH.
```

```
|min_throughput_mbps
|integer
a|Specifies the minimum throughput in Megabytes per sec, 0 means none.
This is mutually exclusive with name and UUID during POST and PATCH.
```

```
|name
|string
a|The QoS policy group name. This is mutually exclusive with UUID and
other QoS attributes during POST and PATCH.
```

```
|uuid
|string
a|The QoS policy group UUID. This is mutually exclusive with name and
other QoS attributes during POST and PATCH.

|===
```

```
[#s3_bucket]
```

```
[.api-collapsible-fifth-title]
```

```
s3_bucket
```

A bucket is a container of objects. Each bucket defines an object namespace. S3 requests specify objects using a bucket-name and object-name pair. An object resides within a bucket.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|Description
```

```
|aggregates
```

```
|array[link:#aggregates[aggregates]]
```

a|A list of aggregates for FlexGroup volume constituents where the bucket is hosted. If this option is not specified, the bucket is auto-provisioned as a FlexGroup volume.

```
|comment
```

```
|string
```

a|Can contain any additional information about the bucket being created or modified.

```
|constituents_per_aggregate
```

```
|integer
```

a|Specifies the number of constituents or FlexVol volumes per aggregate. A FlexGroup volume consisting of all such constituents across all specified aggregates is created. This option is used along with the aggregates option and cannot be used independently.

```
|encryption
```

```
|link:#encryption[encryption]
```

```
a|
```

```
|logical_used_size
```

```
|integer
```

a|Specifies the bucket logical used size up to this point.

```
|name
```

```
|string
```

a|Specifies the name of the bucket. Bucket name is a string that can only

contain the following combination of ASCII-range alphanumeric characters 0-9, a-z, ".", and "-".

|policy

|link:#policy[policy]

a|A policy is an object associated with a bucket. It defines resource (bucket, folder, or object) permissions. These policies get evaluated when an S3 user makes a request by executing a specific command. The user must be part of the principal (user or group) specified in the policy. Permissions in the policies determine whether the request is allowed or denied.

|qos_policy

|link:#qos_policy[qos_policy]

a|Specifies "qos_policy.max_throughput_iops" and/or "qos_policy.max_throughput_mbps" or "qos_policy.min_throughput_iops". Specifies "min_throughput_iops" is only supported on volumes hosted on a node that is flash optimized. A pre-created QoS policy can also be used by specifying "qos_policy.name" or "qos_policy.uuid" properties. Setting or assigning a QoS policy to a bucket is not supported if its containing volume or SVM already has a QoS policy attached.

|size

|integer

a|Specifies the bucket size in bytes; ranges from 80MB to 64TB.

|storage_service_level

|string

a|Specifies the storage service level of the FlexGroup volume on which the bucket should be created. Valid values are "value", "performance" or "extreme".

|svm

|link:#svm[svm]

a|

|uuid

|string

a|Specifies the unique identifier of the bucket.

|volume

```
|link:#volume[volume]
```

```
a|Specifies the FlexGroup volume name and UUID where the bucket is hosted.
```

```

```

```
|Description
```

```
|_links
```

```
|link:#_links[_links]
```

```
a|
```

```
|duration
```

```
|string
```

a|The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:

```
|iops
```

```
|link:#iops[iops]
```

a|The rate of I/O operations observed at the storage object.

```
|latency
```

```
|link:#latency[latency]
```

a|The round trip latency in microseconds observed at the storage object.

```
|status
```

```
|string
```

a|Any errors associated with the sample. For example, if the aggregation of data over multiple nodes fails then any of the partial errors might be returned, "ok" on success, or "error" on any internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is

returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.

|throughput

|link:#throughput[throughput]

a|The rate of throughput bytes per second observed at the storage object.

|timestamp

|string

a|The timestamp of the performance data.

|===

[#iops_raw]

[.api-collapsible-fifth-title]

iops_raw

The number of I/O operations observed at the storage object. This should be used along with delta time to calculate the rate of I/O operations per unit of time.

= Manage S3 service bucket configuration

:leveloffset: +1

[[ID8e91a90bc15a98cff3ea2dd1f9e51d03]]
= Protocols S3 services svm.uuid buckets endpoint overview

== Overview

An S3 bucket is a container of objects. Each bucket defines an object
namespace. S3 server requests specify objects using a bucket-name and
object-name pair. An object consists of data, along with optional metadata
and access controls, accessible via a name. An object resides within a
bucket. There can be more than one bucket in an S3 server. Buckets which
are created for the server are associated with an S3 user that is created
on the S3 server.

An access policy is an object that when associated with a resource,
defines their permissions. Buckets and objects are defined as resources.
By default, only the "root" user can access these resources. Access
policies are used to manage access to these resources by enabling ONTAP
admin to provide "grants" to allow other users to perform operations on
the buckets.

== Examples

=== Retrieving all fields for all S3 buckets of an SVM

----

# The API:
/api/protocols/s3/services/{svm.uuid}/buckets

# The call:
curl -X GET "https://<mgmt-ip>/api/protocols/s3/services/12f3ba4c-7ae0-
11e9-8c06-0050568ea123/buckets?fields=*&return_records=true" -H "accept:
application/json"

```

```
# The response:
{
  "records": [
    {
      "svm": {
        "uuid": "12f3ba4c-7ae0-11e9-8c06-0050568ea123",
        "name": "vs1"

|string
|query
|False
a|Filter by uuid
```

```
|svm.uuid
|string
|path
|True
a|UUID of the SVM to which this object belongs.
```

```
|fields
|array[string]
|query
|False
a|Specify the fields to return.
```

```
|max_records
|integer
|query
|False
a|Limit the number of records returned.
```

```
|return_records
|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number
of records is returned.
```

* Default value: 1

```
|return_timeout
|integer
```

```
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

[[ID7590a05ff5becda39a64589c18c7fb48]]
= Create an S3 bucket configuration for an SVM

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/protocols/s3/services/{svm.uuid}/buckets`#

*Introduced In:* 9.7

Creates the S3 bucket configuration of an SVM.

== Important notes

* Each SVM can have one or more bucket configurations.
* Aggregate lists should be specified explicitly. If not specified, then
the bucket is auto-provisioned as a FlexGroup.
* Constituents per aggregate specifies the number of components (or
FlexVols) per aggregate. Is specified only when an aggregate list is
explicitly defined.
* An access policy can be created when a bucket is created.
* "qos_policy" can be specified if a bucket needs to be attached to a QoS
group policy during creation time.

== Required properties

* `svm.uuid` - Existing SVM in which to create the bucket configuration.
* `name` - Bucket name that is to be created.

== Recommended optional properties

* `aggregates` - List of aggregates for the FlexGroup on which the bucket
is hosted on.
* `constituents_per_aggregate` - Number of constituents per aggregate.
* `size` - Specifying the bucket size is recommended.
* `policy` - Specifying policy enables users to perform operations on
buckets. Hence specifying the resource permissions is recommended.

```

* `qos_policy` - A QoS policy for buckets.

== Default property values

* `size` - 800MB

* `comment` - ""

* `aggregates` - No default value.

* `constituents_per_aggregate` - `_4_`, if an aggregates list is specified. Otherwise, no default value.

* `policy.statements.actions` - `GetObject`, `PutObject`, `DeleteObject`, `ListBucket`, `ListBucketMultipartUploads`, `ListMultipartUploadParts`, `GetObjectTagging`, `PutObjectTagging`, `DeleteObjectTagging`.

* `policy.statements.principals` - all S3 users and groups in the SVM.

* `policy.statements.resources` - all objects in the bucket.

* `policy.statements.conditions` - list of bucket policy conditions.

* `qos-policy` - No default value.

== Related ONTAP commands

* `vserver object-store-server bucket create``

* `vserver object-store-server bucket policy statement create``

* `vserver object-store-server bucket policy-statement-condition create``

== Parameters

[cols=5*,options=header]

|===

|Name

|Type

|In

|Required

|Description

|return_timeout

|integer

|query

|False

a|The number of seconds to allow the call to execute before returning. When doing a POST, PATCH, or DELETE operation on a single record, the

default is 0 seconds. This means that if an asynchronous operation is started, the server immediately returns HTTP code 202 (Accepted) along with a link to the job. If a non-zero value is specified for POST, PATCH, or DELETE operations, ONTAP waits that length of time to see if the job completes so it can return something other than 202.

* Default value: 1

* Max value: 120

* Min value: 0

|return_records

|boolean

|query

|False

a|The default is false. If set to true, the records are returned.

* Default value:

|svm.uuid

|string

|path

|True

a|UUID of the SVM to which this object belongs.

|===

== Request Body

[cols=3*,options=header]

|===

|Name

|Type

|Description

|aggregates

|array[link:#aggregates[aggregates]]

a|A list of aggregates for FlexGroup volume constituents where the bucket is hosted. If this option is not specified, the bucket is auto-provisioned as a FlexGroup volume.

|comment

|string

a|Can contain any additional information about the bucket being created or modified.

|constituents_per_aggregate

|integer

a|Specifies the number of constituents or FlexVol volumes per aggregate. A FlexGroup volume consisting of all such constituents across all specified aggregates is created. This option is used along with the aggregates option and cannot be used independently.

|encryption

|link:#encryption[encryption]

a|

|logical_used_size

|integer

a|Specifies the bucket logical used size up to this point.

|name

|string

a|Specifies the name of the bucket. Bucket name is a string that can only contain the following combination of ASCII-range alphanumeric characters 0-9, a-z, ".", and "-".

|policy

|link:#policy[policy]

a|A policy is an object associated with a bucket. It defines resource (bucket, folder, or object) permissions. These policies get evaluated when an S3 user makes a request by executing a specific command. The user must be part of the principal (user or group) specified in the policy. Permissions in the policies determine whether the request is allowed or denied.

|qos_policy

|link:#qos_policy[qos_policy]

a|Specifies "qos_policy.max_throughput_iops" and/or "qos_policy.max_throughput_mbps" or "qos_policy.min_throughput_iops". Specifies "min_throughput_iops" is only supported on volumes hosted on a node that is flash optimized. A pre-created QoS policy can also be used by specifying "qos_policy.name" or "qos_policy.uuid" properties. Setting or assigning a QoS policy to a bucket is not supported if its containing volume or SVM already has a QoS policy attached.

```
|size
|integer
a|Specifies the bucket size in bytes; ranges from 80MB to 64TB.
```

```
|storage_service_level
|string
a|Specifies the storage service level of the FlexGroup volume on which the bucket should be created. Valid values are "value", "performance" or "extreme".
```

```
|svm
|link:#svm[svm]
a|
```

```
|uuid
|string
a|Specifies the unique identifier of the bucket.
```

```
|volume
|link:#volume[volume]
a|Specifies the FlexGroup volume name and UUID where the bucket is hosted.
```

```
|===
```

[[ID3c8ba7405758a7db2adc285c5c8bc140]]
= Delete the S3 bucket configuration for an SVM

[.api-doc-operation .api-doc-operation-delete]#DELETE# [.api-doc-code-
block]#`/protocols/s3/services/{svm.uuid}/buckets/{uuid}`#

```

Introduced In: 9.7

Deletes the S3 bucket configuration of an SVM. An access policy is also deleted on an S3 bucket "delete" command.

== Related ONTAP commands

```
* `vserver object-store-server bucket delete`  
* `vserver object-store-server bucket policy statement delete`  
* `vserver object-store-server bucket policy-statement-condition delete`
```

== Learn more

```
*  
xref:{relative_path}protocols_s3_services_svm.uuid_buckets_endpoint_overview.html[DOC /protocols/s3/services/{svm.uuid}/buckets]
```

== Parameters

```
[cols=5*,options=header]
```

```
|===
```

```
|Name  
|Type  
|In  
|Required  
|Description
```

```
|uuid  
|string  
|path  
|True  
a|The unique identifier of the bucket.
```

```
|return_timeout  
|integer  
|query  
|False
```

```
a|The number of seconds to allow the call to execute before returning. When doing a POST, PATCH, or DELETE operation on a single record, the default is 0 seconds. This means that if an asynchronous operation is started, the server immediately returns HTTP code 202 (Accepted) along with a link to the job. If a non-zero value is specified for POST, PATCH, or DELETE operations, ONTAP waits that length of time to see if the job
```

completes so it can return something other than 202.

- * Default value: 1
- * Max value: 120
- * Min value: 0

|svm.uuid
|string
|path
|True
a|UUID of the SVM to which this object belongs.

