Manage SAN vVol bindings

Manage SAN vVol bindings

Overview

A VMware virtual volume (vVol) binding is an association between a LUN of class `protocol_endpoint` and a LUN of class `vvol`. Class `protocol_endpoint` LUNs are mapped to igroups and granted access using the same configuration as class `regular` LUNs. When a class `vvol` LUN is bound to a mapped class `protocol_endpoint` LUN, VMware can access the class `vvol` LUN through the class `protocol_endpoint` LUN mapping.

Class `protocol_endpoint` and `vvol` LUNs support many-to-many vVol bindings. A LUN of one class can be bound to zero or more LUNs of the opposite class.

The vVol binding between any two specific LUNs is reference counted. When a REST POST is executed for a vVol binding that already exists, the vVol binding reference count is incremented. When a REST DELETE is executed, the vVol binding reference count is decremented. Only when the vVol binding count reaches zero, or the query parameter `delete_all_references` is supplied, is the vVol binding destroyed.

The vVol binding REST API allows you to create, delete, and discover vVol bindings.

Examples

Creating a vVol binding

```
# The API:  
POST /api/protocols/san/vvol-bindings  
  
# The call:  
curl -X POST 'https://<mgmt-ip>/api/protocols/san/vvol-bindings' -H  
'Accept: application/hal+json' -d '{ "svm": { "name": "svml" },  
"protocol_endpoint": { "name": "/vol/voll/pel" }, "vvol" : { "name":  
"/vol/voll/vvol1" } }'
```

