Manage data-entropy statistics . . . 100
Retrieve data-entropy statistics for volumes . . . 101
Retrieve a data-entropy statistic for a volume . . . 107
View and update audit settings . . . 112
View and update audit settings . . . 112
Retrieve administrative audit settings for GET requests . . . 113
Update administrative audit settings for GET requests . . . 115
Forward audit logs to syslog/splunk servers . . . 118
Forward audit logs to syslog/splunk servers . . . 118
Define a remote syslog or splunk server to receive audit information . . . 121
Define the remote syslog or splunk server information . . . 128

Delete the remote syslog or splunk server information . . . 135
Retrieve the remote syslog or splunk server information . . . 137
Update the remote syslog or splunk server information . . . 141
View administrative audit logs . . . 146
View administrative audit logs . . . 146
Retrieve the administrative audit log viewer . . . 147
Manage data SVM account information . . . 155
Manage data SVM account information . . . 155
Delete a data SVM configured as a tunnel . . . 157
Retrieve SVM information configured as an Active Directory domain-tunnel . . . 158
Update a data SVM configured as a tunnel . . . 162
Configure a data SVM as a proxy . . . 165
Manage LDAP server configuration . . . 168
Manage LDAP server configuration . . . 168
Delete the LDAP configuration for the cluster . . . 171
Retrieve the LDAP configuration for the cluster . . . 172
Update the LDAP configuration for the cluster . . . 181
Create the LDAP configuration for the cluster . . . 194
Manage NIS configuration . . . 216
Manage NIS configuration . . . 216
Delete the NIS configuration for the cluster . . . 218
Retrieve the NIS configuration for the cluster . . . 220
Update the NIS configuration for the cluster . . . 224
Create the NIS configuration for the cluster . . . 228
View and update OAuth 2.0 status . . . 233
View and update OAuth 2.0 status . . . 233
Retrieve the OAuth 2.0 status . . . 234
Update the OAuth 2.0 status . . . 236
View and create OAuth 2.0 configurations . . . 237
View and create OAuth 2.0 configurations . . . 237
The API: . . . 1379
The call: . . . 1379
The response: . . . 1379
Retrieve authentication keys associated with the admin SVM . . . 1380
Create an authentication key . . . 1385
Delete an authentication key . . . 1390
List all authentication keys associated with the admin SVM . . . 1392
View security key managers . . . 1397
View security key managers . . . 1397

Security

ONTAP REST API Security endpoints

Overview

You can use ONTAP security APIs to manage security settings for the cluster and SVMs.

SAML

Configure the SAML 2.0 SP (Service Provider) protocol inside ONTAP. Doing so redirects the authentication task to a third-party Identity Provider (IDP) that can utilize any number of approaches for multi-factor authentication. After SAML authentication is enabled, all interactive web access (System Manager, SPI) is authenticated via SAML and a third-party IDP.

Manage security-related operations

Manage security-related operations

Overview

You can use this API for various cluster-wide security-related operations.

"onboard_key_manager_configurable_status" object

Use this API to retrieve details of whether or not the Onboard Key Manager can be configured on the cluster.

– GET /api/security

– GET /api/security?fields=onboard_key_manager_configurable_status

"software_data_encryption" object

Contains software data encryption related information.

The following APIs can be used to enable or disable and obtain default software data at rest encryption values:

– PATCH /api/security -d '{ "software_data_encryption.disabled_by_default" : true }'

– PATCH /api/security -d '{ "software_data_encryption.disabled_by_default" : false }'

– GET /api/security

– GET /api/security?fields=software_data_encryption

A PATCH request on this API using the parameter "software_data_encryption.conversion_enabled" triggers the conversion of all non-encrypted metadata volumes to encrypted metadata volumes and all non-NAE aggregates to NAE aggregates. For the conversion to start, the cluster must have either Onboard Key Manager or an external key manager set up and the aggregates should either be empty or have only metadata volumes. No data volumes should be present in any of the aggregates. For MetroCluster configurations, the PATCH request will fail if the cluster is in the switchover state.

The following API can be used to initiate software data encryption conversion.

– PATCH /api/security -d '{ "software_data_encryption.conversion_enabled" : true }'

"fips" object

Contains FIPS mode information.

A PATCH request on this API using the parameter "fips.enabled" switches the system from using the default cryptographic module software implementations to validated ones or vice versa, where applicable. If the value of the parameter is "true" and unapproved algorithms are configured as permitted in relevant subsystems, those algorithms will be disabled in the relevant subsystem configurations. If "false", there will be no implied change to the relevant subsystem configurations.

– GET /api/security

– GET /api/security?fields=fips

– PATCH /api/security -d '{ "fips.enabled" : true }'

– PATCH /api/security -d '{ "fips.enabled" : false }'

"tls" object

Contains TLS configuration information.

A PATCH request on this API using the parameter "tls.cipher_suites" and/or "tls.protocol_versions" configures the permissible cipher suites and/or protocol versions for all TLS-enabled applications in the system. All protocol versions at or above the lowest version level specified are enabled, including those that are not explicitly specified.

– GET /api/security

– GET /api/security?fields=tls

– PATCH /api/security -d '{ "tls" : { "protocol_versions" : ["TLSv1.3", "TLSv1.2"], "cipher_suites" : ["TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384",
"TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256"] } }'

"management_protocols" object

Contains Security Protocols information.

This security protocols endpoint is used to retrieve and configure security protocols.

– GET /api/security

– GET /api/security?fields=management_protocols

– PATCH /api/security -d '{ "management_protocols" : { "rsh_enabled" : true } }'

– PATCH /api/security -d '{ "management_protocols" : { "rsh_enabled" : false } }'

– PATCH /api/security -d '{ "management_protocols" : { "telnet_enabled" : true } }'

– PATCH /api/security -d '{ "management_protocols" : { "telnet_enabled" : false } }'

– PATCH /api/security -d '{ "management_protocols" : { "rsh_enabled" : true, "telnet_enabled" : true } }'

GET Examples

Retrieving information about the security configured on the cluster

The following example shows how to retrieve the configuration of the cluster.

```
# The API:
GET /api/security:

# The call:
curl -X GET 'https://<mgmt-ip>/api/security?fields=*' -H 'accept:
application/hal+json'

# The response:
{
"onboard_key_manager_configurable_status": {
  "supported": false,
  "message": "Onboard Key Manager cannot be configured on the cluster.
There are no self-encrypting disks in the cluster, and the following nodes
do not support volume granular encryption: ntap-vsim2.",
  "code": 65537300
},
"software_data_encryption": {
  "conversion_enabled": false,
  "disabled_by_default": false,
  "encryption_state": "unencrypted"
},
"fips": {
  "enabled": false
},
"tls": {
  "cipher_suites": [
    "TLS_RSA_WITH_AES_128_CCM",
    "TLS_RSA_WITH_AES_128_CCM_8",
    "TLS_RSA_WITH_AES_128_GCM_SHA256",
    "TLS_RSA_WITH_AES_128_CBC_SHA",
    "TLS_RSA_WITH_AES_128_CBC_SHA256",
    "TLS_RSA_WITH_AES_256_CCM",
    "TLS_RSA_WITH_AES_256_CCM_8",
    "TLS_RSA_WITH_AES_256_GCM_SHA384",

  "telnet_enabled": false
 }
}
```