[#s3_bucket_policy_condition]

[.api-collapsible-fifth-title]

s3_bucket_policy_condition

Information about policy conditions based on various condition operators and condition keys.

[cols=3*,options=header]

|===

|Name

|Type

|Description

|delimiters

|array[string]

a|An array of delimiters that are compared with the delimiter value specified at the time of execution of an S3-based command, using the condition operator specified.

|max_keys

|array[integer]

a|An array of maximum keys that are allowed or denied to be retrieved using an S3 list operation, based on the condition operator specified.

|operator

|string

a|Condition operator that is applied to the specified condition key.

|prefixes

|array[string]

a|An array of prefixes that are compared with the input prefix value specified at the time of execution of an S3-based command, using the

condition operator specified.

|source_ips

|array[string]

a|An array of IP address ranges that are compared with the IP address of a source command at the time of execution of an S3-based command, using the condition operator specified.

|usernames

|array[string]

a|An array of usernames that a current user in the context is evaluated against using the condition operators.

|===

[#s3_bucket_policy_statement]

[.api-collapsible-fifth-title]

s3_bucket_policy_statement

Specifies information about a single access permission.

[cols=3*,options=header]

|===

|Name

|Type

|Description

|actions

|array[string]

a|

|conditions

|array[link:#s3_bucket_policy_condition[s3_bucket_policy_condition]]

a|Specifies bucket policy conditions.

|effect

|string

a|Specifies whether access is allowed or denied when a user requests the specific action. If access (to allow) is not granted explicitly to a resource, access is implicitly denied. Access can also be denied explicitly to a resource, in order to make sure that a user cannot access

it, even if a different policy grants access.

```
|principals  
|array[string]  
a|
```

```
|resources  
|array[string]  
a|
```

```
|sid  
|string  
a|Specifies the statement identifier used to differentiate between  
statements.
```

```
|===
```

```
[#policy]  
[.api-collapsible-fifth-title]  
policy
```

A policy is an object associated with a bucket. It defines resource (bucket, folder, or object) permissions. These policies get evaluated when an S3 user makes a request by executing a specific command. The user must be part of the principal (user or group) specified in the policy. Permissions in the policies determine whether the request is allowed or denied.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name  
|Type  
|Description
```

```
|statements  
|array[link:#s3_bucket_policy_statement[s3_bucket_policy_statement]]  
a|Specifies bucket access policy statement.
```

```
|===
```

```
[#qos_policy]
```

```
[.api-collapsible-fifth-title]
```

```
qos_policy
```

Specifies "qos_policy.max_throughput_iops" and/or "qos_policy.max_throughput_mbps" or "qos_policy.min_throughput_iops". Specifies "min_throughput_iops" is only supported on volumes hosted on a node that is flash optimized. A pre-created QoS policy can also be used by specifying "qos_policy.name" or "qos_policy.uuid" properties. Setting or assigning a QoS policy to a bucket is not supported if its containing volume or SVM already has a QoS policy attached.

[[ID300d7ed15ed7953288450bab4c49bfc2]]
= Update an S3 bucket configuration for an SVM

```

```
[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-block]#\`/protocols/s3/services/{svm.uuid}/buckets/{uuid}`#
```

Introduced In: 9.7

Updates the S3 bucket configuration of an SVM.

== Important notes

* The following fields can be modified for a bucket:

*** `comment` - Any information related to the bucket.

*** `size` - Bucket size.

*** `policy` - An access policy for resources (buckets and objects) that defines their permissions. New policies are created after existing policies are deleted. To retain any of the existing policy statements, you need to specify those statements again. Policy conditions can also be modified using this API.

*** `qos_policy` - A QoS policy for buckets.

== Related ONTAP commands

* `vserver object-store-server bucket modify`

* `vserver object-store-server bucket policy statement modify`

* `vserver object-store-server bucket policy-statement-condition modify`

== Parameters

```
[cols=5*,options=header]
|===
```

|Name

|Type

|In

|Required

|Description

```
|uuid
|string
|path
|True
a|The unique identifier of the bucket.
```

```
|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When doing a POST, PATCH, or DELETE operation on a single record, the
default is 0 seconds. This means that if an asynchronous operation is
started, the server immediately returns HTTP code 202 (Accepted) along
with a link to the job. If a non-zero value is specified for POST, PATCH,
or DELETE operations, ONTAP waits that length of time to see if the job
completes so it can return something other than 202.
```

```
* Default value: 1
* Max value: 120
* Min value: 0
```

```
|svm.uuid
|string
|path
|True
a|UUID of the SVM to which this object belongs.
```

```
|===
```

```
== Request Body
```

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
|Type
|Description
```

```
|aggregates
```

```
|array[link:#aggregates[aggregates]]
```

```
a|A list of aggregates for FlexGroup volume constituents where the bucket
is hosted. If this option is not specified, the bucket is auto-provisioned
```

as a FlexGroup volume.

|comment

|string

a|Can contain any additional information about the bucket being created or modified.

|constituents_per_aggregate

|integer

a|Specifies the number of constituents or FlexVol volumes per aggregate. A FlexGroup volume consisting of all such constituents across all specified aggregates is created. This option is used along with the aggregates option and cannot be used independently.

|encryption

|link:#encryption[encryption]

a|

|logical_used_size

|integer

a|Specifies the bucket logical used size up to this point.

|name

|string

a|Specifies the name of the bucket. Bucket name is a string that can only contain the following combination of ASCII-range alphanumeric characters 0-9, a-z, ".", and "-".

|policy

|link:#policy[policy]

a|A policy is an object associated with a bucket. It defines resource (bucket, folder, or object) permissions. These policies get evaluated when an S3 user makes a request by executing a specific command. The user must be part of the principal (user or group) specified in the policy. Permissions in the policies determine whether the request is allowed or denied.

|qos_policy

|link:#qos_policy[qos_policy]

a|Specifies "qos_policy.max_throughput_iops" and/or "qos_policy.max_throughput_mbps" or "qos_policy.min_throughput_iops".

Specifies "min_throughput_iops" is only supported on volumes hosted on a node that is flash optimized. A pre-created QoS policy can also be used by specifying "qos_policy.name" or "qos_policy.uuid" properties. Setting or assigning a QoS policy to a bucket is not supported if its containing volume or SVM already has a QoS policy attached.

```
|size
|integer
a|Specifies the bucket size in bytes; ranges from 80MB to 64TB.
```

```
|storage_service_level
|string
a|Specifies the storage service level of the FlexGroup volume on which the bucket should be created. Valid values are "value", "performance" or "extreme".
```

```
|svm
|link:#svm[svm]
a|
```

```
|uuid
|string
a|Specifies the unique identifier of the bucket.
```

```
|volume
|link:#volume[volume]
a|Specifies the FlexGroup volume name and UUID where the bucket is hosted.
```

```
|===
```

[#policy]
[.api-collapsible-fifth-title]
policy

A policy is an object associated with a bucket. It defines resource (bucket, folder, or object) permissions. These policies get evaluated when an S3 user makes a request by executing a specific command. The user must be part of the principal (user or group) specified in the policy. Permissions in the policies determine whether the request is allowed or denied.

[cols=3*,options=header]

|Description

|statements
|array[link:#s3_bucket_policy_statement[s3_bucket_policy_statement]]
a|Specifies bucket access policy statement.

```
|===
```

```
[#qos_policy]  
[.api-collapsible-fifth-title]  
qos_policy
```

Specifies "qos_policy.max_throughput_iops" and/or "qos_policy.max_throughput_mbps" or "qos_policy.min_throughput_iops". Specifies "min_throughput_iops" is only supported on volumes hosted on a node that is flash optimized. A pre-created QoS policy can also be used by specifying "qos_policy.name" or "qos_policy.uuid" properties. Setting or assigning a QoS policy to a bucket is not supported if its containing volume or SVM already has a QoS policy attached.

[#s3_bucket_svm]
[.api-collapsible-fifth-title]
s3_bucket_svm
```

A bucket is a container of objects. Each bucket defines an object namespace. S3 requests specify objects using a bucket-name and object-name pair. An object resides within a bucket.

```
[cols=3*,options=header]
|===
|Name
```

```

|Type
|Description

|aggregates
|array[link:#aggregates[aggregates]]
a|A list of aggregates for FlexGroup volume constituents where the bucket
is hosted. If this option is not specified, the bucket is auto-provisioned
as a FlexGroup volume.

|comment
|string
a|Can contain any additional information about the bucket being created or
modified.

|constituents_per_aggregate
|integer
a|Specifies the number of constituents or FlexVol volumes per aggregate. A
FlexGroup volume consisting of all such constituents across all specified
aggregates is created. This option is used along with the aggregates
option and cannot be used independently.

|encryption
|link:#encryption[encryption]
a|

|logical_used_size
|integer
a|Specifies the bucket logical used size up to this point.

|name
|string
a|Specifies the name of the bucket. Bucket name is a string that can only
contain the following combination of ASCII-range alphanumeric characters
0-9, a-z, ".", and "-".

|policy
|link:#policy[policy]
a|A policy is an object associated with a bucket. It defines resource
(bucket, folder, or object) permissions. These policies get evaluated when
an S3 user makes a request by executing a specific command. The user must
be part of the principal (user or group) specified in the policy.
Permissions in the policies determine whether the request is allowed or

```

denied.

|qos_policy

|link:#qos_policy[qos_policy]

a|Specifies "qos_policy.max_throughput_iops" and/or

"qos_policy.max_throughput_mbps" or "qos_policy.min_throughput_iops".

Specifies "min_throughput_iops" is only supported on volumes hosted on a node that is flash optimized. A pre-created QoS policy can also be used by specifying "qos_policy.name" or "qos_policy.uuid" properties. Setting or assigning a QoS policy to a bucket is not supported if its containing volume or SVM already has a QoS policy attached.

|size

|integer

a|Specifies the bucket size in bytes; ranges from 80MB to 64TB.

|storage_service_level

|string

a|Specifies the storage service level of the FlexGroup volume on which the bucket should be created. Valid values are "value", "performance" or "extreme".

|svm

|link:#svm[svm]

a|

|uuid

|string

a|Specifies the unique identifier of the bucket.

|volume

|link:#volume[volume]

a|Specifies the FlexGroup volume name and UUID where the bucket is hosted.

:leveloffset: -1

= Manage S3 service group configuration

:leveloffset: +1

[[ID0878395c4b28fe8967b40034f259257a]]
= Protocols S3 services svm.uuid groups endpoint overview

== Overview

```

An S3 group consists of one or many users. Policies are attached to the S3 group to have access control over S3 resources at group level.

== Examples

=== Retrieving all fields for all S3 groups of an SVM

The API:

/api/protocols/s3/services/{svm.uuid}/groups:

The call:

```
curl -X GET "https://<mgmt-ip>/api/protocols/s3/services/12f3ba4c-7ae0-11e9-8c06-0050568ea123/groups?fields=*&return_records=true&return_timeout=15" -H "accept: application/json"
```

The response:

```
{
  "records": [
    {
      "comment": "Admin group",
      "id": 5,
      "name": "Admin-Group",
      "policies": [
        { "name": "Policy1" },
        { "name": "Policy2" },
        { "name": "Policy3" }
      ],
      "svm": {
        "name": "svm1",
        "uuid": "02c9e252-41be-11e9-81d5-00a0986138f7"
      },
      "users": [
        { "name": "User1" },
        { "name": "User2" },
        { "name": "User3" }
      ]
    },
    {
      "comment": "Admin group",
      "id": 6,
      "name": "Admin-Group1",
      "policies": [
```

```

    { "name": "Policy1" },
    { "name": "Policy2" },
    { "name": "Policy3" }
  ],
  "svm": {
    "name": "svm1",
    "uuid": "02c9e252-41be-11e9-81d5-00a0986138f7"
  },
  "users": [
    { "name": "User1" },
    { "name": "User2" },
    { "name": "User6" }
  ]
}
],
"num_records": 2
}
-----

```

=== Retrieving the specified group in the SVM

The API:

/api/protocols/s3/services/{svm.uuid}/groups/{group_id}:

The call:

```
curl -X GET "https://<mgmt-ip>/api/protocols/s3/services/12f3ba4c-7ae0-11e9-8c06-0050568ea123/groups/5?fields=*" -H "accept: application/json"
```

The response:

```

{
  "comment": "Admin group",
  "id": 5,
  "name": "Admin-Group",
  "policies": [
    { "name": "Policy1" },
    { "name": "Policy2" },
    { "name": "Policy3" }
  ],
  "svm": {
    "name": "svm1",
    "uuid": "02c9e252-41be-11e9-81d5-00a0986138f7"
  },
  "users": [
    { "name": "User1" },

```

