NAS

NAS overview

Overview

These APIs allow you to complete various tasks, including:

- Creating an NFS server for an SVM
- Managing an NFS configuration of an SVM
- Viewing and updating the NFS configuration of an SVM
- Configuring export policies and rules for an SVM
- Managing export policies and rules for an SVM

APIs

NFS

The NFS APIs enable you to create and configure NFS settings for an SVM. You can delete or update NFS configurations, and you can also disable or enable different NFS features as needed. The export APIs allow you to create and manage export policies for an SVM that enable an administrator to restrict access to volumes for clients that match specific IP addresses and specific authentication types. Export APIs are also used to create export rules for an export policy. The APIs allow each rule to specify the number of mask bits in the client IP address that must be matched for that rule to apply to a particular client request. The APIs also allow each export rule to specify the authentication types that are required for both read-only and read-write operations.

Kerberos

Kerberos is a protocol designed to provide strong authentication for users and hosts within a client/server environment. The basis of the protocol is a shared, secret-key cryptology system. (Kerberos uses shared-key encryption to ensure the confidentiality of the data. It also uses hashing techniques to ensure the integrity of the data (so that no one can modify the data unless allowed to do so). With the NetApp multiprotocol storage platform, through which clients based on UNIX or Windows can access data using CIFS or NFS, it is crucial to provide the ability to use standard network services for authentication and for identity storage.

To configure an ONTAP system to use Kerberos for NFS, Kerberos must be enabled on a data LIF in the SVM that owns the NFS server. A Kerberos realm needs to be created before enabling Kerberos on a data LIF. (The Kerberos realm is needed so that the cluster knows how to format Kerberos ticket requests.) The Kerberos APIs allow you to define, create, modify, and delete realms for the SVM. The APIs also allow you to enable/disable Kerberos on a data LIF and update the Kerberos interface configuration for a particular data LIF in the SVM.

Manage NAS audit configurations

Protocols audit endpoint overview

Overview

Auditing for NAS events is a security measure that enables you to track and log certain CIFS and NFS events on storage virtual machines (SVMs). This helps you track potential security problems and provides evidence of any security breaches.

Examples

Creating an audit entry with log rotation size and log retention count

To create an audit entry with log rotation size and log retention count, use the following API. Note the *return_records=true* query parameter is used to obtain the newly created entry in the response.

```
# The API:
POST /api/protocols/audit/

# The call:
curl -X POST "https://<mgmt-ip>/api/protocols/audit" -H "accept:
application/json" -H "Content-Type: application/json" -d "{ \"enabled\":
true, \"events\": { \"authorization_policy\": false, \"cap_staging\":
false, \"cifs_logon_logoff\": true, \"file_operations\": true,
\"file_share\": false, \"security_group\": false, \"user_account\": false
}, \"log\": { \"format\": \"evtx\", \"retention\": { \"count\": 10 },
\"rotation\": { \"size\": 2048000 }}, \"log_path\": \"/\", \"svm\": {
\"name\": \"vs1\", \"uuid\": \"ec650e97-156e-11e9-abcb-005056bbd0bf\" }}"

# The response:
{
"records": [
  {
    "svm": {
      "uuid": "ec650e97-156e-11e9-abcb-005056bbd0bf",
      "name": "vs1"
    },
    "enabled": true,
    "events": {
      "authorization_policy": false,
      "cap_staging": false,
      "cifs_logon_logoff": true,
      "file_operations": true,
      "file_share": false,
      "security_group": false,
      "user_account": false
    },
    "log": {
```

```
          "format": "evtx",
          "rotation": {
            "size": 2048000
          },
          "retention": {
            "count": 10,
            "duration": "0s"
          }
      },
      "log_path": "/"
    }
  ],
  "num_records": 1
}
```

Creating an audit entry with log rotation schedule and log retention duration

To create an audit entry with log rotation schedule and log retention duration, use the following API. Note that the *return_records=true* query parameter is used to obtain the newly created entry in the response.

```
# The API:
POST /api/protocols/audit/

# The call:
curl -X POST "https://<mgmt-ip>/api/protocols/audit" -H "accept:
application/json" -H "Content-Type: application/json" -d "{ \"enabled\":
false, \"events\": { \"authorization_policy\": false, \"cap_staging\":
false, \"cifs_logon_logoff\": true, \"file_operations\": true,
\"file_share\": false, \"security_group\": false, \"user_account\": false
}, \"log\": { \"format\": \"xml\", \"retention\": { \"duration\":
\"P4DT12H30M5S\" }, \"rotation\": { \"schedule\": { \"days\": [1, 5, 10,
15], \"hours\": [0, 1, 6, 12, 18, 23], \"minutes\": [10, 15, 30, 45, 59],
\"months\": [0], \"weekdays\": [0, 2, 5] } } }, \"log_path\": \"/\",
\"svm\": { \"name\": \"vs3\", \"uuid\": \"a8d64674-13fc-11e9-87b1-
005056a7ae7e\" }}"

# The response:
{
"records": [
  {
    "svm": {
      "uuid": "a8d64674-13fc-11e9-87b1-005056a7ae7e",
      "name": "vs3"
```

```
      },
      "enabled": true,
      "events": {
        "authorization_policy": false,
        "cap_staging": false,
        "cifs_logon_logoff": true,
        "file_operations": true,
        "file_share": false,
        "security_group": false,
        "user_account": false
      },
      "log": {
        "format": "xml",
        "rotation": {
          "schedule": {
            "minutes": [
              10,
              15,
              30,
              45,

              15
            ],
            "months": [
              0
            ]
          }
        },
```

```
         "retention": {
           "count": 0,
           "duration": "P4DT12H30M5S"
         }
       },
       "log_path": "/"
   }
],
"num_records": 1
}
```

Retrieving an audit configuration for all SVMs in the cluster

```
# The API:
GET /api/protocols/audit/

# The call:
curl -X GET "https://<mgmt-
ip>/api/protocols/audit?fields=*&return_records=true&return_timeout=15" -H
"accept: application/json"

# The response:
{
"records": [
  {
    "svm": {
      "uuid": "ec650e97-156e-11e9-abcb-005056bbd0bf",
      "name": "vs1"
    },
    "enabled": true,
    "events": {
      "authorization_policy": false,
      "cap_staging": false,
      "cifs_logon_logoff": true,
      "file_operations": true,
      "file_share": false,
      "security_group": false,
      "user_account": false
    },
    "log": {
      "format": "evtx",

          },
          "retention": {
            "count": 0,
            "duration": "P4DT12H30M5S"
          }
        },
        "log_path": "/"
      }
    ],
    "num_records": 2
  }
```

Retrieving specific entries with event list as cifs-logon-logoff, file-ops = true for an SVM

The configuration returned is identified by the events in the list of audit configurations for an SVM.

```
# The API:
GET /api/protocols/audit/

# The call:
curl -X GET "https://<mgmt-
ip>/api/protocols/audit?events.file_operations=true&events.cifs_logon_logo
ff=true&return_records=true&return_timeout=15" -H "accept:
application/json"

# The response:
{
"records": [
  {
    "svm": {
      "uuid": "ec650e97-156e-11e9-abcb-005056bbd0bf",
      "name": "vs1"
    },
    "events": {
      "cifs_logon_logoff": true,
      "file_operations": true
    }
  },
  {
    "svm": {
      "uuid": "a8d64674-13fc-11e9-87b1-005056a7ae7e",
      "name": "vs3"
    },
    "events": {
      "cifs_logon_logoff": true,
      "file_operations": true
    }
  }
],
"num_records": 2
}
```

Retrieving a specific audit configuration for an SVM

The configuration returned is identified by the UUID of its SVM.

```
# The API:
GET /api/protocols/audit/{svm.uuid}

# The call:
curl -X GET "https://<mgmt-ip>/api/protocols/audit/ec650e97-156e-11e9-
abcb-005056bbd0bf" -H "accept: application/json"

# The response:
{
"svm": {
  "uuid": "ec650e97-156e-11e9-abcb-005056bbd0bf",
  "name": "vs1"
},
"enabled": true,
"events": {
  "authorization_policy": false,
  "cap_staging": false,
  "cifs_logon_logoff": true,
  "file_operations": true,
  "file_share" : false,
  "security_group": false,
  "user_account": false
},
"log": {
  "format": "evtx",
  "rotation": {
    "size": 2048000
  },
  "retention": {
    "count": 10,
    "duration": "0s"
  }
},
"log_path": "/"
}
```

Updating a specific audit configuration of an SVM

The configuration is identified by the UUID of its SVM and the provided information is updated.

```
# The API:
PATCH /api/protocols/audit/{svm.uuid}

# The call:
curl -X PATCH "https://<mgmt-ip>/api/protocols/audit/ec650e97-156e-11e9-
abcb-005056bbd0bf" -H "accept: application/json" -H "Content-Type:
application/json" -d "{ \"enabled\": false}"
```

Deleting a specific audit configuration for an SVM

The entry to be deleted is identified by the UUID of its SVM.

```
# The API:
DELETE /api/protocols/audit/{svm.uuid}

# The call:
curl -X DELETE "https://<mgmt-ip>/api/protocols/audit/ec650e97-156e-11e9-
abcb-005056bbd0bf" -H "accept: application/json"
```

Retrieve audit configurations

GET /protocols/audit

Introduced In: 9.6

Retrieves audit configurations.

Related ONTAP commands

- `vserver audit show`

Learn more

- DOC /protocols/audit

Parameters

Name	Type	In	Required	Description
log_path	string	query	False	Filter by log_path
svm.uuid	string	query	False	Filter by svm.uuid

Name	Type	In	Required	Description
svm.name	string	query	False	Filter by svm.name
log.rotation.size	integer	query	False	Filter by log.rotation.size
log.rotation.schedule.hours	integer	query	False	Filter by log.rotation.schedule.hours
log.rotation.schedule.days	integer	query	False	Filter by log.rotation.schedule.days
log.rotation.schedule.months	integer	query	False	Filter by log.rotation.schedule.months
log.rotation.schedule.weekdays	integer	query	False	Filter by log.rotation.schedule.weekdays
log.rotation.schedule.minutes	integer	query	False	Filter by log.rotation.schedule.minutes
log.retention.duration	string	query	False	Filter by log.retention.duration
log.retention.count	integer	query	False	Filter by log.retention.count
log.format	string	query	False	Filter by log.format
enabled	boolean	query	False	Filter by enabled
events.file_operations	boolean	query	False	Filter by events.file_operations
events.user_account	boolean	query	False	Filter by events.user_account
events.security_group	boolean	query	False	Filter by events.security_group

Name	Type	In	Required	Description
events.authorization _policy	boolean	query	False	Filter by events.authorization _policy
events.cifs_logon_lo goff	boolean	query	False	Filter by events.cifs_logon_lo goff
events.file_share	boolean	query	False	Filter by events.file_share
events.cap_staging	boolean	query	False	Filter by events.cap_staging
fields	array[string]	query	False	Specify the fields to return.
max_records	integer	query	False	Limit the number of records returned.
return_records	boolean	query	False	The default is true for GET calls. When set to false, only the number of records is returned. • Default value: 1
return_timeout	integer	query	False	The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached. • Default value: 1 • Max value: 120 • Min value: 0

Name	Type	In	Required	Description
order_by	array[string]	query	False	Order results by specified fields and optional [asc

Response

```
Status: 200, Ok
```

Name	Type	Description
_links	_links	
num_records	integer	Number of records
records	array[audit]	

Example response

events

Name	Type	Description
authorization_policy	boolean	Authorization policy change events
cap_staging	boolean	Central access policy staging events
cifs_logon_logoff	boolean	CIFS logon and logoff events
file_operations	boolean	File operation events
file_share	boolean	File share category events
security_group	boolean	Local security group management events
user_account	boolean	Local user account management events

_links

Name	Type	Description
self	href	

retention

Name	Type	Description
count	integer	Determines how many audit log files to retain before rotating the oldest log file out. This is mutually exclusive with duration.
duration	string	Specifies an ISO-8601 format date and time to retain the audit log file. The audit log files are deleted once they reach the specified date/time. This is mutually exclusive with count.

audit_schedule

Rotates the audit logs based on a schedule by using the time-based rotation parameters in any combination. The rotation schedule is calculated by using all the time-related values.

Name	Type	Description
days	array[integer]	Specifies the day of the month schedule to rotate audit log. Leave empty for all.
hours	array[integer]	Specifies the hourly schedule to rotate audit log. Leave empty for all.
minutes	array[integer]	Specifies the minutes schedule to rotate the audit log.
months	array[integer]	Specifies the months schedule to rotate audit log. Leave empty for all.
weekdays	array[integer]	Specifies the weekdays schedule to rotate audit log. Leave empty for all.

rotation

Audit event log files are rotated when they reach a configured threshold log size or are on a configured schedule. When an event log file is rotated, the scheduled consolidation task first renames the active converted file to a time-stamped archive file, and then creates a new active converted event log file.

Name	Type	Description
now	boolean	Manually rotates the audit logs. Optional in PATCH only. Not available in POST.
schedule	audit_schedule	Rotates the audit logs based on a schedule by using the time-based rotation parameters in any combination. The rotation schedule is calculated by using all the time-related values.
size	integer	Rotates logs based on log size in bytes.

log

Name	Type	Description
_links	_links	
format	string	The format in which the logs are generated by consolidation process. Possible values are: • xml - Data ONTAP-specific XML log format • evtx - Microsoft Windows EVTX log format ◦ Default value: 1 ◦ enum: ["xml", "evtx"] ◦ Introduced in: 9.6
retention	retention	
rotation	rotation	Audit event log files are rotated when they reach a configured threshold log size or are on a configured schedule. When an event log file is rotated, the scheduled consolidation task first renames the active converted file to a time-stamped archive file, and then creates a new active converted event log file.

svm

Name	Type	Description
_links	_links	
name	string	The name of the SVM.
uuid	string	The unique identifier of the SVM.

audit

Auditing for NAS events is a security measure that enables you to track and log certain CIFS and NFS events on SVMs.

Name	Type	Description
enabled	boolean	Specifies whether or not auditing is enabled on the SVM.
events	events	
log	log	
log_path	string	The audit log destination path where consolidated audit logs are stored.
svm	svm	

error_arguments

Name	Type	Description
code	string	Argument code
message	string	Message argument

error

Name	Type	Description
arguments	array[error_arguments]	Message arguments
code	string	Error code
message	string	Error message
target	string	The target parameter that caused the error.

Create an audit configuration

POST `/protocols/audit`

Introduced In: 9.6

Creates an audit configuration.

Required properties

- `svm.uuid` or `svm.name` - Existing SVM to which audit configuration is to be created.
- `log_path` - Path in the owning SVM namespace that is used to store audit logs.

Default property values

If not specified in POST, the following default property values are assigned:

- `enabled` - *true*
- `events.authorization_policy` - *false*
- `events.cap_staging` - *false*
- `events.file_share` - *false*
- `events.security_group` - *false*
- `events.user_account` - *false*
- `events.cifs_logon_logoff` - *true*
- `events.file_operations` - *true*
- `log.format` - *evtx*
- `log.retention.count` - *0*
- `log.retention.duration` - *PT0S*
- `log.rotation.size` - *100MB*
- `log.rotation.now` - *false*

Related ONTAP commands

- `vserver audit create`
- `vserver audit enable`

Learn more

- DOC /protocols/audit

Parameters

Name	Type	In	Required	Description
return_timeout	integer	query	False	The number of seconds to allow the call to execute before returning. When doing a POST, PATCH, or DELETE operation on a single record, the default is 0 seconds. This means that if an asynchronous operation is started, the server immediately returns HTTP code 202 (Accepted) along with a link to the job. If a non-zero value is specified for POST, PATCH, or DELETE operations, ONTAP waits that length of time to see if the job completes so it can return something other than 202. • Default value: 1 • Max value: 120 • Min value: 0
return_records	boolean	query	False	The default is false. If set to true, the records are returned. • Default value:

Request Body

Name	Type	Description
enabled	boolean	Specifies whether or not auditing is enabled on the SVM.
events	events	
log	log	

Name	Type	Description
log_path	string	The audit log destination path where consolidated audit logs are stored.
svm	svm	

Example request

```

ONTAP Error Response Codes

Error Code	Description
262196	Log_rotation_now is not an allowed operation
2621462	The specified SVM does not exist
9699330	An audit configuration already exists
9699337	Audit system internal update is in progress, audit configuration create failed
9699340	SVM UUID lookup failed
9699358	Audit configuration is absent for enabling
9699359	Audit configuration is already enabled
9699360	Final consolidation is in progress, audit enable failed
9699365	Enabling of audit configuration failed
9699370	Auditing was successfully configured, however audit configuration could not be enabled
9699384	The specified log_path does not exist
9699385	The log_path must be a directory
9699386	The log_path must be a canonical path in the SVMs namespace
9699387	The log_path cannot be empty
9699388	Rotate size must be greater than or equal to 1024 KB
9699389	The log_path must not contain a symbolic link
9699398	The log_path exceeds a maximum supported length of characters
9699399	The log_path contains an unsupported read-only (DP/LS) volume
9699400	The specified log_path is not a valid destination for SVM
9699402	The log_path contains an unsupported snaplock volume
9699403	The log_path cannot be accessed for validation

Error Code	Description
9699406	The log_path validation failed
9699409	Failed to enable multiproto.audit.evtxlog.support support capability
9699428	All nodes need to run ONTAP 8.3.0 release to audit CIFS logon-logoff events
9699429	Failed to enable multiproto.audit.cifslogonlogoff.support support capability
9699431	All nodes need to run ONTAP 8.3.0 release to audit CAP staging events
9699432	Failed to enable multiproto.audit.capstaging.support support capability

Name	Type	Description

events

Name	Type	Description
authorization_policy	boolean	Authorization policy change events
cap_staging	boolean	Central access policy staging events
cifs_logon_logoff	boolean	CIFS logon and logoff events
file_operations	boolean	File operation events
file_share	boolean	File share category events
security_group	boolean	Local security group management events
user_account	boolean	Local user account management events

href

Name	Type	Description
href	string	

_links

Name	Type	Description
self	href	

retention

Name	Type	Description
count	integer	Determines how many audit log files to retain before rotating the oldest log file out. This is mutually exclusive with duration.

Name	Type	Description
duration	string	Specifies an ISO-8601 format date and time to retain the audit log file. The audit log files are deleted once they reach the specified date/time. This is mutually exclusive with count.

audit_schedule

Rotates the audit logs based on a schedule by using the time-based rotation parameters in any combination. The rotation schedule is calculated by using all the time-related values.

Name	Type	Description
days	array[integer]	Specifies the day of the month schedule to rotate audit log. Leave empty for all.
hours	array[integer]	Specifies the hourly schedule to rotate audit log. Leave empty for all.
minutes	array[integer]	Specifies the minutes schedule to rotate the audit log.
months	array[integer]	Specifies the months schedule to rotate audit log. Leave empty for all.
weekdays	array[integer]	Specifies the weekdays schedule to rotate audit log. Leave empty for all.

rotation

Audit event log files are rotated when they reach a configured threshold log size or are on a configured schedule. When an event log file is rotated, the scheduled consolidation task first renames the active converted file to a time-stamped archive file, and then creates a new active converted event log file.

Name	Type	Description
now	boolean	Manually rotates the audit logs. Optional in PATCH only. Not available in POST.

Name	Type	Description
schedule	audit_schedule	Rotates the audit logs based on a schedule by using the time-based rotation parameters in any combination. The rotation schedule is calculated by using all the time-related values.
size	integer	Rotates logs based on log size in bytes.

log

Name	Type	Description
_links	_links	

format	string	The format in which the logs are generated by consolidation process. Possible values are:
		
		• xml - Data ONTAP-specific XML log format
		• evtx - Microsoft Windows EVTX log format
		
		    ◦ Default value: 1
		    ◦ enum: ["xml", "evtx"]
		    ◦ Introduced in: 9.6

retention	retention	
rotation	rotation	Audit event log files are rotated when they reach a configured threshold log size or are on a configured schedule. When an event log file is rotated, the scheduled consolidation task first renames the active converted file to a time-stamped archive file, and then creates a new active converted event log file.

svm

Name	Type	Description
_links	_links	
name	string	The name of the SVM.

Name	Type	Description
uuid	string	The unique identifier of the SVM.

audit

Auditing for NAS events is a security measure that enables you to track and log certain CIFS and NFS events on SVMs.

Name	Type	Description
enabled	boolean	Specifies whether or not auditing is enabled on the SVM.
events	events	
log	log	
log_path	string	The audit log destination path where consolidated audit logs are stored.
svm	svm	

_links

Name	Type	Description

message	string	Message argument

error

Name	Type	Description
arguments	array[error_arguments]	Message arguments
code	string	Error code
message	string	Error message

Name	Type	Description
target	string	The target parameter that caused the error.

Delete an audit configuration

DELETE `/protocols/audit/{svm.uuid}`

Introduced In: 9.6

Deletes an audit configuration.

Related ONTAP commands

- `vserver audit disable`
- `vserver audit delete`

Learn more

- DOC /protocols/audit

Parameters

Name	Type	In	Required	Description
return_timeout	integer	query	False	The number of seconds to allow the call to execute before returning. When doing a POST, PATCH, or DELETE operation on a single record, the default is 0 seconds. This means that if an asynchronous operation is started, the server immediately returns HTTP code 202 (Accepted) along with a link to the job. If a non-zero value is specified for POST, PATCH, or DELETE operations, ONTAP waits that length of time to see if the job completes so it can return something other than 202. • Default value: 1 • Max value: 120 • Min value: 0
svm.uuid	string	path	True	UUID of the SVM to which this object belongs.

Response

```
Status: 202, Accepted
```

Error

```
Status: Default
```

Manage home directory search paths

Protocols CIFS home-directory search-paths endpoint overview

Overview

ONTAP home directory functionality can be used to create home directories for SMB users on the CIFS server and automatically offer each user a dynamic share to their home directory without creating an individual SMB share for each user.

The home directory search path is a set of absolute paths from the root of an SVM that directs ONTAP to search for home directories. If there are multiple search paths, ONTAP tries them in the order specified until it finds a valid path. To use the CIFS home directories feature, at least one home directory search path must be added for an SVM.

Examples

Creating a home directory search path

To create a home directory search path, use the following API. Note the *return_records=true* query parameter used to obtain the newly created entry in the response.

```
# The API:
POST /api/protocols/cifs/home-directory/search-paths

# The call:
curl -X POST "https://<mgmt-ip>/api/protocols/cifs/home-directory/search-
paths?return_records=true" -H "accept: applicaion/json" -H "Content-Type:
application/json" -d "{ \"path\": \"/\", \"svm\": { \"name\": \"vs1\",
\"uuid\": \"a41fd873-ecf8-11e8-899d-0050568e9333\" }}"

# The response:
{
"num_records": 1,
"records": [
   {
     "svm": {
       "uuid": "a41fd873-ecf8-11e8-899d-0050568e9333",
       "name": "vs1"
     },
   "path": "/"
   }
]
}
```

Retrieving the CIFS home directory search paths configuration for all SVMs in the cluster

```
# The API:
```

```
GET /protocols/cifs/home-directory/search-paths

# The call:
curl -X GET "https://<mgmt-ip>/api/protocols/cifs/home-directory/search-
paths?fields=*&return_records=true&return_timeout=15" -H "accept:
application/json"

# The response:
{
"records": [
  {
    "svm": {
      "uuid": "2d96f9aa-f4ce-11e8-b075-0050568e278e",

```

Retrieving a specific home directory searchpath configuration for an SVM

The configuration returned is identified by the UUID of its SVM and the index (position) in the list of search paths that is searched to find a home directory of a user.

```
# The API:
GET /api/protocols/home-directory/search-paths/{svm.uuid}/{index}

# The call:
curl -X GET "https://<mgmt-ip>/api/protocols/cifs/home-directory/search-
paths/2d96f9aa-f4ce-11e8-b075-0050568e278e/2" -H "accept:
application/json"

# The response:
{
"svm": {
   "uuid": "2d96f9aa-f4ce-11e8-b075-0050568e278e",
   "name": "vs1"
},
"index": 2,
"path": "/a"
}
```

Reordering a specific home drectory search path in the list

An entry in the home directory search path list can be reordered to a new positin by specifying the 'new_index' field. The reordered configuration is identified by the UUID of its SVM and the index.

```
# The API:
PATCH /api/protocols/cifs/home-directory/search-paths/{svm.uuid}/{index}

# The call:
curl -X PATCH "https://<mgmt-ip>/api/protocols/cifs/home-directory/search-
paths/2d96f9aa-f4ce-11e8-b075-0050568e278e/2?new_index=1" -H "accept:
application/json"
```

Removing a specific home directory search path for an SVM

The entry being removed is identified by the UUID of its SVM and the index.

```
# The API:
DELETE /api/protocols/cifs/home-directory/search-paths/{svm.uuid}/{index}

# The call:
curl -X DELETE "https://<mgmt-ip>/api/protocols/cifs/home-
directory/search-paths/2d96f9aa-f4ce-11e8-b075-0050568e278e/2" -H "accept:
application/json"
```

Retrieve CIFS home directory search paths

GET `/protocols/cifs/home-directory/search-paths`

Introduced In: 9.6

Retrieves CIFS home directory search paths.

Related ONTAP commands

* `cifs server home-directory search-path show`

Learn more

* DOC /protocols/cifs/home-directory/search-paths

Parameters

Name	Type	In	Required	Description
svm.uuid	string	query	False	Filter by svm.uuid
svm.name	string	query	False	Filter by svm.name
index	integer	query	False	Filter by index
path	string	query	False	Filter by path
fields	array[string]	query	False	Specify the fields to return.
max_records	integer	query	False	Limit the number of records returned.

Name	Type	In	Required	Description
return_records	boolean	query	False	The default is true for GET calls. When set to false, only the number of records is returned. • Default value: 1
return_timeout	integer	query	False	The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached. • Default value: 1 • Max value: 120 • Min value: 0
order_by	array[string]	query	False	Order results by specified fields and optional [asc

Response

```
Status: 200, Ok
```

Create a home directory search path

POST `/protocols/cifs/home-directory/search-paths`

Introduced In: 9.6

Creates a home directory search path.

Required properties

- `svm.uuid` or `svm.name` - Existing SVM in which to create the home directory search path.
- `path` - Path in the owning SVM namespace that is used to search for home directories.

Related ONTAP commands

Manage CIFS services

Protocols CIFS services endpoint overview

Overview

A CIFS server is necessary to provide SMB clients with access to the Storage Virtual Machine (SVM). Before you begin, the following prerequisites must be in place:

- At least one SVM LIF must exist on the SVM.
- The LIFs must be able to connect to the DNS servers configured on the SVM and to an Active Directory domain controller of the domain to which you want to join the CIFS server.
- The DNS servers must contain the service location records that are needed to locate the Active Directory domain services.
- The cluster time must be synchronized to within five minutes of the Active Directory domain controller.

Performance monitoring

Performance of the SVM can be monitored by the `metric.*` and `statistics.*` properties. These show the performance of the SVM in terms of IOPS, latency and throughput. The `metric.*` properties denote an average whereas `statistics.*` properties denote a real-time monotonically increasing value aggregated across all nodes.

Information on the CIFS server

You must keep the following in mind when creating the CIFS server:

- The CIFS server name might or might not be the same as the SVM name.
- The CIFS server name can be up to 15 characters in length.
- The following characters are not allowed: @ # * ( ) = + [ ] \| ; : " , < > \ / ?
- You must use the FQDN when specifying the domain.
- The default is to add the CIFS server machine account to the Active Directory "CN=Computer" object.
- You can choose to add the CIFS server to a different organizational unit (OU) by specifying the "organizational_unit" parameter. When specifying the OU, do not specify the domain portion of the distinguished name; only specify the OU or CN portion of the distinguished name. ONTAP appends the value provided for the required "-domain" parameter onto the value provided for the "-ou" parameter to create the Active Directory distinguished name, which is used when joining the Active Directory domain.
- You can optionally choose to add a text comment of up to 48 characters about the CIFS server. If there is a space in the comment text, you must enclose the entire string in quotation marks.
- You can optionally choose to add a comma-delimited list of one or more NetBIOS aliases for the CIFS server.
- The initial administrative status of the CIFS server is "up".
- The <i>large-mtu</i> and multichannel features are enabled for the new CIFS server.
- If LDAP is configured with the *use_start_tls* and *session_security* features, the new CIFS server will also have this property set.

Examples

Creating a CIFS server

To create a CIFS server, use the following API. Note the *return_records=true* query parameter used to obtain the newly created entry in the response.