PATCH Examples

Enabling software encryption conversion in the cluster

The following example shows how to enable software encryption conversion in the cluster.

```
# The API:
PATCH /api/security

# The call
curl -X PATCH "https://<mgmt_ip>/api/security" -d '{
"software_data_encryption.conversion_enabled" : true }'

# The response:
{
 "job": {
     "uuid": "ebcbd82d-1cd4-11ea-8f75-005056ac4adc",
     "_links": {
         "self": {
             "href": "/api/cluster/jobs/ebcbd82d-1cd4-11ea-8f75-
005056ac4adc"
         }
     }
 }
}
```

This returns a job UUID. A subsequent GET for this job UUID returns details of the job.

```
# The API:
/api/cluster/jobs/{uuid}

# The call
curl -X GET "https://<mgmt_ip>/api/cluster/jobs/ebcbd82d-1cd4-11ea-8f75-
005056ac4adc"

# The response:
{
"uuid": "ebcbd82d-1cd4-11ea-8f75-005056ac4adc",
"description": "PATCH /api/security",
"state": "success",
"message": "success",
"code": 0,
"start_time": "2019-12-12T06:45:40-05:00",
"end_time": "2019-12-12T06:45:40-05:00",
"_links": {
  "self": {
    "href": "/api/cluster/jobs/ebcbd82d-1cd4-11ea-8f75-005056ac4adc"
  }
}
}
```

Enabling FIPS mode in the cluster

The following example shows how to enable FIPS mode in the cluster.

```
# The API:
PATCH /api/security

# The call
curl -X PATCH "https://<mgmt_ip>/api/security" -d '{ "fips.enabled" : true
}'

# The response:
{
 "job": {
     "uuid": "8e7f59ee-a9c4-4faa-9513-bef689bbf2c2",
     "_links": {
         "self": {
             "href": "/api/cluster/jobs/8e7f59ee-a9c4-4faa-9513-
bef689bbf2c2"
         }
     }
 }
}
```

This returns a job UUID. A subsequent GET for this job UUID returns details of the job.

```
# The API:
/api/cluster/jobs/{uuid}

# The call
curl -X GET "https://<mgmt_ip>/api/cluster/jobs/8e7f59ee-a9c4-4faa-9513-
bef689bbf2c2"

# The response:
{
"uuid": "8e7f59ee-a9c4-4faa-9513-bef689bbf2c2",
"description": "PATCH /api/security",
"state": "success",
"message": "success",
"code": 0,
"start_time": "2020-04-28T06:55:40-05:00",
"end_time": "2020-04-28T06:55:41-05:00",
"_links": {
  "self": {
    "href": "/api/cluster/jobs/8e7f59ee-a9c4-4faa-9513-bef689bbf2c2"
  }
}
}
```

Configuring permissible TLS protocols and cipher suites in the cluster

The following example shows how to configure the cluster to only allow TLSv1.3 & TLSv1.2 with selected cipher suites.

```
# The API:
PATCH /api/security

# The call
curl -X PATCH "https://<mgmt_ip>/api/security" -d '{ "tls" : {
"protocol_versions" : ["TLSv1.3", "TLSv1.2"], "cipher_suites" :
["TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384", "TLS_AES_256_GCM_SHA384"] } }'

# The response:
{
 "job": {
     "uuid": "b45b6290-f4f2-442a-aa0e-4d3ffefe5e0d",
     "_links": {
         "self": {
             "href": "/api/cluster/jobs/b45b6290-f4f2-442a-aa0e-
4d3ffefe5e0d"
         }
     }
 }
}
```

This returns a job UUID. A subsequent GET for this job UUID returns details of the job.

```
# The API:
/api/cluster/jobs/{uuid}

# The call
curl -X GET "https://<mgmt_ip>/api/cluster/jobs/b45b6290-f4f2-442a-aa0e-
4d3ffefe5e0d"

# The response:
{
"uuid": "b45b6290-f4f2-442a-aa0e-4d3ffefe5e0d",
"description": "PATCH /api/security",
"state": "success",
"message": "success",
"code": 0,
"start_time": "2021-03-22T08:52:50-05:00",
"end_time": "2021-03-22T08:52:51-05:00",
"_links": {
  "self": {
    "href": "/api/cluster/jobs/b45b6290-f4f2-442a-aa0e-4d3ffefe5e0d"
  }
}
}
```

Enabling security protocols in the cluster

The following example shows how to enable the security protocol rsh in the cluster.

```
# The API:
PATCH /api/security

# The call
curl -X PATCH "https://<mgmt_ip>/api/security" -d '{
"management_protocols" : { "rsh_enabled" : true } }'

# The response
{
"job": {
"uuid": "2980ba28-adab-11eb-8fa3-005056bbfa84",
"_links": {
  "self": {
    "href": "/api/cluster/jobs/2980ba28-adab-11eb-8fa3-005056bbfa84"

Retrieve information about security configured on the cluster

GET `/security`

Introduced In: 9.7

Retrieves information about the security configured on the cluster.

Related ONTAP commands

- `security config show`

Parameters

Name	Type	In	Required	Description
fields	array[string]	query	False	Specify the fields to return.

Response

```
Status: 200, Ok
```

Name	Type	Description
_links	_links	
fips	fips	Cluster-wide Federal Information Processing Standards (FIPS) mode information.
management_protocols	management_protocols	Cluster-wide security protocols related information.
onboard_key_manager_configurable_status	onboard_key_manager_configurable_status	Indicates whether the Onboard Key Manager can be configured in the cluster.
software_data_encryption	software_data_encryption	Cluster-wide software data encryption related information.
tls	tls	Cluster-wide Transport Layer Security (TLS) configuration information

Example response

```
{
  "_links": {
    "self": {
      "href": "/api/resourcelink"
    }
  },
  "onboard_key_manager_configurable_status": {
    "code": 65537300,
    "message": "No platform support for volume encryption in following
nodes - node1, node2."
  },
  "software_data_encryption": {

Name	Type	Description
href	string	

_links

Name	Type	Description
self	href	

fips

Cluster-wide Federal Information Processing Standards (FIPS) mode information.

Name	Type	Description
enabled	boolean	Indicates whether or not the software FIPS mode is enabled on the cluster. Our FIPS compliance involves configuring the use of only approved algorithms in applicable contexts (for example TLS), as well as the use of formally validated cryptographic module software implementations, where applicable. The US government documents concerning FIPS 140-2 outline the relevant security policies in detail.

management_protocols

Cluster-wide security protocols related information.