```
{ "name": "User2" },
{ "name": "User3" }
]
}
```

=== Creating an S3 group for an SVM

The API:

/api/protocols/s3/services/{svm.uuid}/groups

The call:

```
curl -X POST "https://<mgmt-ip>/api/protocols/s3/services/12f3ba4c-7ae0-11e9-8c06-0050568ea123/groups?return_records=true" -H "accept: application/json" -H "authorization: Basic YWRtaW46bmV0YXBwMSE=" -H "Content-Type: application/json" -d "{ \"comment\": \"Admin group\", \"name\": \"Admin-Group\", \"policies\": [ { \"name\": \"Policy1\" }, { \"name\": \"Policy2\" }, { \"name\": \"Policy3\" } ], \"users\": [ { \"name\": \"User1\" }, { \"name\": \"User2\" }, { \"name\": \"User3\" } ]}"
```

The response:

```
HTTP/1.1 202 Accepted
Date: Mon, 16 Mar 2020 11:32:27 GMT

      { "name": "User2" },
      { "name": "User3" }
    ]
  }
]
}
}
-----

```

=== Updating an S3 group for an SVM

The API:

```
/api/protocols/s3/services/{svm.uuid}/groups/{group_id}:
```

The call:

```
curl -X PATCH "https://<mgmt-ip>/api/protocols/s3/services/12f3ba4c-7ae0-11e9-8c06-0050568ea123/groups/5" -H "accept: application/json" -H "authorization: Basic YWRtaW46bmV0YXBwMSE=" -H "Content-Type: application/json" -d "{ \"comment\": \"Admin group\", \"name\": \"Admin-Group\", \"policies\": [ { \"name\": \"Policy1\" } ], \"users\": [ { \"name\": \"user-1\" } ]}"
```

The response:

```
HTTP/1.1 202 Accepted
Date: Mon, 16 Mar 2020 11:32:27 GMT
Server: libzapid-httpd
X-Content-Type-Options: nosniff
Cache-Control: no-cache,no-store,must-revalidate
Content-Length: 189
Content-Type: application/json
```

=== Deleting an S3 group for a specified SVM

The API:

```
/api/protocols/s3/services/{svm.uuid}/groups/{group_id}:
```

The call:

```
curl -X DELETE "https://<mgmt-ip>/api/protocols/s3/services/12f3ba4c-7ae0-11e9-8c06-0050568ea123/groups/5" -H "accept: application/json"
```

= Create an S3 group configuration

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/protocols/s3/services/{svm.uuid}/groups`#

*Introduced In:* 9.8

Creates the S3 group configuration.

```

== Important notes

- * Each SVM can have one or more s3 group configurations.

== Required properties

- * ``svm.uuid`` - Existing SVM in which to create the user configuration.
- * ``name`` - Group name that is to be created.
- * ``users`` - List of users to be added into the group.
- * ``policies`` - List of policies are to be attached to this group.

== Recommended optional properties

- * ``comment`` - Short description about the S3 Group.

== Related ONTAP commands

- * ``vserver object-store-server group create``

== Learn more

- *

`xref:{relative_path}protocols_s3_services_svm.uuid_groups_endpoint_overview.html[DOC /protocols/s3/services/{svm.uuid}/groups]`

== Parameters

`[cols=5*,options=header]`

|===

|Name

|Type

|In

|Required

|Description

|return_records

|boolean

|query

|False

a|The default is false. If set to true, the records are returned.

- * Default value:

```
|svm.uuid
|string
|path
|True
a|UUID of the SVM to which this object belongs.
```

```
|===
```

```
== Request Body
```

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
|Type
|Description
```

```
|comment
|string
```

a|Can contain any additional information about the group being created or modified.

```
|id
|integer
```

a|Specifies a unique group ID used to identify a particular group. This parameter should not be specified in the POST method. A group ID is automatically generated and it is retrieved using the GET method. Group id is SVM scoped.

```
|name
|string
```

a|Specifies the name of the group. A group name length can range from 1 to 128 characters and can only contain the following combination of characters 0-9, A-Z, a-z, "_", "+", "=", ",", ".", "@", and "-".

```
|policies
|array[link:#policies[policies]]
```

a|Specifies a list of policies that are attached to the group. The wildcard character "*" is a valid value for specifying all policies.

```
|svm
|link:#svm[svm]
```

```
a|  
  
|users  
|array[link:#users[users]]  
a|Specifies the list of users who belong to the group.
```

```
|===
```

a|Filter by status
```

```
|svm.uuid
|string
|path
|True
a|Unique identifier of the SVM.
```

```
|interval
|string
|query
|False
a|The time range for the data. Examples can be 1h, 1d, 1m, 1w, 1y.
The period for each time range is as follows:
```

- * 1h: Metrics over the most recent hour sampled over 15 seconds.
- * 1d: Metrics over the most recent day sampled over 5 minutes.
- * 1w: Metrics over the most recent week sampled over 30 minutes.
- * 1m: Metrics over the most recent month sampled over 2 hours.
- * 1y: Metrics over the most recent year sampled over a day.
- * Default value: 1
- * enum: ["1h", "1d", "1w", "1m", "1y"]

```
|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.
```

- * Default value: 1
- * Max value: 120
- * Min value: 0

```
|fields
|array[string]
|query
|False
a|Specify the fields to return.
```

```
|max_records
```

```
|integer
|query
|False
a|Limit the number of records returned.

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

|return_records
|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number
of records is returned.

* Default value: 1

```

```
|duration
|string
a|The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:
```

```
|iops
|link:#iops[iops]
a|The rate of I/O operations observed at the storage object.
```

```
|latency
|link:#latency[latency]
a|The round trip latency in microseconds observed at the storage object.
```

```
|status
|string
a|Errors associated with the sample. For example, if the aggregation of data over multiple nodes fails, then any partial errors might return "ok" on success or "error" on an internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.
```

```
|throughput
|link:#throughput[throughput]
a|The rate of throughput bytes per second observed at the storage object.
```

```
|timestamp
|string
a|The timestamp of the performance data.

```
|actions
```

```
|array[string]
```

a|For each resource, S3 supports a set of operations. The resource operations allowed or denied are identified by an action list:

- * GetObject - retrieves objects from a bucket.
- * PutObject - puts objects in a bucket.
- * DeleteObject - deletes objects from a bucket.
- * ListBucket - lists the objects in a bucket.
- * GetBucketAcl - retrieves the access control list (ACL) of a bucket.
- * GetObjectAcl - retrieves the access control list (ACL) of an object.
- * ListAllMyBuckets - lists all of the buckets in a server.
- * ListBucketMultipartUploads - lists the multipart uploads in progress for a bucket.
- * ListMultipartUploadParts - lists the parts in a multipart upload.
- * GetObjectTagging - retrieves the tag set of an object.
- * PutObjecttagging - sets the tag set for an object.
- * DeleteObjectTagging - deletes the tag set of an object.

The wildcard character "*" can be used to form a regular expression for specifying actions.

```
|effect
```

```
|string
```

a|Specifies whether access is allowed or denied. If access (to allow) is not granted explicitly to a resource, access is implicitly denied. Access can also be denied explicitly to a resource, in order to make sure that a user cannot access it, even if a different policy grants access.

```
|index
|integer
a|Specifies a unique statement index used to identify a particular
statement. This parameter should not be specified in the POST method. A
statement index is automatically generated and is retrieved using the GET
method.
```

```

= Create an S3 policy configuration

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/protocols/s3/services/{svm.uuid}/policies`#

*Introduced In:* 9.8

Creates the S3 policy configuration.

== Important notes

* Each SVM can have one or more s3 policy configurations.

== Required properties

```

* `svm.uuid` - Existing SVM in which to create the s3 policy configuration.

* `name` - Policy name that is to be created.

== Recommended optional properties

* `comment` - Short description about the S3 policy.

* `statements.effect` - Indicates whether to allow or deny access.

* `statements.actions` - List of actions that can be allowed or denied access. Example: GetObject, PutObject, DeleteObject, ListBucket, ListMyBuckets, ListBucketMultipartUploads, ListMultipartUploadParts, GetObjectTagging, PutObjectTagging, DeleteObjectTagging.

* `statements.resources` - Buckets or objects that can be allowed or denied access.

* `statements.sid` - Statement identifier providing additional information about the statement.

== Related ONTAP commands

* `vserver object-store-server policy create`

* `vserver object-store-server policy add-statement`

== Learn more

*

```

|Description

|actions

|array[string]

a|For each resource, S3 supports a set of operations. The resource operations allowed or denied are identified by an action list:

- * GetObject - retrieves objects from a bucket.
- * PutObject - puts objects in a bucket.
- * DeleteObject - deletes objects from a bucket.
- * ListBucket - lists the objects in a bucket.
- * GetBucketAcl - retrieves the access control list (ACL) of a bucket.
- * GetObjectAcl - retrieves the access control list (ACL) of an object.
- * ListAllMyBuckets - lists all of the buckets in a server.
- * ListBucketMultipartUploads - lists the multipart uploads in progress for a bucket.
- * ListMultipartUploadParts - lists the parts in a multipart upload.
- * GetObjectTagging - retrieves the tag set of an object.
- * PutObjecttagging - sets the tag set for an object.
- * DeleteObjectTagging - deletes the tag set of an object.

The wildcard character "*" can be used to form a regular expression for specifying actions.

|effect

|string

[[IDfcc7d90ec5878c1418b1f2bea6415606]]
```

```
= Protocols S3 services svm.uuid users endpoint overview
```

```
== Overview
```

An S3 user account is created on the S3 server. Buckets that are created for the server are associated with that user (as the owner of the buckets).

The creation of the user account involves generating a pair of keys "access" and "secret".

These keys are shared with clients (by the administrator out of band) who want to access the S3 server. The access_key is sent in the request and it identifies the user performing the operation. The client or server never send the secret_key over the wire.

Only the access_key can be retrieved from a GET operation. The secret_key along with the access_key is returned from a POST operation and from a PATCH operation if the administrator needs to regenerate the keys.

```
== Examples
```

```
=== Retrieving S3 user configurations for a particular SVM
```

== Parameters

```
[cols=5*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|In
```

```
|Required
```

```
|Description
```

```
|access_key
```

```
|string
```

```
|query
```

```
|False
```

```
a|Filter by access_key
```

```
|name  
|string  
|query  
|False  
a|Filter by name
```

```
|svm.uuid  
|string  
|query  
|False  
a|Filter by svm.uuid
```

```
|svm.name  
|string  
|query  
|False  
a|Filter by svm.name
```

```
|comment  
|string  
|query  
|False  
a|Filter by comment
```

```
|svm.uuid  
|string  
|path  
|True  
a|UUID of the SVM to which this object belongs.
```

```
|fields  
|array[string]  
|query  
|False  
a|Specify the fields to return.
```

```
|max_records  
|integer  
|query  
|False  
a|Limit the number of records returned.
```

```
|return_records
|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number
of records is returned.

* Default value: 1

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

= Create an S3 user configuration

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/protocols/s3/services/{svm.uuid}/users`#

*Introduced In:* 9.7

Creates the S3 user configuration.