```
# The API:
POST /api/protocols/cifs/services

# The call:
 curl -X POST "https://<mgmt-
ip>/api/protocols/cifs/services?return_records=true" -H "accept:
application/json" -H "Content-Type: application/json" -d "{ \"ad_domain\":
{ \"fqdn\": \"CIFS-2008R2-AD.GDL.ENGLAB.NETAPP.COM\",
\"organizational_unit\": \"CN=Computers\", \"password\": \"cifs*123\",
\"user\": \"administrator\" }, \"comment\": \"This CIFS Server Belongs to
CS Department\", \"default_unix_user\": \"string\", \"enabled\": true,
\"name\": \"CIFS-DOC\", \"netbios\": { \"aliases\": [ \"ALIAS_1\",
\"ALIAS_2\", \"ALIAS_3\" ], \"enabled\": false, \"wins_servers\": [
\"10.224.65.20\", \"10.224.65.21\" ] }, \"security\": {
\"kdc_encryption\": false, \"encrypt_dc_connection\": false,
\"restrict_anonymous\": \"no_enumeration\", \"smb_encryption\": false,
\"smb_signing\": false }, \"svm\": { \"name\": \"vs1\", \"uuid\":
\"ef087155-f9e2-11e8-ac52-0050568ea248\" }}"

# The response:

        "enabled": false
      },
      "default_unix_user": "string"
    }
  ],
  "num_records": 1
  }
```

Retrieving CIFS server configuration details for a specific SVM

```
# The API:
GET /api/protocols/cifs/services/{svm.uuid}

# The call:
curl -X GET "https://<mgmt-ip>/api/protocols/cifs/services/9f5ab4cb-f703-
11e8-91cc-0050568eca13" -H "accept: application/json"

# The response:
{
"svm": {
  "uuid": "9f5ab4cb-f703-11e8-91cc-0050568eca13",
  "name": "vs1"
},
"name": "CIFS-DOC",
"ad_domain": {
  "fqdn": "CIFS-2008R2-AD.GDL.ENGLAB.NETAPP.COM",
  "organizational_unit": "CN=Computers"
},
"enabled": true,
"comment": "This CIFS Server Belongs to CS Department",
"security": {
  "restrict_anonymous": "no_enumeration",
  "smb_signing": false,
  "smb_encryption": false,
  "encrypt_dc_connection": false,
  "kdc_encryption": false,
  "lm_compatibility_level": "lm_ntlm_ntlmv2_krb"
},
"netbios": {
  "aliases": [
    "ALIAS_1",
    "ALIAS_2",
    "ALIAS_3"
  ],
  "wins_servers": [
    "10.224.65.20",
    "10.224.65.21"
  ],
  "enabled": false
},
"default_unix_user": "string"
}
```

Updating CIFS server properties for the specified SVM

```
# The API:
PATCH /api/protocols/cifs/services/{svm.uuid}

# The call:
curl -X PATCH "https://<mgmt-ip>/api/protocols/cifs/services/9f5ab4cb-
f703-11e8-91cc-0050568eca13" -H "accept: application/json" -H "Content-
Type: application/json" -d "{ \"comment\": \"CIFS SERVER MODIFICATION\" }"
```

Removing a CIFS server for a specific SVM

To delete a CIFS server, use the following API. This will delete the CIFS server along with other CIFS configurations such as CIFS share, share ACLs, homedir search-path, and so on.

```
# The API:
DELETE /api/protocols/cifs/services/{svm.uuid}

# The call:
curl -X DELETE "https://<mgmt-ip>/api/protocols/cifs/services/9f5ab4cb-

Retrieve CIFS servers

GET `/protocols/cifs/services`

Introduced In: 9.6

Retrieves CIFS servers.

Expensive properties

There is an added cost to retrieving values for these properties. They are not included by default in GET results and must be explicitly requested using the `fields` query parameter. See Requesting specific fields to learn more.

- `statistics.*`

- `metric.*`

Parameters

Name	Type	In	Required	Description
default_unix_user	string	query	False	Filter by default_unix_user
ad_domain.fqdn	string	query	False	Filter by ad_domain.fqdn
ad_domain.user	string	query	False	Filter by ad_domain.user
ad_domain.organizational_unit	string	query	False	Filter by ad_domain.organizational_unit
name	string	query	False	Filter by name
metric.timestamp	string	query	False	Filter by metric.timestamp • Introduced in: 9.7
metric.throughput.total	integer	query	False	Filter by metric.throughput.total • Introduced in: 9.7
metric.throughput.read	integer	query	False	Filter by metric.throughput.read • Introduced in: 9.7

Name	Type	In	Required	Description
metric.throughput.write	integer	query	False	Filter by metric.throughput.write • Introduced in: 9.7
metric.latency.total	integer	query	False	Filter by metric.latency.total • Introduced in: 9.7
metric.latency.other	integer	query	False	Filter by metric.latency.other • Introduced in: 9.7
metric.latency.read	integer	query	False	Filter by metric.latency.read • Introduced in: 9.7
metric.latency.write	integer	query	False	Filter by metric.latency.write • Introduced in: 9.7
metric.iops.total	integer	query	False	Filter by metric.iops.total • Introduced in: 9.7
metric.iops.other	integer	query	False	Filter by metric.iops.other • Introduced in: 9.7
metric.iops.read	integer	query	False	Filter by metric.iops.read • Introduced in: 9.7

Name	Type	In	Required	Description
metric.iops.write	integer	query	False	Filter by metric.iops.write • Introduced in: 9.7
metric.duration	string	query	False	Filter by metric.duration • Introduced in: 9.7
metric.status	string	query	False	Filter by metric.status • Introduced in: 9.7
statistics.timestamp	string	query	False	Filter by statistics.timestamp • Introduced in: 9.7
statistics.iops_raw.total	integer	query	False	Filter by statistics.iops_raw.total • Introduced in: 9.7
statistics.iops_raw.other	integer	query	False	Filter by statistics.iops_raw.other • Introduced in: 9.7
statistics.iops_raw.read	integer	query	False	Filter by statistics.iops_raw.read • Introduced in: 9.7

Name	Type	In	Required	Description
statistics.iops_raw.write	integer	query	False	Filter by statistics.iops_raw.write • Introduced in: 9.7
statistics.latency_raw.total	integer	query	False	Filter by statistics.latency_raw.total • Introduced in: 9.7
statistics.latency_raw.other	integer	query	False	Filter by statistics.latency_raw.other • Introduced in: 9.7
statistics.latency_raw.read	integer	query	False	Filter by statistics.latency_raw.read • Introduced in: 9.7
statistics.latency_raw.write	integer	query	False	Filter by statistics.latency_raw.write • Introduced in: 9.7
statistics.status	string	query	False	Filter by statistics.status • Introduced in: 9.7
statistics.throughput_raw.total	integer	query	False	Filter by statistics.throughput_raw.total • Introduced in: 9.7

Name	Type	In	Required	Description
statistics.throughput _raw.read	integer	query	False	Filter by statistics.throughput _raw.read • Introduced in: 9.7
statistics.throughput _raw.write	integer	query	False	Filter by statistics.throughput _raw.write • Introduced in: 9.7
enabled	boolean	query	False	Filter by enabled
netbios.enabled	boolean	query	False	Filter by netbios.enabled
netbios.aliases	string	query	False	Filter by netbios.aliases
netbios.wins_servers	string	query	False	Filter by netbios.wins_server s
svm.uuid	string	query	False	Filter by svm.uuid
svm.name	string	query	False	Filter by svm.name
security.lm_compati bility_level	string	query	False	Filter by security.lm_compati bility_level • Introduced in: 9.8
security.restrict_ano nymous	string	query	False	Filter by security.restrict_ano nymous
security.smb_signing	boolean	query	False	Filter by security.smb_signin g

Name	Type	In	Required	Description
security.smb_encryption	boolean	query	False	Filter by security.smb_encryption
security.encrypt_dc_connection	boolean	query	False	Filter by security.encrypt_dc_connection • Introduced in: 9.8
security.kdc_encryption	boolean	query	False	Filter by security.kdc_encryption
comment	string	query	False	Filter by comment
fields	array[string]	query	False	Specify the fields to return.
max_records	integer	query	False	Limit the number of records returned.
return_records	boolean	query	False	The default is true for GET calls. When set to false, only the number of records is returned. • Default value: 1
return_timeout	integer	query	False	The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached. • Default value: 1 • Max value: 120 • Min value: 0

Name	Type	In	Required	Description
order_by	array[string]	query	False	Order results by specified fields and optional [asc

Response

```

ad_domain

Name	Type	Description
fqdn	string	The fully qualified domain name of the Windows Active Directory to which this CIFS server belongs. A CIFS server appears as a member of Windows server object in the Active Directory store. POST and PATCH only.
organizational_unit	string	Specifies the organizational unit within the Active Directory domain to associate with the CIFS server. POST and PATCH only.
password	string	The account password used to add this CIFS server to the Active Directory. This is not audited.
user	string	The user account used to add this CIFS server to the Active Directory. POST and DELETE only.

iops

The rate of I/O operations observed at the storage object.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Peformance metric for write I/O operations.

latency

The round trip latency in microseconds observed at the storage object.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Peformance metric for write I/O operations.

throughput

The rate of throughput bytes per second observed at the storage object.

Name	Type	Description
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.

Name	Type	Description
write	integer	Peformance metric for write I/O operations.

metric

Name	Type	Description
_links	_links	
duration	string	The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:
iops	iops	The rate of I/O operations observed at the storage object.
latency	latency	The round trip latency in microseconds observed at the storage object.
status	string	Any errors associated with the sample. For example, if the aggregation of data over multiple nodes fails then any of the partial errors might be returned, "ok" on success, or "error" on any internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.

Name	Type	Description
throughput	throughput	The rate of throughput bytes per second observed at the storage object.
timestamp	string	The timestamp of the performance data.

cifs_netbios

Name	Type	Description
aliases	array[string]	
enabled	boolean	Specifies whether NetBios name service (NBNS) is enabled for the CIFS. If this service is enabled, the CIFS server will start sending the broadcast for name registration.
wins_servers	array[string]	

cifs_service_security

Name	Type	Description
encrypt_dc_connection	boolean	Specifies whether encryption is required for domain controller connections.

Name	Type	Description
kdc_encryption	boolean	Specifies whether AES-128 and AES-256 encryption is enabled for all Kerberos-based communication with the Active Directory KDC. To take advantage of the strongest security with Kerberos-based communication, AES-256 and AES-128 encryption can be enabled on the CIFS server. Kerberos-related communication for CIFS is used during CIFS server creation on the SVM, as well as during the SMB session setup phase. The CIFS server supports the following encryption types for Kerberos communication: • RC4-HMAC • DES • AES When the CIFS server is created, the domain controller creates a computer machine account in Active Directory. After a newly created machine account authenticates, the KDC and the CIFS server negotiates encryption types. At this time, the KDC becomes aware of the encryption capabilities of the particular machine account and uses those capabilities in subsequent communication with the CIFS server. In addition to negotiating encryption types during CIFS server creation, the encryption types are renegotiated when a machine account password is reset.

Name	Type	Description
lm_compatibility_level	string	It is CIFS server minimum security level, also known as the LMCompatibilityLevel. The minimum security level is the minimum level of the security tokens that the CIFS server accepts from SMB clients. The available values are: • lm_ntlm_ntlmv2_krb Accepts LM, NTLM, NTLMv2 and Kerberos • ntlm_ntlmv2_krb Accepts NTLM, NTLMv2 and Kerberos • ntlmv2_krb Accepts NTLMv2 and Kerberos • krb Accepts Kerberos only
restrict_anonymous	string	Specifies what level of access an anonymous user is granted. An anonymous user (also known as a "null user") can list or enumerate certain types of system information from Windows hosts on the network, including user names and details, account policies, and share names. Access for the anonymous user can be controlled by specifying one of three access restriction settings. The available values are: • no_restriction - No access restriction for an anonymous user. • no_enumeration - Enumeration is restricted for an anonymous user. • no_access - All access is restricted for an anonymous user.
smb_encryption	boolean	Specifies whether encryption is required for incoming CIFS traffic.

Name	Type	Description
smb_signing	boolean	Specifies whether signing is required for incoming CIFS traffic. SMB signing helps to ensure that network traffic between the CIFS server and the client is not compromised.

iops_raw

The number of I/O operations observed at the storage object. This should be used along with delta time to calculate the rate of I/O operations per unit of time.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Peformance metric for write I/O operations.

latency_raw

The raw latency in microseconds observed at the storage object. This should be divided by the raw IOPS value to calculate the average latency per I/O operation.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.

Name	Type	Description
write	integer	Peformance metric for write I/O operations.

throughput_raw

Throughput bytes observed at the storage object. This should be used along with delta time to calculate the rate of throughput bytes per unit of time.

Name	Type	Description
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Peformance metric for write I/O operations.

statistics

Name	Type	Description
iops_raw	iops_raw	The number of I/O operations observed at the storage object. This should be used along with delta time to calculate the rate of I/O operations per unit of time.
latency_raw	latency_raw	The raw latency in microseconds observed at the storage object. This should be divided by the raw IOPS value to calculate the average latency per I/O operation.

Name	Type	Description
status	string	Any errors associated with the sample. For example, if the aggregation of data over multiple nodes fails then any of the partial errors might be returned, "ok" on success, or "error" on any internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.
throughput_raw	throughput_raw	Throughput bytes observed at the storage object. This should be used along with delta time to calculate the rate of throughput bytes per unit of time.
timestamp	string	The timestamp of the performance data.

svm

Name	Type	Description
_links	_links	
name	string	The name of the SVM.
uuid	string	The unique identifier of the SVM.

cifs_service

Name	Type	Description
_links	_links	

Name	Type	Description
ad_domain	ad_domain	
comment	string	A descriptive text comment for the CIFS server. SMB clients can see the CIFS server comment when browsing servers on the network. If there is a space in the comment, you must enclose the entire string in quotation marks.
default_unix_user	string	Specifies the UNIX user to which any authenticated CIFS user is mapped to, if the normal user mapping rules fails.
enabled	boolean	Specifies if the CIFS service is administratively enabled.
metric	metric	
name	string	The name of the CIFS server.
netbios	cifs_netbios	
security	cifs_service_security	
statistics	statistics	
svm	svm	

error_arguments

Name	Type	Description
code	string	Argument code
message	string	Message argument

error

Name	Type	Description
arguments	array[error_arguments]	Message arguments
code	string	Error code
message	string	Error message

Name	Type	Description
target	string	The target parameter that caused the error.

Create a CIFS server

POST `/protocols/cifs/services`

Introduced In: 9.6

Creates a CIFS server. Each SVM can have one CIFS server.

Important notes

- The CIFS server name might or might not be the same as the SVM name.
- The CIFS server name can contain up to 15 characters.
- The CIFS server name does not support the following characters: @ # * ( ) = + [ ] \| ; : " , < > / ?

Required properties

- `svm.uuid` or `svm.name` - Existing SVM in which to create the CIFS server.
- `name` - Name of the CIFS server.
- `ad_domain.fqdn` - Fully qualified domain name of the Windows Active Directory to which this CIFS server belongs.
- `ad_domain.user` - User account with the access to add the CIFS server to the Active Directory.
- `ad_domain.password` - Account password used to add this CIFS server to the Active Directory.

Recommended optional properties

- `comment` - Add a text comment of up to 48 characters about the CIFS server.
- `netbios.aliases` - Add a comma-delimited list of one or more NetBIOS aliases for the CIFS server.
- `netbios.wins_servers` - Add a list of Windows Internet Name Server (WINS) addresses that manage and map the NetBIOS name of the CIFS server to their network IP addresses. The IP addresses must be IPv4 addresses.

Default property values

If not specified in POST, the following default property values are assigned:

- `ad_domain.organizational_unit` - *CN=Computers*
- `enabled` - *true*
- `restrict_anonymous` - *no_enumeration*
- `smb_signing` - *false*
- `smb_encryption` - *false*

- `encrypt_dc_connection` - *false*

- `kdc_encryption` - *false*

- `default_unix_user` - *pcuser*

- `netbios_enabled` - *false* However, if either "netbios.wins-server" or "netbios.aliases" is set during POST and if `netbios_enabled` is not specified then `netbios_enabled` is set to true.

Related ONTAP commands

- `vserver cifs server create`

- `vserver cifs server options modify`

- `vserver cifs security modify`

- `vserver cifs server add-netbios-aliases`

Learn more

- DOC /protocols/cifs/services

Parameters

Name	Type	In	Required	Description
return_timeout	integer	query	False	The number of seconds to allow the call to execute before returning. When doing a POST, PATCH, or DELETE operation on a single record, the default is 0 seconds. This means that if an asynchronous operation is started, the server immediately returns HTTP code 202 (Accepted) along with a link to the job. If a non-zero value is specified for POST, PATCH, or DELETE operations, ONTAP waits that length of time to see if the job completes so it can return something other than 202. • Default value: 1 • Max value: 120 • Min value: 0
return_records	boolean	query	False	The default is false. If set to true, the records are returned. • Default value:

iops

The rate of I/O operations observed at the storage object.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Peformance metric for write I/O operations.

latency

The round trip latency in microseconds observed at the storage object.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Peformance metric for write I/O operations.

throughput

The rate of throughput bytes per second observed at the storage object.

Name	Type	Description
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.

Name	Type	Description
write	integer	Peformance metric for write I/O operations.

metric

Name	Type	Description
_links	_links	
duration	string	The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:
iops	iops	The rate of I/O operations observed at the storage object.
latency	latency	The round trip latency in microseconds observed at the storage object.
status	string	Any errors associated with the sample. For example, if the aggregation of data over multiple nodes fails then any of the partial errors might be returned, "ok" on success, or "error" on any internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_ delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.

Name	Type	Description
throughput	throughput	The rate of throughput bytes per second observed at the storage object.
timestamp	string	The timestamp of the performance data.

cifs_netbios

Name	Type	Description
aliases	array[string]	
enabled	boolean	Specifies whether NetBios name service (NBNS) is enabled for the CIFS. If this service is enabled, the CIFS server will start sending the broadcast for name registration.
wins_servers	array[string]	

cifs_service_security

Name	Type	Description
encrypt_dc_connection	boolean	Specifies whether encryption is required for domain controller connections.

Name	Type	Description
kdc_encryption	boolean	Specifies whether AES-128 and AES-256 encryption is enabled for all Kerberos-based communication with the Active Directory KDC. To take advantage of the strongest security with Kerberos-based communication, AES-256 and AES-128 encryption can be enabled on the CIFS server. Kerberos-related communication for CIFS is used during CIFS server creation on the SVM, as well as during the SMB session setup phase. The CIFS server supports the following encryption types for Kerberos communication: • RC4-HMAC • DES • AES When the CIFS server is created, the domain controller creates a computer machine account in Active Directory. After a newly created machine account authenticates, the KDC and the CIFS server negotiates encryption types. At this time, the KDC becomes aware of the encryption capabilities of the particular machine account and uses those capabilities in subsequent communication with the CIFS server. In addition to negotiating encryption types during CIFS server creation, the encryption types are renegotiated when a machine account password is reset.

Name	Type	Description
lm_compatibility_level	string	It is CIFS server minimum security level, also known as the LMCompatibilityLevel. The minimum security level is the minimum level of the security tokens that the CIFS server accepts from SMB clients. The available values are: • lm_ntlm_ntlmv2_krb Accepts LM, NTLM, NTLMv2 and Kerberos • ntlm_ntlmv2_krb Accepts NTLM, NTLMv2 and Kerberos • ntlmv2_krb Accepts NTLMv2 and Kerberos • krb Accepts Kerberos only
restrict_anonymous	string	Specifies what level of access an anonymous user is granted. An anonymous user (also known as a "null user") can list or enumerate certain types of system information from Windows hosts on the network, including user names and details, account policies, and share names. Access for the anonymous user can be controlled by specifying one of three access restriction settings. The available values are: • no_restriction - No access restriction for an anonymous user. • no_enumeration - Enumeration is restricted for an anonymous user. • no_access - All access is restricted for an anonymous user.
smb_encryption	boolean	Specifies whether encryption is required for incoming CIFS traffic.

Name	Type	Description
smb_signing	boolean	Specifies whether signing is required for incoming CIFS traffic. SMB signing helps to ensure that network traffic between the CIFS server and the client is not compromised.

iops_raw

The number of I/O operations observed at the storage object. This should be used along with delta time to calculate the rate of I/O operations per unit of time.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Peformance metric for write I/O operations.

latency_raw

The raw latency in microseconds observed at the storage object. This should be divided by the raw IOPS value to calculate the average latency per I/O operation.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.

Name	Type	Description
write	integer	Peformance metric for write I/O operations.

throughput_raw

Throughput bytes observed at the storage object. This should be used along with delta time to calculate the rate of throughput bytes per unit of time.

Name	Type	Description
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Peformance metric for write I/O operations.

statistics

Name	Type	Description
iops_raw	iops_raw	The number of I/O operations observed at the storage object. This should be used along with delta time to calculate the rate of I/O operations per unit of time.
latency_raw	latency_raw	The raw latency in microseconds observed at the storage object. This should be divided by the raw IOPS value to calculate the average latency per I/O operation.

Name	Type	Description
status	string	Any errors associated with the sample. For example, if the aggregation of data over multiple nodes fails then any of the partial errors might be returned, "ok" on success, or "error" on any internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.
throughput_raw	throughput_raw	Throughput bytes observed at the storage object. This should be used along with delta time to calculate the rate of throughput bytes per unit of time.
timestamp	string	The timestamp of the performance data.

svm

Name	Type	Description
_links	_links	
name	string	The name of the SVM.
uuid	string	The unique identifier of the SVM.

cifs_service

Name	Type	Description
_links	_links	

Name	Type	Description
ad_domain	ad_domain	
comment	string	A descriptive text comment for the CIFS server. SMB clients can see the CIFS server comment when browsing servers on the network. If there is a space in the comment, you must enclose the entire string in quotation marks.
default_unix_user	string	Specifies the UNIX user to which any authenticated CIFS user is mapped to, if the normal user mapping rules fails.
enabled	boolean	Specifies if the CIFS service is administratively enabled.
metric	metric	
name	string	The name of the CIFS server.
netbios	cifs_netbios	
security	cifs_service_security	
statistics	statistics	
svm	svm	

job_link

Name	Type	Description
_links	_links	
uuid	string	The UUID of the asynchronous job that is triggered by a POST, PATCH, or DELETE operation.

error_arguments

Name	Type	Description
code	string	Argument code
message	string	Message argument

error

Name	Type	Description
arguments	array[error_arguments]	Message arguments
code	string	Error code
message	string	Error message
target	string	The target parameter that caused the error.

Delete a CIFS server and related configurations

DELETE /protocols/cifs/services/{svm.uuid}

Introduced In: 9.6

Deletes a CIFS server and related CIFS configurations.

Related ONTAP commands

- `vserver cifs server delete`

- `vserver cifs remove-netbios-aliases`

Learn more

- DOC /protocols/cifs/services

Parameters

Name	Type	In	Required	Description
return_timeout	integer	query	False	The number of seconds to allow the call to execute before returning. When doing a POST, PATCH, or DELETE operation on a single record, the default is 0 seconds. This means that if an asynchronous operation is started, the server immediately returns HTTP code 202 (Accepted) along with a link to the job. If a non-zero value is specified for POST, PATCH, or DELETE operations, ONTAP waits that length of time to see if the job completes so it can return something other than 202. • Default value: 1 • Max value: 120 • Min value: 0
svm.uuid	string	path	True	UUID of the SVM to which this object belongs.

Request Body

Name	Type	Description
ad_domain	ad_domain	

Example request

```
{
  "ad_domain": {
    "fqdn": "example.com"
  }
}
```

Response

```
Status: 202, Accepted
```

Name	Type	Description
job	job_link	

Example response

```
{
  "job": {
    "_links": {
      "self": {
        "href": "/api/resourcelink"
      }
    },
    "uuid": "string"
  }
}
```

Error

```
Status: Default, Error
```

Name	Type	Description
error	error	

Example error