Name	Type	Description
rsh_enabled	boolean	Indicates whether or not security protocol rsh is enabled on the cluster.
telnet_enabled	boolean	Indicates whether or not security protocol telnet is enabled on the cluster.

onboard_key_manager_configurable_status

Indicates whether the Onboard Key Manager can be configured in the cluster.

Name	Type	Description
code	integer	Code corresponding to the status message. Returns a 0 if the Onboard Key Manager can be configured in the cluster.
message	string	Reason that Onboard Key Manager cannot be configured in the cluster.
supported	boolean	Set to true if the Onboard Key Manager can be configured in the cluster.

software_data_encryption

Cluster-wide software data encryption related information.

Name	Type	Description
conversion_enabled	boolean	Indicates whether or not software encryption conversion is enabled on the cluster. A PATCH request initiates the conversion of all non-encrypted metadata volumes in the cluster to encrypted metadata volumes and all non-NAE aggregates to NAE aggregates. For the PATCH request to start, the cluster must have either an Onboard or an external key manager set up and the aggregates should either be empty or have only metadata volumes. No data volumes should be present in any of the aggregates in the cluster. For MetroCluster configurations, a PATCH request enables conversion on all the aggregates and metadata volumes of both local and remote clusters and is not allowed when the MetroCluster is in switchover state.
disabled_by_default	boolean	Indicates whether or not default software data at rest encryption is disabled on the cluster.

Name	Type	Description
encryption_state	string	Software data encryption state. encrypted ‐ All the volumes are encrypted. encrypting ‐ Encryption conversion operation is in progress. partial ‐ Some volumes are encrypted, and others remains in plain text. rekeying ‐ All volumes are currently being encrypted with a new key. unencrypted ‐ None of the volumes are encrypted. conversion_paused ‐ Encryption conversion operation is paused on one or more volumes. rekey_paused ‐ Encryption rekey operation is paused on one or more volumes.
rekey	boolean	

tls

Cluster-wide Transport Layer Security (TLS) configuration information

Name	Type	Description
cipher_suites	array[string]	Names a cipher suite that the system can select during TLS handshakes. A list of available options can be found on the Internet Assigned Number Authority (IANA) website.
protocol_versions	array[string]	Names a TLS protocol version that the system can select during TLS handshakes. The use of SSLv3 or TLSv1 is discouraged.

error_arguments

Name	Type	Description
code	string	Argument code
message	string	Message argument

returned_error

Name	Type	Description
arguments	array[error_arguments]	Message arguments
code	string	Error code
message	string	Error message
target	string	The target parameter that caused the error.

Update the software FIPS mode or enable conversion of non-encrypted metadata volumes non-NAE aggregates

PATCH `/security`

Introduced In: 9.8

Updates the software FIPS mode or modifies software data encryption. The PATCH request can be used to enable conversion of non-encrypted metadata volumes to encrypted metadata volumes and non-NAE aggregates to NAE aggregates.

Related ONTAP commands

- `security config modify`

Parameters

Name	Type	In	Required	Description
return_timeout	integer	query	False	The number of seconds to allow the call to execute before returning. When doing a POST, PATCH, or DELETE operation on a single record, the default is 0 seconds. This means that if an asynchronous operation is started, the server immediately returns HTTP code 202 (Accepted) along with a link to the job. If a non-zero value is specified for POST, PATCH, or DELETE operations, ONTAP waits that length of time to see if the job completes so it can return something other than 202. • Default value: 0 • Max value: 120 • Min value: 0

Request Body

Name	Type	Description
fips	fips	Cluster-wide Federal Information Processing Standards (FIPS) mode information.
management_protocols	management_protocols	Cluster-wide security protocols related information.
software_data_encryption	software_data_encryption	Cluster-wide software data encryption related information.

Name	Type	Description

ONTAP Error Response Codes

Error Code	Description
5636142	This operation is not supported in a mixed-release cluster.
5636145	This operation is not supported when cluster security is configured with FIPS mode.
52428817	SSLv3 is not supported when FIPS is enabled.
52428824	TLSv1 is not supported when FIPS is enabled.
52428830	Cannot enable FIPS-compliant mode because the configured minimum security strength for certificates is not compatible.
52428832	TLSv1.1 is not supported when FIPS is enabled.
52559974	Cannot enable FIPS-compliant mode because a certificate that is not FIPS-compliant is in use.
65536987	One or more key servers are unavailable.
196608047	Operation is not allowed when volume move is in progress.
196608070	Key manager is not configured on the cluster. Configure either an external Key Management Server or an onboard key manager.
196608081	Cannot start software encryption conversion while there are data volumes in the cluster.
196608082	The operation is not valid when the MetroCluster is in switchover mode.
196608368	Failed to perform the requested operation. One or more data volume in offline state.
196608369	Conversion cannot be enabled because the cluster contains read-only or primordial logical data-protection volumes. Retry the patch operation after deleting those volumes.
196608370	The conversion of non-encrypted volumes to NVE (NetApp Volume Encryption) volumes is already running. Monitor the NVE conversion status by querying the "software_data_encryption.encryption_state" field on the "/api/security" endpoint.

Error Code	Description
196608371	NVE (NetApp Volume Encryption) volumes are already being rekeyed. Monitor the NVE rekey status by querying the "software_data_encryption.encryption_state" field on the "/api/security" endpoint.
196608372	An automated ONTAP update is in progress, retry the PATCH request after it is completed.
196608373	Unable to perform the encryption operation because of a mixed-release cluster. Complete the upgrade or revert operation, then try the PATCH request again.
196608374	Failed to perform the requested operation. One or more SVMs not in admin running state.
196608375	Failed to perform the requested operation. One or more volume is of temporary type.
196608376	Internal error. Could not get volume encryption information.
196608377	Internal error. The Volume Location Database (VLDB) is inconsistent. Contact support personnel to resolve this issue.
196608378	Failed to perform the requested operation. Data SVM Key manager configuration is in mixed state.
196608379	Internal error. The encryption metadata for the volume is inconsistent. Contact technical support for assistance.
196608380	Failed to perform the requested operation. Wafliron is currently active.
196608381	Failed to perform the requested operation. A clone split operation is in progress.
196608382	Failed to perform the requested operation. A volume rehost operation is in progress.
196608383	Failed to perform the requested operation. The cluster contains one or more SnapLock volume.
196608384	The PATCH request to start rekey failed because the cluster contains one or more plain text volumes. Retry the PATCH request after converting the existing plain text volumes to encrypted volumes.
196608385	Failed to perform the requested operation. Keystore configuration is being switched. Wait until the keystore is in the active state and then try the PATCH request again.

Error Code	Description
196608386	Failed to perform the requested operation. Rekey operation for one or more SVMs is in progress. Wait until the keystore is in the active state and then try the PATCH request again.
196608387	"software_data_encryption.conversion_enabled" cannot be set to "false" in a PATCH request.
196608388	Both "software_data_encryption.conversion_enabled" and "software_data_encryption.disabled_by_default" cannot be set to "true" in a single PATCH request.
196608389	Both "software_data_encryption.conversion_enabled" and "software_data_encryption.rekey" cannot be set to "true" in a single PATCH request.
196608390	"software_data_encryption.rekey" cannot be set to "false" in a PATCH request.
196608391	Both "software_data_encryption.rekey" and "software_data_encryption.disabled_by_default" cannot be set to "true" in a single PATCH request.
196608392	The PATCH request for cluster level rekey requires an effective cluster version of 9.16.1 or later.
196608393	The PATCH request for cluster level rekey is not supported on this platform.