== Important notes

```

* Each SVM can have one or more user configurations.

* If user creation is successful, a user access_key and secret_key is returned as part of the response.

== Required properties

* `svm.uuid` - Existing SVM in which to create the user configuration.

* `name` - User name that is to be created.

== Default property values

* `comment` - ""

== Related ONTAP commands

* `vserver object-store-server user create`

== Learn more

*

xref:{relative_path}protocols_s3_services_svm.uuid_users_endpoint_overview.html[DOC /protocols/s3/services/{svm.uuid}/users]

== Parameters

[cols=5*,options=header]

|===

|Name

|Type

|In

|Required

|Description

|return_records

|boolean

|query

|False

a|The default is false. If set to true, the records are returned.

* Default value:

|svm.uuid

|string

|path

```

|True
a|UUID of the SVM to which this object belongs.

|===

[[ID93192bc70fff137d7432fd14599f7d62]]
```

```
= SAN overview
```

```
== Overview
```

The storage area network (SAN) endpoints and objects enable you to configure, provision, and manage SAN-related objects.

'''

== Fibre Channel

=== Logins

Fibre Channel logins represent connections, formed by Fibre Channel initiators, that have successfully logged in to ONTAP. This represents the Fibre Channel login on which higher-level protocols, such as Fibre Channel Protocol (FCP) and Non-Volatile Memory Express over Fibre Channel (NVMe over FC), rely.

The Fibre Channel logins REST API provides information about active Fibre Channel logins.

=== WWPN Aliases

A WWPN (world wide port name) is a unique 64-bit identifier for a Fibre Channel initiator. It is displayed as a 16-character hexadecimal value. SAN administrators may find it easier to identify Fibre Channel initiators using an alias, especially in larger SANs.

The WWPN alias REST API allows you to create, delete and discover aliases for WWPNs.

=== Services

A Fibre Channel Protocol (FCP) service defines the properties of the Fibre Channel Protocol target for an SVM. There can be at most one FCP service for a given SVM. An SVM's FCP service must be created before FCP initiators can login to the SVM.

The Fibre Channel Protocol (FCP) service REST API allows you to create, update, delete, and discover Fibre Channel Services for SVMs. Fibre Channel interfaces are the logical endpoints for Fibre Channel network connections to an SVM.

'''

== iSCSI

=== Credentials

An iSCSI credentials object defines the authentication credentials to be

used between an iSCSI initiator and ONTAP. It identifies an authentication type, user names, and the passwords that must be used to authenticate a specific initiator.

The iSCSI credentials REST API allows you to create, update, delete, and discover iSCSI credential objects.

=== Services

An iSCSI service defines the properties of the iSCSI target for an SVM. There can be at most one iSCSI service for an SVM. An SVM's iSCSI service must be created before iSCSI initiators can login to the SVM.

The iSCSI service REST API allows you to create, update, delete, and discover iSCSI services for SVMs.

=== Sessions

An iSCSI session consists of one or more TCP connections that link an iSCSI initiator with an iSCSI target. TCP connections can be added and removed from an iSCSI session by the iSCSI initiator. Across all TCP connections within an iSCSI session, an initiator sees one and the same target. After the connection is established, iSCSI control, data, and status messages are communicated over the session.

The iSCSI sessions REST API provides information about iSCSI initiators that have successfully logged in to ONTAP.

=== Learn More

* `_IP Interfaces_` found in the `_networking_` section. IP interfaces are the logical endpoints for iSCSI network connections to an SVM.

'''

== Initiator Groups

An initiator group (igroup) is a collection of Fibre Channel WWPNs (world wide port names), iSCSI IQNs (qualified names), iSCSI EUIs (extended unique identifiers), or any combination of these, that identify host initiators.

Initiator groups are used to control which hosts can access specific LUNs. To grant access to a LUN from one or more hosts, a network administrator creates an initiator group containing the hosts' initiator names, and then creates a LUN map that associates the initiator group with the LUN.

The initiator group REST API allows you to create, update, delete, and discover initiator groups. It also enables you to add and remove initiators that can access the target and associated LUNs.

== Portsets

A portset is a collection of Fibre Channel Protocol and/or iSCSI network interfaces from the portset's SVM.

Portsets are used to limit the network interfaces through which an initiator can connect to mapped LUNs. When a portset is bound to an initiator group (igroup), and the initiator group is mapped to a LUN, the initiators of the initiator group can only reach the LUN through the network interfaces in the portset.

Portsets are not recommended for new configurations. With modern releases of ONTAP, it is recommended to use multiple SVMs and initiator groups with no bound portset to load balance applications over multiple ports on a node. Selective LUN mapping will automatically limit the number of visible paths to a LUN from the client host to those required for efficient access and high availability. The REST portset API is primarily intended for legacy use.

The portset REST API allows you to create, delete, and discover portsets, and to add and remove network interfaces from portsets.

A portset can be bound to one or more initiator groups. An initiator group (igroup) can be bound to at most one portset.

== LUN Maps

A LUN map is an association between a LUN and an initiator group. When a LUN is mapped to an initiator group, the group's initiators are granted access to the LUN. The relationship between an initiator group and a LUN is many initiator groups to many LUNs.

The LUN map REST API allows you to create, delete, and discover LUN maps.

== LUNs

A LUN is the logical representation of storage in a storage area network (SAN).

The LUN REST API allows you to create, update, delete, and discover LUNs.

```
|fields  
|array[string]  
|query  
|False  
a|Specify the fields to return.
```

```
|max_records  
|integer  
|query  
|False  
a|Limit the number of records returned.
```

```
|return_records  
|boolean  
|query  
|False  
a|The default is true for GET calls. When set to false, only the number  
of records is returned.
```

* Default value: 1

```
|return_timeout  
|integer  
|query
```

```
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

a|The port address of the initiator's FC port.
```

Each port in an FC switched fabric has its own unique port address for routing purposes. The port address is assigned by a switch in the fabric when that port logs in to the fabric. This property refers to the address given by a switch to the initiator port.

This is useful for obtaining statistics and diagnostic information from FC switches.

This is a hexadecimal encoded numeric value.

:leveloffset: -1

= Manage FC WWPN aliases

:leveloffset: +1

[[ID00dfb76b24d921e3e123bd628cbc329e]]
= Network FC wwpn-aliases endpoint overview

```

== Overview

A worldwide port name (WWPN) is a unique 64-bit identifier for a Fibre Channel (FC) initiator. It is displayed as a 16-character hexadecimal value. SAN administrators might find it easier to identify FC initiators using an alias, especially in larger SANs.

The WWPN alias REST API allows you to create, delete, and discover aliases for WWPNs.

Multiple aliases can be created for a WWPN, but you cannot use the same alias for multiple WWPNs.

An alias can consist of up to 32 characters. Valid characters are:

- * A through Z
- * a through z
- * numbers 0 through 9
- * hyphen ("-")
- * underscore ("_")
- * left and right braces ("{" , "}")
- * period (".")

== Examples

=== Creating a WWPN alias

The API:

POST /api/network/fc/wwpn-aliases

The call:

```
curl -X POST "https://<mgmt-ip>/api/network/fc/wwpn-aliases" -H "accept: application/json" -d '{ "svm": { "name": "svm1" }, "wwpn": "50:0a:09:82:b4:30:25:05", "alias": "alias3" }'
```

=== Retrieving all properties of all WWPN aliases

The `fields` query parameter is used to request that all properties be returned.

```

# The API:
GET /api/network/fc/wwpn-aliases

# The call:
curl -X GET "https://<mgmt-ip>/api/network/fc/wwpn-aliases?fields=*" -H
"accept: application/hal+json"

# The response:
{
  "records": [
    {
      "svm": {
        "uuid": "68589d3d-7efa-11e8-9eed-005056b43025",
        "name": "svm1",
        "_links": {
          "self": {
            "href": "/api/svm/svms/68589d3d-7efa-11e8-9eed-005056b43025"
          }
        }
      },
      "alias": "alias1",
      "wwpn": "20:00:00:50:56:b4:30:25",

:leveloffset: -1

= Manage FC services for SVMs

:leveloffset: +1

[[IDaf6cbc29ba0689b84e7d047a13639132]]
= Protocols SAN fcp services endpoint overview

```

== Overview

A Fibre Channel Protocol (FC Protocol) service defines the properties of the FC Protocol target for an SVM. There can be at most one FC Protocol service for an SVM. An SVM FC Protocol service must be created before FC Protocol initiators can log in to the SVM.

The FC Protocol service REST API allows you to create, update, delete, and discover FC services for SVMs.

== Performance monitoring

Performance of the SVM can be monitored by the ``metric.+++`` and ``statistics.+++`` properties. These show the performance of the SVM in terms of IOPS, latency, and throughput. The ``metric.+++`` properties denote an average whereas ``statistics.+++`` properties denote a real-time monotonically increasing value aggregated across all nodes.

== Examples

=== Creating an FC Protocol service for an SVM

The simplest way to create an FC Protocol service is to specify only the SVM, either by name or UUID. By default, the new FC Protocol service is enabled.

In this example, the ``return_records`` query parameter is used to retrieve the new FC Protocol service object in the REST response.

The API:

```
POST /api/protocols/san/fcp/services
```

The call:

```
curl -X POST 'https://<mgmt-  
ip>/api/protocols/san/fcp/services?return_records=true' -H 'accept:  
application/hal+json' -d '{"svm": { "name": "svm1" } }'
```

The response:

```
{  
  "num_records": 1,  
  "records": [  
    {
```

```

    "svm": {
      "uuid": "5c659d90-c01a-11e8-88ed-005056bbb24b",
      "name": "svm1",
      "_links": {
        "self": {
          "href": "/api/svm/svms/5c659d90-c01a-11e8-88ed-005056bbb24b"
        }
      }
    },
    "enabled": true,
    "target": {
      "name": "20:00:00:50:56:bb:b2:4b"
    },
    "_links": {
      "self": {
        "href": "/api/protocols/san/fcp/services/5c659d90-c01a-11e8-88ed-005056bbb24b"
      }
    }
  }
]
}

```

'''

=== Retrieving FC Protocol services for all SVMs in the cluster

The API:

GET /api/protocols/san/fcp/services

The call:

curl -X GET 'https://<mgmt-ip>/api/protocols/san/fcp/services' -H 'accept: application/hal+json'

The response:

```

{
  "records": [
    {
      "svm": {
        "uuid": "5c659d90-c01a-11e8-88ed-005056bbb24b",
        "name": "svm1",
        "_links": {
          "self": {

```

```
    "href": "/api/svm/svms/5c659d90-c01a-11e8-88ed-005056bbb24b"
  }
}
},
"_links": {
  "self": {
    "href": "/api/protocols/san/fcp/services/5c659d90-c01a-11e8-88ed-005056bbb24b"
  }
}
},
{
  "svm": {
    "uuid": "6011f874-c01a-11e8-88ed-005056bbb24b",
    "name": "svm2",
    "_links": {
      "self": {
        "href": "/api/svm/svms/6011f874-c01a-11e8-88ed-005056bbb24b"
      }
    }
  },
  "_links": {
    "self": {
      "href": "/api/protocols/san/fcp/services/6011f874-c01a-11e8-88ed-005056bbb24b"
    }
  }
}
],
"num_records": 2,
"_links": {
  "self": {
    "href": "/api/protocols/san/fcp/services"
  }
}
}
```

...

=== Retrieving details for a specific FC Protocol service

The FC Protocol service is identified by the UUID of its SVM.

```

# The API:
GET /api/protocols/san/fcp/services/{svm.uuid}

# The call:
curl -X GET 'https://<mgmt-ip>/api/protocols/san/fcp/services/5c659d90-
c01a-11e8-88ed-005056bbb24b' -H 'accept: application/hal+json'

# The response:
{
  "svm": {
    "uuid": "5c659d90-c01a-11e8-88ed-005056bbb24b",
    "name": "svml",
    "_links": {
      "self": {
        "href": "/api/svm/svms/5c659d90-c01a-11e8-88ed-005056bbb24b"
      }
    }
  },
  "enabled": true,
  "target": {
    "name": "20:00:00:50:56:bb:b2:4b"
  },
  "_links": {
    "self": {
      "href": "/api/protocols/san/fcp/services/5c659d90-c01a-11e8-88ed-
005056bbb24b"
    }
  }
}
-----

'''

```

=== Disabling an FC Protocol service

Disabling an FC Protocol service shuts down all active FC Protocol logins for the SVM and prevents new FC Protocol logins.

The FC Protocol service to update is identified by the UUID of its SVM.

```

-----

# The API:
PATCH /api/protocols/san/fcp/services/{svm.uuid}

# The call:

```

```
curl -X PATCH 'https://<mgmt-ip>/api/protocols/san/fcp/services/5c659d90-
c01a-11e8-88ed-005056bbb24b' -H 'accept: application/hal+json' -d '{
"enabled": "false" }'
```

You can retrieve the FC Protocol service to confirm the change.

In this example, the `fields` query parameter is used to limit the response to the `enabled` property and FC Protocol service identifiers.

The API:

```
GET /api/protocols/san/fcp/services/{svm.uuid}
```

The call:

```
curl -X GET 'https://<mgmt-ip>/api/protocols/san/fcp/services/5c659d90-
c01a-11e8-88ed-005056bbb24b?fields=enabled' -H 'accept:
application/hal+json'
```

The response:

```
{
"svm": {
  "uuid": "5c659d90-c01a-11e8-88ed-005056bbb24b",
  "name": "svm1",
  "_links": {
    "self": {
      "href": "/api/svm/svms/5c659d90-c01a-11e8-88ed-005056bbb24b"
    }
  }
},
"enabled": false,
"_links": {
  "self": {
    "href": "/api/protocols/san/fcp/services/5c659d90-c01a-11e8-88ed-
005056bbb24b"
  }
}
}
```

'''

=== Deleting an FC Protocol service

The FC Protocol service must be disabled before it can be deleted.