```json
{
  "error": {
    "arguments": {
      "code": "string",
      "message": "string"
    },
    "code": "4",
    "message": "entry doesn't exist",
    "target": "uuid"
  }
}
```

ad_domain

Name	Type	Description
fqdn	string	The fully qualified domain name of the Windows Active Directory to which this CIFS server belongs. A CIFS server appears as a member of Windows server object in the Active Directory store. POST and PATCH only.
organizational_unit	string	Specifies the organizational unit within the Active Directory domain to associate with the CIFS server. POST and PATCH only.
password	string	The account password used to add this CIFS server to the Active Directory. This is not audited.
user	string	The user account used to add this CIFS server to the Active Directory. POST and DELETE only.

cifs_service_delete

Name	Type	Description
ad_domain	ad_domain	

href

Name	Type	Description

user	string	The user account used to add this CIFS server to the Active Directory. POST and DELETE only.

iops

The rate of I/O operations observed at the storage object.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Peformance metric for write I/O operations.

latency

The round trip latency in microseconds observed at the storage object.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Peformance metric for write I/O operations.

throughput

The rate of throughput bytes per second observed at the storage object.

Name	Type	Description
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.

Name	Type	Description
write	integer	Peformance metric for write I/O operations.

metric

Name	Type	Description
_links	_links	
duration	string	The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:
iops	iops	The rate of I/O operations observed at the storage object.
latency	latency	The round trip latency in microseconds observed at the storage object.
status	string	Any errors associated with the sample. For example, if the aggregation of data over multiple nodes fails then any of the partial errors might be returned, "ok" on success, or "error" on any internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.

Name	Type	Description
throughput	throughput	The rate of throughput bytes per second observed at the storage object.
timestamp	string	The timestamp of the performance data.

cifs_netbios

Name	Type	Description
aliases	array[string]	
enabled	boolean	Specifies whether NetBios name service (NBNS) is enabled for the CIFS. If this service is enabled, the CIFS server will start sending the broadcast for name registration.
wins_servers	array[string]	

cifs_service_security

Name	Type	Description
encrypt_dc_connection	boolean	Specifies whether encryption is required for domain controller connections.

Name	Type	Description
kdc_encryption	boolean	Specifies whether AES-128 and AES-256 encryption is enabled for all Kerberos-based communication with the Active Directory KDC. To take advantage of the strongest security with Kerberos-based communication, AES-256 and AES-128 encryption can be enabled on the CIFS server. Kerberos-related communication for CIFS is used during CIFS server creation on the SVM, as well as during the SMB session setup phase. The CIFS server supports the following encryption types for Kerberos communication: • RC4-HMAC • DES • AES When the CIFS server is created, the domain controller creates a computer machine account in Active Directory. After a newly created machine account authenticates, the KDC and the CIFS server negotiates encryption types. At this time, the KDC becomes aware of the encryption capabilities of the particular machine account and uses those capabilities in subsequent communication with the CIFS server. In addition to negotiating encryption types during CIFS server creation, the encryption types are renegotiated when a machine account password is reset.

Name	Type	Description
lm_compatibility_level	string	It is CIFS server minimum security level, also known as the LMCompatibilityLevel. The minimum security level is the minimum level of the security tokens that the CIFS server accepts from SMB clients. The available values are: • lm_ntlm_ntlmv2_krb Accepts LM, NTLM, NTLMv2 and Kerberos • ntlm_ntlmv2_krb Accepts NTLM, NTLMv2 and Kerberos • ntlmv2_krb Accepts NTLMv2 and Kerberos • krb Accepts Kerberos only
restrict_anonymous	string	Specifies what level of access an anonymous user is granted. An anonymous user (also known as a "null user") can list or enumerate certain types of system information from Windows hosts on the network, including user names and details, account policies, and share names. Access for the anonymous user can be controlled by specifying one of three access restriction settings. The available values are: • no_restriction - No access restriction for an anonymous user. • no_enumeration - Enumeration is restricted for an anonymous user. • no_access - All access is restricted for an anonymous user.
smb_encryption	boolean	Specifies whether encryption is required for incoming CIFS traffic.

Name	Type	Description
smb_signing	boolean	Specifies whether signing is required for incoming CIFS traffic. SMB signing helps to ensure that network traffic between the CIFS server and the client is not compromised.

iops_raw

The number of I/O operations observed at the storage object. This should be used along with delta time to calculate the rate of I/O operations per unit of time.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Peformance metric for write I/O operations.

latency_raw

The raw latency in microseconds observed at the storage object. This should be divided by the raw IOPS value to calculate the average latency per I/O operation.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.

Name	Type	Description
write	integer	Peformance metric for write I/O operations.

throughput_raw

Throughput bytes observed at the storage object. This should be used along with delta time to calculate the rate of throughput bytes per unit of time.

Name	Type	Description
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Peformance metric for write I/O operations.

statistics

Name	Type	Description
iops_raw	iops_raw	The number of I/O operations observed at the storage object. This should be used along with delta time to calculate the rate of I/O operations per unit of time.
latency_raw	latency_raw	The raw latency in microseconds observed at the storage object. This should be divided by the raw IOPS value to calculate the average latency per I/O operation.

Name	Type	Description
status	string	Any errors associated with the sample. For example, if the aggregation of data over multiple nodes fails then any of the partial errors might be returned, "ok" on success, or "error" on any internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.
throughput_raw	throughput_raw	Throughput bytes observed at the storage object. This should be used along with delta time to calculate the rate of throughput bytes per unit of time.
timestamp	string	The timestamp of the performance data.

svm

Name	Type	Description
_links	_links	
name	string	The name of the SVM.
uuid	string	The unique identifier of the SVM.

error_arguments

Name	Type	Description
code	string	Argument code
message	string	Message argument

error

Name	Type	Description
arguments	array[error_arguments]	Message arguments
code	string	Error code
message	string	Error message
target	string	The target parameter that caused the error.

Update CIFS mandatory and optional parameters

PATCH /protocols/cifs/services/{svm.uuid}

Introduced In: 9.6

Updates both the mandatory and optional parameters of the CIFS configuration. Ensure the CIFS server is administratively disabled when renaming the CIFS server or modifying the *ad_domain* properties.

Related ONTAP commands

* vserver cifs server modify

* vserver cifs server options modify

* vserver cifs security modify

* vserver cifs server add-netbios-aliases

* vserver cifs server remove-netbios-aliases

Learn more

* DOC /protocols/cifs/services

Parameters

Name	Type	In	Required	Description
return_timeout	integer	query	False	The number of seconds to allow the call to execute before returning. When doing a POST, PATCH, or DELETE operation on a single record, the default is 0 seconds. This means that if an asynchronous operation is started, the server immediately returns HTTP code 202 (Accepted) along with a link to the job. If a non-zero value is specified for POST, PATCH, or DELETE operations, ONTAP waits that length of time to see if the job completes so it can return something other than 202. • Default value: 1 • Max value: 120 • Min value: 0
svm.uuid	string	path	True	UUID of the SVM to which this object belongs.

Request Body

Name	Type	Description
_links	_links	
ad_domain	ad_domain	

Name	Type	Description
comment	string	A descriptive text comment for the CIFS server. SMB clients can see the CIFS server comment when browsing servers on the network. If there is a space in the comment, you must enclose the entire string in quotation marks.
default_unix_user	string	Specifies the UNIX user to which any authenticated CIFS user is mapped to, if the normal user mapping rules fails.
enabled	boolean	Specifies if the CIFS service is administratively enabled.
metric	metric	
name	string	The name of the CIFS server.

_links

Name	Type	Description
self	href	

ad_domain

Name	Type	Description
fqdn	string	The fully qualified domain name of the Windows Active Directory to which this CIFS server belongs. A CIFS server appears as a member of Windows server object in the Active Directory store. POST and PATCH only.
organizational_unit	string	Specifies the organizational unit within the Active Directory domain to associate with the CIFS server. POST and PATCH only.
password	string	The account password used to add this CIFS server to the Active Directory. This is not audited.
user	string	The user account used to add this CIFS server to the Active Directory. POST and DELETE only.

iops

The rate of I/O operations observed at the storage object.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Peformance metric for write I/O operations.

latency

The round trip latency in microseconds observed at the storage object.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Peformance metric for write I/O operations.

throughput

The rate of throughput bytes per second observed at the storage object.

Name	Type	Description
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.

Name	Type	Description
write	integer	Peformance metric for write I/O operations.

metric

Name	Type	Description
_links	_links	
duration	string	The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:
iops	iops	The rate of I/O operations observed at the storage object.
latency	latency	The round trip latency in microseconds observed at the storage object.
status	string	Any errors associated with the sample. For example, if the aggregation of data over multiple nodes fails then any of the partial errors might be returned, "ok" on success, or "error" on any internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.

Name	Type	Description
throughput	throughput	The rate of throughput bytes per second observed at the storage object.
timestamp	string	The timestamp of the performance data.

cifs_netbios

Name	Type	Description
aliases	array[string]	
enabled	boolean	Specifies whether NetBios name service (NBNS) is enabled for the CIFS. If this service is enabled, the CIFS server will start sending the broadcast for name registration.
wins_servers	array[string]	

cifs_service_security

Name	Type	Description
encrypt_dc_connection	boolean	Specifies whether encryption is required for domain controller connections.

Name	Type	Description
kdc_encryption	boolean	Specifies whether AES-128 and AES-256 encryption is enabled for all Kerberos-based communication with the Active Directory KDC. To take advantage of the strongest security with Kerberos-based communication, AES-256 and AES-128 encryption can be enabled on the CIFS server. Kerberos-related communication for CIFS is used during CIFS server creation on the SVM, as well as during the SMB session setup phase. The CIFS server supports the following encryption types for Kerberos communication: • RC4-HMAC • DES • AES When the CIFS server is created, the domain controller creates a computer machine account in Active Directory. After a newly created machine account authenticates, the KDC and the CIFS server negotiates encryption types. At this time, the KDC becomes aware of the encryption capabilities of the particular machine account and uses those capabilities in subsequent communication with the CIFS server. In addition to negotiating encryption types during CIFS server creation, the encryption types are renegotiated when a machine account password is reset.

Name	Type	Description
lm_compatibility_level	string	It is CIFS server minimum security level, also known as the LMCompatibilityLevel. The minimum security level is the minimum level of the security tokens that the CIFS server accepts from SMB clients. The available values are: • lm_ntlm_ntlmv2_krb Accepts LM, NTLM, NTLMv2 and Kerberos • ntlm_ntlmv2_krb Accepts NTLM, NTLMv2 and Kerberos • ntlmv2_krb Accepts NTLMv2 and Kerberos • krb Accepts Kerberos only
restrict_anonymous	string	Specifies what level of access an anonymous user is granted. An anonymous user (also known as a "null user") can list or enumerate certain types of system information from Windows hosts on the network, including user names and details, account policies, and share names. Access for the anonymous user can be controlled by specifying one of three access restriction settings. The available values are: • no_restriction - No access restriction for an anonymous user. • no_enumeration - Enumeration is restricted for an anonymous user. • no_access - All access is restricted for an anonymous user.
smb_encryption	boolean	Specifies whether encryption is required for incoming CIFS traffic.

Name	Type	Description
smb_signing	boolean	Specifies whether signing is required for incoming CIFS traffic. SMB signing helps to ensure that network traffic between the CIFS server and the client is not compromised.

iops_raw

The number of I/O operations observed at the storage object. This should be used along with delta time to calculate the rate of I/O operations per unit of time.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Peformance metric for write I/O operations.

latency_raw

The raw latency in microseconds observed at the storage object. This should be divided by the raw IOPS value to calculate the average latency per I/O operation.

Name	Type	Description
other	integer	Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.

Name	Type	Description
write	integer	Peformance metric for write I/O operations.

throughput_raw

Throughput bytes observed at the storage object. This should be used along with delta time to calculate the rate of throughput bytes per unit of time.

Name	Type	Description
read	integer	Performance metric for read I/O operations.
total	integer	Performance metric aggregated over all types of I/O operations.
write	integer	Peformance metric for write I/O operations.

statistics

Name	Type	Description
iops_raw	iops_raw	The number of I/O operations observed at the storage object. This should be used along with delta time to calculate the rate of I/O operations per unit of time.
latency_raw	latency_raw	The raw latency in microseconds observed at the storage object. This should be divided by the raw IOPS value to calculate the average latency per I/O operation.

Name	Type	Description
status	string	Any errors associated with the sample. For example, if the aggregation of data over multiple nodes fails then any of the partial errors might be returned, "ok" on success, or "error" on any internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.
throughput_raw	throughput_raw	Throughput bytes observed at the storage object. This should be used along with delta time to calculate the rate of throughput bytes per unit of time.
timestamp	string	The timestamp of the performance data.

svm

Name	Type	Description
_links	_links	
name	string	The name of the SVM.
uuid	string	The unique identifier of the SVM.

cifs_service

Name	Type	Description
_links	_links	

Name	Type	Description
ad_domain	ad_domain	
comment	string	A descriptive text comment for the CIFS server. SMB clients can see the CIFS server comment when browsing servers on the network. If there is a space in the comment, you must enclose the entire string in quotation marks.
default_unix_user	string	Specifies the UNIX user to which any authenticated CIFS user is mapped to, if the normal user mapping rules fails.
enabled	boolean	Specifies if the CIFS service is administratively enabled.
metric	metric	
name	string	The name of the CIFS server.
netbios	cifs_netbios	
security	cifs_service_security	
statistics	statistics	
svm	svm	

job_link

Name	Type	Description
_links	_links	
uuid	string	The UUID of the asynchronous job that is triggered by a POST, PATCH, or DELETE operation.

error_arguments

Name	Type	Description
code	string	Argument code
message	string	Message argument

error

Name	Type	Description
arguments	array[error_arguments]	Message arguments
code	string	Error code
message	string	Error message
target	string	The target parameter that caused the error.

Retrieve CIFS protocol historical performance metrics for an SVM

GET `/protocols/cifs/services/{svm.uuid}/metrics`

Introduced In: 9.7

Retrieves historical performance metrics for the CIFS protocol of an SVM.

Parameters

Name	Type	In	Required	Description
timestamp	string	query	False	Filter by timestamp
status	string	query	False	Filter by status
throughput.total	integer	query	False	Filter by throughput.total
throughput.other	integer	query	False	Filter by throughput.other
throughput.read	integer	query	False	Filter by throughput.read
throughput.write	integer	query	False	Filter by throughput.write
iops.total	integer	query	False	Filter by iops.total
iops.other	integer	query	False	Filter by iops.other
iops.read	integer	query	False	Filter by iops.read
iops.write	integer	query	False	Filter by iops.write

Name	Type	In	Required	Description
latency.total	integer	query	False	Filter by latency.total
latency.other	integer	query	False	Filter by latency.other
latency.read	integer	query	False	Filter by latency.read
latency.write	integer	query	False	Filter by latency.write
duration	string	query	False	Filter by duration
svm.uuid	string	path	True	Unique identifier of the SVM.

Name	Type	In	Required	Description
interval	string	query	False	The time range for the data. Examples can be 1h, 1d, 1m, 1w, 1y. The period for each time range is as follows:
				• 1h: Metrics over the most recent hour sampled over 15 seconds.
				• 1d: Metrics over the most recent day sampled over 5 minutes.
				• 1w: Metrics over the most recent week sampled over 30 minutes.
				• 1m: Metrics over the most recent month sampled over 2 hours.
				• 1y: Metrics over the most recent year sampled over a day.
				• Default value: 1
				• enum: ["1h", "1d", "1w", "1m", "1y"]

Name	Type	In	Required	Description
return_timeout	integer	query	False	The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached. • Default value: 1 • Max value: 120 • Min value: 0
fields	array[string]	query	False	Specify the fields to return.
max_records	integer	query	False	Limit the number of records returned.
order_by	array[string]	query	False	Order results by specified fields and optional [asc
desc] direction. Default direction is 'asc' for ascending.	return_records	boolean	query	False

Response

```
Status: 200, Ok
```

Name	Type	Description
_links	_links	
num_records	integer	Number of records
records	array[records]	

Example response

```json
{
  "_links": {
    "next": {
      "href": "/api/resourcelink"
    },

View CIFS active sessions

Protocols CIFS sessions endpoint overview

Overview

ONTAP CIFS sessions `show` functionality is used to provide a list of currently established CIFS sessions with SMB Clients.

Information on the CIFS session

- List all the SMB sessions for SVM and the clients along with volume information on which the clients are using.

Example

Retrieves established sessions information

To retrieve the list of CIFS sessions, use the following API. Note that *return_records=true*.

```
# The API:
GET /protocols/cifs/sessions

# The call:
curl -X GET "https://<cluster-mgmt-
ip>/api/protocols/cifs/sessions?return_timeout=15&return_records=true" -H
```

```
"accept: application/json"

# The response:

Removing all existing CIFS sessions for a specific node on a specific SVM

To delete all the existing CIFS session, pass the identifier and connection ID as zero (0) in the following API. This will delete all of the CIFS sessions for the given SVM on the node.

```
# The API:
DELETE
/protocols/cifs/sessions/{node.uuid}/{svm.uuid}/{identifier}/{connection_id}

# The call:
curl -X DELETE "https://<cluster-mgmt-ip>/api/protocols/cifs/sessions/85d46998-4e5d-11ea-afb1-0050568ec4e4/fc824aa8-4e60-11ea-afb1-0050568ec4e4/0/0" -H "accept: application/json" -H "authorization: Basic YWRtaW46bmV0YXBwMSE="
```

Removing all CIFS sessions for a specific connection on a specific node on a specific SVM

To delete a CIFS session, use the following API. This will delete the CIFS sessions for a given SVM on the node.

```
# The API:
DELETE
/protocols/cifs/sessions/{node.uuid}/{svm.uuid}/{identifier}/{connection_i
d}

# The call:
curl -X DELETE "https://<cluster-mgmt-
ip>/api/protocols/cifs/sessions/85d46998-4e5d-11ea-afb1-

```

Removing a specific CIFS session for a specific Node on a specific SVM

To delete a specific CIFS session, use the following API. This will delete the specific CIFS session for the given SVM on the node.

```
# The API:
DELETE
/protocols/cifs/sessions/{node.uuid}/{svm.uuid}/{identifier}/{connection_i
d}

# The call:
curl -X DELETE "https://<cluster-mgmt-
ip>/api/protocols/cifs/sessions/85d46998-4e5d-11ea-afb1-
0050568ec4e4/fc824aa8-4e60-11ea-afb1-
0050568ec4e4/625718873227788300/91842" -H "accept: application/json" -H
"authorization: Basic YWRtaW46bmV0YXBwMSE="
```

Retrieve CIFS session information for all SVMs

GET `/protocols/cifs/sessions`

Introduced In: 9.8

Retrieves the CIFS sessions information for all SVMs.

Related ONTAP commands

- `vserver cifs session show -active-volumes`

* DOC /protocols/cifs/sessions

Parameters

Name	Type	In	Required	Description
client_ip	string	query	False	Filter by client_ip
open_other	integer	query	False	Filter by open_other
node.name	string	query	False	Filter by node.name
node.uuid	string	query	False	Filter by node.uuid
large_mtu	boolean	query	False	Filter by large_mtu
idle_duration	string	query	False	Filter by idle_duration
connection_count	integer	query	False	Filter by connection_count
mapped_unix_user	string	query	False	Filter by mapped_unix_user
identifier	integer	query	False	Filter by identifier
continuous_availability	string	query	False	Filter by continuous_availability
smb_encryption	string	query	False	Filter by smb_encryption
open_files	integer	query	False	Filter by open_files
smb_signing	boolean	query	False	Filter by smb_signing
volumes.name	string	query	False	Filter by volumes.name
volumes.uuid	string	query	False	Filter by volumes.uuid

Name	Type	In	Required	Description
connected_duration	string	query	False	Filter by connected_duration
authentication	string	query	False	Filter by authentication
svm.uuid	string	query	False	Filter by svm.uuid
svm.name	string	query	False	Filter by svm.name
server_ip	string	query	False	Filter by server_ip
user	string	query	False	Filter by user
connection_id	integer	query	False	Filter by connection_id
open_shares	integer	query	False	Filter by open_shares
protocol	string	query	False	Filter by protocol
fields	array[string]	query	False	Specify the fields to return.
max_records	integer	query	False	Limit the number of records returned.
return_timeout	integer	query	False	The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached. • Default value: 1 • Max value: 120 • Min value: 0

Name	Type	In	Required	Description
return_records	boolean	query	False	The default is true for GET calls. When set to false, only the number of records is returned. • Default value: 1
order_by	array[string]	query	False	Order results by specified fields and optional [asc

Name	Type	Description
uuid	string	Unique identifier for the volume. This corresponds to the instance-uuid that is exposed in the CLI and ONTAPI. It does not change due to a volume move. • example: 028baa66-41bd-11e9-81d5-00a0986138f7

cifs_session

Name	Type	Description
_links	_links	
authentication	string	SMB authentication over which the client accesses the share. The following values are supported: • none - No authentication • ntlmv1 - Ntlm version 1 mechanism • ntlmv2 - Ntlm version 2 mechanism • kerberos - Kerberos authentication • anonymous - Anonymous mechanism
client_ip	string	Specifies IP address of the client.
connected_duration	string	Specifies an ISO-8601 format of date and time used to retrieve the connected time duration in hours, minutes, and seconds format.
connection_count	integer	A counter used to track requests that are sent to the volumes to the node.
connection_id	integer	A unique 32-bit unsigned number used to represent each SMB session's connection ID.

Name	Type	Description
continuous_availability	string	The level of continuous availabilty protection provided to the SMB sessions and/or files. • unavailable - Open file is not continuously available. For sessions, it contains one or more open files but none of them are continuously available. • available - open file is continuously available. For sessions, it contains one or more open files and all of them are continuously available. • partial - Sessions only. Contains at least one continuously available open file with other files open but not continuously available.
identifier	integer	A unique 64-bit unsigned number used to represent each SMB session's identifier.
idle_duration	string	Specifies an ISO-8601 format of date and time used to retrieve the idle time duration in hours, minutes, and seconds format.
large_mtu	boolean	Specifies whether the large MTU is enabled or not for an SMB session.
mapped_unix_user	string	Indicated that a mapped UNIX user has logged in.
node	node	
open_files	integer	Number of files the SMB session has opened.
open_other	integer	Number of other files the SMB session has opened.
open_shares	integer	Number of shares the SMB session has opened.

Name	Type	Description
protocol	string	The SMB protocol version over which the client accesses the volumes. The following values are supported: • smb1 - SMB version 1 • smb2 - SMB version 2 • smb2_1 - SMB version 2 minor version 1 • smb3 - SMB version 3 • smb3_1 - SMB version 3 minor version 1
server_ip	string	Specifies the IP address of the SVM.
smb_encryption	string	Indicates an SMB encryption state. The following values are supported: • unencrypted - SMB session is not encrypted • encrypted - SMB session is fully encrypted. SVM level encryption is enabled and encryption occurs for the entire session. • partially_encrypted - SMB session is partially encrypted. Share level encryption is enabled and encryption is initiated when the tree-connect occurs.
smb_signing	boolean	Specifies whether or not SMB signing is enabled.
svm	svm	
user	string	Indicates that a Windows user has logged in.
volumes	array[volumes]	A group of volumes, the client is accessing.

error_arguments

target	string	The target parameter that caused the error.

Delete SMB session information for an SVM node

DELETE
/protocols/cifs/sessions/{node.uuid}/{svm.uuid}/{identifier}/{connection_id}

Introduced In: 9.9

Deletes SMB session information on a node for an SVM.

- To delete the specific SMB session information, pass the relavant SMB session's identifier and connection Id.
- To delete all the SMB session information on specific connection, pass the specific SMB session's Identifier value as zero(0).
- To delete all the SMB session information, pass the specific session's identifier and connection Id values as zero(0).
- To delete all the SMB session information on specific Identifier alone is not allowed.

Manage CIFS shares

Protocols CIFS shares endpoint overview

Overview

Before any users or applications can access data on the CIFS server over SMB, a CIFS share must be created with sufficient share permissions. CIFS share is a named access point in a volume which is tied to the CIFS server on the SVM. Before creating a CIFS share make sure that the path is valid within the scope of the SVM and that it is reachable.

Permissions can be assigned to this newly created share by specifying the 'acls' field. When a CIFS share is created, ONTAP creates a default ACL for this share with 'Full-Control' permissions for an 'Everyone' user.

Examples

Creating a CIFS share

To create a CIFS share for a CIFS server, use the following API. Note the *return_records=true* query parameter used to obtain the newly created entry in the response.

```
# The API:
POST /api/protocols/cifs/shares

# The call:
curl -X POST "https://<mgmt-
ip>/api/protocols/cifs/shares?return_records=true" -H "accept:
application/json" -H "Content-Type: application/json" -d "{
\"access_based_enumeration\": false, \"acls\": [ { \"permission\":
\"no_access\", \"type\": \"unix_user\", \"user_or_group\": \"root\" } ],
\"change_notify\": true, \"comment\": \"HR Department Share\",
\"encryption\": false, \"home_directory\": false, \"name\": \"TEST\",
\"oplocks\": true, \"no_strict_security\": true, \"path\": \"/\", \"svm\":
{ \"name\": \"vs1\", \"uuid\": \"000c5cd2-ebdf-11e8-a96e-0050568ea3cb\" },
\"unix_symlink\": \"local\"}"

# The response:

  {
    "user_or_group": "Everyone",
    "type": "windows",
    "permission": "full_control"
  },
  {
    "user_or_group": "root",
    "type": "unix_user",
    "permission": "no_access"
  }
],
"volume": {
  "name": "vol1",
  "uuid": "4e06f1bc-1ddc-42e2-abb2-f221c6a2ab2a"
}
}
```

Updating a specific CIFS share for an SVM

The CIFS share being modified is identified by the UUID of its SVM and the CIFS share name. The CIFS share
ACLs cannot be modified with this API.

```
# The API:
PATCH /api/protocols/cifs/shares/{svm.uuid}/{name}

# The call:
 curl -X PATCH "https://<mgmt-ip>/api/protocols/cifs/shares/000c5cd2-ebdf-
11e8-a96e-0050568ea3cb/TEST" -H "accept: application/json" -H "Content-
Type: application/json" -d "{ \"access_based_enumeration\": true,
\"change_notify\": true, \"comment\": \"HR Department Share\",
\"encryption\": false, \"oplocks\": true, \"no_strict_security\": true,
\"path\": \"/\", \"unix_symlink\": \"widelink\"}"
```

Removing a specific CIFS share for an SVM

The CIFS share being removed is identified by the UUID of its SVM and the CIFS share name.

```
# The API:
DELETE /api/protocols/cifs/shares/{svm.uuid}/{name}

# The call:
curl -X DELETE "https://<mgmt-ip>/api/protocols/cifs/shares/000c5cd2-ebdf-
11e8-a96e-0050568ea3cb/test" -H "accept: application/json"
```

Retrieve CIFS shares

GET `/protocols/cifs/shares`

Introduced In: 9.6

Retrieves CIFS shares.

Parameters

Name	Type	In	Required	Description
path	string	query	False	Filter by path

Name	Type	In	Required	Description
change_notify	boolean	query	False	Filter by change_notify
unix_symlink	string	query	False	Filter by unix_symlink
volume.name	string	query	False	Filter by volume.name
volume.uuid	string	query	False	Filter by volume.uuid
no_strict_security	boolean	query	False	Filter by no_strict_security • Introduced in: 9.9
name	string	query	False	Filter by name
acls.type	string	query	False	Filter by acls.type
acls.permission	string	query	False	Filter by acls.permission
acls.user_or_group	string	query	False	Filter by acls.user_or_group
access_based_enumeration	boolean	query	False	Filter by access_based_enumeration
svm.uuid	string	query	False	Filter by svm.uuid
svm.name	string	query	False	Filter by svm.name
home_directory	boolean	query	False	Filter by home_directory
oplocks	boolean	query	False	Filter by oplocks
encryption	boolean	query	False	Filter by encryption
comment	string	query	False	Filter by comment

Name	Type	In	Required	Description
fields	array[string]	query	False	Specify the fields to return.
max_records	integer	query	False	Limit the number of records returned.
return_records	boolean	query	False	The default is true for GET calls. When set to false, only the number of records is returned. • Default value: 1
return_timeout	integer	query	False	The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached. • Default value: 1 • Max value: 120 • Min value: 0
order_by	array[string]	query	False	Order results by specified fields and optional [asc

volume

Name	Type	Description
_links	_links	
name	string	The name of the volume.
uuid	string	Unique identifier for the volume. This corresponds to the instance-uuid that is exposed in the CLI and ONTAPI. It does not change due to a volume move. • example: 028baa66-41bd-11e9-81d5-00a0986138f7 • Introduced in: 9.6

cifs_share

CIFS share is a named access point in a volume. Before users and applications can access data on the CIFS server over SMB, a CIFS share must be created with sufficient share permission. CIFS shares are tied to the CIFS server on the SVM. When a CIFS share is created, ONTAP creates a default ACL for the share with Full Control permissions for Everyone.

Name	Type	Description
_links	_links	
access_based_enumeration	boolean	If enabled, all folders inside this share are visible to a user based on that individual user access right; prevents the display of folders or other shared resources that the user does not have access to.
acls	array[acls]	
change_notify	boolean	Specifies whether CIFS clients can request for change notifications for directories on this share.
comment	string	Specify the CIFS share descriptions.
encryption	boolean	Specifies that SMB encryption must be used when accessing this share. Clients that do not support encryption are not able to access this share.

Name	Type	Description
home_directory	boolean	Specifies whether or not the share is a home directory share, where the share and path names are dynamic. ONTAP home directory functionality automatically offer each user a dynamic share to their home directory without creating an individual SMB share for each user. The ONTAP CIFS home directory feature enable us to configure a share that maps to different directories based on the user that connects to it. Instead of creating a separate shares for each user, a single share with a home directory parameters can be created. In a home directory share, ONTAP dynamically generates the share-name and share-path by substituting %w, %u, and %d variables with the corresponding Windows user name, UNIX user name, and domain name, respectively. • Default value: • Introduced in: 9.6 • readCreate: 1
name	string	Specifies the name of the CIFS share that you want to create. If this is a home directory share then the share name includes the pattern as %w (Windows user name), %u (UNIX user name) and %d (Windows domain name) variables in any combination with this parameter to generate shares dynamically.
no_strict_security	boolean	Specifies whether or not CIFS clients can follow a unix symlinks outside the share boundaries.

Name	Type	Description
oplocks	boolean	Specify whether opportunistic locks are enabled on this share. "Oplocks" allow clients to lock files and cache content locally, which can increase performance for file operations.
path	string	The fully-qualified pathname in the owning SVM namespace that is shared through this share. If this is a home directory share then the path should be dynamic by specifying the pattern %w (Windows user name), %u (UNIX user name), or %d (domain name) variables in any combination. ONTAP generates the path dynamically for the connected user and this path is appended to each search path to find the full Home Directory path. • example: /volume_1/eng_vol/ • maxLength: 256 • minLength: 1 • Introduced in: 9.6
svm	svm	
unix_symlink	string	Controls the access of UNIX symbolic links to CIFS clients. The supported values are: • local - Enables only local symbolic links which is within the same CIFS share. • widelink - Enables both local symlinks and widelinks. • disable - Disables local symlinks and widelinks.
volume	volume

Create a CIFS share

POST `/protocols/cifs/shares`

Introduced In: 9.6

Creates a CIFS share.

Required properties

- `svm.uuid` or `svm.name` - Existing SVM in which to create the CIFS share.
- `name` - Name of the CIFS share.
- `path` - Path in the owning SVM namespace that is shared through this share.

Recommended optional properties

- `comment` - Optionally choose to add a text comment of up to 256 characters about the CIFS share.
- `acls` - Optionally choose to add share permissions that users and groups have on the CIFS share.

Default property values

If not specified in POST, the following default property values are assigned:

- `home_directory` - *false*
- `oplocks` - *true*
- `access_based_enumeration` - *false*
- `change_notify` - *true*
- `encryption` - *false*

- `unix_symlink` - *local*

Related ONTAP commands

- `vserver cifs share create`
- `vserver cifs share properties add`
- `vserver cifs share access-control create`

Parameters

Name	Type	In	Required	Description
name	string	path	True	Share Name

Name	Type	In	Required	Description
svm.uuid	string	path	True	UUID of the SVM to which this object belongs.
fields	array[string]	query	False	Specify the fields to return.

Response