Manage security-related accounts

Manage security-related accounts

Overview

A valid user account is required to login to and provision, monitor, and manage the cluster. The scope of the management operation can be at the cluster level or at an individual SVM level. There is a need to create user accounts with specific privileges apart from the default user accounts, "admin", for cluster and "vsadmin" for

SVM. Custom user accounts can be configured to perform specific (scoped) operations. User accounts can either be created locally (on the Netapp system) or referenced from an external directory server (NIS, LDAP, or Active Directory). Apart from creation, modification, and deletion of a user account, locking and unlocking of a user account or resetting the password (for local accounts only) is possible.

A user account must be associated with the following before it can become operational:

1. A management application (SSH, HTTP, console, service_processor, and such like) for user login. HTTP enables REST API access.
2. Scope - either cluster or SVM.
3. Authentication source - password (local, NIS/LDAP, Active Directory), public/private key pair-based, certificate based.
4. RBAC role - determines what operations are permitted for the user account.

Restrictions

A number of internal/restricted account names, such as admin, diag, autosupport, and root cannot be used.

There must be at least one console cluster administrator account. Any attempt to delete the last remaining administrator account fails.

Multi-factor authentication is only possible for SSH and Service Processor (SP) applications. For the SSH application, the only possible combinations are password (local or NIS/LDAP/Active Directory) and public key and password or public key (local) and TOTP. For the SP application, the only valid combination is password and public key.

If an account is created using the HTTP application type, the password authentication method, and its username contains one of the following special characters: @ or \|, then you cannot use this account for basic authorization and its only purpose is for OAuth 2.0 validation.

All authentication sources are not supported by all applications. You must select a compatible authentication method based on the application. The following types of authentications methods are supported:

Application	Supported Authentication Methods
amqp	password
console	password
service_processor	password, publickey
HTTP	password, domain, nsswitch, certificate
ONTAPI	password, domain, nsswitch, certificate
SSH	password, publickey (key pair), domain, nsswitch, totp

In this table, "totp" means time-based one-time password and is only allowed to be configured as second authentication, "certificate" means security certificate, "domain" means that the user directory server is an external Active Directory, "nsswitch" means the directory server is an external NIS or LDAP server. At login time, the user is authenticated with these external directory servers which must be provisioned separately. For the SP (*service_processor* in above table) application, *publickey* can only be configured as the second factor of authentication.

Support for publickey authentication and MFA for Domain users has been added.

Support for TOTP as a secondary authentication method with password or public key as the primary authentication method has been added.

For SP (*service_processor* in above table) application, support for *publickey* as a secondary authentication method with password as the primary authentication method has been added.

Examples

Creating a cluster-scoped user account

Specify the user account name, role name, and the tuples (of application and authentication methods) in the body of the POST request. The owner.uuid or owner.name are not required to be specified for a cluster-scoped user account.

Each entry in the applications array must be for a different application.

```
# The API:
POST "/api/security/accounts"

# The call to create a cluster user account with applications ssh, http
and password authentication scheme:
curl -X POST "https://<mgmt-ip>/api/security/accounts" -d
'{"name":"cluster_user1","applications":[{"application":"ssh","authenticat
ion_methods":["password"],"second_authentication_method":"none"},{"applica
tion":"http","authentication_methods":["password"]}],"role":"admin","passw
ord":"p@ssw@rd123"}'
Note: The password is an optional parameter for creation and can be set
later using a PATCH request. See the examples for modification of user
account or password.
```

Creating an SVM-scoped user account

For an SVM-scoped account, specify either the SVM name as the owner.name or SVM uuid as the owner.uuid along with other parameters for the user account. These indicate the SVM for which the user account is being created and can be obtained from the response body of GET performed on the */api/svm/svms* API.

```
# The API:
POST "/api/security/accounts"

# The call:
curl -X POST "https://<mgmt-ip>/api/security/accounts" -d
'{"owner":{"uuid":"aaef7c38-4bd3-11e9-b238-
0050568e2e25"},"name":"svm_user1","applications":[{"application":"ssh","au
thentication_methods":["password"],"second_authentication_method":"none"}]
,"role":"vsadmin","password":"p@ssw@rd123"}'
```

Retrieving the configured user accounts

Use the following API to retrieve all of the user accounts or a filtered list of user accounts (by name, for a specific SVM, and so on).

```
# The API:
GET "/api/security/accounts"

# The call to retrieve all the user accounts configured in the cluster:
curl -X GET "https://<mgmt-ip>/api/security/accounts"

# The response:

# The scoped call to retrieve the configured cluster-scoped user accounts:
curl -X GET "https://<mgmt-ip>/api/security/accounts/?scope=cluster"

# The scoped call to retrieve the configured SVM-scoped user accounts:
curl -X GET "https://<mgmt-ip>/api/security/accounts/?scope=svm"

# The scoped call to retrieve the user accounts configured for the SVM
"svm1":
curl -X GET "https://<mgmt-ip>/api/security/accounts/?owner.name=svm1"

# The scoped call to retrieve the user accounts configured with the
"admin" role:
curl -X GET "https://<mgmt-ip>/api/security/accounts/?role=admin"
```

Creating an Active Directory users with publickey authentication

Specify the Active Directory user account name, role name, and the tuples (application and authentication methods) in the body of the POST request. The owner.uuid or owner.name are not required to be specified for a cluster-scoped user account.

```
# The API:
POST "/api/security/accounts"

# The call to create a cluster user account with application ssh and
publickey authentication scheme for domain users:
curl -X POST "https://<mgmt-ip>/api/security/accounts" -d
'{"name":"domain_name\\cluster_user__u1","applications":[{"application":"s
sh","authentication_methods":["publickey"]}]}'
```

Creating an Active Directory user with MFA(domain+publickey)

Specify the Active Directory user account name, role name, and the tuples (application and authentication methods) in the body of the POST request. The owner.uuid or owner.name are not required to be specified for a cluster-scoped user account.

```
# The API:
POST "/api/security/accounts"

# The call to create a cluster user account with application ssh and and
MFA for domain users:
curl -X POST "https://<mgmt-ip>/api/security/accounts" -d
'{"name":"domain_name\\cluster_user_u1","applications":[{"application":"ss
h","authentication_methods":["domain"],"second_authentication_method":"pub
lickey"}]}'
```