The FC Protocol service to delete is identified by the UUID of its SVM.

The API:

```
DELETE /api/protocols/san/fcp/services/{svm.uuid}
```

The call:

```
curl -X DELETE 'https://<mgmt-ip>/api/protocols/san/fcp/services/5c659d90-c01a-11e8-88ed-005056bbb24b' -H 'accept: application/hal+json'
```

[[ID18eccbf3ee0a0a995ed6b2fc0e142bd4]]

= Retrieve FC protocol services

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-block]#`/protocols/san/fcp/services`#

Introduced In: 9.6

Retrieves FC Protocol services.

== Expensive properties

There is an added cost to retrieving values for these properties. They are not included by default in GET results and must be explicitly requested using the `fields` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

* `statistics.+++`

* `metric.+++`

```
a|
```

```
|duration
```

```
|string
```

```
a|The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated
```

over the following durations:

```
|iops
|link:#iops[iops]
a|The rate of I/O operations observed at the storage object.
```

```
|latency
|link:#latency[latency]
a|The round trip latency in microseconds observed at the storage object.
```

```
|status
|string
a|Any errors associated with the sample. For example, if the aggregation of data over multiple nodes fails then any of the partial errors might be returned, "ok" on success, or "error" on any internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.
```

```
|throughput
|link:#throughput[throughput]

```

a|The target name of the FC Protocol service. This is generated for the SVM during POST.

The FC Protocol target name is a world wide node name (WWNN).

If required, the target name can be modified using the ONTAP command line.

* example: 20:00:00:50:56:bb:b2:4b

* maxLength: 128

* minLength: 1

* readOnly: 1

* Introduced in: 9.6

```
|===
```

```
[#fcp_service]
```

```
[.api-collapsible-fifth-title]
```

```
fcp_service
```

A Fibre Channel (FC) Protocol service defines the properties of the FC Protocol target for an SVM. There can be at most one FC Protocol service for an SVM. An SVM's FC Protocol service must be created before FC Protocol initiators can login to the SVM.

A FC Protocol service is identified by the UUID of its SVM.

| 2621462
| The supplied SVM does not exist.
| 2621507
| The Fibre Channel Protocol is not allowed for the specified SVM.

```

```
| 2621706
| The specified `svm.uuid` and `svm.name` do not refer to the same SVM.

| 2621707
| No SVM was specified. Either `svm.name` or `svm.uuid` must be supplied.

| 5374082
| The Fibre Channel Protocol service already exists for the SVM.

| 5374092
| The Fibre Channel Procotol is not supported on the cluster hardware
configuration; there are no Fibre Channel adapters.

| 5374893
| The SVM is stopped. The SVM must be running to create a Fibre Channel
Protocol service.

|Name
|Type
|Description

|_links
|link:#_links[_links]
a|

|duration
|string
a|The duration over which this sample is calculated. The time durations
are represented in the ISO-8601 standard format. Samples can be calculated
over the following durations:

|iops
|link:#iops[iops]
a|The rate of I/O operations observed at the storage object.

|latency
|link:#latency[latency]
a|The round trip latency in microseconds observed at the storage object.

|status
|string
a|Any errors associated with the sample. For example, if the aggregation
of data over multiple nodes fails then any of the partial errors might be
returned, "ok" on success, or "error" on any internal uncategorized
failure. Whenever a sample collection is missed but done at a later time,
it is back filled to the previous 15 second timestamp and tagged with
"backfilled_data". "Inconsistent_delta_time" is encountered when the time

```

between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.

|throughput

|link:#throughput[throughput]

a|The rate of throughput bytes per second observed at the storage object.

|timestamp

|string

a|The timestamp of the performance data.

|===

```
a|The target name of the FC Protocol service. This is generated for the SVM during POST.
```

The FC Protocol target name is a world wide node name (WWNN).

If required, the target name can be modified using the ONTAP command line.

* example: 20:00:00:50:56:bb:b2:4b

* maxLength: 128

* minLength: 1

* readOnly: 1

* Introduced in: 9.6

|===

```
[#fcp_service]
[.api-collapsible-fifth-title]
fcp_service
```

A Fibre Channel (FC) Protocol service defines the properties of the FC Protocol target for an SVM. There can be at most one FC Protocol service for an SVM. An SVM's FC Protocol service must be created before FC Protocol initiators can login to the SVM.

A FC Protocol service is identified by the UUID of its SVM.

```

```
|Description
```

```
|iops_raw
```

```
|link:#iops_raw[iops_raw]
```

```
a|The number of I/O operations observed at the storage object. This should
```

be used along with delta time to calculate the rate of I/O operations per unit of time.

|latency_raw

|link:#latency_raw[latency_raw]

a|The raw latency in microseconds observed at the storage object. This should be divided by the raw IOPS value to calculate the average latency per I/O operation.

|status

|string

a|Any errors associated with the sample. For example, if the aggregation of data over multiple nodes fails then any of the partial errors might be returned, "ok" on success, or "error" on any internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.

|throughput_raw

|link:#throughput_raw[throughput_raw]

a|Throughput bytes observed at the storage object. This should be used along with delta time to calculate the rate of throughput bytes per unit of time.

|timestamp

|string

a|The timestamp of the performance data.

|===

[#svm]

a|The time range for the data. Examples can be 1h, 1d, 1m, 1w, 1y.
The period for each time range is as follows:

* 1h: Metrics over the most recent hour sampled over 15 seconds.
* 1d: Metrics over the most recent day sampled over 5 minutes.
* 1w: Metrics over the most recent week sampled over 30 minutes.
* 1m: Metrics over the most recent month sampled over 2 hours.
* 1y: Metrics over the most recent year sampled over a day.
* Default value: 1
* enum: ["1h", "1d", "1w", "1m", "1y"]

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|order_by
|array[string]
|query
|False
```

a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

|return_records

|boolean

|query

|False

a|The default is true for GET calls. When set to false, only the number of records is returned.

* Default value: 1

|duration
|string
a|The duration over which this sample is calculated. The time durations

```

are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:

|iops

|link:#iops[iops]

a|The rate of I/O operations observed at the storage object.

|latency

|link:#latency[latency]

a|The round trip latency in microseconds observed at the storage object.

|status

|string

a|Any errors associated with the sample. For example, if the aggregation of data over multiple nodes fails then any of the partial errors might be returned, "ok" on success, or "error" on any internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.

|svm

|link:#svm[svm]

a|

|throughput

|link:#throughput[throughput]

a|The rate of throughput bytes per second observed at the storage object.

|timestamp

|string

a|The timestamp of the performance data.

[[IDaa53d13ce02e3b14470d7ddb6a063f66]]
= Protocols SAN igroups endpoint overview
```

```
== Overview
```

An initiator group (igroup) is a collection of Fibre Channel (FC) world wide port names (WWPNs), and/or iSCSI Qualified Names (IQNs), and/or iSCSI EUIs (Extended Unique Identifiers) that identify host initiators.

Initiator groups are used to control which hosts can access specific LUNs. To grant access to a LUN from one or more hosts, create an initiator group containing the host initiator names, then create a LUN map that associates the initiator group with the LUN.

An initiator group may contain either initiators or other initiator groups, but not both simultaneously. When a parent initiator group is mapped, it inherits all of the initiators of any initiator groups nested below it. If any nested initiator group is modified to contain different initiators, the parent initiator groups inherit the change. A parent can have many nested initiator groups and an initiator group can be nested under multiple parents. Initiators can only be added or removed from the initiator group that directly contains them. The maximum supported depth of nesting is three layers.

Best practice when using nested initiator groups is to match host hierarchies. A single initiator group should correspond to a single host. If a LUN needs to be mapped to multiple hosts, the initiator groups representing those hosts should be aggregated into a parent initiator group and the LUN should be mapped to that initiator group. For multi-ported hosts, initiators have a comment property where the port corresponding to the initiator can be documented.

The initiator group REST API allows you to create, update, delete, and discover initiator groups, and to add and remove initiators that can access the target and associated LUNs.

An initiator can appear in multiple initiator groups. An initiator group can be mapped to multiple LUNs. A specific initiator can be mapped to a specific LUN only once. With the introduction of nestable initiator groups, best practice is to use the hierarchy such that an initiator is only a direct member of a single initiator group, and that initiator group can then be referenced by other initiator groups. This avoid needing to update multiple initiator groups when initiators change.

All initiators or nested initiator groups in an initiator group must be from the same operating system. The initiator group's operating system is specified when the initiator group is created.

When an initiator group is created, the `protocol` property is used to restrict member initiators to Fibre Channel (`_fc_`), iSCSI (`_iscsi_`), or both (`_mixed_`). Initiator groups within a nested hierarchy may not have conflicting protocols.

Zero or more initiators or nested initiator groups can be supplied when the initiator group is created. After creation, initiators can be added or removed from the initiator group using the `/protocols/san/igroups/{igroup.uuid}/initiators` endpoint. Initiator groups containing other initiator groups report the aggregated list of initiators from all nested initiator groups, but modifications of the initiator list must be performed on the initiator group that directly contains the initiators. See xref:{relative_path}post-protocols-san-igroups-initiators\(#-san-igroup-initiator-create\)anddelete-protocols-san-igroups-initiators-.html<</SAN/igroup_initiator_create,POST /protocols/san/igroups/{igroup.uuid}/initiators>> and [DELETE /protocols/san/igroups/{igroup.uuid}/initiators/{name}] for more details.`

An FC WWPN consists of 16 hexadecimal digits grouped as 8 pairs separated by colons. The format for an iSCSI IQN is `_iqn.yyyy-mm.reverse_domain_name:any_`. The iSCSI EUI format consists of the `_eui._`

prefix followed by 16 hexadecimal characters.

== Examples

=== Creating an initiator group with no initiators

The example initiator group used here is for Linux iSCSI initiators only. Note that the `return_records` query parameter is used to obtain the newly created initiator group in the response.

The API:

POST /api/protocols/san/igroups

The call:

```
curl -X POST 'https://<mgmt-  
ip>/api/protocols/san/igroups?return_records=true' -H 'accept:  
application/hal+json' -d '{ "svm": { "name": "svm1" }, "name": "igroup1",  
"os_type": "linux", "protocol": "iscsi" }'
```

The response:

```
{  
  "num_records": 1,  
  "records": [  
    {  
      "svm": {  
        "uuid": "02b0dfff-aa28-11e8-a653-005056bb7072",  
        "name": "svm1",  
        "_links": {  
          "self": {  
            "href": "/api/svm/svms/02b0dfff-aa28-11e8-a653-005056bb7072"  
          }  
        }  
      },  
      "uuid": "8f249e7d-ab9f-11e8-b8a3-005056bb7072",  
      "name": "igroup1",  
      "protocol": "iscsi",  
      "os_type": "linux",  
      "_links": {

=== Retrieving all properties of all initiator groups

The `fields` query parameter is used to request all initiator group properties. Note that the nested and parent initiator groups are considered expensive properties and will only be returned if explicitly requested.

The API:

```
GET /api/protocols/san/igroups
```

The call:

```
curl -X GET 'https://<mgmt-ip>/api/protocols/san/igroups?fields=*,igroups,parent_igroups' -H 'accept: application/hal+json'
```

The response:

```

[#igroup]
[.api-collapsible-fifth-title]
igroup
```

An initiator group (igroup) is a collection of Fibre Channel (FC) world wide port names (WWPNs), and/or iSCSI Qualified Names (IQNs), and/or iSCSI EUIs (Extended Unique Identifiers) that identify host initiators.

Initiator groups are used to control which hosts can access specific LUNs. To grant access to a LUN from one or more hosts, create an initiator group containing the host initiator names, then create a LUN map that associates the initiator group with the LUN.

An initiator group may contain either initiators or other initiator groups, but not both simultaneously. When a parent initiator group is mapped, it inherits all of the initiators of any initiator groups nested below it. If any nested initiator group is modified to contain different initiators, the parent initiator groups inherit the change. A parent can have many nested initiator groups and an initiator group can be nested under multiple parents. Initiators can only be added or removed from the initiator group that directly contains them. The maximum supported depth of nesting is three layers.

Best practice when using nested initiator groups is to match host hierarchies. A single initiator group should correspond to a single host. If a LUN needs to be mapped to multiple hosts, the initiator groups

representing those hosts should be aggregated into a parent initiator group and the LUN should be mapped to that initiator group. For multi-ported hosts, initiators have a comment property where the port corresponding to the initiator can be documented.