```
Status: 200, Ok
```

Name	Type	Description
_links	_links	
access_based_enumeration	boolean	If enabled, all folders inside this share are visible to a user based on that individual user access right; prevents the display of folders or other shared resources that the user does not have access to.
acls	array[acls]	
change_notify	boolean	Specifies whether CIFS clients can request for change notifications for directories on this share.
comment	string	Specify the CIFS share descriptions.
encryption	boolean	Specifies that SMB encryption must be used when accessing this share. Clients that do not support encryption are not able to access this share.

Name	Type	Description
home_directory	boolean	Specifies whether or not the share is a home directory share, where the share and path names are dynamic. ONTAP home directory functionality automatically offer each user a dynamic share to their home directory without creating an individual SMB share for each user. The ONTAP CIFS home directory feature enable us to configure a share that maps to different directories based on the user that connects to it. Instead of creating a separate shares for each user, a single share with a home directory parameters can be created. In a home directory share, ONTAP dynamically generates the share-name and share-path by substituting %w, %u, and %d variables with the corresponding Windows user name, UNIX user name, and domain name, respectively. • Default value: 1 • Introduced in: 9.6 • readCreate: 1
name	string	Specifies the name of the CIFS share that you want to create. If this is a home directory share then the share name includes the pattern as %w (Windows user name), %u (UNIX user name) and %d (Windows domain name) variables in any combination with this parameter to generate shares dynamically.
no_strict_security	boolean	Specifies whether or not CIFS clients can follow a unix symlinks outside the share boundaries.

Name	Type	Description
oplocks	boolean	Specify whether opportunistic locks are enabled on this share. "Oplocks" allow clients to lock files and cache content locally, which can increase performance for file operations.
path	string	The fully-qualified pathname in the owning SVM namespace that is shared through this share. If this is a home directory share then the path should be dynamic by specifying the pattern %w (Windows user name), %u (UNIX user name), or %d (domain name) variables in any combination. ONTAP generates the path dynamically for the connected user and this path is appended to each search path to find the full Home Directory path. • example: /volume_1/eng_vol/ • maxLength: 256 • minLength: 1 • Introduced in: 9.6
svm	svm	
unix_symlink	string	Controls the access of UNIX symbolic links to CIFS clients. The supported values are: • local - Enables only local symbolic links which is within the same CIFS share. • widelink - Enables both local symlinks and widelinks. • disable - Disables local symlinks and widelinks.
volume	volume

cifs_share

CIFS share is a named access point in a volume. Before users and applications can access data on the CIFS server over SMB, a CIFS share must be created with sufficient share permission. CIFS shares are tied to the CIFS server on the SVM. When a CIFS share is created, ONTAP creates a default ACL for the share with Full Control permissions for Everyone.

Name	Type	Description
_links	_links	
access_based_enumeration	boolean	If enabled, all folders inside this share are visible to a user based on that individual user access right; prevents the display of folders or other shared resources that the user does not have access to.
acls	array[acls]

Manage share-level ACL

Protocols CIFS shares svm.uuid share acls endpoint overview

Overview

Access to files and folders can be secured over a network by configuring share access control lists (ACLs) on CIFS shares. Share-level ACLs can be configured by using either Windows users and groups or UNIX users and groups. A share-level ACL consists of a list of access control entries (ACEs). Each ACE contains a user or group name and a set of permissions that determines user or group access to the share, regardless of the security style of the volume or qtree containing the share.

When an SMB user tries to access a share, ONTAP checks the share-level ACL to determine whether access should be granted. A share-level ACL only restricts access to files in the share; it never grants more access than the file level ACLs.

Examples

Creating a CIFS share ACL

To create a share ACL for a CIFS share, use the following API. Note the *return_records=true* query parameter used to obtain the newly created entry in the response.

```
# The API:
POST /api/protocols/cifs/shares{svm.uuid}/{share}/acls

# The call:
curl -X POST "https://<mgmt-ip>/api/protocols/cifs/shares/000c5cd2-ebdf-
11e8-a96e-0050568ea3cb/sh1/acls?return_records=true" -H "accept:
application/json" -H "Content-Type: application/json" -d "{
\"permission\": \"no_access\", \"type\": \"windows\", \"user_or_group\":
\"root\"}"

# The response:
{
"num_records": 1,
"records": [
  {
    "svm": {
      "name": "vs1"
    },
    "user_or_group": "root",
    "type": "windows",
    "permission": "no_access"
  }
]
}
```

Retrieving all CIFS shares ACLs for a specific CIFS share for a specific SVM in the cluster

```
# The API:
GET /api/protocols/cifs/shares/{svm.uuid}/{share}/acls

# The call:
curl -X GET "https://<mgmt-ip>/api/protocols/cifs/shares/000c5cd2-ebdf-
11e8-a96e-
0050568ea3cb/sh1/acls?fields=*&return_records=true&return_timeout=15" -H
"accept: application/json"

# The response:
{
"records": [
  {
    "svm": {
      "uuid": "000c5cd2-ebdf-11e8-a96e-0050568ea3cb",
      "name": "vs1"
    },
    "share": "sh1",
    "user_or_group": "Everyone",
    "type": "windows",
    "permission": "full_control"
  },
  {
    "svm": {
      "uuid": "000c5cd2-ebdf-11e8-a96e-0050568ea3cb",
      "name": "vs1"
    },
    "share": "sh1",
    "user_or_group": "root",
    "type": "windows",
    "permission": "no_access"
  }
],
"num_records": 2
}
```

Retrieving a CIFS share ACLs for a user or a group of type Windows or type UNIX on a CIFS share for a specific SVM

```
# The API:
GET
/api/protocols/cifs/shares/{svm.uuid}/{share}/acls/{user_or_group}/{type}

# The call:
curl -X GET "https://<mgmt-ip>/api/protocols/cifs/shares/000c5cd2-ebdf-
11e8-a96e-0050568ea3cb/sh1/acls/everyone/windows" -H "accept:
application/json"

# The response:
{
"svm": {
   "uuid": "000c5cd2-ebdf-11e8-a96e-0050568ea3cb",
   "name": "vs1"
},
"share": "sh1",
"user_or_group": "everyone",
"type": "windows",
"permission": "full_control"
}
```

Updating a CIFS share ACLs of a user or group on a CIFS share for a specific SVM

The CIFS share ACL being modified is identified by the UUID of its SVM, the CIFS share name, user or group name and the type of the user or group.

```
# The API:
PATCH
/api/protocols/cifs/shares/{svm.uuid}/{share}/acls/{user_or_group}/{type}

# The call:
curl -X PATCH "https://<mgmt-ip>/api/protocols/cifs/shares/000c5cd2-ebdf-
11e8-a96e-0050568ea3cb/sh1/acls/everyone/windows" -H "accept:
application/json" -H "Content-Type: application/json" -d "{
\"permission\": \"no_access\"}"
```

Removing a CIFS share ACLs of a user or group on a CIFS Share for a specific SVM

The CIFS share ACL being removed is identified by the UUID of its SVM, the CIFS share name, user or group name and the type of the user or group.

```
# The API:
DELETE
/api/protocols/cifs/shares/{svm.uuid}/{share}/acls/{user_or_group}/{type}

# The call:
curl -X DELETE "https://<mgmt-ip>/api/protocols/cifs/shares/000c5cd2-ebdf-
11e8-a96e-0050568ea3cb/sh1/acls/everyone/windows" -H "accept:
application/json"
```

Retrieve a share-level ACL on a CIFS share

GET /protocols/cifs/shares/{svm.uuid}/{share}/acls

Introduced In: 9.6

Retrieves the share-level ACL on a CIFS share.

Related ONTAP commands

- `vserver cifs share access-control show`

- DOC /protocols/cifs/shares/{svm.uuid}/{share}/acls

Parameters

Name	Type	In	Required	Description
share	string	path	True	CIFS Share Name
permission	string	query	False	Filter by permission
user_or_group	string	query	False	Filter by user_or_group
type	string	query	False	Filter by type
svm.uuid	string	query	False	Filter by svm.uuid • Introduced in: 9.9

Name	Type	In	Required	Description
svm.name	string	query	False	Filter by svm.name • Introduced in: 9.9
svm.uuid	string	path	True	UUID of the SVM to which this object belongs.
fields	array[string]	query	False	Specify the fields to return.
max_records	integer	query	False	Limit the number of records returned.
return_records	boolean	query	False	The default is true for GET calls. When set to false, only the number of records is returned. • Default value: 1
return_timeout	integer	query	False	The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached. • Default value: 1 • Max value: 120 • Min value: 0
order_by	array[string]	query	False	Order results by specified fields and optional [asc

Create a share-level ACL on a CIFS share

POST `/protocols/cifs/shares/{svm.uuid}/{share}/acls`

Introduced In: 9.6

Creates a share-level ACL on a CIFS share.

Required properties

* `svm.uuid` or `svm.name` - Existing SVM in which to create the share acl.
* `share` - Existing CIFS share in which to create the share acl.
* `user_or_group` - Existing user or group name for which the acl is added on the CIFS share.
* `permission` - Access rights that a user or group has on the defined CIFS share.

Default property values

* `type` - *windows*

Related ONTAP commands

Parameters

Name	Type	In	Required	Description
share	string	path	True	CIFS Share Name
return_records	boolean	query	False	The default is false. If set to true, the records are returned. • Default value:

Name	Type	In	Required	Description
svm.uuid	string	path	True	UUID of the SVM to which this object belongs.

Request Body

Name	Type	Description
_links	_links	
permission	string	Specifies the access rights that a user or group has on the defined CIFS Share. The following values are allowed: • no_access - User does not have CIFS share access • read - User has only read access • change - User has change access • full_control - User has full_control access
share	string	CIFS share name
svm	svm	
type	string	Specifies the type of the user or group to add to the access control list of a CIFS share. The following values are allowed: • windows - Windows user or group • unix_user - UNIX user • unix_group - UNIX group
user_or_group	string	Specifies the user or group name to add to the access control list of a CIFS share.

Example request

```json
{
  "_links": {
    "self": {
      "href": "/api/resourcelink"
    }
  },
  "permission": "no_access",
  "share": "string",
  "svm": {
    "_links": {
      "self": {
        "href": "/api/resourcelink"
      }
    },
    "name": "svm1",
    "uuid": "02c9e252-41be-11e9-81d5-00a0986138f7"
  },
  "type": "windows",
  "user_or_group": "ENGDOMAIN\\ad_user"
}
```

Response

```
Status: 201, Created
```

Error

```
Status: Default
```

ONTAP Error Response Codes

Manage CIFS UNIX symlink mapping

Protocols CIFS unix-symlink-mapping endpoint overview

Overview

ONTAP allows both CIFS and NFS to access the same datastore. This datastore can contain symbolic links which are files, created by UNIX clients. It contains a reference to another file or directory. If an SMB client accesses a symbolic link, it is redirected to the target file or directory that the symbolic link refers to. The symbolic links can point to files within the volume that contain the share, or to files that are contained in other

volumes on the Storage Virtual Machine (SVM), or even to volumes contained on other SVMs.

There are two types of symbolic links:

Relative A relative symbolic link contains a reference to the file or directory relative to its parent directory. Therefore, the path of the file it is referring to should not begin with a backslash (/). If you enable symbolic links on a share, relative symbolic links work without UNIX symlink mapping.

Absolute An absolute symbolic link contains a reference to a file or directory in the form of an absolute path. Therefore, the path of the file it is referring to should begin with a backslash (/). An absolute symbolic link can refer to a file or directory within or outside of the file system of the symbolic link. If the target is not in the same local file system, the symbolic link is called a "widelink". If the symbolic link is enabled on a share and absolute symbolic links do not work right away, the mapping between the UNIX path of the symbolic link to the destination CIFS path must be created. When creating absolute symbolic link mappings, locality could be either "local" or "widelink" and it must be specified. If UNIX symlink mapping is created for a file or directory which is outside of the local share but the locality is set to "local", ONTAP does not allow access to the target.

A UNIX symbolic link support could be added to SMB shares by specifying the *unix_symlink* property during the creation of SMB shares or at any time by modifying the existing SMB *unix_symlink* property. UNIX symbolic link support is enabled by default.

Examples

Creating a UNIX symlink mapping for CIFS shares

To create UNIX symlink mappings for SMB shares, use the following API. Note the *return_records=true* query parameter used to obtain the newly created entry in the response.

```
# The API:
POST /api/protocols/cifs/unix-symlink-mapping

# The call:
curl -X POST "https://<mgmt-ip>/api/protocols/cifs/unix-symlink-
mapping?return_records=true" -H "accept: application/json" -H "Content-
Type: application/json" -d "{ \"svm\": { \"name\": \"vs1\", \"uuid\":
\"000c5cd2-ebdf-11e8-a96e-0050568ea3cb\" }, \"target\": {
\"home_directory\": false, \"locality\": \"local\", \"path\":
\"/dir1/dir2/\", \"server\": \"cifs123\", \"share\": \"sh1\" },
\"unix_path\": \"/mnt/eng_volume/\"}"

# The response:
{
"num_records": 1,
"records": [
  {
    "svm": {
      "uuid": "000c5cd2-ebdf-11e8-a96e-0050568ea3cb",
      "name": "vs1"
    },
    "unix_path": "/mnt/eng_volume/",
    "target": {
      "share": "sh1",
      "path": "/dir1/dir2/",
      "server": "cifs123",
      "locality": "local",
      "home_directory": false
    }
  }
]
}
```

Retrieving UNIX symlink mappings for all SVMs in the cluster

```
# The API:
GET /api/protocols/cifs/unix-symlink-mapping

# The call:
curl -X GET "https://<mgmt-ip>/api/protocols/cifs/unix-symlink-
mapping?fields=*&return_records=true&return_timeout=15" -H "accept:
application/hal+json"
```

```
# The response:
{
"records": [
  {
    "svm": {
      "uuid": "000c5cd2-ebdf-11e8-a96e-0050568ea3cb",

        }
      }
    },
    "unix_path": "/mnt/eng_volume/",
    "target": {
      "share": "ENG_SHARE",
      "path": "/dir1/dir2/",
      "server": "ENGCIFS",
      "locality": "widelink",
      "home_directory": false
    },
```

```
      "_links": {
        "self": {
          "href": "/api/protocols/cifs/unix-symlink-mapping/1d30d1b1-ebdf-
11e8-a96e-0050568ea3cb/%2Fmnt%2Feng_volume%2F"
        }
      }
    }
  ],
  "num_records": 2,
  "_links": {
    "self": {
      "href": "/api/protocols/cifs/unix-symlink-
mapping?fields=*&return_records=true&return_timeout=15"
    }
  }
}
}
```

Retrieving a specific UNIX symlink mapping for an SVM

The mapping being returned is identified by the UUID of its SVM and the unix-path.

```
# The API:
GET /api/protocols/cifs/unix-symlink-mapping/{svm.uuid}/{unix_path}

# The call:
curl -X GET "https://<mgmt-ip>/api/protocols/cifs/unix-symlink-
mapping/000c5cd2-ebdf-11e8-a96e-0050568ea3cb/%2Fmnt%2Feng_volume%2F" -H
"accept: application/json"

# The response:
{
"svm": {
  "uuid": "000c5cd2-ebdf-11e8-a96e-0050568ea3cb",
 "name": "vs1"
},
"unix_path": "/mnt/eng_volume/",
"target": {
  "share": "sh1",
  "path": "/dir1/dir2/",
  "server": "CIFS123",
  "locality": "local",
  "home_directory": false
}
}
```

Updating a specific UNIX symlink mapping for an SVM

The mapping being modified is identified by the UUID of its SVM and the unix-path.

```
# The API:
PATCH /api/protocols/cifs/unix-symlink-mapping/{svm.uuid}/{unix_path}

# The call:
curl -X PATCH "https://<mgmt-ip>/api/protocols/cifs/unix-symlink-
mapping/000c5cd2-ebdf-11e8-a96e-0050568ea3cb/%2Fmnt%2Feng_volume%2F" -H
"accept: application/json" -H "Content-Type: application/json" -d "{
\"target\": { \"home_directory\": true, \"locality\": \"widelink\",
\"path\": \"/new_path/\", \"server\": \"HR_SERVER\", \"share\": \"sh2\"
}}"
```

Removing a specific UNIX symlink mapping for an SVM

The mapping being removed is identified by the UUID of its SVM and the unix-path.

```
# The API:
DELETE /api/protocols/cifs/unix-symlink-mapping/{svm.uuid}/{unix_path}

# The call:
curl -X DELETE "https://<mgmt-ip>/api/protocols/cifs/unix-symlink-
mapping/000c5cd2-ebdf-11e8-a96e-0050568ea3cb/%2Fmnt%2Feng_volume%2F" -H
"accept: application/json"
```

Retrieve UNIX symbolic link mappings for CIFS clients

GET `/protocols/cifs/unix-symlink-mapping`

Introduced In: 9.6

Retrieves UNIX symbolic link mappings for CIFS clients.

Related ONTAP commands

- `vserver cifs symlink show`

Learn more

- DOC /protocols/cifs/unix-symlink-mapping

Parameters

Name	Type	In	Required	Description
target.locality	string	query	False	Filter by target.locality
target.home_directory	boolean	query	False	Filter by target.home_directory
target.server	string	query	False	Filter by target.server
target.path	string	query	False	Filter by target.path
target.share	string	query	False	Filter by target.share
unix_path	string	query	False	Filter by unix_path
svm.uuid	string	query	False	Filter by svm.uuid
svm.name	string	query	False	Filter by svm.name
fields	array[string]	query	False	Specify the fields to return.
max_records	integer	query	False	Limit the number of records returned.
return_records	boolean	query	False	The default is true for GET calls. When set to false, only the number of records is returned. • Default value: 1

Name	Type	In	Required	Description
return_timeout	integer	query	False	The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached. • Default value: 1 • Max value: 120 • Min value: 0
order_by	array[string]	query	False	Order results by specified fields and optional [asc

Response

```
Status: 200, Ok
```

svm

Name	Type	Description
_links	_links	
name	string	The name of the SVM.
uuid	string	The unique identifier of the SVM.

cifs_target

Name	Type	Description
home_directory	boolean	Specify if the destination share is a home directory.
locality	string	Specifies whether the CIFS symbolic link is a local link or wide link. The following values are supported: • local - Local symbolic link maps only to the same CIFS share. • widelink - Wide symbolic link maps to any CIFS share on the network.

Name	Type	Description
path	string	Specifies the CIFS path on the destination to which the symbolic link maps. The final path is generated by concatenating the CIFS server name, the share name, the cifs-path and the remaining path in the symbolic link left after the prefix match. This value is specified by using a UNIX-style path name. The trailing forward slash is required for the full path name to be properly interpreted.
server	string	Specifies the destination CIFS server where the UNIX symbolic link is pointing. This field is mandatory if the locality of the symbolic link is 'widelink'. You can specify the value in any of the following formats: • DNS name of the CIFS server. • IP address of the CIFS server. • NetBIOS name of the CIFS server.
share	string	Specifies the CIFS share name on the destination CIFS server to which the UNIX symbolic link is pointing.

cifs_symlink_mapping

ONTAP allows for both CIFS and NFS access to the same datastore. This datastore can contain symbolic links created by UNIX clients which can point anywhere from the perspective of the UNIX client. To Access such UNIX symlink from CIFS share, we need to create a CIFS symbolic link path mapping from a UNIX symlink and target it as a CIFS path.

Name	Type	Description
_links	_links	
svm	svm	
target	cifs_target	

Name	Type	Description
unix_path	string	Specifies the UNIX path prefix to be matched for the mapping.

Create a UNIX symbolic link mapping for a CIFS client

POST `/protocols/cifs/unix-symlink-mapping`

Introduced In: 9.6

Creates a UNIX symbolic link mapping for a CIFS client.

Required properties

* `svm.uuid` or `svm.name` - Existing SVM in which to create the CIFS unix-symlink-mapping.
* `unix_path` - UNIX path to which the CIFS symlink mapping to be created.
* `target.share` - CIFS share name on the destination CIFS server to which the UNIX symbolic link is pointing.
* `target.path` - CIFS path on the destination to which the symbolic link maps.

Default property values

* `target.server` - *Local_NetBIOS_Server_Name*
* `locality` - *local*

- `home_directory` - *false*

Parameters

Name	Type	In	Required	Description
return_records	boolean	query	False	The default is false. If set to true, the records are returned. • Default value:

Request Body

Name	Type	Description
_links	_links	
svm	svm	
target	cifs_target	
unix_path	string	Specifies the UNIX path prefix to be matched for the mapping.

Example request

```json
{
  "_links": {
    "self": {
      "href": "/api/resourcelink"
    }
  },
  "svm": {
    "_links": {
      "self": {
        "href": "/api/resourcelink"
      }
    },
    "name": "svm1",
    "uuid": "02c9e252-41be-11e9-81d5-00a0986138f7"
  },
  "target": {
    "locality": "local",
    "path": "/dir1/dir2/",
    "server": "ENGCIFS",
    "share": "ENG_SHARE"
  },
  "unix_path": "/mnt/eng_volume/"
}
```

Response

```
Status: 201, Created
```

Name	Type	Description
_links	_links	
num_records	integer	Number of records
records	array[cifs_symlink_mapping]	

Example response

```json
{
  "_links": {
    "next": {
      "href": "/api/resourcelink"
    },
    "self": {
      "href": "/api/resourcelink"
    }
  },
  "records": {
    "_links": {
      "self": {
        "href": "/api/resourcelink"
      }
    },
    "svm": {
      "_links": {
        "self": {

    },
    "target": {
      "locality": "local",
      "path": "/dir1/dir2/",
      "server": "ENGCIFS",
      "share": "ENG_SHARE"
    },
    "unix_path": "/mnt/eng_volume/"
  }
}
```

Error

```
Status: Default
```

ONTAP Error Response Codes

Error Code	Description
655654	Must specify the target CIFS share while creating path mapping entries with localities "local" or "widelink"
655572	The target path contains illegal characters or is too long
655574	The target server contains illegal characters or is too long
655436	If the locality is "local", the target server must be blank or must match the CIFS NetBIOS name for given SVM
655439	The Specified target server is local CIFS server for given SVM but the locality is specified as "widelink"
655546	Failed to create symlink mapping becasue administrative share cannot be used as target share
655437	Failed to create the symlink mapping with locality "local" because the target share does not exist for specified SVM
655429	UNIX path must begin and end with a "/"
655430	Target path must begin and end with a "/"
655399	Failed to get the CIFS server for specified SVM

Name	Type	Description
error	error	

Example error

```
{
  "error": {
    "arguments": {
      "code": "string",
      "message": "string"
    },
    "code": "4",
    "message": "entry doesn't exist",
    "target": "uuid"
  }
}
```

svm_reference

SVM, applies only to SVM-scoped objects.

Name	Type	Description
_links	_links	
name	string	The name of the SVM.
uuid	string	The unique identifier of the SVM.

file_access_filter

ONTAP allows creation of filters for file access tracing for both CIFS and NFS. These filters have protocols, path, username and client IP based on which file access operations are logged.

Name	Type	Description
client_ip	string	Specifies the IP address from which the client accesses the file or directory.
enabled	boolean	Specifies whether to enable or disable the filter. Filters are enabled by default and are deleted after 60 mins.
index	integer	Position of the file access tracing filter.

Name	Type	Description
path	string	Specifies the path for which permission tracing can be applied. The value can be complete path from root of CIFS share or root of volume for NFS.
protocol	string	Specifies the protocol for which permission trace is required.
svm	svm_reference	SVM, applies only to SVM-scoped objects.
trace_allowed_ops	boolean	Specifies if the filter can trace file access denied and allowed events. The value of trace-allow is false by default, and it traces access denied events. The value is set to true for tracing access allowed events.
unix_user	string	Specifies the UNIX username whose access requests you want to trace. The filter would match only if the request is received with this user.
windows_user	string	Specifies the Windows username whose access requests you want to trace. The filter would match only if the request is received with this user.

node

Name	Type	Description
_links	_links	
name	string	
uuid	string	

reason

Displays the allowed or denied reason for the file access tracing events that are generated.

Name	Type	Description
message	string	The error message.

share

Name	Type	Description
_links	_links	
name	string	Share name

volume

Name	Type	Description
_links	_links	
name	string	The name of the volume.
uuid	string	Unique identifier for the volume. This corresponds to the instance-uuid that is exposed in the CLI and ONTAPI. It does not change due to a volume move. • example: 028baa66-41bd-11e9-81d5-00a0986138f7 • Introduced in: 9.6

file_access_event

ONTAP generates the list of file access tracing records stored on the cluster. These records are generated in response to security trace filters applied. The list of trace events recorded depends on the parameters configured for the filter.

Name	Type	Description
_links	_links	
create_time	string	Specifies the time at which the trace event entry was generated.
filter	file_access_filter	ONTAP allows creation of filters for file access tracing for both CIFS and NFS. These filters have protocols, path, username and client IP based on which file access operations are logged. • Introduced in: 9.8
index	integer	Specifies the sequence number of the security trace event.
node	node	

Name	Type	Description
reason	reason	Displays the allowed or denied reason for the file access tracing events that are generated.
session_id	integer	Specifies the CIFS session ID for the file access trace event, this is generated only for CIFS file accesses.
share	share	
svm	svm_reference	SVM, applies only to SVM-scoped objects.
volume	volume	

error_arguments

Name	Type	Description
code	string	Argument code
message	string	Message argument

error

Name	Type	Description
arguments	array[error_arguments]	Message arguments
code	string	Error code
message	string	Error message
target	string	The target parameter that caused the error.

Delete trace results

DELETE `/protocols/file-access-tracing/events/{node.uuid}/{svm.uuid}/{index}`

Introduced In: 9.8

Deletes trace results.

Related ONTAP commands

* `vserver security trace result delete`

Parameters

Name	Type	In	Required	Description
node.uuid	string	path	True	Node UUID.
index	integer	path	True	Sequence number of traced event.
svm.uuid	string	path	True	UUID of the SVM to which this object belongs.

Response

```
Status: 200, Ok
```

Error

```
Status: Default, Error
```

Name	Type	Description
error	error	

Example error

```
{
  "error": {
    "arguments": {
      "code": "string",
      "message": "string"
    },
    "code": "4",
    "message": "entry doesn't exist",
    "target": "uuid"
  }
}
```

Parameters

Name	Type	In	Required	Description
node.uuid	string	path	True	Node UUID.
index	integer	path	True	Sequence number of traced event.

Name	Type	In	Required	Description
svm.uuid	string	path	True	UUID of the SVM to which this object belongs.
fields	array[string]	query	False	Specify the fields to return.

Response

```
Status: 200, Ok
```

Name	Type	Description
_links	_links	
create_time	string	Specifies the time at which the trace event entry was generated.
filter	file_access_filter	ONTAP allows creation of filters for file access tracing for both CIFS and NFS. These filters have protocols, path, username and client IP based on which file access operations are logged. • Introduced in: 9.8
index	integer	Specifies the sequence number of the security trace event.
node	node	
reason	reason	Displays the allowed or denied reason for the file access tracing events that are generated.
session_id	integer	Specifies the CIFS session ID for the file access trace event, this is generated only for CIFS file accesses.
share	share	
svm	svm_reference	SVM, applies only to SVM-scoped objects.
volume	volume

Retrieve information about security trace filter entries

GET /protocols/file-access-tracing/filters

Introduced In: 9.8

Retrieves information about security trace filter entries.

Related ONTAP commands

- `vserver security trace filter show`

Parameters

Name	Type	In	Required	Description
svm.uuid	string	query	False	Filter by svm.uuid
svm.name	string	query	False	Filter by svm.name
windows_user	string	query	False	Filter by windows_user
protocol	string	query	False	Filter by protocol
enabled	boolean	query	False	Filter by enabled
index	integer	query	False	Filter by index
unix_user	string	query	False	Filter by unix_user
client_ip	string	query	False	Filter by client_ip
trace_allowed_ops	boolean	query	False	Filter by trace_allowed_ops
path	string	query	False	Filter by path
fields	array[string]	query	False	Specify the fields to return.
max_records	integer	query	False	Limit the number of records returned.
return_records	boolean	query	False	The default is true for GET calls. When set to false, only the number of records is returned. • Default value: 1

312

Name	Type	In	Required	Description
return_timeout	integer	query	False	The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached. • Default value: 1 • Max value: 120 • Min value: 0
order_by	array[string]	query	False	Order results by specified fields and optional [asc

View file security permissions

Protocols file-security effective-permissions svm.uuid path endpoint overview

Overview

This API displays the effective permission granted to a Windows or UNIX user on the specified file or folder path.

Examples

Retrieving the effective permission for the specified Windows user on the specified path of an SVM.