Retrieving the configured Active directory user accounts

Use the following API to retrieve all of the Active directory user accounts.

```
# The API:
curl -X GET "https://<mgmt-ip>/api/security/accounts/?name=*\*"

# The response:
{
"records": [
{
  "owner": {
    "uuid": "d6a740a0-4086-11ed-9f68-0050568edfd7",
    "name": "cluster-1",
    "_links": {
      "self": {
        "href": "/api/svm/svms/d6a740a0-4086-11ed-9f68-0050568edfd7"
      }
    }
  },

 }
}
```

Creating a user with MFA (password+TOTP)

Cluster-scoped user account: Follow the cluster-scoped user creation example and additionally specify the 'totp' as the second_authentication_method.

```
# The API:
POST "/api/security/accounts"

# The call to create a cluster user account with application ssh,
authentication password and totp:
curl -X POST "https://<mgmt-ip>/api/security/accounts" -d
'{"name":"cluster_user_1","applications":[{"application":"ssh","authentica
tion_methods":["password"],"second_authentication_method":"totp"}]}'
```

SVM-scoped user account: Follow the SVM-scoped user creation example and additionally specify the 'totp' as the second_authentication_method.

```
#The API

# The call to create a SVM-scoped user account with application ssh,
authentication password and totp:
curl -X POST "https://<mgmt-ip>/api/security/accounts" -d
'{"owner":{"uuid":"aaef7c38-4bd3-11e9-b238-
0050568e2e25"},"name":"svm_user1","applications":[{"application":"ssh","au
thentication_methods":["password"],"second_authentication_method":"totp"}]
,"role":"vsadmin","password":"<SVM-USER-PASSWORD>"}'
```

Creating an SP user with MFA (password + publickey)

Specify the SP user account name, role name, and the tuples (application and authentication methods) in the body of the POST request. The owner.uuid or owner.name are not required to be specified for a cluster-scoped user account.

```
# The API:
POST "/api/security/accounts"

# The call to create a cluster user account with application
service_processor, authentication method password and second
authentication publickey
curl -X POST "https://<mgmt-ip>/api/security/accounts" -d
'{"name":"cluster_sp_user1","applications":[{"application":"service_proces
sor","authentication_methods":["password"],"second_authentication_method":
"publickey"}]}'
```

Retrieving the configured SP user accounts

Use the following API to retrieve all of the configured SP user accounts.

```
# The API:
curl -X GET "https://<mgmt-
ip>/api/security/accounts/?applications.application=service_processor"

# The response:
{
"records": [
  {
    "owner": {
      "uuid": "2903de6f-4bd2-11e9-b238-0050568e2e25",
      "name": "cluster1",
      "_links": {
        "self": {
          "href": "/api/svm/svms/2903de6f-4bd2-11e9-b238-0050568e2e25"
        }
      }
    },
    "name": "cluster_sp_user1",
    "applications": [
      {
        "application": "service_processor"
      }
    ],
    "_links": {
      "self": {
        "href": "/api/security/accounts/2903de6f-4bd2-11e9-b238-
0050568e2e25/"
      }
    }
  }
],
"num_records": 1,
"_links": {
  "self": {
    "href":
"/api/security/accounts/?applications.application=service_processor"
  }
}
}
```

Retrieve user accounts in the cluster

GET `/security/accounts`

Introduced In: 9.6

Retrieves a list of user accounts in the cluster.

Related ONTAP commands

- `security login show`

Parameters

Name	Type	In	Required	Description
password_hash_algorithm	string	query	False	Filter by password_hash_algorithm • Introduced in: 9.11
owner.name	string	query	False	Filter by owner.name • Introduced in: 9.7
owner.uuid	string	query	False	Filter by owner.uuid • Introduced in: 9.7
locked	boolean	query	False	Filter by locked • Introduced in: 9.7
comment	string	query	False	Filter by comment • Introduced in: 9.7
scope	string	query	False	Filter by scope • Introduced in: 9.7

Name	Type	In	Required	Description
applications.is_ns_switch_group	boolean	query	False	Filter by applications.is_ns_switch_group • Introduced in: 9.15
applications.second_authentication_method	string	query	False	Filter by applications.second_authentication_method • Introduced in: 9.7
applications.application	string	query	False	Filter by applications.application • Introduced in: 9.7
applications.authentication_methods	string	query	False	Filter by applications.authentication_methods • Introduced in: 9.7
applications.is_ldap_fastbind	boolean	query	False	Filter by applications.is_ldap_fastbind • Introduced in: 9.14
role.name	string	query	False	Filter by role.name • Introduced in: 9.7
name	string	query	False	Filter by name • Introduced in: 9.7 • maxLength: 64 • minLength: 3

Name	Type	In	Required	Description
fields	array[string]	query	False	Specify the fields to return.
max_records	integer	query	False	Limit the number of records returned.
return_records	boolean	query	False	The default is true for GET calls. When set to false, only the number of records is returned. • Default value: 1
return_timeout	integer	query	False	The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached. • Default value: 15 • Max value: 120 • Min value: 0
order_by	array[string]	query	False	Order results by specified fields and optional [asc

account_application

Name	Type	Description
application	string	Applications
authentication_methods	array[string]	
is_ldap_fastbind	boolean	Optional property that specifies the mode of authentication as LDAP Fastbind.
is_ns_switch_group	boolean	Optional property that specifies whether the user is an LDAP or NIS group.

Name	Type	Description
second_authentication_method	string	An optional additional authentication method for multi-factor authentication (MFA). This property is only supported for SSH (*ssh*) and Service Processor (*service_processor*) applications. It is ignored for all other applications. Time-based One-Time Passwords (TOTPs) are only supported with the authentication method password or public key. For the Service Processor (*service_processor*) application, *none* and *publickey* are the only supported enum values.

owner

Owner name and UUID that uniquely identifies the user account.

Name	Type	Description
_links	_links	
name	string	The name of the SVM. This field cannot be specified in a PATCH method.
uuid	string	The unique identifier of the SVM. This field cannot be specified in a PATCH method.

Create a new user account

POST `/security/accounts`

Introduced In: 9.6

Creates a new user account.

Required parameters

- `name` - Account name to be created.
- `applications` - Array of one or more application tuples (of application and authentication methods).

Optional parameters

- `owner.name` or `owner.uuid` - Name or UUID of the SVM for an SVM-scoped user account. If not supplied, a cluster-scoped user account is created.
- `role` - RBAC role for the user account. Defaulted to `admin` for cluster user account and to `vsadmin` for SVM-scoped account.
- `password` - Password for the user account (if the authentication method is opted as password for one or more of applications).
- `second_authentication_method` - Needed for MFA and only supported for *ssh* and *service_processor* applications. Defaults to *none* if not supplied.
- `comment` - Comment for the user account (e.g purpose of this account).
- `locked` - Locks the account after creation. Defaults to `false` if not supplied.
- `is_ldap_fastbind` - Needed for LDAP Fastbind Authentication and only supported for applications SSH, ONTAPI, and HTTP with authentication method "nsswitch" only. Defaults to false if not supplied.
- `is_ns_switch_group` - Specifies whether the user is an LDAP or NIS group and is only supported for SSH, ONTAPI, and HTTP applications with the authentication method "nsswitch". Defaults to false if not supplied.