An initiator can appear in multiple initiator groups. An initiator group can be mapped to multiple LUNs. A specific initiator can be mapped to a specific LUN only once. With the introduction of nestable initiator groups, best practice is to use the hierarchy such that an initiator is only a direct member of a single initiator group, and that initiator group can then be referenced by other initiator groups.

All initiators or nested initiator groups in an initiator group must be from the same operating system. The initiator group's operating system is specified when the initiator group is created.

When an initiator group is created, the `protocol` property is used to restrict member initiators to Fibre Channel (`_fcp_`), iSCSI (`_iscsi_`), or both (`_mixed_`). Initiator groups within a nested hierarchy may not have conflicting protocols.

Zero or more initiators or nested initiator groups can be supplied when the initiator group is created. After creation, initiators can be added or removed from the initiator group using the `/protocols/san/igroups/{igroup.uuid}/initiators` endpoint. Initiator groups containing other initiator groups report the aggregated list of initiators from all nested initiator groups, but modifications of the initiator list must be performed on the initiator group that directly contains the initiators. See `xref:{relative_path}post-protocols-san-igroups-initiators(#-san-igroup-initiator-create)anddelete-protocols-san-igroups-initiators-.html` <</SAN/igroup_initiator_create,POST /protocols/san/igroups/{igroup.uuid}/initiators>> and `[DELETE /protocols/san/igroups/{igroup.uuid}/initiators/{name}]` for more details.

|comment

|string

a|A comment available for use by the administrator. Valid in POST and PATCH.

|delete_on_unmap

|boolean

a|An option that causes the initiator group to be deleted when the last LUN map associated with it is deleted. Optional in POST and PATCH. This property defaults to `_false_` when the initiator group is created.

|igroups

|array[link:#igroup_child[igroup_child]]

a|The initiator groups that are members of the group. Optional in POST.

This property is mutually exclusive with the `_initiators_` property during POST.

This array contains only the direct children of the initiator group. If the member initiator groups have further nested initiator groups, those are reported in the ``igroups`` property of the child initiator group.

Zero or more nested initiator groups can be supplied when the initiator group is created. The initiator group will act as if it contains the aggregation of all initiators in any nested initiator groups.

After creation, nested initiator groups can be added or removed from the initiator group using the ``/protocols/san/igroups/{igroup.uuid}/igroups`` endpoint. See `xref:{relative_path}post-protocols-san-igroups-igroups(#-san-igroup-nested-create)anddelete-protocols-san-igroups-igroups-.html` <</SAN/igroup_nested_create,POST
`/protocols/san/igroups/{igroup.uuid}/igroups>>` and `[DELETE
/protocols/san/igroups/{igroup.uuid}/igroups/{uid}]` for more details.

|initiators

|array[link:#initiators[initiators]]

a|The initiators that are members of the group or any group nested below this group. Optional in POST.

This property is mutually exclusive with the `_igroups_` property during POST.

During GET, this array contains initiators that are members of this group or any nested initiator groups below this group. When initiators of nested

groups are returned, they include links to the initiator group that directly contains the initiator.

Zero or more initiators can be supplied when the initiator group is created. After creation, initiators can be added or removed from the initiator group using the `/protocols/san/igroups/{igroup.uuid}/initiators` endpoint. See xref:{relative_path}post-protocols-san-igroups-initiators\(#-san-igroup-initiator-create\)anddelete-protocols-san-igroups-initiators-.html<</SAN/igroup_initiator_create,POST /protocols/san/igroups/{igroup.uuid}/initiators>> and [DELETE /protocols/san/igroups/{igroup.uuid}/initiators/{name}] for more details.`

|lun_maps
|array[link:#lun_maps[lun_maps]]
a|All LUN maps with which the initiator is associated.

If the requested igroup is part of a remote, non-local, MetroCluster SVM, the LUN maps are not retrieved.

There is an added cost to retrieving property values for ``lun_maps``. They are not populated for either a collection GET or an instance GET unless explicitly requested using the ``fields`` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

|name
|string
a|The name of the initiator group. Required in POST; optional in PATCH.

|os_type
|string
a|The host operating system of the initiator group. All initiators in the group should be hosts of the same operating system. Required in POST; optional in PATCH.

|parent_igroups
|array[link:#igroup_parent[igroup_parent]]
a|The initiator groups that contain this initiator group as a member.

|portset

```
|link:#portset[portset]
```

a|The portset to which the initiator group is bound. Binding the initiator group to a portset restricts the initiators of the group to accessing mapped LUNs only through network interfaces in the portset.

Optional in POST and PATCH. PATCH `portset.name` to an empty string ("" to unbind a portset from the initiator group.

```
|protocol
```

```
|string
```

a|The protocols supported by the initiator group. This restricts the type of initiators that can be added to the initiator group. Optional in POST; if not supplied, this defaults to `_mixed_`.

The protocol of an initiator group cannot be changed after creation of the group.

```
|supports_igroups
```

```
|boolean
```

a|An initiator group may contain either initiators or other initiator groups, but not both simultaneously. This property is `_true_` when initiator groups can be added to this initiator group. The ``initiators.name`` property cannot be used to determine this via a query because it reports initiators inherited from nested igroups.

Optional in POST and PATCH. PATCH `portset.name` to an empty string (""), to unbind a portset from the initiator group.

|protocol

|string

a|The protocols supported by the initiator group. This restricts the type of initiators that can be added to the initiator group. Optional in POST; if not supplied, this defaults to `_mixed_`.

The protocol of an initiator group cannot be changed after creation of the group.

|supports_igroups

|boolean

a|An initiator group may contain either initiators or other initiator groups, but not both simultaneously. This property is `_true_` when initiator groups can be added to this initiator group. The ``initiators.name`` property cannot be used to determine this via a query because it reports initiators inherited from nested igroups.

|svm

|link:#svm[svm]

a|

|uuid

|string

a|The unique identifier of the initiator group.

[#igroup]

[.api-collapsible-fifth-title]

igroup

An initiator group (igroup) is a collection of Fibre Channel (FC) world wide port names (WWPNs), and/or iSCSI Qualified Names (IQNs), and/or iSCSI EUIs (Extended Unique Identifiers) that identify host initiators.

Initiator groups are used to control which hosts can access specific LUNs. To grant access to a LUN from one or more hosts, create an initiator group containing the host initiator names, then create a LUN map that associates the initiator group with the LUN.

An initiator group may contain either initiators or other initiator groups, but not both simultaneously. When a parent initiator group is mapped, it inherits all of the initiators of any initiator groups nested below it. If any nested initiator group is modified to contain different initiators, the parent initiator groups inherit the change. A parent can have many nested initiator groups and an initiator group can be nested under multiple parents. Initiators can only be added or removed from the initiator group that directly contains them. The maximum supported depth of nesting is three layers.

Best practice when using nested initiator groups is to match host hierarchies. A single initiator group should correspond to a single host. If a LUN needs to be mapped to multiple hosts, the initiator groups representing those hosts should be aggregated into a parent initiator group and the LUN should be mapped to that initiator group. For multi-ported hosts, initiators have a comment property where the port corresponding to the initiator can be documented.

An initiator can appear in multiple initiator groups. An initiator group can be mapped to multiple LUNs. A specific initiator can be mapped to a specific LUN only once. With the introduction of nestable initiator groups, best practice is to use the hierarchy such that an initiator is only a direct member of a single initiator group, and that initiator group

can then be referenced by other initiator groups.

All initiators or nested initiator groups in an initiator group must be from the same operating system. The initiator group's operating system is specified when the initiator group is created.

When an initiator group is created, the `protocol` property is used to restrict member initiators to Fibre Channel (`_fcp_`), iSCSI (`_iscsi_`), or both (`_mixed_`). Initiator groups within a nested hierarchy may not have conflicting protocols.

Zero or more initiators or nested initiator groups can be supplied when the initiator group is created. After creation, initiators can be added or removed from the initiator group using the

`/protocols/san/igroups/{igroup.uuid}/initiators` endpoint. Initiator groups containing other initiator groups report the aggregated list of initiators from all nested initiator groups, but modifications of the initiator list must be performed on the initiator group that directly contains the initiators. See xref:{relative_path}post-protocols-san-igroups-initiators\(#-san-igroup-initiator-create\)anddelete-protocols-san-igroups-initiators-.html<</SAN/igroup_initiator_create,POST /protocols/san/igroups/{igroup.uuid}/initiators>> and [DELETE /protocols/san/igroups/{igroup.uuid}/initiators/{name}] for more details.`

```

```
|string
```

```
a|A comment available for use by the administrator. Valid in POST and PATCH.
```

```
|delete_on_unmap
```

```
|boolean
```

```
a|An option that causes the initiator group to be deleted when the last LUN map associated with it is deleted. Optional in POST and PATCH. This
```

property defaults to `_false_` when the initiator group is created.

|igroups

|array[link:#igroup_child[igroup_child]]

a|The initiator groups that are members of the group. Optional in POST.

This property is mutually exclusive with the `_initiators_` property during POST.

This array contains only the direct children of the initiator group. If the member initiator groups have further nested initiator groups, those are reported in the ``igroups`` property of the child initiator group.

Zero or more nested initiator groups can be supplied when the initiator group is created. The initiator group will act as if it contains the aggregation of all initiators in any nested initiator groups.

After creation, nested initiator groups can be added or removed from the initiator group using the ``/protocols/san/igroups/{igroup.uuid}/igroups`` endpoint. See `xref:{relative_path}post-protocols-san-igroups-igroups(#-san-igroup-nested-create)anddelete-protocols-san-igroups-igroups-.html<</SAN/igroup_nested_create,POST`
`/protocols/san/igroups/{igroup.uuid}/igroups>>` and `[DELETE`
`/protocols/san/igroups/{igroup.uuid}/igroups/{uid}]` for more details.

|initiators

|array[link:#initiators[initiators]]

a|The initiators that are members of the group or any group nested below this group. Optional in POST.

This property is mutually exclusive with the `_igroups_` property during POST.

During GET, this array contains initiators that are members of this group or any nested initiator groups below this group. When initiators of nested groups are returned, they include links to the initiator group that directly contains the initiator.

Zero or more initiators can be supplied when the initiator group is created. After creation, initiators can be added or removed from the initiator group using the ``/protocols/san/igroups/{igroup.uuid}/initiators`` endpoint. See `xref:{relative_path}post-protocols-san-igroups-initiators(#-san-igroup-initiator-create)anddelete-protocols-san-igroups-initiators-.html<</SAN/igroup_initiator_create,POST`

/protocols/san/igroups/{igroup.uuid}/initiators>> and [DELETE /protocols/san/igroups/{igroup.uuid}/initiators/{name}] for more details.

|lun_maps
|array[link:#lun_maps[lun_maps]]
a|All LUN maps with which the initiator is associated.

If the requested igroup is part of a remote, non-local, MetroCluster SVM, the LUN maps are not retrieved.

There is an added cost to retrieving property values for `lun_maps`. They are not populated for either a collection GET or an instance GET unless explicitly requested using the `fields` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

|name
|string
a|The name of the initiator group. Required in POST; optional in PATCH.

|os_type
|string
a|The host operating system of the initiator group. All initiators in the group should be hosts of the same operating system. Required in POST; optional in PATCH.

|parent_igroups
|array[link:#igroup_parent[igroup_parent]]
a|The initiator groups that contain this initiator group as a member.

|portset
|link:#portset[portset]
a|The portset to which the initiator group is bound. Binding the initiator group to a portset restricts the initiators of the group to accessing mapped LUNs only through network interfaces in the portset.

Optional in POST and PATCH. PATCH `portset.name` to an empty string (""), to unbind a portset from the initiator group.

|protocol

```
|string
a|The protocols supported by the initiator group. This restricts the type
of initiators that can be added to the initiator group. Optional in POST;
if not supplied, this defaults to _mixed_.
```

The protocol of an initiator group cannot be changed after creation of the group.