```
= The API:

curl -X GET "https://10.63.26.252/api/protocols/file-security/effective-
permissions/cf5f271a-1beb-11ea-8fad-
005056bb645e/administrator/windows/%2F?share.name=sh1&return_records=true"
-H "accept: application/json" -H "authorization: Basic
YWRtaW46bmV0YXBwMSE="

= The response:

{
"svm": {
  "uuid": "cf5f271a-1beb-11ea-8fad-005056bb645e",
  "name": "vs1"
},
"user": "administrator",

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|path
|string
|path
|===

```
|True
a|File Path

|user
|string
|query
|True
a|User_Name

|share.name
|string
|query
|False
a|Share Name

|type
|string
|query
|False
a|User Type

|svm.uuid
|string
|path
|True
a|UUID of the SVM to which this object belongs.

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|===

== Response
```

Status: 200, Ok

```
[cols=3*,options=header]
|===
```

Name	Type	Description

|file_permissions
|array[string]
a|Specifies the effective permission granted to a user on the specified file or folder path.

|path
|string
a|Specifies the path of the file or the folder for which you want to display effective permissions.
The path is relative to the SVM root volume. If "-share-name" is specified then path will be relative to the share path.

|share
|link:#share[share]
a|

|share_permissions
|array[string]
a|Specifies the effective permission granted to a user on the specified file or folder path.

|svm
|link:#svm_reference[svm_reference]
a|SVM, applies only to SVM-scoped objects.

|type
|string
a|Specifies the user type. The following values are allowed:

* windows - Windows user
* unix   - UNIX user

|user
|string
a|Specifies the user for which effective permission needs to be displayed for the specified path.

```

= Manage file security permissions and audit policies

:leveloffset: +1

[[IDea15ada06352c37d5be759880d57f3d4]]
= Protocols file-security permissions svm.uuid path endpoint overview
```

```
== Overview

Using this API, You can manage NTFS file security and audit policies of
file or directory without the need of a client. It works similar to what
you could do with a cacls in windows client. It will create an NTFS
security descriptor(SD) to which you can add access control entries (ACEs)
to the discretionary access control list (DACL) and the system access
control list (SACL). Generally, an SD contains following information:

** Security identifiers (SIDs) for the owner and primary group of an
object. A security identifier (SID) is a unique value of variable length
used to identify a trustee. Each account has a unique SID issued by an
authority, such as a Windows domain controller, and is stored in a
security database.

** A DACL  identifies the trustees that are allowed or denied access to a
securable object. When a process tries to access a securable object, the
system checks the ACEs in the object's DACL to determine whether to grant
access to it.

** A SACL  enables administrators to log attempts to access a secured
object. Each ACE specifies the types of access attempts by a specified
trustee that cause the system to generate a record in the security event
log. An ACE in a SACL can generate audit records when an access attempt
fails, when it succeeds, or both.

** A set of control bits that qualify the meaning of a SD or its
individual members.

Currently, in ONTAP CLI, creating and applying NTFS ACLs is a 5-step
process:

** Create an SD.

** Add DACLs and SACLs to the NTFS SD. If you want to audit file and
directory events, you must configure auditing on the Vserver, in addition,
to adding a SACL to the SD.

** Create a file/directory security policy. This step associates the
policy with a SVM.

** Create a policy task. A policy task refers to a single operation to
apply to a file (or folder) or to a set of files (or folders). Among other
things, the task defines which SD to apply to a path.
```

** Apply a policy to the associated SVM.

This REST API to set the DACL/SACL is similar to the windows GUI. The approach used here has been simplified by combining all steps into a single step. The REST API uses only minimal and mandatory parameters to create access control entries (ACEs), which can be added to the discretionary access control list (DACL) and the system access control list (SACL). Based on information provided, SD is created and applied on the target path.

== Examples

=== Creating a new SD

Use this endpoint to apply a fresh set of SACLs and DACLs. A new SD is created based on the input parameters and it replaces the old SD for the given target path:

'''

The API:
POST /protocols/file-security/permissions/{svm.uuid}/{path}

block]#`/protocols/file-security/permissions/{svm.uuid}/{path}`#

Introduced In: 9.9

Retrieves file permissions

== Related ONTAP commands

* `vserver security file-directory show`

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
```

```
|In
|Required
|Description

|path
|string
|path
|True
a|target path

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|svm.uuid
|string
|path
|True
a|UUID of the SVM to which this object belongs.
```

 |===

 == Response

Status: 200, Ok

```
[cols=3*,options=header]
|===
|Name
|Type
|Description

|acls
|array[link:#acl[acl]]
a|A discretionary access security list (DACL) identifies the trustees that
are allowed or denied access
to a securable object. When a process tries to access a securable
object, the system checks the access control entries (ACEs) in the
object's DACL to determine whether to grant access to it.

|control_flags
```

|string
a|Specifies the control flags in the SD. It is a Hexadecimal Value.

|dos_attributes
|string
a|Specifies the file attributes on this file or directory.

|effective_style
|string
a|Specifies the effective style of the SD. The following values are supported:

* unix - UNIX style
* ntfs - NTFS style
* mixed - Mixed style
* unified - Unified style

|group
|string
a|Specifies the owner's primary group.
You can specify the owner group using either a group name or SID.

|group_id
|string
a|Specifies group ID on this file or directory.

|ignore_paths
|array[string]
a|Specifies that permissions on this file or directory cannot be replaced.

|inode
|integer
a|Specifies the File Inode number.

|mode_bits
|integer
a|Specifies the mode bits on this file or directory.

|owner

|string
a|Specifies the owner of the SD.
You can specify the owner using either a user name or security identifier
(SID).
The owner of the SD can modify the permissions on the
file (or folder) or files (or folders) to which the SD
is applied and can give other users the right to take ownership
of the object or objects to which the SD is applied.

|propagation_mode
|string
a|Specifies how to propagate security settings to child subfolders and
files.
This setting determines how child files/folders contained within a parent
folder inherit access control and audit information from the parent
folder.
The available values are:

* propogate   - propagate inheritable permissions to all subfolders and
files
* replace   - replace existing permissions on all subfolders and files
with inheritable permissions

|security_style
|string
a|Specifies the security style of the SD. The following values are
supported:

* unix - UNIX style
* ntfs - NTFS style
* mixed - Mixed style
* unified - Unified style

|text_dos_attr
|string
a|Specifies the textual format of file attributes on this file or
directory.

|text_mode_bits
|string
a|Specifies the textual format of mode bits on this file or directory.

```
|user_id
|string
a|Specifies user ID of this file or directory.

[#acl]
[.api-collapsible-fifth-title]
acl

An ACE is an element in an access control list (ACL).
An ACL can have zero or more ACEs. Each ACE controls or monitors access to
an object by a specified trustee.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|access
|string
a|Specifies whether the ACL is for DACL or SACL.
The available values are:

* access_allow                    - DACL for allow access
* access_deny                     - DACL for deny access
* access_allowed_callback         - CALLBACK for allowed access
* access_denied_callback          - CALLBACK for denied access
* access_allowed_callback_object  - CALLBACK OBJECT for allowed access
* access_denied_callback_object   - CALLBACK OBJECT for denied access
```

```
* system_audit_callback              - SYSTEM Audit Callback ace
* system_audit_callback_object       - SYSTEM Audit Callback Object ace
* system_resource_attribute          - SYSTEM Resource Attribute
* system_scoped_policy_id            - SYSTEM Scope Policy ID
* audit_success                      - SACL for success access
* audit_failure                      - SACL for failure access
* audit_success_and_failure          - SACL for both success and failure
access

|advanced_rights
|link:#advanced_rights[advanced_rights]
a|Specifies the advanced access right controlled by the ACE for the
account specified.
 You can specify more than one "advanced-rights" value by using a comma-
delimited list.

|apply_to
|link:#apply_to[apply_to]
a|Specifies where to apply the DACL or SACL entries.
You can specify more than one value by using a comma-delimited list.

|inherited
|boolean
a|Indicates whether or not the ACE flag is inherited.

|rights
|string
a|Specifies the access right controlled by the ACE for the account
specified.
The "rights" parameter is mutually exclusive with the "advanced_rights"
parameter. If you specify the "rights" parameter, you can specify one
of the following "rights" values:

|user
|string
a|Specifies the account to which the ACE applies.
You can specify either name or SID.

= Update the SD information

[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-block]#`/protocols/file-security/permissions/{svm.uuid}/{path}`#

Introduced In: 9.9

Updates SD specific Information i.e owner, group & control-flags

== Related ONTAP commands

* `vserver security file-directory ntfs modify`

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|path
|string
|path
|True
a|target path

```
|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When doing a POST, PATCH, or DELETE operation on a single record, the
default is 0 seconds.  This means that if an asynchronous operation is
started, the server immediately returns HTTP code 202 (Accepted) along
with a link to the job.  If a non-zero value is specified for POST, PATCH,
or DELETE operations, ONTAP waits that length of time to see if the job
completes so it can return something other than 202.

* Default value: 1
* Max value: 120
* Min value: 0

|svm.uuid
|string
|path
|True
a|UUID of the SVM to which this object belongs.

file (or folder) or files (or folders) to which the SD
is applied and can give other users the right to take ownership
of the object or objects to which the SD is applied.

|propagation_mode
|string

a|Specifies how to propagate security settings to child subfolders and files.
This setting determines how child files/folders contained within a parent folder inherit access control and audit information from the parent folder.
The available values are:

* propogate   - propagate inheritable permissions to all subfolders and files
* replace   - replace existing permissions on all subfolders and files with inheritable permissions

|security_style
|string
a|Specifies the security style of the SD. The following values are supported:

* unix - UNIX style
* ntfs - NTFS style
* mixed - Mixed style
* unified - Unified style

|text_dos_attr
|string
a|Specifies the textual format of file attributes on this file or directory.

|text_mode_bits
|string
a|Specifies the textual format of mode bits on this file or directory.

|user_id
|string
a|Specifies user ID of this file or directory.

[#acl]
[.api-collapsible-fifth-title]
acl

An ACE is an element in an access control list (ACL).
An ACL can have zero or more ACEs. Each ACE controls or monitors access to
an object by a specified trustee.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|access
|string
a|Specifies whether the ACL is for DACL or SACL.
The available values are:

* access_allow   - DACL for allow access
* access_deny   - DACL for deny access
* access_allowed_callback   - CALLBACK for allowed access
* access_denied_callback   - CALLBACK for denied access
* access_allowed_callback_object - CALLBACK OBJECT for allowed access
* access_denied_callback_object   - CALLBACK OBJECT for denied access
* system_audit_callback   - SYSTEM Audit Callback ace
* system_audit_callback_object   - SYSTEM Audit Callback Object ace
* system_resource_attribute   - SYSTEM Resource Attribute
* system_scoped_policy_id   - SYSTEM Scope Policy ID
* audit_success   - SACL for success access
* audit_failure   - SACL for failure access
* audit_success_and_failure   - SACL for both success and failure
access

```
|advanced_rights
|link:#advanced_rights[advanced_rights]
a|Specifies the advanced access right controlled by the ACE for the
account specified.
 You can specify more than one "advanced-rights" value by using a comma-
delimited list.

|apply_to
|link:#apply_to[apply_to]
a|Specifies where to apply the DACL or SACL entries.
You can specify more than one value by using a comma-delimited list.

|inherited
|boolean
a|Indicates whether or not the ACE flag is inherited.

|rights
|string
a|Specifies the access right controlled by the ACE for the account
specified.
The "rights" parameter is mutually exclusive with the "advanced_rights"
parameter. If you specify the "rights" parameter, you can specify one
of the following "rights" values:

|user
|string
a|Specifies the account to which the ACE applies.
You can specify either name or SID.

|===

[#file_directory_security]
[.api-collapsible-fifth-title]
file_directory_security

Manages New Technology File System (NTFS) security and NTFS audit
policies.

[cols=3*,options=header]
|===
```

|Name
|Type
|Description

|acls
|array[link:#acl[acl]]
a|A discretionary access security list (DACL) identifies the trustees that are allowed or denied access
to a securable object. When a process tries to access a securable object, the system checks the access control entries (ACEs) in the object's DACL to determine whether to grant access to it.

|control_flags
|string
a|Specifies the control flags in the SD. It is a Hexadecimal Value.

|dos_attributes
|string
a|Specifies the file attributes on this file or directory.

|effective_style
|string
a|Specifies the effective style of the SD. The following values are supported:

* unix - UNIX style
* ntfs - NTFS style
* mixed - Mixed style
* unified - Unified style

|group
|string
a|Specifies the owner's primary group.
You can specify the owner group using either a group name or SID.

|group_id
|string
a|Specifies group ID on this file or directory.

|ignore_paths
|array[string]

a|Specifies that permissions on this file or directory cannot be replaced.

|inode
|integer
a|Specifies the File Inode number.

|mode_bits
|integer
a|Specifies the mode bits on this file or directory.

|owner
|string
a|Specifies the owner of the SD.
You can specify the owner using either a user name or security identifier
(SID).
The owner of the SD can modify the permissions on the
file (or folder) or files (or folders) to which the SD
is applied and can give other users the right to take ownership
of the object or objects to which the SD is applied.

|propagation_mode
|string
a|Specifies how to propagate security settings to child subfolders and
files.
This setting determines how child files/folders contained within a parent
folder inherit access control and audit information from the parent
folder.
The available values are:

* propogate   - propagate inheritable permissions to all subfolders and
files
* replace   - replace existing permissions on all subfolders and files
with inheritable permissions

|security_style
|string
a|Specifies the security style of the SD. The following values are
supported:

* unix - UNIX style
* ntfs - NTFS style
* mixed - Mixed style

```
* unified - Unified style

|text_dos_attr
|string
a|Specifies the textual format of file attributes on this file or
directory.

|text_mode_bits
|string
a|Specifies the textual format of mode bits on this file or directory.

|user_id
|string
a|Specifies user ID of this file or directory.

= Add a new SACL or DACL ACE

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/protocols/file-security/permissions/{svm.uuid}/{path}/acl`#

Introduced In: 9.9

Adds the new SACL/DACL ACL.

== Related ONTAP commands

* `vserver security file-directory ntfs dacl add`
* `vserver security file-directory ntfs sacl add`

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|path
|string
|path
|True
a|path

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When doing a POST, PATCH, or DELETE operation on a single record, the
default is 0 seconds. This means that if an asynchronous operation is
started, the server immediately returns HTTP code 202 (Accepted) along
with a link to the job. If a non-zero value is specified for POST, PATCH,
or DELETE operations, ONTAP waits that length of time to see if the job
completes so it can return something other than 202.

* Default value: 1
* Max value: 120

* Min value: 0

|return_records
|boolean
|query
|False
a|The default is false. If set to true, the records are returned.

* Default value:

|svm.uuid
|string
|path
|True
a|UUID of the SVM to which this object belongs.

|===

== Request Body

[cols=3*,options=header]
|===
|Name
|Type
|Description

|access
|string
a|Specifies whether the ACL is for DACL or SACL.
The available values are:

* access_allow   - DACL for allow access
* access_deny   - DACL for deny access
* audit_success   - SACL for success access
* audit_failure   - SACL for failure access

|advanced_rights
|link:#advanced_rights[advanced_rights]
a|Specifies the advanced access right controlled by the ACE for the account specified.
 You can specify more than one "advanced-rights" value by using a comma-delimited list.

|apply_to
|link:#apply_to[apply_to]
a|Specifies where to apply the DACL or SACL entries.
You can specify more than one value by using a comma-delimited list.

|ignore_paths
|array[string]
a|Specifies that permissions on this file or directory cannot be replaced.

|propagation_mode
|string
a|Specifies how to propagate security settings to child subfolders and files.
This setting determines how child files/folders contained within a parent folder inherit access control and audit information from the parent folder.
The available values are:

* propogate   - propagate inheritable permissions to all subfolders and files
* replace   - replace existing permissions on all subfolders and files with inheritable permissions

|rights
|string
a|Specifies the access right controlled by the ACE for the account specified.
The "rights" parameter is mutually exclusive with the "advanced_rights" parameter. If you specify the "rights" parameter, you can specify one of the following "rights" values:

|user
|string
a|Specifies the account to which the ACE applies.
You can specify either name or SID.

a|Specifies how to propagate security settings to child subfolders and
files.
This setting determines how child files/folders contained within a parent
folder inherit access control and audit information from the parent
folder.
The available values are:

* propogate    - propagate inheritable permissions to all subfolders and
files
* replace      - replace existing permissions on all subfolders and files
with inheritable permissions

|Name
|Type
|In
|Required
|Description

|path
|string
|path
|True
a|path

|user
|string
|path
|True
a|User Name
```

```
|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When doing a POST, PATCH, or DELETE operation on a single record, the
default is 0 seconds.  This means that if an asynchronous operation is
started, the server immediately returns HTTP code 202 (Accepted) along
with a link to the job.  If a non-zero value is specified for POST, PATCH,
or DELETE operations, ONTAP waits that length of time to see if the job
completes so it can return something other than 202.

* Default value: 1
* Max value: 120
* Min value: 0

|svm.uuid
|string
|path
|True
a|UUID of the SVM to which this object belongs.

|===

== Request Body

[cols=3*,options=header]
|===
|Name
|Type
|Description

|access
|string
a|Specifies whether the ACL is for DACL or SACL.
The available values are:

* access_allow                    - DACL for allow access
* access_deny                     - DACL for deny access
* audit_success                   - SACL for success access
* audit_failure                   - SACL for failure access

|advanced_rights
```

|link:#advanced_rights[advanced_rights]
a|Specifies the advanced access right controlled by the ACE for the
account specified.
 You can specify more than one "advanced-rights" value by using a comma-
delimited list.

|apply_to
|link:#apply_to[apply_to]
a|Specifies where to apply the DACL or SACL entries.
You can specify more than one value by using a comma-delimited list.

|ignore_paths
|array[string]
a|Specifies that permissions on this file or directory cannot be replaced.

|propagation_mode
|string
a|Specifies how to propagate security settings to child subfolders and
files.
This setting determines how child files/folders contained within a parent
folder inherit access control and audit information from the parent
folder.
The available values are:

* propogate   - propagate inheritable permissions to all subfolders and
files
* replace   - replace existing permissions on all subfolders and files
with inheritable permissions

|rights
|string
a|Specifies the access right controlled by the ACE for the account
specified.
The "rights" parameter is mutually exclusive with the "advanced_rights"
parameter. If you specify the "rights" parameter, you can specify one
of the following "rights" values:

|user
|string
a|Specifies the account to which the ACE applies.
You can specify either name or SID.

```

:leveloffset: -1

= Manage FPolicy configuration

:leveloffset: +1

[[IDa0fa8a4aa77cd7c25fc3795b93fc445c]]
= Protocols fpolicy endpoint overview

== Overview

FPolicy is an infrastructure component of ONTAP that enables partner
applications to connect to ONTAP in order to monitor and set file access
permissions. Every time a client accesses a file from a storage system,
based on the configuration of FPolicy, the partner application is notified
about file access. This enables partners to set restrictions on files that
are created or accessed on the storage system. FPolicy also allows you to
create file policies that specify file operation permissions according to
file type. For example, you can restrict certain file types, such as .jpeg
and .mp3 files, from being stored on the storage system. FPolicy can
monitor file access from CIFS and NFS clients.

As part of FPolicy configuration, you can specify an FPolicy engine which
defines the external FPolicy server, FPolicy events, which defines the
protocol and file operations to monitor and the FPolicy policy that acts
as a container for the FPolicy engine and FPolicy events. It provides a
```

way for policy management functions, such as policy enabling and
disabling.

== Examples

=== Creating an FPolicy configuration

To create an FPolicy for an SVM use the following API. Note that the
_return_records=true_ query parameter is used to obtain the newly created
entry in the response.

The API:
POST /protocols/fpolicy/

#The call:
curl -X POST "https://<mgmt-ip>/api/protocols/fpolicy?return_records=tre"
-H "accept: application/json" -H "Content-Type: application/json" -d "{
\"engines\": [{ \"name\": \"engine1\", \"port\": 9876,
\"primary_servers\": [\"10.132.145.22\", \"10.140.101.109\"],
\"secondary_servers\": [\"10.132.145.20\", \"10.132.145.21\"], \"type\":
\"synchronous\" }], \"events\": [{ \"file_operations\": { \"read\":
true, \"write\": true }, \"filters\": { \"monitor_ads\": true }, \"name\":
\"event_cifs\", \"protocol\": \"cifs\", \"volume_monitoring\": true }],
\"policies\": [{ \"engine\": { \"name\": \"engine1\" }, \"events\": [{
\"name\": \"event_cifs\" }], \"mandatory\": true, \"name\": \"pol0\",
\"priority\": 1, \"scope\": { \"include_volumes\": [\"vol1\"] } }],
\"svm\": { \"name\": \"vs1\", \"uuid\": \"b34f5e3d-01d0-11e9-8f63-
0050568ea311\" }}"

# The response:
{
"num_records": 1,
"records": [
  {
    "svm": {
      "uuid": "b34f5e3d-01d0-11e9-8f63-0050568ea311",

a|Filter by policies.mandatory

|policies.name
|string
|query
|False
a|Filter by policies.name
```

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_records
|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number
of records is returned.

* Default value: 1

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

|array[string]
a|

|secondary_servers
|array[string]
a|

|type
|string
a|The notification mode determines what ONTAP does after sending
notifications to FPolicy servers.
The possible values are:

***** synchronous  - After sending a notification, wait for a response
from the FPolicy server.

***** asynchronous - After sending a notification, file request processing
continues.

* Default value: 1
* enum: ["synchronous", "asynchronous"]
* Introduced in: 9.6

|===

[#file_operations]
[.api-collapsible-fifth-title]
file_operations

Specifies the file operations for the FPolicy event. You must specify a
valid protocol in the protocol parameter.
The event will check the operations specified from all client requests
using the protocol.

[cols=3*,options=header]
|===
|Name
|Type
|Description
```

```
|close
|boolean
a|File close operations

|create
|boolean
a|File create operations

|create_dir
|boolean
a|Directory create operations

|delete
|boolean
a|File delete operations

|delete_dir
|boolean
a|Directory delete operations

|getattr
|boolean
a|Get attribute operations

|link
|boolean
a|Link operations

|lookup
|boolean
a|Lookup operations

|open
|boolean
a|File open operations

|read
```

```
|boolean
a|File read operations

|rename
|boolean
a|File rename operations

|rename_dir
|boolean
a|Directory rename operations

|setattr
|boolean
a|Set attribute operations

|symlink
|boolean
a|Symbolic link operations

|write
|boolean
a|File write operations

|===

[#filters]
[.api-collapsible-fifth-title]
filters

Specifies the list of filters for a given file operation for the specified
protocol.
When you specify the filters, you must specify the valid protocols and a
valid file operations.

[cols=3*,options=header]
|===
|Name
|Type
|Description
```

|close_with_modification
|boolean
a|Filter the client request for close with modification.

|close_with_read
|boolean
a|Filter the client request for close with read.

|close_without_modification
|boolean
a|Filter the client request for close without modification.

|exclude_directory
|boolean
a|Filter the client requests for directory operations. When this filter is specified directory operations are not monitored.

|first_read
|boolean
a|Filter the client requests for the first-read.

|first_write
|boolean
a|Filter the client requests for the first-write.

|monitor_ads
|boolean
a|Filter the client request for alternate data stream.

|offline_bit
|boolean
a|Filter the client request for offline bit set. FPolicy server receives notification only when offline files are accessed.

|open_with_delete_intent
|boolean
a|Filter the client request for open with delete intent.

|open_with_write_intent
|boolean
a|Filter the client request for open with write intent.

|setattr_with_access_time_change
|boolean
a|Filter the client setattr requests for changing the access time of a file or directory.

|setattr_with_allocation_size_change
|boolean
a|Filter the client setattr requests for changing the allocation size of a file.

|setattr_with_creation_time_change
|boolean
a|Filter the client setattr requests for changing the creation time of a file or directory.

|setattr_with_dacl_change
|boolean
a|Filter the client setattr requests for changing dacl on a file or directory.

|setattr_with_group_change
|boolean
a|Filter the client setattr requests for changing group of a file or directory.

|setattr_with_mode_change
|boolean
a|Filter the client setattr requests for changing the mode bits on a file or directory.

|setattr_with_modify_time_change
|boolean
a|Filter the client setattr requests for changing the modification time of a file or directory.

|setattr_with_owner_change
|boolean
a|Filter the client setattr requests for changing owner of a file or
directory.

|setattr_with_sacl_change
|boolean
a|Filter the client setattr requests for changing sacl on a file or
directory.

|setattr_with_size_change
|boolean
a|Filter the client setattr requests for changing the size of a file.

|write_with_size_change
|boolean
a|Filter the client request for write with size change.

|===

[#fpolicy_event]
[.api-collapsible-fifth-title]
fpolicy_event

The information that a FPolicy process needs to determine what file access
operations to monitor and for which of the monitored events notifications
should be sent to the external FPolicy server.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|file_operations
|link:#file_operations[file_operations]
a|Specifies the file operations for the FPolicy event. You must specify a
valid protocol in the protocol parameter.
The event will check the operations specified from all client requests
using the protocol.

|filters
|link:#filters[filters]
a|Specifies the list of filters for a given file operation for the
specified protocol.
When you specify the filters, you must specify the valid protocols and a
valid file operations.

|name
|string
a|Specifies the name of the FPolicy event.

|protocol
|string
a|Protocol for which event is created. If you specify protocol, then you
must also specify a valid value for the file operation parameters.
The value of this parameter must be one of the following:

***** cifs - for the CIFS protocol.

***** nfsv3 - for the NFSv3 protocol.

***** nfsv4 - for the NFSv4 protocol.

|volume_monitoring
|boolean
a|Specifies whether volume operation monitoring is required.

[#fpolicy]
[.api-collapsible-fifth-title]
fpolicy

FPolicy is an infrastructure component of ONTAP that enables partner
applications connected to your storage systems to monitor and set file
access permissions. Every time a client accesses a file from a storage
system, based on the configuration of FPolicy, the partner application is
notified about file access.

[[ID56c7e0a049f82c24e072d81054a5db28]]
= Create an FPolicy configuration

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/protocols/fpolicy`#

*Introduced In:* 9.6

Creates an FPolicy configuration.

== Required properties

* `svm.uuid` or `svm.name` - Existing SVM in which to create the FPolicy
configuration.

== Recommended optional properties

* `engines` -  External server to which the notifications will be sent.
* `events` - File operations to monitor.
* `policies` - Policy configuration which acts as a container for FPolicy
```

event and FPolicy engine.
* `scope` - Scope of the policy. Can be limited to exports, volumes,
shares or file extensions.