ONTAP Error Response Codes

Error Code	Description
1261215	The role was not found.
1261225	Invalid command directory name.
1263343	Cannot lock user with password not set or non-password authentication method.
2621475	This operation is not supported on a node SVM.
2621601	This operation is not supported on a system SVM.
2621706	The specified owner.uuid and owner.name refer to different SVMs.
5636099	User creation with a non-admin role is not supported for service-processor application.
5636121	The user account name is reserved for use by the system.
5636126	Cannot create a user with the username or role as autosupport because it is reserved by the system.
5636136	Specifying "is_ns_switch_group" as "true" is supported only for authentication method "nsswitch".
5636140	Creating a login with application console for a data SVM is not supported.
5636141	Creating a login with application service-processor for a data SVM is not supported.
5636164	The authentication method and the second authentication method cannot be any combination of 'nsswitch' and 'password'.
5636165	Second authentication method is not supported for NIS or LDAP group based accounts.
5636176	The application and authentication-method combination is invalid.
5636178	An invalid value is specified for field "application".
5636179	Creating an AMQP application login for a data SVM is not supported.
5636197	LDAP fastbind combination for application and authentication method is not supported.
5636198	LDAP fastbind authentication is supported only for nsswitch.
5636206	Non-domain user cannot have a backslash in the username.
5636207	If the value for either the authentication-method or second-authentication-method parameters is domain, the other parameter must be publickey or none.

Error Code	Description
5636212	TOTP is supported only when the primary authentication method is password or public key.
5636214	Configuring the user with TOTP as a secondary authentication method requires an effective cluster version of 9.13.1 or later.
5636223	Specifying "is_ns_switch_group" as "true" is supported only for SSH, ONTAPI, and HTTP applications.
5636224	Configuring a Service Processor (SP) user with two-factor authentication requires an effective cluster version of 9.15.1 or later.
5636225	For a Service Processor (SP) user, the second factor of authentication must be one of publickey or none.
5636226	Internal error. Failed to check for ONTAP capability.
5636250	The "second_authentication_method" parameter is supported for HTTP, SSH, and Service Processor (SP) applications only.
5636251	For HTTP application, "publickey" is the only supported value for the "second_authentication_method" parameter; and can be specified only if the "authentication_methods" parameter has value "password" or "domain" or "nsswitch".
7077897	Invalid character in username.
7077898	The username must contain both letters and numbers.
7077899	The username does not meet length requirements.
7077906	A role with that name has not been defined for the Vserver.
7077918	The password cannot contain the username.
7077919	The minimum length for new password does not meet the policy.
7077920	A new password must have both letters and numbers.
7077921	The minimum number of special characters required do not meet the policy.
7077929	Cannot lock user with password not set or non-password authentication method.
7077940	The password exceeds the maximum supported length.
7077941	The defined password composition exceeds the maximum password length of 128 characters.

Error Code	Description
7078900	An admin password is not set. Set the password by including it in the request.

Also see the table of common errors in the Response body overview section of this documentation.

Manage scoped user accounts

Manage scoped user accounts

Overview

This API displays and manages the configuration of scoped user accounts.

Newly created user accounts might need to be updated for many reasons. For example, a user account might need to use a different application or its role might need to be modified. According to a policy, the password or authentication source of a user account might need to be changed, or a user account might need to be locked or deleted from the system. This API allows you to make these changes to user accounts.

Specify the owner UUID and the user account name in the URI path. The owner UUID corresponds to the UUID of the SVM for which the user account has been created and can be obtained from the response body of the GET request performed on one of the following APIs: /api/security/accounts for all user accounts /api/security/accounts/?scope=cluster for cluster-scoped user accounts /api/security/accounts/?scope=svm for SVM-scoped accounts /api/security/accounts/?owner.name=<svm-name></i> for a specific SVM This API response contains the complete URI for each user account that can be used.</svm-name>

Examples

Retrieving the user account details

```
# The API:
GET "/api/security/accounts/{owner.uuid}/{name}"
```

```
# The call:
curl -X GET "https://<mgmt-ip>/api/security/accounts/aef7c38-4bd3-11e9-
b238-0050568e2e25/svm_user1"

# The response:
{
"owner": {
  "uuid": "aaef7c38-4bd3-11e9-b238-0050568e2e25",
  "name": "svm1",
  "_links": {
    "self": {
      "href": "/api/svm/svms/aaef7c38-4bd3-11e9-b238-0050568e2e25"
    }
        }
},
"name": "svm_user1",
"applications": [
  {
    "application": "ssh",
    "authentication_methods": [
      "password"
    ],
    "second_authentication_method": "none"
  }
],
"role": {
  "name": "vsadmin",
  "_links": {
    "self": {
      "href": "/api/svms/aaef7c38-4bd3-11e9-b238-
0050568e2e25/admin/roles/vsadmin"
    }
  }
},
"locked": false,
"password_hash_algorithm": "sha512",
"scope": "svm",
"_links": {
  "self": {
    "href": "/api/security/accounts/aaef7c38-4bd3-11e9-b238-
0050568e2e25/svm_user1"
  }
}
}
```

Updating the applications and role in a user account

Specify the desired configuration in the form of tuples (of applications and authentication methods) and the role. All other previously configured applications that are not specified in the "applications" parameter of the PATCH request will be de-provisioned for the user account.

```
# The API:
PATCH "/api/security/accounts/{owner.uuid}/{name}"

# The call to update the applications and role:
curl -X PATCH "https://<mgmt-ip>/api/security/accounts/aaef7c38-4bd3-11e9-
b238-0050568e2e25/svm_user1" -d
'{"applications":[{"application":"http","authentication_methods":["domain"
]},{"application":"ontapi","authentication_methods":["password"]}],"role":
{"name": "vsadmin-backup"}}'

# The call to update only the role:
curl -X PATCH "https://<mgmt-ip>/api/security/accounts/aaef7c38-4bd3-11e9-
b238-0050568e2e25/svm_user1" -d '{"role":"vsadmin-protocol"}'
```

Updating the password for a user account

```
# The API:
PATCH "/api/security/accounts/{owner.uuid}/{name}"

# The call:
curl -X PATCH "https://<mgmt-ip>/api/security/accounts/aaef7c38-4bd3-11e9-
b238-0050568e2e25/svm_user1" -d '{"password":"newp@ssw@rd2"}'
```

Locking a user account

```
The API:
PATCH "/api/security/accounts/{owner.uuid}/{name}"
The call:
curl -X PATCH "https://<mgmt-ip>/api/security/accounts/aaef7c38-4bd3-11e9-
b238-0050568e2e25/svm_user1" -d '{"locked":"true"}'
```

Deleting a user account

```
# The API:
DELETE "/api/security/accounts/{owner.uuid}/{name}"

# The call:
curl -X DELETE "https://<mgmt-ip>/api/security/accounts/aaef7c38-4bd3-
11e9-b238-0050568e2e25/svm_user1"
```

Delete a user account

DELETE `/security/accounts/{owner.uuid}/{name}`

Introduced In: 9.6

Deletes a user account.