```
|supports_igroups
|boolean
a|An initiator group may contain either initiators or other initiator
groups, but not both simultaneously. This property is _true_ when
initiator groups can be added to this initiator group. The
`initiators.name` property cannot be used to determine this via a query
because it reports initiators inherited from nested igroups.
```

|Required
|Description

|igroup.uuid
|string
|path
|True
a|The unique identifier of the parent initiator group.

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_records
|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number
of records is returned.

* Default value: 1

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120

```

```
* Min value: 0
```

```
|order_by  
|array[string]  
|query  
|False  
a|Order results by specified fields and optional [asc|desc] direction.  
Default direction is 'asc' for ascending.
```

|allow_delete_while_mapped
```

```
|boolean
```

```
|query
```

```
|False
```

```
a|Allows the deletion of a nested initiator group from of a mapped initiator group.
```

Deleting a nested initiator group from a mapped initiator group means that the LUNs, to which the initiator group is mapped, are no longer available to the initiators nested below the initiator group being removed. This might cause a disruption in the availability of data.

This parameter should be used with caution.

[[ID75c7e1736eb84a868f428b42e4f26e2e]]
= Delete an initiator from an initiator group

[.api-doc-operation .api-doc-operation-delete]#DELETE# [.api-doc-code-
block]#`/protocols/san/igroups/{igroup.uuid}/initiators/{name}`#

*Introduced In:* 9.6

Deletes an initiator from an initiator group.
This API only supports removal of initiators owned directly by the
initiator group. Initiators of nested initiator groups must be
removed on the initiator group that directly owns the initiator.

== Related ONTAP commands

* `lun igroup remove`

== Learn more

* xref:{relative_path}protocols_san_igroups_endpoint_overview.html[DOC
/protocols/san/igroups]

== Parameters

[cols=5*,options=header]
|===

|Name

```

```
|Type
|In
|Required
|Description

|igroup.uuid
|string
|path
|True
a|The unique identifier of the initiator group.
```

```
|name
|string
|path
|True
a|The name of the initiator to delete.
```

```
|allow_delete_while_mapped
|boolean
|query
|False
a|Allows the deletion of an initiator from of a mapped initiator group.
```

Deleting an initiator from a mapped initiator group makes the LUNs to which the initiator group is mapped no longer available to the initiator. This might cause a disruption in the availability of data.

This parameter should be used with caution.

* Default value:

= Retrieve an initiator group

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-block]#`/protocols/san/igroups/{uuid}`#

Introduced In: 9.6

Retrieves an initiator group.

== Expensive properties

There is an added cost to retrieving values for these properties. They are not included by default in GET results and must be explicitly requested using the `fields` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

* `igroups.+++`

* `lun_maps.+++`

* `parent_igroups.+++`

== Related ONTAP commands

* `lun igroup show`

* `lun mapping show`

== Learn more

* [xref:{relative_path}protocols_san_igroups_endpoint_overview.html\[DOC /protocols/san/igroups\]](#)

```

== Parameters

[cols=5*,options=header]
|===
|Name
|Type
|In
|Required
|Description

|uuid
|string
|path
|True
a|The unique identifier of the initiator group.

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|===

== Response

```

Status: 200, Ok

```

[cols=3*,options=header]
|===
|Name
|Type
|Description

|_links
|link:#_links[_links]
a|

|comment
|string
a|A comment available for use by the administrator. Valid in POST and PATCH.

```

|delete_on_unmap

|boolean

a|An option that causes the initiator group to be deleted when the last LUN map associated with it is deleted. Optional in POST and PATCH. This property defaults to `_false_` when the initiator group is created.

|igroups

|array[link:#igroup_child[igroup_child]]

a|The initiator groups that are members of the group. Optional in POST.

This property is mutually exclusive with the `_initiators_` property during POST.

This array contains only the direct children of the initiator group. If the member initiator groups have further nested initiator groups, those are reported in the ``igroups`` property of the child initiator group.

Zero or more nested initiator groups can be supplied when the initiator group is created. The initiator group will act as if it contains the aggregation of all initiators in any nested initiator groups.

After creation, nested initiator groups can be added or removed from the initiator group using the ``/protocols/san/igroups/{igroup.uuid}/igroups`` endpoint. See `xref:{relative_path}post-protocols-san-igroups-igroups(#-san-igroup-nested-create)anddelete-protocols-san-igroups-igroups-.html` <</SAN/igroup_nested_create,POST
`/protocols/san/igroups/{igroup.uuid}/igroups>>` and `[DELETE
/protocols/san/igroups/{igroup.uuid}/igroups/{uid}]` for more details.

|initiators

|array[link:#initiators[initiators]]

a|The initiators that are members of the group or any group nested below this group. Optional in POST.

This property is mutually exclusive with the `_igroups_` property during POST.

During GET, this array contains initiators that are members of this group or any nested initiator groups below this group. When initiators of nested groups are returned, they include links to the initiator group that directly contains the initiator.

Zero or more initiators can be supplied when the initiator group is

created. After creation, initiators can be added or removed from the initiator group using the `/protocols/san/igroups/{igroup.uuid}/initiators` endpoint. See xref:{relative_path}post-protocols-san-igroups-initiators\(#-san-igroup-initiator-create\)anddelete-protocols-san-igroups-initiators-.html<</SAN/igroup_initiator_create,POST /protocols/san/igroups/{igroup.uuid}/initiators>> and [DELETE /protocols/san/igroups/{igroup.uuid}/initiators/{name}] for more details.`

`|lun_maps`
`|array[link:#lun_maps[lun_maps]]`
`a|All LUN maps with which the initiator is associated.`

If the requested igroup is part of a remote, non-local, MetroCluster SVM, the LUN maps are not retrieved.

There is an added cost to retrieving property values for ``lun_maps``. They are not populated for either a collection GET or an instance GET unless explicitly requested using the ``fields`` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

`|name`
`|string`
`a|The name of the initiator group. Required in POST; optional in PATCH.`

`|os_type`
`|string`
`a|The host operating system of the initiator group. All initiators in the group should be hosts of the same operating system. Required in POST; optional in PATCH.`

`|parent_igroups`
`|array[link:#igroup_parent[igroup_parent]]`
`a|The initiator groups that contain this initiator group as a member.`

`|portset`
`|link:#portset[portset]`
`a|The portset to which the initiator group is bound. Binding the initiator group to a portset restricts the initiators of the group to accessing mapped LUNs only through network interfaces in the portset.`

Optional in POST and PATCH. PATCH `portset.name` to an empty string ("") to unbind a portset from the initiator group.

|protocol

|string

a|The protocols supported by the initiator group. This restricts the type of initiators that can be added to the initiator group. Optional in POST; if not supplied, this defaults to `_mixed_`.

The protocol of an initiator group cannot be changed after creation of the group.

|supports_igroups

|boolean

a|An initiator group may contain either initiators or other initiator groups, but not both simultaneously. This property is `_true_` when initiator groups can be added to this initiator group. The ``initiators.name`` property cannot be used to determine this via a query because it reports initiators inherited from nested igroups.

|svm

|link:#svm[svm]

a|

|uuid

|string

a|The unique identifier of the initiator group.

|===

```
|delete_on_unmap
```

```
|boolean
```

```
a|An option that causes the initiator group to be deleted when the last LUN map associated with it is deleted. Optional in POST and PATCH. This property defaults to _false_ when the initiator group is created.
```

```
|igroups
```

```
|array[link:#igroup_child[igroup_child]]
```

```
a|The initiator groups that are members of the group. Optional in POST.
```

This property is mutually exclusive with the `_initiators_` property during POST.

This array contains only the direct children of the initiator group. If the member initiator groups have further nested initiator groups, those are reported in the ``igroups`` property of the child initiator group.

Zero or more nested initiator groups can be supplied when the initiator group is created. The initiator group will act as if it contains the aggregation of all initiators in any nested initiator groups.

After creation, nested initiator groups can be added or removed from the initiator group using the ``/protocols/san/igroups/{igroup.uuid}/igroups`` endpoint. See `xref:{relative_path}post-protocols-san-igroups-igroups(#-san-igroup-nested-create)anddelete-protocols-san-igroups-igroups-.html` <</SAN/igroup_nested_create, POST `/protocols/san/igroups/{igroup.uuid}/igroups``>> and `[DELETE /protocols/san/igroups/{igroup.uuid}/igroups/{uid}]` for more details.

|initiators

|array[link:#initiators[initiators]]

a|The initiators that are members of the group or any group nested below this group. Optional in POST.

This property is mutually exclusive with the `_igroups_` property during POST.

During GET, this array contains initiators that are members of this group or any nested initiator groups below this group. When initiators of nested groups are returned, they include links to the initiator group that directly contains the initiator.

Zero or more initiators can be supplied when the initiator group is created. After creation, initiators can be added or removed from the initiator group using the ``/protocols/san/igroups/{igroup.uuid}/initiators`` endpoint. See `xref:{relative_path}post-protocols-san-igroups-initiators(#-san-igroup-initiator-create)anddelete-protocols-san-igroups-initiators-.html` <</SAN/igroup_initiator_create, POST `/protocols/san/igroups/{igroup.uuid}/initiators``>> and `[DELETE /protocols/san/igroups/{igroup.uuid}/initiators/{name}]` for more details.

|lun_maps

|array[link:#lun_maps[lun_maps]]

a|All LUN maps with which the initiator is associated.

If the requested igroup is part of a remote, non-local, MetroCluster SVM, the LUN maps are not retrieved.

There is an added cost to retrieving property values for `lun_maps`. They are not populated for either a collection GET or an instance GET unless explicitly requested using the `fields` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

|name

|string

a|The name of the initiator group. Required in POST; optional in PATCH.

|os_type

|string

a|The host operating system of the initiator group. All initiators in the group should be hosts of the same operating system. Required in POST; optional in PATCH.

|parent_igroups

|array[link:#igroup_parent[igroup_parent]]

a|The initiator groups that contain this initiator group as a member.

|portset

|link:#portset[portset]

a|The portset to which the initiator group is bound. Binding the initiator group to a portset restricts the initiators of the group to accessing mapped LUNs only through network interfaces in the portset.

Optional in POST and PATCH. PATCH `portset.name` to an empty string (""), to unbind a portset from the initiator group.

|protocol

|string

a|The protocols supported by the initiator group. This restricts the type of initiators that can be added to the initiator group. Optional in POST; if not supplied, this defaults to `_mixed_`.

The protocol of an initiator group cannot be changed after creation of the

group.

|supports_igroups

|boolean

a|An initiator group may contain either initiators or other initiator groups, but not both simultaneously. This property is `_true_` when initiator groups can be added to this initiator group. The ``initiators.name`` property cannot be used to determine this via a query because it reports initiators inherited from nested igroups.

|svm

|link:#svm[svm]

a|

|uuid

|string

a|The unique identifier of the initiator group.

```
|===
```

| Error Code | Description

| 1254264

| An attempt was made to bind a portset to an initiator group that is already bound to a portset.

| 5373958

| An invalid initiator group name was supplied for a rename operation.

| 5374023

| A rename operation failed because an initiator group with the same name already exists.

| 5374027

| An attempt was made to bind a portset with no member network interfaces to the initiator group.

| 5374028

| An attempt was made to bind a portset with an incompatible protocol to the initiator group.

| 5374733

| An initiator is already in another initiator group with a conflicting operating system type.

| 5374745

| An attempt was made to add an initiator group as a child to itself.

| 5374746

| The cluster is currently running in a mixed version and nested initiator groups cannot be created until the effective cluster version reaches 9.9.1.

| 5374747

| The cluster is currently running in a mixed version and initiator group comments cannot be created until the effective cluster version reaches 9.9.1.

| 5374852

| The initiator group does not exist.

| 5374868

| The initiator group was partially modified before an error was encountered while renaming the initiator group.