Retrieving all vVol bindings

```
# The API:  
GET /api/protocols/san/vvol-bindings  
  
# The call:  
curl -X GET 'https://<mgmt-ip>/api/protocols/san/vvol-bindings' -H  
'Accept: application/hal+json'  
  
# The response:
```

```

vvol_binding

A VMware virtual volume (vVol) binding is an association between a LUN of class `protocol_endpoint` and a LUN of class `vvol`. Class `protocol_endpoint` LUNs are mapped to igroups and granted access using the same configuration as class `regular` LUNs. When a class `vvol` LUN is bound to a mapped class `protocol_endpoint` LUN, VMware can access the class `vvol` LUN through the class `protocol_endpoint` LUN mapping.

Class `protocol_endpoint` and `vvol` LUNs support many-to-many vVol bindings. A LUN of one class can be bound to zero or more LUNs of the opposite class.

The vVol binding between any two specific LUNs is reference counted. When a REST POST is executed for a vVol binding that already exists, the vVol binding reference count is incremented. When a REST DELETE is executed, the vVol binding reference count is decremented. Only when the vVol binding count reaches zero, or the query parameter `delete_all_references` is supplied, is the vVol binding destroyed.

Name	Type	Description

Create a vVol binding

POST /protocols/san/vvol-bindings

Introduced In: 9.10

Creates a vVol binding. The binding between any two specific LUNs is reference counted. When a binding is created that already exists, the binding count is incremented.

Required properties

- `svm.uuid` or `svm.name` - Existing SVM in which to create the vVol binding.
- `protocol_endpoint.uuid` or `protocol_endpoint.name` - Existing class `protocol_endpoint` LUN to bind to the specified class `vvol` LUN.
- `vvol.uuid` or `vvol.name` - Existing class `vvol` LUN to bind to the specified class `protocol_endpoint` LUN.

Related ONTAP commands

ONTAP Error Response Codes

Error Code	Description
2621462	The specified SVM does not exist or is not accessible to the caller.

Error Code	Description
2621706	Both the SVM UUID and SVM name were supplied, but don't refer to the same SVM.
2621707	No SVM was specified. Either <code>svm.name</code> or <code>svm.uuid</code> must be supplied.
5374238	A LUN in a snapshot was specified.
5374323	The LUN specified as the protocol endpoint LUN is not of class <code>protocol_endpoint</code> .
5374325	The LUN specified as the vVol LUN is not of class <code>vvol</code> .
5374874	The UUID and name supplied for the protocol endpoint of Vvol LUN do not refer to the same LUN. Use to the <code>target</code> property of the error object to differentiate between the protocol endpoint LUN and the vVol LUN.
5374875	The protocol endpoint or vVol LUN was not found or is not accessible to the caller. Use to the <code>target</code> property of the error object to differentiate between the protocol endpoint LUN and the vVol LUN.
5374876	The protocol endpoint or vVol LUN was not found in the SVM. Use to the <code>target</code> property of the error object to differentiate between the protocol endpoint LUN and the vVol LUN.
5374924	No protocol endpoint LUN was supplied.
5374925	No vVol LUN was supplied.

Also see the table of common errors in the [Response body](#) overview section of this documentation.

Definitions

Name	Type	Description
href	string	

_links

protocol_endpoint

The class `protocol_endpoint` LUN in the vVol binding. Required in POST.

Name	Type	Description
name	string	The name of a LUN. A LUN is located within a volume. Optionally, it can be located within a qtree in a volume. LUN names are paths of the form "/vol/<volume>[<qtree>]/<namespace>" where the qtree name is optional.
uuid	string	The unique identifier of the LUN.

svm

The SVM in which the vVol binding and its LUNs are located. Required in POST.

Name	Type	Description
name	string	The name of the SVM. This field cannot be specified in a PATCH method.
uuid	string	The unique identifier of the SVM. This field cannot be specified in a PATCH method.

vvol

The class `vvol` LUN in the vVol binding. Required in POST.

Name	Type	Description
name	string	<p>The name of a LUN. A LUN is located within a volume. Optionally, it can be located within a qtree in a volume.</p> <p>LUN names are paths of the form "/vol/<volume>[/<qtree>]/<name>" where the qtree name is optional.</p>
uuid	string	The unique identifier of the LUN.

vvol_binding

A VMware virtual volume (vVol) binding is an association between a LUN of class `protocol_endpoint` and a LUN of class `vvol`. Class `protocol_endpoint` LUNs are mapped to igroups and granted access using the same configuration as class `regular` LUNs. When a class `vvol` LUN is bound to a mapped class `protocol_endpoint` LUN, VMware can access the class `vvol` LUN through the class `protocol_endpoint` LUN mapping.

Class `protocol_endpoint` and `vvol` LUNs support many-to-many vVol bindings. A LUN of one class can be bound to zero or more LUNs of the opposite class.

The vVol binding between any two specific LUNs is reference counted. When a REST POST is executed for a vVol binding that already exists, the vVol binding reference count is incremented. When a REST DELETE is executed, the vVol binding reference count is decremented. Only when the vVol binding count reaches zero, or the query parameter `delete_all_references` is supplied, is the vVol binding destroyed.

Name	Type	Description
count	integer	<p>The vVol binding between any two specific LUNs is reference counted. When a REST POST is executed for a vVol binding that already exists, the vVol binding reference count is incremented. When a REST DELETE is executed, the vVol binding reference count is decremented. Only when the vVol binding count reaches zero, or the query parameter <code>delete_all_references</code> is supplied, is the vVol binding destroyed.</p>

Name	Type	Description
id	integer	<p>The ONTAP internal identifier assigned to the vVol binding. The bind identifier is unique amongst all class <code>vvol</code> LUNs bound to the same class <code>protocol_endpoint</code> LUN.</p> <p>This property was included in early releases of the REST API for vVols and is maintained for backward compatibility. See the <code>secondary_id</code> property, which replaces <code>id</code>.</p> <ul style="list-style-type: none"> • example: 1 • readOnly: 1 • x-ntap-deprecated: 9.13.1 • Introduced in: 9.10 • x-nullables: true
is_optimal	boolean	Indicates if the class <code>protocol_endpoint</code> LUN and the class <code>vvol</code> LUN are on the same cluster node.
protocol_endpoint	protocol_endpoint	The class <code>protocol_endpoint</code> LUN in the vVol binding. Required in POST.
secondary_id	string	<p>The identifier assigned to the vVol binding, known as the secondary LUN ID. The identifier is unique amongst all class <code>vvol</code> LUNs bound to the same class <code>protocol_endpoint</code> LUN.</p> <p>The format for a secondary LUN ID is 16 hexadecimal digits (zero-filled) followed by a lower case "h".</p>
svm	svm	The SVM in which the vVol binding and its LUNs are located. Required in POST.
vvol	vvol	The class <code>vvol</code> LUN in the vVol binding. Required in POST.

message	string	Error message
target	string	The target parameter that caused the error.

Delete a vVol binding

`DELETE /protocols/san/vvol-bindings/{protocol_endpoint.uuid}/{vvol.uuid}`

Introduced In: 9.10

Deletes a vVol binding. The binding between any two specific LUNs is reference counted. When a binding is deleted, the binding count is decremented, but the LUNs remain bound if the resultant reference count is greater than zero. When the binding count reaches zero, the binding is destroyed.