Required parameters

- `name` - Account name to be deleted.
- `owner.uuid` - UUID of the SVM housing the user account to be deleted.

Related ONTAP commands

- `security login delete`

Learn more

- DOC /security/accounts/{owner.uuid}/{name}
- DOC /security/accounts

Parameters

Name	Type	In	Required	Description
owner.uuid	string	path	True	Account owner UUID
name	string	path	True	User account name

Response

```
Status: 200, Ok
```

Error

```
Status: Default
```

ONTAP Error Response Codes

Error Code	Description
5636098	Last unlocked account that has an admin role cannot be deleted.
5636125	The operation is not supported on system accounts.
5636146	Cannot delete the last console account with admin role.

Also see the table of common errors in the Response body overview section of this documentation.

Name	Type	Description
error	returned_error	

Example error

```
{
  "error": {
    "arguments": [
      {
        "code": "string",
        "message": "string"
      }
    ],
    "code": "4",
    "message": "entry doesn't exist",
    "target": "uuid"
  }
}

Update a user account

PATCH `/security/accounts/{owner.uuid}/{name}`

Introduced In: 9.6

Updates a user account. Locks or unlocks a user account and/or updates the role, applications, and/or password for the user account.

Required parameters

- `name` - Account name to be updated.
- `owner.uuid` - UUID of the SVM housing the user account to be updated.

Optional parameters

- `applications` - Array of one or more tuples (of application and authentication methods).
- `role` - RBAC role for the user account.
- `password` - Password for the user account (if the authentication method is opted as password for one or more of applications).
- `second_authentication_method` - Needed for MFA and only supported for *ssh* and *service_processor* applications. Defaults to *none* if not supplied.
- `comment` - Comment for the user account (e.g purpose of this account).
- `locked` - Set to true/false to lock/unlock the account.
- `is_ldap_fastbind` - Set to true/false to enable LDAP Fastbind Authentication.
- `is_ns_switch_group` - Set to true/false to specify whether the user is an LDAP or NIS group.

Parameters

Name	Type	In	Required	Description
owner.uuid	string	path	True	Account owner UUID
name	string	path	True	User account name

Request Body

Name	Type	Description
applications	array[account_application]	

Name	Type	Description
comment	string	Optional comment for the user account.
locked	boolean	Locked status of the account.
password	string	Password for the account. The password can contain a mix of lower and upper case alphabetic characters, digits, and special characters.
password_hash_algorithm	string	Password hash algorithm used to generate a hash of the user's password for password matching.To modify "password_hash_algorithm", use REST API "/api/security/authentication/password".
role	role	
scope	string	Scope of the entity. Set to "cluster" for cluster owned objects and to "svm" for SVM owned objects.

Example request

```
{
  "applications": [
    {
      "application": "string",
      "authentication_methods": [
        "string"
      ],
      "second_authentication_method": "string"
    }
  ],
  "comment": "string",
  "password": "string",
  "password_hash_algorithm": "sha512",
  "role": {
    "name": "admin"
  },
  "scope": "string"
}
```

Response

```
Status: 200, Ok
```

Error

```
Status: Default
```

ONTAP Error Response Codes

Error Code	Description
1261215	The role was not found.
1261218	The user was not found.
1263343	Cannot lock user with password not set or non-password authentication method.
5636096	Cannot perform the operation for this user account since the password is not set.
5636097	The operation for user account failed since user password is not set.

Error Code	Description
5636100	Modification of a service-processor user’s role to a non-admin role is not supported.
5636125	The operation not supported on autosupport user account which is reserved.
5636129	The role does not exist.
5636136	Specifying "is_ns_switch_group" as "true" is supported only for authentication method "nsswitch".
5636154	For mixed-version cluster the second authentication method parameter is supported for SSH and Service Processor (SP) applications only.
5636159	For a given user and application, if the second-authentication-method is specified, only one such login entry is supported.
5636164	The authentication method and the second authentication method cannot be any combination of 'nsswitch' and 'password'.
5636165	Second authentication method is not supported for NIS or LDAP group based accounts.
5636197	LDAP fastbind combination for application and authentication method is not supported.
5636198	LDAP fastbind authentication is supported only for nsswitch.
5636212	TOTP is supported only when the primary authentication method is password or public key.
5636214	Configuring the user with TOTP as a secondary authentication method requires an effective cluster version of 9.13.1 or later.
5636223	Specifying "is_ns_switch_group" as "true" is supported only for SSH, ONTAPI and HTTP applications.
5636224	Configuring a Service Processor (SP) user with two-factor authentication requires an effective cluster version of 9.15.1 or later.
5636225	For a Service Processor (SP) user, the second factor of authentication must be one of publickey or none.
5636226	Internal error. Failed to check for ONTAP capability.
5636233	User modification failed because LDAP is not configured for the SVM or the LDAP connection is not secure.
7077896	Cannot lock the account of the last console admin user.

Error Code	Description
7077906	A role with that name has not been defined for the Vserver.
7077911	The user is not configured to use the password authentication method.
7077918	The password cannot contain the username.
7077919	The minimum length for new password does not meet the policy.
7077920	The new password must have both letters and numbers.
7077921	The minimum number of special characters required do not meet the policy.
7077924	The new password must be different than last N passwords.
7077925	The new password must be different to the old password.
7077929	Cannot lock user with password not set or non-password authentication method.
7077940	The password exceeds maximum supported length.
7077941	Defined password composition exceeds the maximum password length of 128 characters.
7078900	An aAdmin password is not set. Set the password by including it in the request.

Also see the table of common errors in the Response body overview section of this documentation.

Manage the anti-ransomware package

Manage the anti-ransomware package

Overview

This API displays and manages the anti-ransomware package version.

Examples

Retrieving the anti-ransomware package version of all nodes in the cluster.

The following example shows how to retrieve anti-ransomware package version.

```
# The API:
GET /security/anti-ransomware

# The call:
curl -X GET "https://<mgmt-ip>/api/security/anti-ransomware" -H "accept:
application/hal+json"

# The response:
{
"nodes": [
  {
    "name": "sti11-vsim-ucs573i",
    "version": "1.0"
  },
  {
    "name": "sti11-vsim-ucs573j",
    "version": "1.0"
  }
],
"_links": {
  "self": {
    "href": "/api/security/anti-ransomware/"
  }
}
}
```

Updating the anti-ransomware package

The following example shows how to update the anti-ransomware package on the cluster.

```
# The API:
PATCH /security/anti-ransomware

# The call:
curl -X PATCH "https://<mgmt-ip>/api/security/anti-ransomware" -H "accept:
application/hal+json" -d '{"uri": "http://server/package"}'

# The response:
{
"job": {
  "uuid": "74d0faef-3e1a-11ef-af89-005056ac6d8a",
  "_links": {
    "self": {
      "href": "/api/cluster/jobs/74d0faef-3e1a-11ef-af89-005056ac6d8a"
    }
  }
}
}
```

The call to update the anti-ransomware package returns the job UUID, including a HAL link to retrieve details about the job. The job object includes a `state` field and a message to indicate the progress of the job. When the job is complete and the application is fully created, the message indicates success and the job `state` field is set to `success`.