[#igroup]
[.api-collapsible-fifth-title]
igroup

```

An initiator group (igroup) is a collection of Fibre Channel (FC) world wide port names (WWPNs), and/or iSCSI Qualified Names (IQNs), and/or iSCSI EUIs (Extended Unique Identifiers) that identify host initiators.

Initiator groups are used to control which hosts can access specific LUNs. To grant access to a LUN from one or more hosts, create an initiator group containing the host initiator names, then create a LUN map that associates the initiator group with the LUN.

An initiator group may contain either initiators or other initiator groups, but not both simultaneously. When a parent initiator group is mapped, it inherits all of the initiators of any initiator groups nested below it. If any nested initiator group is modified to contain different initiators, the parent initiator groups inherit the change. A parent can have many nested initiator groups and an initiator group can be nested under multiple parents. Initiators can only be added or removed from the initiator group that directly contains them. The maximum supported depth of nesting is three layers.

Best practice when using nested initiator groups is to match host hierarchies. A single initiator group should correspond to a single host. If a LUN needs to be mapped to multiple hosts, the initiator groups representing those hosts should be aggregated into a parent initiator group and the LUN should be mapped to that initiator group. For multi-ported hosts, initiators have a comment property where the port corresponding to the initiator can be documented.

An initiator can appear in multiple initiator groups. An initiator group can be mapped to multiple LUNs. A specific initiator can be mapped to a specific LUN only once. With the introduction of nestable initiator groups, best practice is to use the hierarchy such that an initiator is only a direct member of a single initiator group, and that initiator group can then be referenced by other initiator groups.

All initiators or nested initiator groups in an initiator group must be from the same operating system. The initiator group's operating system is specified when the initiator group is created.

When an initiator group is created, the `protocol` property is used to restrict member initiators to Fibre Channel (`_fcp_`), iSCSI (`_iscsi_`), or both (`_mixed_`). Initiator groups within a nested hierarchy may not have conflicting protocols.

Zero or more initiators or nested initiator groups can be supplied when the initiator group is created. After creation, initiators can be added or removed from the initiator group using the

`/protocols/san/igroups/{igroup.uuid}/initiators` endpoint. Initiator groups containing other initiator groups report the aggregated list of initiators from all nested initiator groups, but modifications of the initiator list must be performed on the initiator group that directly contains the initiators. See xref:{relative_path}post-protocols-san-igroups-initiators\(#-san-igroup-initiator-create\)anddelete-protocols-san-igroups-initiators-.html<</SAN/igroup_initiator_create, POST /protocols/san/igroups/{igroup.uuid}/initiators>> and [DELETE /protocols/san/igroups/{igroup.uuid}/initiators/{name}] for more details.`

[cols=3*,options=header]

|===

|Name

|Type

|Description

|_links

|link:#_links[_links]

a|

|comment

|string

a|A comment available for use by the administrator. Valid in POST and PATCH.

|delete_on_unmap

|boolean

a|An option that causes the initiator group to be deleted when the last LUN map associated with it is deleted. Optional in POST and PATCH. This property defaults to `_false_` when the initiator group is created.

|igroups

|array[link:#igroup_child[igroup_child]]

a|The initiator groups that are members of the group. Optional in POST.

This property is mutually exclusive with the `_initiators_` property during POST.

This array contains only the direct children of the initiator group. If the member initiator groups have further nested initiator groups, those are reported in the ``igroups`` property of the child initiator group.

Zero or more nested initiator groups can be supplied when the initiator

group is created. The initiator group will act as if it contains the aggregation of all initiators in any nested initiator groups.

After creation, nested initiator groups can be added or removed from the initiator group using the `/protocols/san/igroups/{igroup.uuid}/igroups` endpoint. See xref:{relative_path}post-protocols-san-igroups-igroups\(#-san-igroup-nested-create\) and delete-protocols-san-igroups-igroups-.html <</SAN/igroup_nested_create, POST /protocols/san/igroups/{igroup.uuid}/igroups>> and [DELETE /protocols/san/igroups/{igroup.uuid}/igroups/{uid}] for more details.`

|initiators

|array[link:#initiators[initiators]]

a|The initiators that are members of the group or any group nested below this group. Optional in POST.

This property is mutually exclusive with the `_igroups_` property during POST.

During GET, this array contains initiators that are members of this group or any nested initiator groups below this group. When initiators of nested groups are returned, they include links to the initiator group that directly contains the initiator.

Zero or more initiators can be supplied when the initiator group is created. After creation, initiators can be added or removed from the initiator group using the `/protocols/san/igroups/{igroup.uuid}/initiators` endpoint. See xref:{relative_path}post-protocols-san-igroups-initiators\(#-san-igroup-initiator-create\) and delete-protocols-san-igroups-initiators-.html <</SAN/igroup_initiator_create, POST /protocols/san/igroups/{igroup.uuid}/initiators>> and [DELETE /protocols/san/igroups/{igroup.uuid}/initiators/{name}] for more details.`

|lun_maps

|array[link:#lun_maps[lun_maps]]

a|All LUN maps with which the initiator is associated.

If the requested igroup is part of a remote, non-local, MetroCluster SVM, the LUN maps are not retrieved.

There is an added cost to retrieving property values for ``lun_maps``. They are not populated for either a collection GET or an instance GET unless explicitly requested using the ``fields`` query parameter. See

xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields[Requesting specific fields] to learn more.

|name

|string

a|The name of the initiator group. Required in POST; optional in PATCH.

|os_type

|string

a|The host operating system of the initiator group. All initiators in the group should be hosts of the same operating system. Required in POST; optional in PATCH.

|parent_igroups

|array[link:#igroup_parent[igroup_parent]]

a|The initiator groups that contain this initiator group as a member.

|portset

|link:#portset[portset]

a|The portset to which the initiator group is bound. Binding the initiator group to a portset restricts the initiators of the group to accessing mapped LUNs only through network interfaces in the portset.

Optional in POST and PATCH. PATCH `portset.name` to an empty string ("" to unbind a portset from the initiator group.

|protocol

|string

a|The protocols supported by the initiator group. This restricts the type of initiators that can be added to the initiator group. Optional in POST; if not supplied, this defaults to `_mixed_`.

The protocol of an initiator group cannot be changed after creation of the group.

|supports_igroups

|boolean

a|An initiator group may contain either initiators or other initiator groups, but not both simultaneously. This property is `_true_` when initiator groups can be added to this initiator group. The ``initiators.name`` property cannot be used to determine this via a query

because it reports initiators inherited from nested igroups.

:leveloffset: -1

= Manage iSCSI credentials

:leveloffset: +1

[[ID925edad39b028fd012b88ac8c56025c9]]
= Protocols SAN iSCSI credentials endpoint overview

== Overview

```

An iSCSI credentials object defines authentication credentials to be used between an initiator and ONTAP. It identifies an authentication type, user names, and passwords that must be used to authenticate a specific

initiator.

The iSCSI credentials REST API allows you to create, update, delete, and discover iSCSI credentials.

== How iSCSI authentication works

An iSCSI credentials object defines the authentication credentials to be used between an initiator and ONTAP. While establishing an iSCSI connection, the initiator sends a login request to ONTAP to begin an iSCSI session. ONTAP then either permits or denies the login request, or determines that a login is not required.

For an initiator, you can specify an authentication type, user names and passwords, and a whitelist of optional network addresses from which the initiator is allowed to connect.

== iSCSI authentication methods

* Challenge-Handshake Authentication Protocol (CHAP) - The initiator logs in using a CHAP user name and password. There are two types of CHAP user names and passwords:

** Inbound - ONTAP authenticates the initiator. Inbound settings are required if you are using CHAP authentication.

** Outbound - These are optional credentials to enable the initiator to authenticate ONTAP. You can use credentials only if inbound credentials are also being used.

* deny - The initiator is denied access to ONTAP.

* none - ONTAP does not require authentication for the initiator.

The CHAP inbound/outbound password can be any valid string or an even number of valid hexadecimal digits preceded by '0X' or '0x'.

== Initiator address list

The initiator address list is a way to specify valid IP addresses from which the initiator is allowed to connect. If the list is specified and the source address of an iSCSI connection is not in the list, the connection is rejected. Initiator addresses can be specified in either IPv4 or IPv6 format and in one of two forms:

* Range

```
{
  "start": "192.168.0.0",
  "end": "192.168.0.255"
}
```

```
-----  
* Mask
```

```
-----  
{  
  "address": "192.168.0.0",  
  "netmask": "24"  
}
```

```
-----  
== Initiator "default"
```

The default iSCSI authentication definition is created when the iSCSI service is created. An iSCSI credentials object with `_default_` as the initiator name identifies the default authentication for an SVM. The default credentials are used for any initiator that does not have specific iSCSI credentials. The default iSCSI authentication method is `_none_`, but can be changed to `_deny_` or `_CHAP_`. The default credentials object does not support an initiator address list.

```
== Examples
```

```
=== Creating iSCSI credentials requiring no authentication
```

```
-----  
  
# The API:  
POST /api/protocols/san/iscsi/credentials  
  
# The call:  
curl -X POST 'https://<mgmt-ip>/api/protocols/san/iscsi/credentials' -H  
'accept: application/hal+json' -d '{ "svm": { "name": "svm1" },  
"initiator": "iqn.1992-08.com.netapp:initiator1", "authentication_type":  
"none" }'
```

```
-----  
  
'''  
  
=== Creating iSCSI credentials using CHAP inbound authentication
```

```
-----  
  
# The API:  
POST /api/protocols/san/iscsi/credentials
```

```
# The call:
```

```
curl -X POST 'https://<mgmt-ip>/api/protocols/san/iscsi/credentials' -H
'accept: application/hal+json' -d '{ "svm": { "name": "svm1" },
"initiator": "iqn.1992-08.com.netapp:initiator2", "authentication_type":
"CHAP", "chap": { "inbound": { "user": "user1", "password": "password1" }
} }'
```

'''

=== Retrieving all properties of all iSCSI credentials

The `fields` query parameter is used to request all iSCSI credentials properties.

Passwords are not included in the GET output.

The API:

```
GET /api/protocols/san/iscsi/credentials
```

The call:

```
curl -X GET 'https://<mgmt-
ip>/api/protocols/san/iscsi/credentials?fields=*' -H 'accept:
application/hal+json'
```

The response:

```

= Create iSCSI credentials

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/protocols/san/iscsi/credentials`#

```

Introduced In: 9.6

Creates iSCSI credentials.

== Required properties

* `svm.uuid` or `svm.name` - Existing SVM in which to create the iSCSI credentials.

* `initiator` - Initiator for which the iSCSI credentials are to be created.

* `authentication_type` - Type of authentication to use for the credentials.

== Recommended optional properties

* `chap.inbound.user` - In-bound CHAP authentication user name.

* `chap.inbound.password` - In-bound CHAP authentication password.

* `chap.outbound.user` - Out-bound CHAP authentication user name.

* `chap.outbound.password` - Out-bound CHAP authentication password.

== Related ONTAP commands

* `vserver iscsi security create`

== Error

Status: Default

ONTAP Error Response Codes

```

|====
| Error Code | Description
|
| 2621462
| An SVM with the specified UUID does not exist.
|
| 2621706
| Both the SVM UUID and SVM name were supplied, but they do not refer to
the same SVM.
|
| 2621707
| No SVM was specified. Either `svm.name` or `svm.uuid` must be supplied.
|
| 5373969
| A non-empty qualifier is required after the prefix. An example of a
valid IQN is _iqn.1995-08.com.example:string_.
|
| 5373970
| The IQN prefix is invalid. The correct IQN prefix is _iqn_. An example
of a valid IQN is _iqn.1995-08.com.example:string_.
|
| 5373971
| The date field is invalid. A valid date field is _yyyy-mm_. An example
of a valid IQN is _iqn.1995-08.com.example:string_.

```

| 5373972
| The naming authority and string fields can contain only the characters
a-z, _0-9_, _._, _:_ , and _-_.

| 5373977
| The EUI-64 identifier field must be exactly 16 hexadecimal digits.

| 5373978
| The EUI formatted initiator name supplied is invalid. A valid EUI format
is _eui.XXXXXXXXXXXXXXXXXX_, where X is a hexadecimal digit.

| 5373997
| The initiator name supplied is invalid. The valid initiator name formats
are _iqn.1995-08.com.example:string_ or _eui.0123456789abcdef_.

| 5374078
| The iSCSI service does not exist.

| 5374142
| An iSCSI security credential already exists for the specified initiator.

| 5374145
| The iSCSI security password must contain an even number of valid hex
digits.

| 5374147
| The CHAP inbound and outbound passwords must be different.

| 5374149
| The inbound user and password properties are required for CHAP
authentication.

| 5374150
| Outbound CHAP authentication requires an outbound password.

| 5374855
| The value for property `initiator_address.ranges.start` is greater than
the value for property `initiator_address.ranges.end`.

| 5374856
| The value for property `initiator_address.ranges.start` does not belong
to the same IP address family as the value for property
`initiator_address.ranges.end`.

| 5374900
| Setting the CHAP authentication properties are not supported with

```
authentication types _none_ or _deny_.

ONTAP Error Response Codes

```
|===
```

```
| Error Code | Description
```

```
| 2621462
```

```
| An SVM with the specified UUID does not exist.
```

```
| 2621706
```

```
| Both the SVM UUID and SVM name were supplied, but they do not refer to the same SVM.
```

```
| 2621707
```

```
| No SVM was specified. Either `svm.name` or `svm.uuid` must be supplied.
```

```
| 5374148
```

```
| The default security credential cannot be deleted for an SVM.
```

```
| 5374895
```

```
| The iSCSI security credential does not exist on the specified SVM.