== Default property values

If not specified in POST, the following default property values are
assigned:

* `engines.type` - _synchronous_
* `policies.engine` - _native_
* `policies.mandatory` - _true_
* `events.volume_monitoring` - _false_
* `events.file_operations.+*+` - _false_
* `events.filters.+*+` - _false_

== Related ONTAP commands

* `fpolicy policy event create`
* `fpolicy policy external-engine create`
* `fpolicy policy create`
* `fpolicy policy scope create`
* `fpolicy enable`

[#fpolicy_engine]
[.api-collapsible-fifth-title]
fpolicy_engine

The engine defines how ONTAP makes and manages connections to external
FPolicy servers.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|name
|string
a|Specifies the name to assign to the external server configuration.

|port
|integer
a|Port number of the FPolicy server application.

|primary_servers
|array[string]
a|

|secondary_servers
|array[string]
a|

|type
|string
a|The notification mode determines what ONTAP does after sending
notifications to FPolicy servers.
The possible values are:

***** synchronous  - After sending a notification, wait for a response
from the FPolicy server.

***** asynchronous - After sending a notification, file request processing
continues.
```

```
* Default value: 1
* enum: ["synchronous", "asynchronous"]
* Introduced in: 9.6

|===

[#file_operations]
[.api-collapsible-fifth-title]
file_operations

Specifies the file operations for the FPolicy event. You must specify a
valid protocol in the protocol parameter.
The event will check the operations specified from all client requests
using the protocol.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|close
|boolean
a|File close operations

|create
|boolean
a|File create operations

|create_dir
|boolean
a|Directory create operations

|delete
|boolean
a|File delete operations

|delete_dir
|boolean
a|Directory delete operations
```

|getattr
|boolean
a|Get attribute operations

|link
|boolean
a|Link operations

|lookup
|boolean
a|Lookup operations

|open
|boolean
a|File open operations

|read
|boolean
a|File read operations

|rename
|boolean
a|File rename operations

|rename_dir
|boolean
a|Directory rename operations

|setattr
|boolean
a|Set attribute operations

|symlink
|boolean
a|Symbolic link operations

```
|write
|boolean
a|File write operations

|===

[#filters]
[.api-collapsible-fifth-title]
filters

Specifies the list of filters for a given file operation for the specified
protocol.
When you specify the filters, you must specify the valid protocols and a
valid file operations.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|close_with_modification
|boolean
a|Filter the client request for close with modification.

|close_with_read
|boolean
a|Filter the client request for close with read.

|close_without_modification
|boolean
a|Filter the client request for close without modification.

|exclude_directory
|boolean
a|Filter the client requests for directory operations. When this filter is
specified directory operations are not monitored.

|first_read
|boolean
```

a|Filter the client requests for the first-read.

|first_write
|boolean
a|Filter the client requests for the first-write.

|monitor_ads
|boolean
a|Filter the client request for alternate data stream.

|offline_bit
|boolean
a|Filter the client request for offline bit set. FPolicy server receives
notification only when offline files are accessed.

|open_with_delete_intent
|boolean
a|Filter the client request for open with delete intent.

|open_with_write_intent
|boolean
a|Filter the client request for open with write intent.

|setattr_with_access_time_change
|boolean
a|Filter the client setattr requests for changing the access time of a
file or directory.

|setattr_with_allocation_size_change
|boolean
a|Filter the client setattr requests for changing the allocation size of a
file.

|setattr_with_creation_time_change
|boolean
a|Filter the client setattr requests for changing the creation time of a
file or directory.

|setattr_with_dacl_change
|boolean
a|Filter the client setattr requests for changing dacl on a file or
directory.

|setattr_with_group_change
|boolean
a|Filter the client setattr requests for changing group of a file or
directory.

|setattr_with_mode_change
|boolean
a|Filter the client setattr requests for changing the mode bits on a file
or directory.

|setattr_with_modify_time_change
|boolean
a|Filter the client setattr requests for changing the modification time of
a file or directory.

|setattr_with_owner_change
|boolean
a|Filter the client setattr requests for changing owner of a file or
directory.

|setattr_with_sacl_change
|boolean
a|Filter the client setattr requests for changing sacl on a file or
directory.

|setattr_with_size_change
|boolean
a|Filter the client setattr requests for changing the size of a file.

|write_with_size_change
|boolean
a|Filter the client request for write with size change.

|===

```
[#fpolicy_event]
[.api-collapsible-fifth-title]
fpolicy_event

The information that a FPolicy process needs to determine what file access
operations to monitor and for which of the monitored events notifications
should be sent to the external FPolicy server.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|file_operations
|link:#file_operations[file_operations]
a|Specifies the file operations for the FPolicy event. You must specify a
valid protocol in the protocol parameter.
The event will check the operations specified from all client requests
using the protocol.

|filters
|link:#filters[filters]
a|Specifies the list of filters for a given file operation for the
specified protocol.
When you specify the filters, you must specify the valid protocols and a
valid file operations.

|name
|string
a|Specifies the name of the FPolicy event.

|protocol
|string
a|Protocol for which event is created. If you specify protocol, then you
must also specify a valid value for the file operation parameters.
The value of this parameter must be one of the following:

***** cifs  - for the CIFS protocol.

***** nfsv3 - for the NFSv3 protocol.
```

```
***** nfsv4 - for the NFSv4 protocol.

|volume_monitoring
|boolean
a|Specifies whether volume operation monitoring is required.

[#fpolicy_policy]
[.api-collapsible-fifth-title]
fpolicy_policy

[cols=3*,options=header]
|===
|Name
|Type
|Description

|enabled
|boolean
a|Specifies if the policy is enabled on the SVM or not. If no value is
mentioned for this field but priority is set, then this policy will be
enabled.

|engine
|link:#fpolicy_engine_reference[fpolicy_engine_reference]
a|FPolicy external engine

|events
|array[link:#fpolicy_event_reference[fpolicy_event_reference]]
a|

|mandatory
|boolean
a|Specifies what action to take on a file access event in a case when all
primary and secondary servers are down or no response is received from the
FPolicy servers within a given timeout period. When this parameter is set
to true, file access events will be denied under these circumstances.

|name
```

```
|string
a|Specifies the name of the policy.

|string
a|The unique identifier of the SVM.

|===

[#fpolicy]
[.api-collapsible-fifth-title]
fpolicy
```

FPolicy is an infrastructure component of ONTAP that enables partner
applications connected to your storage systems to monitor and set file
access permissions. Every time a client accesses a file from a storage
system, based on the configuration of FPolicy, the partner application is
notified about file access.

a|

|secondary_servers
|array[string]
a|

|type
|string
a|The notification mode determines what ONTAP does after sending
```

notifications to FPolicy servers.
The possible values are:

***** synchronous - After sending a notification, wait for a response
from the FPolicy server.

***** asynchronous - After sending a notification, file request processing
continues.

* Default value: 1
* enum: ["synchronous", "asynchronous"]
* Introduced in: 9.6

|===

[#file_operations]
[.api-collapsible-fifth-title]
file_operations

Specifies the file operations for the FPolicy event. You must specify a
valid protocol in the protocol parameter.
The event will check the operations specified from all client requests
using the protocol.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|close
|boolean
a|File close operations

|create
|boolean
a|File create operations

|create_dir
|boolean
a|Directory create operations

```
|delete
|boolean
a|File delete operations

|delete_dir
|boolean
a|Directory delete operations

|getattr
|boolean
a|Get attribute operations

|link
|boolean
a|Link operations

|lookup
|boolean
a|Lookup operations

|open
|boolean
a|File open operations

|read
|boolean
a|File read operations

|rename
|boolean
a|File rename operations

|rename_dir
|boolean
a|Directory rename operations

|setattr
```

```
|boolean
a|Set attribute operations

|symlink
|boolean
a|Symbolic link operations

|write
|boolean
a|File write operations

|===

[#filters]
[.api-collapsible-fifth-title]
filters

Specifies the list of filters for a given file operation for the specified
protocol.
When you specify the filters, you must specify the valid protocols and a
valid file operations.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|close_with_modification
|boolean
a|Filter the client request for close with modification.

|close_with_read
|boolean
a|Filter the client request for close with read.

|close_without_modification
|boolean
a|Filter the client request for close without modification.
```

|exclude_directory
|boolean
a|Filter the client requests for directory operations. When this filter is specified directory operations are not monitored.

|first_read
|boolean
a|Filter the client requests for the first-read.

|first_write
|boolean
a|Filter the client requests for the first-write.

|monitor_ads
|boolean
a|Filter the client request for alternate data stream.

|offline_bit
|boolean
a|Filter the client request for offline bit set. FPolicy server receives notification only when offline files are accessed.

|open_with_delete_intent
|boolean
a|Filter the client request for open with delete intent.

|open_with_write_intent
|boolean
a|Filter the client request for open with write intent.

|setattr_with_access_time_change
|boolean
a|Filter the client setattr requests for changing the access time of a file or directory.

|setattr_with_allocation_size_change
|boolean
a|Filter the client setattr requests for changing the allocation size of a

file.

|setattr_with_creation_time_change
|boolean
a|Filter the client setattr requests for changing the creation time of a file or directory.

|setattr_with_dacl_change
|boolean
a|Filter the client setattr requests for changing dacl on a file or directory.

|setattr_with_group_change
|boolean
a|Filter the client setattr requests for changing group of a file or directory.

|setattr_with_mode_change
|boolean
a|Filter the client setattr requests for changing the mode bits on a file or directory.

|setattr_with_modify_time_change
|boolean
a|Filter the client setattr requests for changing the modification time of a file or directory.

|setattr_with_owner_change
|boolean
a|Filter the client setattr requests for changing owner of a file or directory.

|setattr_with_sacl_change
|boolean
a|Filter the client setattr requests for changing sacl on a file or directory.

|setattr_with_size_change
|boolean

a|Filter the client setattr requests for changing the size of a file.

|write_with_size_change
|boolean
a|Filter the client request for write with size change.

|===

[#fpolicy_event]
[.api-collapsible-fifth-title]
fpolicy_event

The information that a FPolicy process needs to determine what file access
operations to monitor and for which of the monitored events notifications
should be sent to the external FPolicy server.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|file_operations
|link:#file_operations[file_operations]
a|Specifies the file operations for the FPolicy event. You must specify a
valid protocol in the protocol parameter.
The event will check the operations specified from all client requests
using the protocol.

|filters
|link:#filters[filters]
a|Specifies the list of filters for a given file operation for the
specified protocol.
When you specify the filters, you must specify the valid protocols and a
valid file operations.

|name
|string
a|Specifies the name of the FPolicy event.

```
|protocol
|string
a|Protocol for which event is created. If you specify protocol, then you
must also specify a valid value for the file operation parameters.
The value of this parameter must be one of the following:

***** cifs  - for the CIFS protocol.

***** nfsv3 - for the NFSv3 protocol.

***** nfsv4 - for the NFSv4 protocol.

|volume_monitoring
|boolean
a|Specifies whether volume operation monitoring is required.

:leveloffset: -1

= Manage FPolicy engine configuration

:leveloffset: +1

[[ID1ce5874bae3a0cfcf065409bf46a1ffb]]
= Protocols fpolicy svm.uuid engines endpoint overview

== Overview

The FPolicy engine allows you to configure the external servers to which
the file access notifications are sent. As part of FPolicy engine
configuration, you can configure the server(s) to which the notification
is sent, an optional set of secondary server(s) to which the notification
is sent in the case of the primary server(s) failure, the port number for
FPolicy application and the type of the engine, synchronous or
asynchronous.

For the synchronous engine, ONTAP will wait for a response from the
FPolicy application before it allows the operation. With an asynchronous
engine, ONTAP proceeds with the operation processing after sending the
notification to the FPolicy application. An engine can belong to multiple
FPolicy policies.
```

== Examples

=== Creating an FPolicy engine

'''

The API:
POST /protocols/fpolicy/{svm.uuid}/engines

#The call:
curl -X POST "https://<mgmt-ip>/api/protocols/fpolicy/4f643fb4-fd21-11e8-
ae49-0050568e2c1e/engines/" -H "accept: application/json" -H "Content-
Type: application/json" -d "{ \"name\": \"engine0\", \"port\": 9876,
\"primary_servers\": [\"10.132.145.22\", \"10.140.101.109\"],
\"secondary_servers\": [\"10.132.145.20\", \"10.132.145.21\"], \"type\":
\"synchronous\"}"

# The response:
{
"num_records": 1,
"records": [
  {
    "name": "engine0",
    "primary_servers": [
      "10.132.145.22",
      "10.140.101.109"
    ],
    "secondary_servers": [
      "10.132.145.20",
      "10.132.145.21"
    ],
    "port": 9876,
    "type": "synchronous"
  }
]
}

'''

= Retrieve the FPolicy engine configuration for all engines of an SVM

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/protocols/fpolicy/{svm.uuid}/engines`#

Introduced In: 9.6

Retrieves FPolicy engine configurations of all the engines for a specified
SVM. ONTAP allows creation of cluster-level FPolicy engines that act as a
template for all the SVMs belonging to the cluster. These cluster-level
FPolicy engines are also retrieved for the specified SVM.

== Related ONTAP commands

* `fpolicy policy external-engine show`

|===

|Name
|Type
|In
|Required
|Description

|secondary_servers
|string
|query
|False
a|Filter by secondary_servers

|type
|string
|query
|False
a|Filter by type

|primary_servers
|string
|query
|False
a|Filter by primary_servers

|port
|integer
|query
|False
a|Filter by port

|name
|string
|query
```

|False
a|Filter by name

|svm.uuid
|string
|path
|True
a|UUID of the SVM to which this object belongs.

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_records
|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number of records is returned.

* Default value: 1

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached.

* Default value: 1
* Max value: 120
* Min value: 0

```
|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

= Create the FPolicy engine configuration for an SVM

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/protocols/fpolicy/{svm.uuid}/engines`#

Introduced In: 9.6

Creates an FPolicy engine configuration for a specified SVM. FPolicy
engine creation is allowed only on data SVMs.

== Required properties

* `svm.uuid` - Existing SVM in which to create the FPolicy engine.
* `name` - Name of external engine.
* `port` - Port number of the FPolicy server application.
* `primary_servers` - List of primary FPolicy servers to which the node
will send notifications.

== Recommended optional properties

* `secondary_servers` - It is recommended to configure secondary FPolicy server to which the node will send notifications when the primary server is down.

== Default property values

* `type` - _synchronous_

== Related ONTAP commands

:leveloffset: -1

= Manage FPolicy event configuration

:leveloffset: +1

[[IDbe5feb63c656629fe122ce4a5a81b5a7]]
= Protocols fpolicy svm.uuid events endpoint overview

== Overview
```

FPolicy events configurations allow you to specify which file access is monitored. As part of an FPolicy event, you can configure the SVM for which the events are generated, the name of the event configuration, the protocol (cifs, nfsv3/nfsv4) for which the events are generated, the file operations which are monitored, and filters that can be used to filter the unwanted notification generation for a specified protocol and file operation.

Each protocol has a set of supported file operations and filters. An SVM can have multiple events. A single FPolicy policy can have multiple FPolicy events.

== Examples

=== Creating an FPolicy event for a CIFS protocol with all the supported file operations and filters

'''

```
# The API:
POST /protocols/fpolicy/{svm.uuid}/events

# The call:

= Retrieve the FPolicy event configuration for all events for an SVM

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-block]#`/protocols/fpolicy/{svm.uuid}/events`#

```
*Introduced In:* 9.6

Retrieves FPolicy event configurations for all events for a specified SVM.
ONTAP allows the creation of cluster-level FPolicy events that act as a
template for all the data SVMs belonging to the cluster. These cluster-
level FPolicy events are also retrieved for the specified SVM.

[[IDf404a1c1a3cd105db5e3da645ba7428f]]
= Create the FPolicy event configuration for an SVM

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-block]#`/protocols/fpolicy/{svm.uuid}/events`#

Introduced In: 9.6

Creates an FPolicy event configuration for a specified SVM. FPolicy event creation is allowed only on data SVMs. When a protocol is specified, you must specify a file operation or a file operation and filters.

== Required properties

* `svm.uuid` - Existing SVM in which to create the FPolicy event.
* `name` - Name of the FPolicy event.

== Recommended optional properties

* `file-operations` - List of file operations to monitor.
* `protocol` - Protocol for which the file operations should be monitored.
* `filters` - List of filters for the specified file operations.

== Default property values

If not specified in POST, the following default property values are assigned:

* `file_operations.+*+` - _false_
* `filters.+*+` - _false_
* `volume-monitoring` - _false_

== Related ONTAP commands

* `fpolicy policy event create`

== Learn more

*

|Description

|file_operations
|link:#file_operations[file_operations]
a|Specifies the file operations for the FPolicy event. You must specify a
valid protocol in the protocol parameter.
The event will check the operations specified from all client requests
using the protocol.

|filters
|link:#filters[filters]
a|Specifies the list of filters for a given file operation for the
specified protocol.
When you specify the filters, you must specify the valid protocols and a
valid file operations.

|name
|string
a|Specifies the name of the FPolicy event.

|protocol
|string
a|Protocol for which event is created. If you specify protocol, then you
must also specify a valid value for the file operation parameters.
The value of this parameter must be one of the following:

***** cifs  - for the CIFS protocol.
```

```
***** nfsv3 - for the NFSv3 protocol.

***** nfsv4 - for the NFSv4 protocol.

|volume_monitoring
|boolean
a|Specifies whether volume operation monitoring is required.

= Update a specific FPolicy event configuration for an SVM

[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-block]#`/protocols/fpolicy/{svm.uuid}/events/{name}`#

Introduced In: 9.6

Updates a specific FPolicy event configuration for an SVM. A cluster-level FPolicy event configuration cannot be modified for a data SVM through REST. When the file operations and filters fields are modified, the previous values are retained and new values are added to the list of previous values. To remove a particular file operation or filter, set its value to false in the request.

:leveloffset: -1

= Manage SVM FPolicy configuration

:leveloffset: +1

[[IDef4e7735985eced50dd8214382f310ab]]
```

```
= Protocols fpolicy svm.uuid policies endpoint overview

== Overview

The FPolicy policy acts as a container for different constituents of the
FPolicy such as FPolicy events and the FPolicy engine. It also provides a
platform for policy management functions, such as policy enabling and
disabling. As part of FPolicy policy configuration, you can specifiy the
name of policy, the SVM to which it belongs, the FPolicy events to
monitor, the FPolicy engine to which the generated notifications are sent
and the policy priority. FPolicy policy configuration also allows to you
to configure the file access behaviour when the primary and secondary
servers are down. Under such circumstances, if the "mandatory" field is
set to true, file access is denied.

Each FPolicy policy is associated with a scope which allows you to
restrain the scope of the policy to specified storage objects such as
volume, shares and export or to a set of file extensions such as .txt,
.jpeg. An FPolicy policy can be configured to send notifications, to the
FPolicy server or for native file blocking which uses the file extension
specified in the policy scope. An SVM can have multiple FPolicy policies
which can be enabled or disabled independently of each other.

== Examples

=== Creating an FPolicy policy

Use the following API to create an FPolicy policy configuration. Note that
the _return_records=true_ query parameter used to obtain the newly created
entry in the response.

'''

----

# The API:
POST /protocols/fpolicy/{svm.uuid}/policies

# The call:
curl -X POST "https://<mgmt-ip>/api/protocols/fpolicy/a00fac5d-0164-11e9-
b64a-0050568eeb34/policies?return_records=true" -H "accept:
application/json" -H "Content-Type: application/json" -d "{ \"engine\": {
\"name\": \"engine1\" }, \"events\": [ { \"name\": \"cifs\" }, { \"name\":
\"nfs\" } ], \"mandatory\": true, \"name\": \"FPolicy_policy_0\",
\"scope\": { \"exclude_export_policies\": [ \"export_pol1\" ],
```

```
\"exclude_extension\": [ \"txt\", \"png\" ], \"exclude_shares\": [ \"sh1\"
], \"exclude_volumes\": [ \"vol0\" ], \"include_export_policies\": [
\"export_pol10\" ], \"include_extension\": [ \"pdf\" ],
\"include_shares\": [ \"sh2\", \"sh3\" ], \"include_volumes\": [ \"vol1\",
\"vol2\" ] }}"

# The response:

= Retrieve the FPolicy configuration for an SVM

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/protocols/fpolicy/{svm.uuid}/policies`#

Introduced In: 9.6

Retrieves the FPolicy policy configuration of an SVM. ONTAP allows the
creation of a cluster level FPolicy policy that acts as a template for all
the data SVMs belonging to the cluster. This cluster level FPolicy policy
is also retrieved for the specified SVM.

== Related ONTAP commands

* `fpolicy policy show`
* `fpolicy policy scope show`

== Learn more

*
xref:{relative_path}protocols_fpolicy_svm.uuid_policies_endpoint_overview.
html[DOC /protocols/fpolicy/{svm.uuid}/policies]

```
== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|enabled
|boolean
|query
|False
a|Filter by enabled

|scope.exclude_volumes
|string
|query
|False
a|Filter by scope.exclude_volumes

|scope.include_export_policies
|string
|query
|False
a|Filter by scope.include_export_policies

|scope.exclude_shares
|string
|query
|False
a|Filter by scope.exclude_shares

|scope.include_volumes
|string
|query
|False
a|Filter by scope.include_volumes
```

|scope.include_extension
|string
|query
|False
a|Filter by scope.include_extension

|scope.exclude_extension
|string
|query
|False
a|Filter by scope.exclude_extension

|scope.exclude_export_policies
|string
|query
|False
a|Filter by scope.exclude_export_policies

|scope.include_shares
|string
|query
|False
a|Filter by scope.include_shares

|priority
|integer
|query
|False
a|Filter by priority

|events.name
|string
|query
|False
a|Filter by events.name

|engine.name
|string
|query
|False

a|Filter by engine.name

|mandatory
|boolean
|query
|False
a|Filter by mandatory

|name
|string
|query
|False
a|Filter by name

|svm.uuid
|string
|path
|True
a|UUID of the SVM to which this object belongs.

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_records
|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number of records is returned.

* Default value: 1

```
|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

= Create the FPolicy configuration for an SVM

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/protocols/fpolicy/{svm.uuid}/policies`#

*Introduced In:* 9.6

Creates an FPolicy policy configuration for the specified SVM. To create
an FPolicy policy, you must specify the policy scope and the FPolicy
events to be monitored.
```

Important notes:

* A single policy can monitor multiple events.
* An FPolicy engine is an optional field whose default value is set to
native. A native engine can be used to simply block the file access based
on the file extensions specified in the policy scope.
* To enable a policy, the policy priority must be specified. If the
priority is not specified, the policy is created but it is not enabled.
* The "mandatory" field, if set to true, blocks the file access when the
primary or secondary FPolicy servers are down.

== Required properties

* `svm.uuid` - Existing SVM in which to create the FPolicy policy.
* `events` - Name of the events to monitior.
* `name` - Name of the FPolicy policy.
* `scope` - Scope of the policy. Can be limited to exports, volumes,
shares or file extensions.
* `priority`- Priority of the policy (ranging from 1 to 10).

== Default property values

* `mandatory` - _true_
* `engine` - _native_

== Related ONTAP commands

* `fpolicy policy scope create`
* `fpolicy policy create`
* `fpolicy enable`

== Learn more

*
xref:{relative_path}protocols_fpolicy_svm.uuid_policies_endpoint_overview.
html[DOC /protocols/fpolicy/{svm.uuid}/policies]

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required

```
|Description

|return_records
|boolean
|query
|False
a|The default is false.  If set to true, the records are returned.

* Default value:

|svm.uuid
|string
|path
|True
a|UUID of the SVM to which this object belongs.

|===

== Request Body

[cols=3*,options=header]
|===
|Name
|Type
|Description

|enabled
|boolean
a|Specifies if the policy is enabled on the SVM or not. If no value is
mentioned for this field but priority is set, then this policy will be
enabled.

|engine
|link:#fpolicy_engine_reference[fpolicy_engine_reference]
a|FPolicy external engine

|events
|array[link:#fpolicy_event_reference[fpolicy_event_reference]]
a|

|mandatory
|boolean
```

a|Specifies what action to take on a file access event in a case when all
primary and secondary servers are down or no response is received from the
FPolicy servers within a given timeout period. When this parameter is set
to true, file access events will be denied under these circumstances.

|name
|string
a|Specifies the name of the policy.

|priority
|integer
a|Specifies the priority that is assigned to this policy.

= View NFS connected clients

:leveloffset: +1

[[ID472949dceb9436ecf5035a0164b54b04]]
= Protocols NFS connected-clients endpoint overview
```

```
== Overview

ONTAP connected clients show functionality is mainly used to provide a
list of currently connected NFS clients. It also provides a potential list
of other NFS clients that can be connected but are currently idle.

The following are details of the fields retrieved for the Connected
Clients GET API:

node.name: The node name hosting this record; basically the node hosting
the "server_ip".
node.uuid: The node UUID hosting this record; basically the node hosting
the "server_ip".
svm.name: The svm name to which the "server_ip" belongs to.
svm.uuid: The svm uuid to which the "server_ip" belongs to.
server_ip: All clients that are connected to this interface are displayed
in rows.
client_ip: The IP address of the client that is connected to the
interface.
volume.name: The name of the volume the client is accessing.
volume.uuid: The UUID of the volume the client is accessing. This field is
expensive field and will be fetched in advance privilege level.
protocol: The NFS protocol version over which client is accessing the
volume.
export_policy.id: The export policy ID associated with the volume.
export_policy.name: The export policy name associated with the volume.
idle_duration: The time elapsed since the last request was sent by the
client for this volume.
local_request_count: A counter that tracks requests that are sent to the
volume with fast-path to local node.
remote_request_count: A counter that tracks requests that are sent to the
volume with slow-path to remote node.

== Example

=== Retrieves connected client information

----

# The API:
GET /protocols/nfs/connected-clients

# The call:
curl -X GET "https://<cluster-mgmt-ip>/api/protocols/nfs/connected-
clients?return_timeout=15&return_records=true" -H "accept:
```

```
application/json"

# The response:

= Retrieve NFS configuration for an SVM

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-block]#`/protocols/nfs/connected-clients`#

Introduced In: 9.7

Retrieves the NFS configuration of SVMs.

== Expensive properties

export_policy.id is expensive field. It is not included by default in GET results and must be explicitly requested using the `fields` query parameter. See xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields[Requesting specific fields] to learn more.

* `export_policy.id`

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In

```
|Required
|Description

|export_policy.name
|string
|query
|False
a|Filter by export_policy.name

* Introduced in: 9.9

|export_policy.id
|integer
|query
|False
a|Filter by export_policy.id

* Introduced in: 9.9

|local_request_count
|integer
|query
|False
a|Filter by local_request_count

|client_ip
|string
|query
|False
a|Filter by client_ip

|volume.name
|string
|query
|False
a|Filter by volume.name

|volume.uuid
|string
|query
|False
a|Filter by volume.uuid
```

|node.name
|string
|query
|False
a|Filter by node.name

|node.uuid
|string
|query
|False
a|Filter by node.uuid

|svm.uuid
|string
|query
|False
a|Filter by svm.uuid

|svm.name
|string
|query
|False
a|Filter by svm.name

|server_ip
|string
|query
|False
a|Filter by server_ip

|idle_duration
|string
|query
|False
a|Filter by idle_duration

|remote_request_count
|integer
|query

|False
a|Filter by remote_request_count

|protocol
|string
|query
|False
a|Filter by protocol

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached.

* Default value: 1
* Max value: 120
* Min value: 0

|return_records
|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number of records is returned.

* Default value: 1

```
|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

[[ID51108759bd44154af1195cf90ae73491]]
= Create an export policy

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/protocols/nfs/export-policies`#

*Introduced In:* 9.6

Creates an export policy. An SVM can have any number of export policies to
define rules for which clients can access data exported by the SVM. A
policy with no rules prohibits access.

== Required properties

* `svm.uuid` or `svm.name` - Existing SVM in which to create an export
policy.
* `name`  - Name of the export policy.

== Recommended optional properties

* `rules`  - Rule(s) of an export policy. Used to create the export rule
and populate the export policy with export rules in a single request.

== Related ONTAP commands

* `vserver export-policy create`
* `vserver export-policy rule create`
```

== Learn more

* xref:{relative_path}protocols_nfs_export-
policies_endpoint_overview.html[DOC /protocols/nfs/export-policies]

== Parameters

= Create an export policy rule

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/protocols/nfs/export-policies/{policy.id}/rules`#

*Introduced In:* 9.6

Creates an export policy rule.

== Required properties

* `policy.id`  - Existing export policy for which to create an export
rule.
* `clients.match`  - List of clients (hostnames, ipaddresses, netgroups,
domains) to which the export rule applies.
* `ro_rule`  - Used to specify the security type for read-only access to
volumes that use the export rule.
* `rw_rule`  - Used to specify the security type for read-write access to
volumes that use the export rule.

== Default property values

If not specified in POST, the following default property values are
assigned:

* `protocols` - _any_
```

* `anonymous_user` - _none_
* `superuser` - _any_
* `allow_device_creation` - _true_
* `ntfs_unix_security` - _fail_
* `chown_mode` - _restricted_
* `allow_suid` - _true_

== Related ONTAP commands

* `vserver export-policy rule create`

= Create an export policy rule client

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/protocols/nfs/export-policies/{policy.id}/rules/{index}/clients`#

*Introduced In:* 9.6

Creates an export policy rule client

== Required properties

* `policy.id` - Existing export policy that contains export policy rules
for the client being added.
* `index`  - Existing export policy rule for which to create an export
client.
* `match`  - Base name for the export policy client.

== Related ONTAP commands
```

* `vserver export-policy rule add-clientmatches`

== Error

Status: Default

```
ONTAP Error Response codes

|===
| Error codes | Description

| 1966082
| LIF could not be found in database. Contact technical support for
assistance.

| 3276801
| Failed to bind service principal name on LIF.

| 3276809
| Failed to disable NFS Kerberos on LIF.

| 3276832
| Failed to insert Kerberos attributes to database.

| 3276842
| Internal error. Failed to import Kerberos keytab file into the
management databases. Contact technical support for assistance.

| 3276861
| Kerberos is already enabled/disabled on this LIF.

| 3276862
| Kerberos service principal name is required.

| 3276889
| Failed to enable NFS Kerberos on LIF.

| 3276937
```

| Failed to lookup the Vserver for the virtual interface.

| 3276941
| Kerberos is a required field.

| 3276942
| Service principal name is invalid. It must of the format:"nfs/+++<LIF-FQDN>+++@REALM"+++</LIF-FQDN>+++

| 3276944
| Internal error. Reason: Failed to initialize the Kerberos context

| 3276945
| Internal error. Reason: Failed to parse the service principal name

| 3276951
| Warning: Skipping unsupported encryption type for service principal name

| 3276952
| "organizational_unit" option cannot be used for "Other" vendor.

| 3276965
| Account sharing across Vservers is not allowed. Use a different service principal name unique within the first 15 characters.

| 3277019
| Cannot specify -force when enabling Kerberos.

| 3277020
| Modifying the NFS Kerberos configuration for a LIF that is not configured for NFS is not supported.

| 3277043
| Keytab import failed due to missing keys. Keys for encryption types are required for Vserver but found no matching keys for service principal name. Generate the keytab file with all required keys and try again.

[[IDdcfabf95b26d5de5ba040b462cc660f5]]
= Create a Kerberos realm

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/protocols/nfs/kerberos/realms`#

*Introduced In:* 9.6

Creates a Kerberos realm.

== Required properties

* `svm.uuid` or `svm.name` - Existing SVM on which to create the Kerberos
realm.
* `name` - Base name for the Kerberos realm.
* `kdc.vendor` - Vendor of the Key Distribution Center (KDC) server for
this Kerberos realm. If the configuration uses a Microsoft Active
Directory domain for authentication, this field nust be `microsoft`.
* `kdc.ip` - IP address of the KDC server for this Kerberos realm.

== Recommended optional properties

* `ad_server.name` - Host name of the Active Directory Domain Controller
(DC). This is a mandatory parameter if the kdc-vendor is `microsoft`.
```

* `ad_server.address` - IP address of the Active Directory Domain
Controller (DC). This is a mandatory parameter if the kdc-vendor is
`microsoft`.

== Default property values

If not specified in POST, the following default property value is
assigned:

* `kdc.port` - _88_

== Related ONTAP commands

* `vserver nfs kerberos realm create`

== Learn more

*

----

== Performance monitoring
```

Performance of the SVM can be monitored by the `metric.+*+` and
`statistics.+*+` properties. These show the performance of the SVM in
terms of IOPS, latency and throughput. The `metric.+*+` properties denote
an average whereas `statistics.+*+` properties denote a real-time
monotonically increasing value aggregated across all nodes.

[[ID877233b6662621094c3c75db212cf6d8]]
= Retrieve NFS configuration for SVMs

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/protocols/nfs/services`#

Introduced In: 9.6

Retrieves the NFS configuration of SVMs.

== Expensive properties

There is an added cost to retrieving values for these properties. They are
not included by default in GET results and must be explicitly requested
using the `fields` query parameter. See
xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requestin
g_specific_fields[Requesting specific fields] to learn more.

* `statistics.+*+`
* `metric.+*+`

== Related ONTAP commands

* `vserver nfs show`
* `vserver nfs status`

== Learn more

* xref:{relative_path}protocols_nfs_services_endpoint_overview.html[DOC
/protocols/nfs/services]

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_timeout
|integer

|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0

|return_records
|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number
of records is returned.

* Default value: 1

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

|iops
|link:#iops[iops]
a|The rate of I/O operations observed at the storage object.

|latency
|link:#latency[latency]
a|The round trip latency in microseconds observed at the storage object.

|status
```

|string
a|Any errors associated with the sample. For example, if the aggregation
of data over multiple nodes fails then any of the partial errors might be
returned, "ok" on success, or "error" on any internal uncategorized
failure. Whenever a sample collection is missed but done at a later time,
it is back filled to the previous 15 second timestamp and tagged with
"backfilled_data". "Inconsistent_ delta_time" is encountered when the time
between two collections is not the same for all nodes. Therefore, the
aggregated value might be over or under inflated. "Negative_delta" is
returned when an expected monotonically increasing value has decreased in
value. "Inconsistent_old_data" is returned when one or more nodes do not
have the latest data.

|throughput
|link:#throughput[throughput]
a|The rate of throughput bytes per second observed at the storage object.

|timestamp
|string
a|The timestamp of the performance data.

[[ID306947cc5f3edee45ef642852bcef853]]
= Create an NFS configuration for an SVM

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-block]#`/protocols/nfs/services`#

Introduced In: 9.6

Creates an NFS configuration for an SVM.

== Required properties

* `svm.uuid` or `svm.name` - Existing SVM for which to create the NFS configuration.

== Default property values

If not specified in POST, the following default property values are assigned:

* `enabled` - _true_
* `state` - online
* `transport.udp_enabled` - _true_
* `transport.tcp_enabled` - _true_
* `protocol.v3_enabled` - _true_
* `protocol.v3_64bit_identifiers_enabled` - _false_
* `protocol.v4_id_domain` - defaultv4iddomain.com
* `protocol.v4_64bit_identifiers_enabled` - _true_
* `protocol.v4_enabled` - _false_
* `protocol.v41_enabled` - _false_
* `protocol.v40_features.acl_enabled` - _false_
* `protocol.v40_features.read_delegation_enabled` - _false_
* `protocol.v40_features.write_delegation_enabled` - _false_
* `protocol.v41_features.acl_enabled` - _false_
* `protocol.v41_features.read_delegation_enabled` - _false_
* `protocol.v41_features.write_delegation_enabled` - _false_

* `protocol.v41_features.pnfs_enabled` - _false_
* `vstorage_enabled` - _false_
* `rquota_enabled` - _false_
* `showmount_enabled` - _true_
* `auth_sys_extended_groups_enabled` - _false_
* `extended_groups_limit` - _32_
* `positive_cached_credential_ttl` - _7200000_

== Error
```

Status: Default

```
ONTAP Error Response Codes

|===
| Error Code | Description

| 3276916
| Vserver is not running

| 3276994
| Kerberos must be disabled on all LIFs on Vserver before adding or
removing AES encryption. Disable Kerberos on the LIF and try again

| 3277038
| Cannot enable \"showmount\" feature because it requires an effective
cluster version of Data ONTAP 8.3.0 or later

| 3277049
| Cannot enable \"showmount\" feature on ID-Discard Vserver. Ensure that
the Vserver is initialized and retry the command

| 3277052
```

```
| NFSv4.x access to transitioned volumes in this Vserver could trigger
conversion of non-Unicode directories to Unicode, which might impact data-
serving performance. Before enabling NFSv4.x for this Vserver, refer to
the Data and Configuration Transition Guide

| 3277069
| Cannot disable TCP because the SnapDiff RPC server is in the \"on\"
state

| 3277089
| Attempting to create an NFS server using 64-bits for NFSv3 FSIDs and
File IDs on Vserver. Older client software might not work with 64-bit
identifiers

| 3277099
| Domain name contains invalid characters or it is too short. Allowed
characters are: alphabetical characters (A-Za-z), numeric characters (0-
9), minus sign (-), and the period (.). The first character must be
alphabetical or numeric, last character must not be a minus sign or a
period. Minimum supported length: 2 characters, maximum of 256 characters

[#v3]
[.api-collapsible-fifth-title]
v3

The NFSv3 operations

[cols=3*,options=header]
|===
|Name
|Type
|Description

|_links
|link:#_links[_links]
a|

|duration
|string
a|The duration over which this sample is calculated. The time durations
are represented in the ISO-8601 standard format. Samples can be calculated
over the following durations:

|iops
|link:#iops[iops]
a|The rate of I/O operations observed at the storage object.

|latency
|link:#latency[latency]
a|The round trip latency in microseconds observed at the storage object.

|status
```

|string
a|Any errors associated with the sample. For example, if the aggregation
of data over multiple nodes fails then any of the partial errors might be
returned, "ok" on success, or "error" on any internal uncategorized
failure. Whenever a sample collection is missed but done at a later time,
it is back filled to the previous 15 second timestamp and tagged with
"backfilled_data". "Inconsistent_ delta_time" is encountered when the time
between two collections is not the same for all nodes. Therefore, the
aggregated value might be over or under inflated. "Negative_delta" is
returned when an expected monotonically increasing value has decreased in
value. "Inconsistent_old_data" is returned when one or more nodes do not
have the latest data.

|throughput
|link:#throughput[throughput]
a|The rate of throughput bytes per second observed at the storage object.

|timestamp
|string
a|The timestamp of the performance data.

|===
|Name
|Type
|Description

|_links
|link:#_links[_links]
a|

|duration
|string
a|The duration over which this sample is calculated. The time durations
are represented in the ISO-8601 standard format. Samples can be calculated
over the following durations:
```

|iops
|link:#iops[iops]
a|The rate of I/O operations observed at the storage object.

|latency
|link:#latency[latency]
a|The round trip latency in microseconds observed at the storage object.

|status
|string
a|Any errors associated with the sample. For example, if the aggregation of data over multiple nodes fails then any of the partial errors might be returned, "ok" on success, or "error" on any internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_ delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.

|throughput
|link:#throughput[throughput]
a|The rate of throughput bytes per second observed at the storage object.

|timestamp
|string
a|The timestamp of the performance data.

|v4_64bit_identifiers_enabled
|boolean
a|Specifies whether 64-bit support for NFSv4.x FSIDs and file IDs is
enabled.

|v4_id_domain
|string
a|Specifies the domain portion of the string form of user and group
names as defined by the NFSv4 protocol.

|===

[#iops_raw]
[.api-collapsible-fifth-title]
iops_raw

The number of I/O operations observed at the storage object. This should
be used along with delta time to calculate the rate of I/O operations per
unit of time.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|other
|integer
a|Performance metric for other I/O operations. Other I/O operations can be
metadata operations, such as directory lookups and so on.
```

```
|read
|integer
a|Performance metric for read I/O operations.

|total
|integer
a|Performance metric aggregated over all types of I/O operations.

|write
|integer
a|Peformance metric for write I/O operations.

|===

[#latency_raw]
[.api-collapsible-fifth-title]
latency_raw

The raw latency in microseconds observed at the storage object. This
should be divided by the raw IOPS value to calculate the average latency
per I/O operation.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|other
|integer
a|Performance metric for other I/O operations. Other I/O operations can be
metadata operations, such as directory lookups and so on.

|read
|integer
a|Performance metric for read I/O operations.

|total
```

```
|integer
a|Performance metric aggregated over all types of I/O operations.

|write
|integer
a|Peformance metric for write I/O operations.

|===

[#throughput_raw]
[.api-collapsible-fifth-title]
throughput_raw

Throughput bytes observed at the storage object. This should be used along
with delta time to calculate the rate of throughput bytes per unit of
time.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|read
|integer
a|Performance metric for read I/O operations.

|total
|integer
a|Performance metric aggregated over all types of I/O operations.

|write
|integer
a|Peformance metric for write I/O operations.

|===

[#v3]
[.api-collapsible-fifth-title]
```

```
v3

The NFSv3 operations

[cols=3*,options=header]
|===
|Name
|Type
|Description

|iops_raw
|link:#iops_raw[iops_raw]
a|The number of I/O operations observed at the storage object. This should
be used along with delta time to calculate the rate of I/O operations per
unit of time.

|latency_raw
|link:#latency_raw[latency_raw]
a|The raw latency in microseconds observed at the storage object. This
should be divided by the raw IOPS value to calculate the average latency
per I/O operation.

|status
|string
a|Any errors associated with the sample. For example, if the aggregation
of data over multiple nodes fails then any of the partial errors might be
returned, "ok" on success, or "error" on any internal uncategorized
failure. Whenever a sample collection is missed but done at a later time,
it is back filled to the previous 15 second timestamp and tagged with
"backfilled_data". "Inconsistent_delta_time" is encountered when the time
between two collections is not the same for all nodes. Therefore, the
aggregated value might be over or under inflated. "Negative_delta" is
returned when an expected monotonically increasing value has decreased in
value. "Inconsistent_old_data" is returned when one or more nodes do not
have the latest data.

|throughput_raw
|link:#throughput_raw[throughput_raw]
a|Throughput bytes observed at the storage object. This should be used
along with delta time to calculate the rate of throughput bytes per unit
of time.
```

```
|timestamp
|string
a|The timestamp of the performance data.

a|

|auth_sys_extended_groups_enabled
|boolean
a|Specifies whether or not extended groups support over AUTH_SYS is enabled.

|enabled
|boolean

a|Specifies if the NFS service is administratively enabled.

|extended_groups_limit
|integer
a|Specifies the maximum auxillary groups supported over AUTH_SYS and RPCSEC_GSS.

|metric
|link:#metric[metric]
a|Historical performance numbers, such as IOPS latency and throughput, for SVM-NFS protocol.

|positive_cached_credential_ttl
|integer
a|Specifies the time to live value (in msecs) of a positive cached credential

|protocol
|link:#protocol[protocol]
a|

|rquota_enabled
|boolean
a|Specifies whether or not the remote quota feature is enabled.

|showmount_enabled
|boolean
a|Specifies whether or not the showmount feature is enabled.

|state
|string
a|Specifies the state of the NFS service on the SVM. The following values are supported:

***** online - NFS server is ready to accept client requests.

***** offline - NFS server is not ready to accept client requests.

|statistics

ONTAP Error Response Codes

|===
| Error Code | Description

| 3276916
| Vserver is not running

| 3277069
| Cannot disable TCP because the SnapDiff RPC server is in the \"on\"
state

| 3277087
| Attempting to reduce the number of bits used for NFSv3 FSIDs and File
IDs from 64 to 32 on Vserver. This could result in collisions between
different File IDs and is not recommended

| 3277088
| Attempting to increase the number of bits used for NFSv3 FSIDs and File
IDs from 32 to 64 on Vserver. This could result in older client software
no longer working with the volumes owned by Vserver

| 3277090
| Attempting to disallow multiple FSIDs per mount point on Vserver. Since
this Vserver currently uses 32-bit NFSv3 FSIDs and File IDs, this could
result in collisions between different File IDs and is not recommended

| 3277099
| Domain name contains invalid characters or its too short. Allowed
characters are: alphabetical characters (A-Za-z), numeric characters (0-
9), minus sign (-), and the period (.). The first character must be
alphabetical or numeric, last character must not be a minus sign or a
period. Minimum supported length: 2 characters, maximum of 256 characters

|duration
|string
a|The duration over which this sample is calculated. The time durations
are represented in the ISO-8601 standard format. Samples can be calculated
over the following durations:

|iops
|link:#iops[iops]
a|The rate of I/O operations observed at the storage object.

|latency
|link:#latency[latency]
a|The round trip latency in microseconds observed at the storage object.

|status
|string
a|Any errors associated with the sample. For example, if the aggregation
of data over multiple nodes fails then any of the partial errors might be
returned, "ok" on success, or "error" on any internal uncategorized
failure. Whenever a sample collection is missed but done at a later time,
it is back filled to the previous 15 second timestamp and tagged with
"backfilled_data". "Inconsistent_ delta_time" is encountered when the time
between two collections is not the same for all nodes. Therefore, the
aggregated value might be over or under inflated. "Negative_delta" is
returned when an expected monotonically increasing value has decreased in
value. "Inconsistent_old_data" is returned when one or more nodes do not
have the latest data.

|throughput
|link:#throughput[throughput]
a|The rate of throughput bytes per second observed at the storage object.

[.api-collapsible-fifth-title]
protocol

[cols=3*,options=header]
|===
|Name
|Type
|Description

|v3_64bit_identifiers_enabled
|boolean
a|Specifies whether 64-bit support for NFSv3 FSIDs and file IDs is
enabled.

|v3_enabled
|boolean
a|Specifies whether NFSv3 protocol is enabled.
```

```
|v40_enabled
|boolean
a|Specifies whether NFSv4.0 protocol is enabled.

|v40_features
|link:#v40_features[v40_features]
a|

|v41_enabled
|boolean
a|Specifies whether NFSv4.1 or later protocol is enabled.

|v41_features
|link:#v41_features[v41_features]
a|

|v4_64bit_identifiers_enabled
|boolean
a|Specifies whether 64-bit support for NFSv4.x FSIDs and file IDs is
enabled.

|v4_id_domain
|string
a|Specifies the domain portion of the string form of user and group
names as defined by the NFSv4 protocol.

|===

[#iops_raw]
[.api-collapsible-fifth-title]
iops_raw

The number of I/O operations observed at the storage object. This should
be used along with delta time to calculate the rate of I/O operations per
unit of time.

[cols=3*,options=header]
|===
|Name
```

|Type
|Description

|other
|integer
a|Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.

|read
|integer
a|Performance metric for read I/O operations.

|total
|integer
a|Performance metric aggregated over all types of I/O operations.

|write
|integer
a|Peformance metric for write I/O operations.

|===

[#latency_raw]
[.api-collapsible-fifth-title]
latency_raw

The raw latency in microseconds observed at the storage object. This should be divided by the raw IOPS value to calculate the average latency per I/O operation.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|other
|integer
a|Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.

```
|read
|integer
a|Performance metric for read I/O operations.

|total
|integer
a|Performance metric aggregated over all types of I/O operations.

|write
|integer
a|Peformance metric for write I/O operations.

|===

[#throughput_raw]
[.api-collapsible-fifth-title]
throughput_raw

Throughput bytes observed at the storage object. This should be used along
with delta time to calculate the rate of throughput bytes per unit of
time.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|read
|integer
a|Performance metric for read I/O operations.

|total
|integer
a|Performance metric aggregated over all types of I/O operations.

|write
|integer
a|Peformance metric for write I/O operations.
```

```
|===

[#v3]
[.api-collapsible-fifth-title]
v3

The NFSv3 operations

[cols=3*,options=header]
|===
|Name
|Type
|Description

|iops_raw
|link:#iops_raw[iops_raw]
a|The number of I/O operations observed at the storage object. This should
be used along with delta time to calculate the rate of I/O operations per
unit of time.

|latency_raw
|link:#latency_raw[latency_raw]
a|The raw latency in microseconds observed at the storage object. This
should be divided by the raw IOPS value to calculate the average latency
per I/O operation.

|status
|string
a|Any errors associated with the sample. For example, if the aggregation
of data over multiple nodes fails then any of the partial errors might be
returned, "ok" on success, or "error" on any internal uncategorized
failure. Whenever a sample collection is missed but done at a later time,
it is back filled to the previous 15 second timestamp and tagged with
"backfilled_data". "Inconsistent_delta_time" is encountered when the time
between two collections is not the same for all nodes. Therefore, the
aggregated value might be over or under inflated. "Negative_delta" is
returned when an expected monotonically increasing value has decreased in
value. "Inconsistent_old_data" is returned when one or more nodes do not
have the latest data.
```

```
|throughput_raw
|link:#throughput_raw[throughput_raw]
a|Throughput bytes observed at the storage object. This should be used
along with delta time to calculate the rate of throughput bytes per unit
of time.

|timestamp
|string

|svm.uuid
|string
|path
|True
a|Unique identifier of the SVM.

|interval
|string
|query
|False
a|The time range for the data. Examples can be 1h, 1d, 1m, 1w, 1y.
The period for each time range is as follows:

* 1h: Metrics over the most recent hour sampled over 15 seconds.
* 1d: Metrics over the most recent day sampled over 5 minutes.
* 1w: Metrics over the most recent week sampled over 30 minutes.
* 1m: Metrics over the most recent month sampled over 2 hours.
* 1y: Metrics over the most recent year sampled over a day.
* Default value: 1
* enum: ["1h", "1d", "1w", "1m", "1y"]

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0

```
|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

a|

|duration
```

|string
a|The duration over which this sample is calculated. The time durations
are represented in the ISO-8601 standard format. Samples can be calculated
over the following durations:

|iops
|link:#iops[iops]
a|The rate of I/O operations observed at the storage object.

|latency
|link:#latency[latency]
a|The round trip latency in microseconds observed at the storage object.

|status
|string
a|Any errors associated with the sample. For example, if the aggregation
of data over multiple nodes fails then any of the partial errors might be
returned, "ok" on success, or "error" on any internal uncategorized
failure. Whenever a sample collection is missed but done at a later time,
it is back filled to the previous 15 second timestamp and tagged with
"backfilled_data". "Inconsistent_ delta_time" is encountered when the time
between two collections is not the same for all nodes. Therefore, the
aggregated value might be over or under inflated. "Negative_delta" is
returned when an expected monotonically increasing value has decreased in
value. "Inconsistent_old_data" is returned when one or more nodes do not
have the latest data.

|throughput
|link:#throughput[throughput]
a|The rate of throughput bytes per second observed at the storage object.

|timestamp
|string
a|The timestamp of the performance data.

:leveloffset: -1

= View and create Vscan configuration

:leveloffset: +1

[[ID7ade8e5079ac8777797a42d59e4e5fa6]]
= Protocols Vscan endpoint overview

== Overview

Use Vscan to protect data from being compromised by viruses or other
malicious code. Vscan combines best-in-class third party antivirus
software with ONTAP features that give you the flexibility you need to
control which files get scanned and when. Storage systems offload scanning
operations to external servers hosting antivirus software from third party
vendors. An Antivirus Connector on the external server handles

1042

```
communications between the storage system and the antivirus software.

== Examples

=== Retrieving all of the Vscan configurations

----

# The API:
/api/protocols/vscan

# The call:
curl -X GET "https://<mgmt-
ip>/api/protocols/vscan?fields=*&return_records=true&return_timeout=15" -H
"accept: application/json"

= Retrieve the Vscan configuration

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/protocols/vscan`#

*Introduced In:* 9.6

Retrieves the Vscan configuration.
This includes scanner-pools, On-Access policies, On-Demand policies, and
information about whether a Vscan is enabled or disabled on an SVM.

Important notes:

* You can enable only one Vscan configuration at a time for an SVM.
* You can only query using `svm.uuid` or `svm.name`.

== Related ONTAP commands

* `vserver vscan show`
* `vserver vscan scanner-pool show`
* `vserver vscan scanner-pool servers show`
* `vserver vscan scanner-pool privileged-users show`
* `vserver vscan on-access-policy show`
* `vserver vscan on-access-policy file-ext-to-exclude show`
```

* `vserver vscan on-access-policy file-ext-to-include show`
* `vserver vscan on-access-policy paths-to-exclude show`
* `vserver vscan on-demand-task show`

a|Filter by scanner_pools.privileged_users

|scanner_pools.servers
|string
|query
|False
a|Filter by scanner_pools.servers

|scanner_pools.name
|string
|query
|False
a|Filter by scanner_pools.name

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records

```
|integer
|query
|False
a|Limit the number of records returned.

|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

|array[string]
a|List of file extensions for which scanning is not performed.

|exclude_paths
|array[string]
a|List of file paths for which scanning must not be performed.

|include_extensions
|array[string]
a|List of file extensions to be scanned.

|max_file_size
|integer
a|Maximum file size, in bytes, allowed for scanning.

|scan_without_extension
|boolean
a|Specifies whether or not files without any extension can be scanned.
```

```
|===

[#vscan_on_demand]
[.api-collapsible-fifth-title]
vscan_on_demand

Use On-Demand scanning to check files for viruses on a schedule. An On-
Demand policy defines the scope of an On-Demand scan.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|log_path
|string
a|The path from the Vserver root where the task report is created.

|name
|string
a|On-Demand task name

|scan_paths
|array[string]
a|List of paths that need to be scanned.

|schedule
|link:#schedule[schedule]
a|Schedule of the task.

|scope
|link:#scope[scope]
a|

|===

[#vscan_scanner_pool]
[.api-collapsible-fifth-title]
vscan_scanner_pool

Scanner pool is a set of attributes which are used to validate and manage
connections between clustered ONTAP and external virus-scanning server, or
"Vscan server".

[cols=3*,options=header]
|===
|Name
|Type
|Description

|cluster
|link:#cluster_reference[cluster_reference]
a|

|name
|string
a|Specifies the name of the scanner pool. Scanner pool name can be up to
256 characters long and is a string that can only contain any combination
of ASCII-range alphanumeric characters a-z, A-Z, 0-9), "_", "-" and ".".
```

|privileged_users
|array[string]
a|Specifies a list of privileged users. A valid form of privileged user-name is "domain-name\user-name". Privileged user-names are stored and treated as case-insensitive strings. Virus scanners must use one of the registered privileged users for connecting to clustered Data ONTAP for exchanging virus-scanning protocol messages and to access file for scanning, remedying and quarantining operations.

* example: ["cifs\u1", "cifs\u2"]
* Introduced in: 9.6

|role
|string
a|Specifies the role of the scanner pool. The possible values are:

*** primary   - Always active.

*** secondary - Active only when none of the primary external virus-scanning servers are connected.

*** idle   - Always inactive.

|servers
|array[string]
a|Specifies a list of IP addresses or FQDN for each Vscan server host names which are allowed to connect to clustered ONTAP.

* example: ["1.1.1.1", "10.72.204.27", "vmwin204-27.fsct.nb"]
* Introduced in: 9.6

|===

[#svm]
[.api-collapsible-fifth-title]
svm

SVM, applies only to SVM-scoped objects.

[cols=3*,options=header]

a|

|name
|string
a|The name of the SVM.

|uuid
|string
a|The unique identifier of the SVM.

|===

[#vscan]
[.api-collapsible-fifth-title]
vscan

Vscan can be used to protect data from being compromised by viruses or
other malicious code. This combines best-in-class third-party antivirus
software with ONTAP features that give you the flexibility you need to
control which files get scanned and when. Storage systems offload scanning
operations to external servers hosting antivirus software from thirdparty
vendors. An Antivirus Connector on the external server handles
communications between the storage system and the antivirus software.

[[IDb22a3412a94a5cf24e7259ba88757b61]]
= Create a Vscan configuration

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
```

```
block]#`/protocols/vscan`#
```

Introduced In: 9.6

Creates a Vscan configuration, which includes a list of scanner-pools,
Vscan On-Access policies and Vscan On-Demand policies. Defines whether the
Vscan configuration you create is enabled or disabled for a specified SVM.

Important notes:

* You can enable only one Vscan configuration at a time for an SVM.
* There needs to be at least one active scanner-pool and one enabled On-
Access policy to enable Vscan successfully.
* By default, a Vscan is enabled when it's created.
* By default, the Vscan On-Access policies created from this endpoint are
in the disabled state. You can use the On-Access policy PATCH endpoint to
enable a particular On-Access policy. In ONTAP 9.6, only one Vscan On-
Access policy can be enabled and only one Vscan On-Demand policy can be
scheduled on an SVM.

== Required properties

* `svm.uuid` or `svm.name` - Existing SVM in which to create the Vscan
configuration.

== Recommended optional properties

* `scanner_pools` - There must be at least one active scanner-pool for
Vscan configuration. Created either through Vscan POST operation or
scanner-pools POST operation.

== Default property values

If not specified in POST, the following default property value is
assigned:

* `enabled` - _true_

== Related ONTAP commands

* `vserver vscan enable`
* `vserver vscan scanner-pool create`
* `vserver vscan scanner-pool apply-policy`
* `vserver vscan scanner-pool servers add`
* `vserver vscan scanner-pool privileged-users add`
* `vserver vscan on-access-policy create`
* `vserver vscan on-access-policy file-ext-to-exclude add`

* `vserver vscan on-access-policy file-ext-to-include add`
* `vserver vscan on-access-policy paths-to-exclude add`
* `vserver vscan on-demand-task create`

[#vscan_scanner_pool]
[.api-collapsible-fifth-title]
vscan_scanner_pool

Scanner pool is a set of attributes which are used to validate and manage
connections between clustered ONTAP and external virus-scanning server, or
"Vscan server".

[cols=3*,options=header]
|===
|Name
|Type
|Description

|cluster
|link:#cluster_reference[cluster_reference]
a|

|name
|string
a|Specifies the name of the scanner pool. Scanner pool name can be up to
256 characters long and is a string that can only contain any combination
of ASCII-range alphanumeric characters a-z, A-Z, 0-9), "_", "-" and ".".
```

```
|privileged_users
|array[string]
a|Specifies a list of privileged users. A valid form of privileged user-
name is "domain-name\user-name". Privileged user-names are stored and
treated as case-insensitive strings. Virus scanners must use one of the
registered privileged users for connecting to clustered Data ONTAP for
exchanging virus-scanning protocol messages and to access file for
scanning, remedying and quarantining operations.

* example: ["cifs\u1", "cifs\u2"]
* Introduced in: 9.6

|role
|string
a|Specifies the role of the scanner pool. The possible values are:

*** primary   - Always active.

*** secondary - Active only when none of the primary external virus-
scanning servers are connected.

*** idle      - Always inactive.

|servers
|array[string]
a|Specifies a list of IP addresses or FQDN for each Vscan server host
names which are allowed to connect to clustered ONTAP.

* example: ["1.1.1.1", "10.72.204.27", "vmwin204-27.fsct.nb"]
* Introduced in: 9.6

a|The unique identifier of the SVM.

|===

[#vscan]
[.api-collapsible-fifth-title]
vscan

Vscan can be used to protect data from being compromised by viruses or other malicious code. This combines best-in-class third-party antivirus software with ONTAP features that give you the flexibility you need to control which files get scanned and when. Storage systems offload scanning operations to external servers hosting antivirus software from thirdparty vendors. An Antivirus Connector on the external server handles communications between the storage system and the antivirus software.

|query
|False
a|Limit the number of records returned.

|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number of records is returned.

* Default value: 1

|return_timeout

```
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

= Delete a Vscan configuration

[.api-doc-operation .api-doc-operation-delete]#DELETE# [.api-doc-code-
block]#`/protocols/vscan/{svm.uuid}`#

*Introduced In:* 9.6

Deletes a Vscan configuration.

Important notes:

* The Vscan DELETE endpoint deletes all of the Vscan configuration of an
SVM. It first disables the Vscan and then deletes all of the SVM scanner-
pools, On-Access policies, and On-Demand policies.
* Disable the active Vscan On-Access policy on an SVM before performing
the Vscan delete operation on that SVM.

== Related ONTAP commands

* `vserver vscan scanner-pool delete`
* `vserver vscan on-access-policy delete`
```

[#vscan_scanner_pool]
[.api-collapsible-fifth-title]
vscan_scanner_pool

Scanner pool is a set of attributes which are used to validate and manage
connections between clustered ONTAP and external virus-scanning server, or
"Vscan server".

[cols=3*,options=header]
|===
|Name
|Type
|Description

|cluster
|link:#cluster_reference[cluster_reference]
a|

|name
|string
a|Specifies the name of the scanner pool. Scanner pool name can be up to
256 characters long and is a string that can only contain any combination
of ASCII-range alphanumeric characters a-z, A-Z, 0-9), "_", "-" and ".".

|privileged_users
|array[string]
a|Specifies a list of privileged users. A valid form of privileged user-
name is "domain-name\user-name". Privileged user-names are stored and
treated as case-insensitive strings. Virus scanners must use one of the
registered privileged users for connecting to clustered Data ONTAP for
exchanging virus-scanning protocol messages and to access file for
scanning, remedying and quarantining operations.

* example: ["cifs\u1", "cifs\u2"]
* Introduced in: 9.6
```

|role
|string
a|Specifies the role of the scanner pool. The possible values are:

*** primary - Always active.

*** secondary - Active only when none of the primary external virus-
scanning servers are connected.

*** idle   - Always inactive.

|servers
|array[string]
a|Specifies a list of IP addresses or FQDN for each Vscan server host
names which are allowed to connect to clustered ONTAP.

* example: ["1.1.1.1", "10.72.204.27", "vmwin204-27.fsct.nb"]
* Introduced in: 9.6

= Update the Vscan configuration for an SVM

[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-block]#`/protocols/vscan/{svm.uuid}`#

Introduced In: 9.6

Updates the Vscan configuration of an SVM. Allows you to either enable or disable a Vscan, and allows you to clear the Vscan cache that stores the past scanning data for an SVM.

Important note:

* The Vscan PATCH endpoint does not allow you to modify scanner-pools, On-Demand policies or On-Access policies. Those modifications can only be done through their respective endpoints.

== Related ONTAP commands

* `vserver vscan enable`
* `vserver vscan disable`
* `vserver vscan reset`

== Learn more

[#vscan]
[.api-collapsible-fifth-title]
vscan

Vscan can be used to protect data from being compromised by viruses or
other malicious code. This combines best-in-class third-party antivirus
software with ONTAP features that give you the flexibility you need to
control which files get scanned and when. Storage systems offload scanning
operations to external servers hosting antivirus software from thirdparty
vendors. An Antivirus Connector on the external server handles
```

communications between the storage system and the antivirus software.

:leveloffset: -1

= Manage Vscan On-Access policies

:leveloffset: +1

[[ID27878bd1881a6490a90c5c7311004f24]]
= Protocols Vscan svm.uuid on-access-policies endpoint overview

== Overview

Use Vscan On-Access scanning to actively scan file objects for viruses
when clients access files over SMB. To control which file operations
trigger a vscan, use Vscan File-Operations Profile (vscan-fileop-profile)
option in the CIFS share. The Vscan On-Access policy configuration defines
the scope and status of On-Access scanning on file objects. Use this API
to retrieve and manage Vscan On-Access policy configurations and Vscan On-
Access policy statuses for the SVM.

== Examples

=== Retrieving all fields for all policies of an SVM

'''

----

# The API:
/api/protocols/vscan/{svm.uuid}/on-access-policies/

# The call:
```

```
curl -X GET "https://<mgmt-ip>/api/protocols/vscan/{svm.uuid}/on-access-
policies?fields=*" -H "accept: application/hal+json"

# The response:
{

policies_endpoint_overview.html[DOC /protocols/vscan/{svm.uuid}/on-access-
policies]

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|enabled
```

```
|boolean
|query
|False
a|Filter by enabled

|scope.exclude_paths
|string
|query
|False
a|Filter by scope.exclude_paths

|scope.max_file_size
|integer
|query
|False
a|Filter by scope.max_file_size

|scope.only_execute_access
|boolean
|query
|False
a|Filter by scope.only_execute_access

|scope.include_extensions
|string
|query
|False
a|Filter by scope.include_extensions

|scope.scan_readonly_volumes
|boolean
|query
|False
a|Filter by scope.scan_readonly_volumes

|scope.exclude_extensions
|string
|query
|False
a|Filter by scope.exclude_extensions
```

|scope.scan_without_extension
|boolean
|query
|False
a|Filter by scope.scan_without_extension

|mandatory
|boolean
|query
|False
a|Filter by mandatory

|name
|string
|query
|False
a|Filter by name

|svm.uuid
|string
|path
|True
a|UUID of the SVM to which this object belongs.

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_records
|boolean
|query
|False

```
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

[[ID7ef77b7c3e23ce127242ca2a39b0432f]]
= Create a Vscan On-Access policy

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/protocols/vscan/{svm.uuid}/on-access-policies`#

*Introduced In:* 9.6

Creates a Vscan On-Access policy. Created only on a data SVM.
```

Important notes:

* You must enable the policy on an SVM before its files can be scanned.
* You can enable only one On-Access policy at a time on an SVM. By
default, the policy is enabled on creation. * If the Vscan On-Access
policy has been created successfully on an SVM but cannot be enabled due
to an error, the Vscan On-Access policy configurations are saved. The
Vscan On-Access policy is then enabled using the PATCH operation.

== Required properties

* `svm.uuid` - Existing SVM in which to create the Vscan On-Access policy.
* `name` - Name of the Vscan On-Access policy. Maximum length is 256
characters.

== Default property values

If not specified in POST, the following default property values are
assigned:

* `enabled` - _true_
* `mandatory` - _true_
* `include_extensions` - _*_
* `max_file_size` - _2147483648_
* `only_execute_access` - _false_
* `scan_readonly_volumes` - _false_
* `scan_without_extension` - _true_

== Related ONTAP commands

* `vserver vscan on-access-policy create`
* `vserver vscan on-access-policy enable`
* `vserver vscan on-access-policy disable`
* `vserver vscan on-access-policy file-ext-to-include add`
* `vserver vscan on-access-policy file-ext-to-exclude add`
* `vserver vscan on-access-policy paths-to-exclude add`

== Learn more

* xref:{relative_path}protocols_vscan_svm.uuid_on-access-
policies_endpoint_overview.html[DOC /protocols/vscan/{svm.uuid}/on-access-
policies]

ONTAP Error Response Codes

|===
| Error Code | Description

| 10027043
| The new On-Access policy cannot be created as the SVM has reached the
maximum number of On-Access policies allowed. Delete an existing policy in
order to create a new policy

| 10027101
| The file size must be in the range 1KB to 1TB

| 10027107
| The include extensions list cannot be empty. Specify at least one
extension for inclusion

| 10027109
| The specified CIFS path is invalid. It must be in the form "\dir1\dir2"
or "\dir1\dir2\"

| 10027249
| The On-Access policy created successfully but failed to enable the
policy. The reason for enable policy operation failure might be that
another policy is enabled. Disable the enabled policy and then enable the
newly created policy using the PATCH operation

| 10027253
| The number of paths specified exceeds the configured number of maximum
paths. You cannot specify more than the maximum number of configured paths

| 10027254
| The number of extensions specified exceeds the configured maximum number
of extensions. You cannot specify more than the maximum number of
configured extensions

= Update the Vscan On-Access policy configuration for an SVM

[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-
block]#`/protocols/vscan/{svm.uuid}/on-access-policies/{name}`#

Introduced In: 9.6

Updates the Vscan On-Access policy configuration and/or enables/disables
the Vscan On-Access policy of an SVM. You cannot modify the configurations
for an On-Access policy associated with an administrative SVM, although
you can encable and disable the policy associated with an administrative
SVM.

= Manage Vscan On-Demand policies

:leveloffset: +1
```

```
[[ID4c16192590d9e83141206f239522728f]]
= Protocols Vscan svm.uuid on-demand-policies endpoint overview
```

== Overview

Vscan On-Demand scanning is used to check files for viruses on a schedule.
For example, it can be used to run scans only in off-peak hours, or to
scan very large files that are excluded from an on-access scan. Vscan On-
Demand scanning can be used for any path in the SVM namespace.

Vscan On-Demand policy configurations define the scope of a Vscan On-
Demand scan. The schedule parameter in the On-Demand policy configuration
decides when to execute the task. Schedule can be created using the
/api/clusters/schedule endpoint and can be assigned on policy create or
policy modify. This API is used to retrieve and manage Vscan On-Demand
policy configurations. It is also used to schedule the Vscan On-Demand
scan.

== Examples

=== Retrieving all fields for all policies of an SVM

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|scan_paths
|string
|query
|False
a|Filter by scan_paths

|schedule.uuid
|string
|query
|False

a|Filter by schedule.uuid

|schedule.name
|string
|query
|False
a|Filter by schedule.name

|scope.include_extensions
|string
|query
|False
a|Filter by scope.include_extensions

|scope.exclude_extensions
|string
|query
|False
a|Filter by scope.exclude_extensions

|scope.scan_without_extension
|boolean
|query
|False
a|Filter by scope.scan_without_extension

|scope.exclude_paths
|string
|query
|False
a|Filter by scope.exclude_paths

|scope.max_file_size
|integer
|query
|False
a|Filter by scope.max_file_size

|log_path
|string

|query
|False
a|Filter by log_path

|name
|string
|query
|False
a|Filter by name

|svm.uuid
|string
|path
|True
a|UUID of the SVM to which this object belongs.

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_records
|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number
of records is returned.

* Default value: 1

|return_timeout
|integer
|query
|False

a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

====

[[ID1a6304e0bff07a3ecca8754dcd31114b]]
= Create a Vscan On-Demand policy

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/protocols/vscan/{svm.uuid}/on-demand-policies`#

*Introduced In:* 9.6

Creates a Vscan On-Demand policy. Created only on a data SVM.

Important notes:

*** Only one policy can be scheduled at a time on an SVM. Use schedule
name or schedule uuid to schedule an On-Demand policy.
```

*** Scanning must be enabled on the SVM before the policy is scheduled to run.

*** The exclude_extensions setting overrides the include_extensions setting. Set scan_without_extension to true to scan files without extensions.

== Required properties

* `svm.uuid` - Existing SVM in which to create the Vscan On-Demand policy.
* `name` - Name of the Vscan On-Demand policy. Maximum length is 256 characters.
* `log_path` - Path from the Vserver root where the On-Demand policy report is created.
* `scan_paths` - List of paths that need to be scanned.

== Recommended optional properties

* `schedule` - Scan schedule. It is recommended to set the schedule property, as it dictates when to scan for viruses.

== Default property values

If not specified in POST, the following default property values are assigned:

* `include_extensions` - _*_
* `max_file_size` - _10737418240_
* `scan_without_extension` - _true_

== Related ONTAP commands

* `vserver vscan on-demand-task create`
* `vserver vscan on-demand-task schedule`

== Learn more

* xref:{relative_path}protocols_vscan_svm.uuid_on-demand-policies_endpoint_overview.html[DOC /protocols/vscan/{svm.uuid}/on-demand-policies]

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|return_records
|boolean
|query
|False
a|The default is false. If set to true, the records are returned.

* Default value:

|svm.uuid
|string
|path
|True
a|UUID of the SVM to which this object belongs.

|===

ONTAP Error Response Codes

|===
| Error Code | Description

| 10027101
| The file size must be in the range 1KB to 1TB
```

| 10027107
| The include extensions list cannot be empty. Specify at least one extension for inclusion.

| 10027164
| An On-Demand policy cannot be scheduled, as the Vscan is disabled. Enable the Vscan and retry the operation.

| 10027167
| The specified schedule does not exist. Create the schedule or create a policy without specifying the schedule.

| 10027168
| The specified scan path does not exist. The scan path must be specified from the root of the SVM, and must begin with UNIX path delimiters (use "`/`" not "`\`")

| 10027169
| The specified scan path is not supported for scanning.

| 10027173
| The new On-Demand policy cannot be created as the SVM has reached the maximum number of On-Demand policies allowed. Delete an existing policy in order to create a new policy.

| 10027174
| The specified exclude path is invalid. The path must be specified from the root of the SVM, and must begin with UNIX path delimiters (use "/" not "\")

| 10027175
| An On-Demand policy cannot be scheduled as the Vserver is not in an operational state.

| 10027176
| The log-path specified does not exist. The log path must be specified from the root of the SVM, and must begin with UNIX path delimiters (use "`/`" not "`\`").

| 10027177
| The log path specified is not supported.

| 10027253
| The number of paths specified exceeds the configured maximum number of paths. You cannot specify more than the maximum number of configured paths.

```
| 10027254
| The number of extensions specified exceeds the configured maximum number
of extensions. You cannot specify more than the maximum number of
configured extensions.

| 10027255
| Another policy is already scheduled. Only one policy per SVM is allowed
to be scheduled at any one time. Create a policy without specifying a
schedule.

= Update the Vscan On-Demand policy configuration for an SVM

[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-block]#`/protocols/vscan/{svm.uuid}/on-demand-policies/{name}`#

Introduced In: 9.6

Updates the Vscan On-Demand policy configuration of an SVM. Use schedule name or schedule UUID to schedule an On-Demand scan.

== Related ONTAP commands

* `vserver vscan on-demand-task modify`
* `vserver vscan on-demand-task schedule`
* `vserver vscan on-demand-task unschedule`

ONTAP Error Response Codes

|===
| Error Code | Description

| 10027101
| The file size must be in the range 1KB to 1TB

| 10027107
| The include extensions list cannot be empty. Specify at least one
extension for inclusion.

| 10027164
| An On-Demand policy cannot be scheduled, as the Vscan is disabled.
Enable the Vscan and retry the operation.

| 10027167
| The specified schedule does not exist. Create the schedule or create a
policy without specifying the schedule.

| 10027168
| The specified scan path does not exist. The scan path must be specified
from the root of the SVM, and must begin with UNIX path delimiters (use
"`/`" not "`\`")

| 10027169
| The specified scan path is not supported for scanning.

| 10027174
| The specified exclude path is invalid. The path must be specified from
the root of the SVM, and must begin with UNIX path delimiters (use "/" not
"\")

| 10027175
| An On-Demand policy cannot be scheduled as the SVM is not in an
operational state.

| 10027176
| The log-path specified does not exist. The log path must be specified
from the root of the SVM, and must begin with UNIX path delimiters (use
"`/`" not "`\`")
```

| 10027177
| The log path specified is not supported.

| 10027253
| The number of paths specified exceeds the configured maximum number of paths. You cannot specify more than the maximum number of configured paths.

| 10027254
| The number of extensions specified exceeds the configured maximum number of extensions. You cannot specify more than the maximum number of configured extensions.

| 10027255
| Another policy is already scheduled. Only one policy per SVM is allowed to be scheduled at any one time. Update a policy without specifying a schedule.

= Manage Vscan scanner-pool configuration

:leveloffset: +1

[[ID589f4f9191266343eb9fddc4b7351159]]
= Protocols Vscan svm.uuid scanner-pools endpoint overview

== Overview

A scanner-pool defines the Vscan servers and privileged users that can
connect to SVMs and a scanner policy or role determines whether a scanner-
pool is active. You can configure a scanner-pool to be used on the local
cluster or any other cluster in an MCC/DR setup.
```

```
== Examples

=== Retrieving all fields for all scanner-pools of an SVM

----

# The API:
/api/protocols/vscan/{svm.uuid}/scanner-pools

# The call:
curl -X GET "https://<mgmt-ip>/api/protocols/vscan/<svm-uuid>/scanner-
pools?fields=*&return_records=true&return_timeout=15" -H "accept:
application/json"

# The response:
{
"records": [
  {
    "svm": {
      "uuid": "0e2f7c91-f227-11e8-9601-0050568ecc06"
    },
    "name": "scanner-1",
    "servers": [
      "1.1.1.1",
      "10.72.204.27"
    ],
    "privileged_users": [
      "cifs\\u1",
      "cifs\\u2"
    ],
    "role": "primary"
  },
  {
    "svm": {
      "uuid": "0e2f7c91-f227-11e8-9601-0050568ecc06"
    },
    "name": "scanner-2",
    "servers": [
      "1.1.1.1",
      "10.72.204.27"
    ],
    "privileged_users": [
      "cifs\\u1",
      "cifs\\u2"
    ],
```

```
      "role": "secondary"
    }
  ],
"num_records": 2
}
----

=== Retrieving all scanner-pools with _role_ set as _secondary_

----

# The API:
/api/protocols/vscan/{svm.uuid}/scanner-pools

# The call:
curl -X GET "https://<mgmt-ip>/api/protocols/vscan/<svm-uuid>/scanner-
pools?role=secondary&fields=*&return_records=true&return_timeout=15" -H
"accept: application/json"

# The response:
{
"records": [

[#vscan_scanner_pool]
[.api-collapsible-fifth-title]
vscan_scanner_pool

Scanner pool is a set of attributes which are used to validate and manage
connections between clustered ONTAP and external virus-scanning server, or
"Vscan server".

[cols=3*,options=header]
|===
|Name
|Type
|Description

|cluster
|link:#cluster_reference[cluster_reference]
a|

|name
|string
a|Specifies the name of the scanner pool. Scanner pool name can be up to
256 characters long and is a string that can only contain any combination
of ASCII-range alphanumeric characters a-z, A-Z, 0-9), "_", "-" and ".".

|privileged_users
|array[string]
a|Specifies a list of privileged users. A valid form of privileged user-
name is "domain-name\user-name". Privileged user-names are stored and
treated as case-insensitive strings. Virus scanners must use one of the
registered privileged users for connecting to clustered Data ONTAP for
exchanging virus-scanning protocol messages and to access file for
scanning, remedying and quarantining operations.

* example: ["cifs\u1", "cifs\u2"]
* Introduced in: 9.6

```
|role
|string
a|Specifies the role of the scanner pool. The possible values are:

*** primary  - Always active.

*** secondary - Active only when none of the primary external virus-
scanning servers are connected.

*** idle      - Always inactive.

|servers
|array[string]
a|Specifies a list of IP addresses or FQDN for each Vscan server host
names which are allowed to connect to clustered ONTAP.

* example: ["1.1.1.1", "10.72.204.27", "vmwin204-27.fsct.nb"]
* Introduced in: 9.6

[[ID6d1a4f07fedb0abbbc23dc86a3ed0b05]]
= Create a Vscan scanner-pool configuration for an SVM

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/protocols/vscan/{svm.uuid}/scanner-pools`#

*Introduced In:* 9.6
```

Creates a Vscan scanner-pool configuration for a specified SVM. You can create a scanner-pool with all fields specified or only mandatory fields specified.

Important notes:

* A scanner-pool must have servers and privileged users specified.
* If the role or cluster is not specified, the scanner-pool is created on the local cluster with the role set as primary.
*`Only one of the fields cluster-uuid or cluster-name is required.

== Required properties

* `svm.uuid` or `svm.name` - Existing SVM in which to create the Vscan configuration.
* `name` - Scanner-pool name.
* `privileged_users` - List of privileged users.
* `servers` - List of server IP addresses or FQDNs.

== Recommended optional properties

* `role` - Setting a role for a scanner-pool is recommended.
* `cluster` - Passing the cluster name or UUID (or both) in a multi-cluster environment is recommended.

== Default property values

If not specified in POST, the following default property values are assigned:

* `role` - _primary_
* `cluster.name` - Local cluster name.
* `cluster.uuid` - Local cluster UUID.

== Related ONTAP commands

* `vserver vscan scanner-pool create`
* `vserver vscan scanner-pool apply-policy`
* `vserver vscan scanner-pool privileged-users add`
* `vserver vscan scanner-pool servers add`

== Learn more

* xref:{relative_path}protocols_vscan_svm.uuid_scanner-pools_endpoint_overview.html[DOC /protocols/vscan/{svm.uuid}/scanner-pools]

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|return_records
|boolean
|query
|False
a|The default is false. If set to true, the records are returned.

* Default value:

|svm.uuid
|string
|path
|True
a|UUID of the SVM to which this object belongs.

|===

= Delete a Vscan scanner-pool configuration

[.api-doc-operation .api-doc-operation-delete]#DELETE# [.api-doc-code-
block]#`/protocols/vscan/{svm.uuid}/scanner-pools/{name}`#

*Introduced In:* 9.6

Deletes a Vscan scanner-pool configuration.

Important notes:

* The Vscan scanner-pool DELETE endpoint deletes all of the Vscan scanner-
pools for a specified SVM.
* If a Vscan is enabled, it requires at least one scanner-pool to be in
the active state. Therefore, disable Vscan on the specified SVM so all the
scanner-pools configured on that SVM can be deleted.

a|Specifies a list of IP addresses or FQDN for each Vscan server host
names which are allowed to connect to clustered ONTAP.

* example: ["1.1.1.1", "10.72.204.27", "vmwin204-27.fsct.nb"]
* Introduced in: 9.6

[#vscan_scanner_pool]
[.api-collapsible-fifth-title]
vscan_scanner_pool

Scanner pool is a set of attributes which are used to validate and manage
connections between clustered ONTAP and external virus-scanning server, or
"Vscan server".

[cols=3*,options=header]
|===
|Name
|Type
|Description

|cluster
|link:#cluster_reference[cluster_reference]
```

a|

|name
|string
a|Specifies the name of the scanner pool. Scanner pool name can be up to 256 characters long and is a string that can only contain any combination of ASCII-range alphanumeric characters a-z, A-Z, 0-9), "_", "-" and ".".

|privileged_users
|array[string]
a|Specifies a list of privileged users. A valid form of privileged user-name is "domain-name\user-name". Privileged user-names are stored and treated as case-insensitive strings. Virus scanners must use one of the registered privileged users for connecting to clustered Data ONTAP for exchanging virus-scanning protocol messages and to access file for scanning, remedying and quarantining operations.

* example: ["cifs\u1", "cifs\u2"]
* Introduced in: 9.6

|role
|string
a|Specifies the role of the scanner pool. The possible values are:

*** primary   - Always active.

*** secondary - Active only when none of the primary external virus-scanning servers are connected.

*** idle   - Always inactive.

|servers
|array[string]
a|Specifies a list of IP addresses or FQDN for each Vscan server host names which are allowed to connect to clustered ONTAP.

* example: ["1.1.1.1", "10.72.204.27", "vmwin204-27.fsct.nb"]
* Introduced in: 9.6