```
# The API:
/api/cluster/jobs/{uuid}

# The call:
curl -X GET "https://<mgmt-ip>/api/cluster/jobs/74d0faef-3e1a-11ef-af89-
005056ac6d8a" -H "accept: application/hal+json"

# The response:
{
"uuid": "74d0faef-3e1a-11ef-af89-005056ac6d8a",
"description": "PATCH /api/security/anti-ransomware",
"state": "success",
"message": "success",
"code": 0,
"_links": {
  "self": {
    "href": "/api/cluster/jobs/74d0faef-3e1a-11ef-af89-005056ac6d8a"
  }
}
}
```

Retrieve the anti-ransomware version of the nodes in the cluster

GET `/security/anti-ransomware`

Introduced In: 9.16

Retrieves the anti-ransomware package version of the nodes in the cluster.

Related ONTAP commands

- `security anti-ransomware show`

Parameters

Name	Type	In	Required	Description
fields	array[string]	query	False	Specify the fields to return.

Name	Type	In	Required	Description
return_timeout	integer	query	False	The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached. • Default value: 15 • Max value: 120 • Min value: 0

Response

```
Status: 200, Ok
```

Name	Type	Description
nodes	array[anti_ransomware_node]	
uri	string	URI of the anti-ransomware package through a server

Example response

```
{
  "nodes": [
    {
      "name": "node1",
      "version": "1.0"
    }
  ],
  "uri": "http://server/package"
}
```

Error

```
Status: Default
```

ONTAP Error Response Codes

Error Code	Description
917775	Operation is not supported on offline volumes.
203161606	Failed to check the "anti-ransomware-state" of the volume.
203162108	Operation is not supported on volumes that contain LUNs or namespaces.
203162109	Operation is not supported on an anti-ransomware disable-in-progress volume.

Also see the table of common errors in the Response body overview section of this documentation.

Name	Type	Description
error	returned_error	

Example error

```
{
  "error": {
    "arguments": [
      {
        "code": "string",
        "message": "string"
      }
    ],
    "code": "4",
    "message": "entry doesn't exist",
    "target": "uuid"
  }
}
```

Update the anti-ransomware package on the cluster

PATCH `/security/anti-ransomware`

Introduced In: 9.16

Updates the anti-ransomware package on the cluster.

Required properties

- `uri` - URI of the anti-ransomware package

Related ONTAP commands

- `security anti-ransomware update-package-from-uri`

Parameters

Name	Type	In	Required	Description
return_timeout	integer	query	False	The number of seconds to allow the call to execute before returning. When doing a POST, PATCH, or DELETE operation on a single record, the default is 0 seconds. This means that if an asynchronous operation is started, the server immediately returns HTTP code 202 (Accepted) along with a link to the job. If a non-zero value is specified for POST, PATCH, or DELETE operations, ONTAP waits that length of time to see if the job completes so it can return something other than 202. • Default value: 0 • Max value: 120 • Min value: 0

Request Body

Name	Type	Description
nodes	array[anti_ransomware_node]	
uri	string	URI of the anti-ransomware package through a server

Example request

```
{
  "nodes": [
    {
      "name": "node1",
      "version": "1.0"
    }
  ],
  "uri": "http://server/package"
}
```

Response

```
Status: 200, Ok
```

Name	Type	Description
job	job_link	

Example response

```
{
  "job": {
    "uuid": "string"
  }
}
```

Response

```
Status: 202, Accepted
```

Error

```
Status: Default
```

ONTAP Error Response Codes

Error Code	Description
203161684	Autonomous Ransomware Protection (ARP) package file must be either a .tar or .tgz file.
203161685	Autonomous Ransomware Protection (ARP) package file download failed.
203161686	Autonomous Ransomware Protection (ARP) package file unzip failed.
203161687	Autonomous Ransomware Protection (ARP) package file untar failed.
203161688	Autonomous Ransomware Protection (ARP) package archive invalid. No ARP version file found.
203161689	Internal error. Filesystem error while installing Autonomous Ransomware Protection (ARP) package file.
203161690	Autonomous Ransomware Protection (ARP) package update requires an effective cluster version of 9.16.1 or later.
203161691	Autonomous Ransomware Protection (ARP) package file is invalid. The checksum verification of the ARP configuration files failed.
203161692	Autonomous Ransomware Protection (ARP) package update failed because one or more nodes are not healthy.
203161694	Failed to update the Autonomous Ransomware Protection (ARP) package file because the `uri` property was not specified.

Manage anti-ransomware auto enablement

Manage anti-ransomware auto enablement

Overview

This API provides details about the anti-ransomware auto enablement status including information about warm-up periods and auto settings.

```
# The API
/security/anti-ransomware/auto-enable

# The call:
curl -X GET "https://<mgmt-ip>/api/security/anti-ransomware/auto-enable"
-H "accept: application/hal+json"

# The response:
{
"new_volume_auto_enable": true,
"existing_volume_auto_enable": true,
"warm_up_period_applicable": true,
"warm_up_period_completed": false,
"warm_up_period_duration": "12 hrs",
"warm_up_period_time_remaining" : "6 hrs",
"_links": {
  "self": {
    "href": "/security/anti-ransomware/auto-enable"
  }
}
}
```

Retrieve anti-ransomware auto enablement values

GET `/security/anti-ransomware/auto-enable`

Introduced In: 9.18

Retrieves the current anti-ransomware auto enablement values, including details about warm-up period and auto enablement setting for new and existing volumes.

Parameters

Name	Type	In	Required	Description
fields	array[string]	query	False	Specify the fields to return.

Response

```
Status: 200, Ok
```

Name	Type	Description
_links	self_link	
new_volume_auto_enable	boolean	Auto Anti-Ransomware Protection (ARP) setting for new volumes.
warm_up_period_applicable	boolean	Indicates if the warm-up period is applicable.

target	string	The target parameter that caused the error.

Delete suspect files

Delete suspect files

The suspects DELETE API clears all the suspect files for a volume from the list of potential suspects.

Clear suspect files of a volume

DELETE `/security/anti-ransomware/suspects/{volume.uuid}`

Introduced In: 9.10

Clears either all the suspect files of a volume or suspect files of a volume based on file format or suspect time provided.

Related ONTAP commands

- `security anti-ransomware volume attack clear-suspect`

Parameters

Name	Type	In	Required	Description
volume.uuid	string	path	True	Identification of the Anti-ransomware suspect file for the deletion. • format: uuid
is_false_positive	boolean	query	False	Specifies whether the suspected ransomware activity is a false positive or not. • Default value:
file.format	string	query	False	Specifies the file format of the suspect file. • Introduced in: 9.18
return_records	boolean	query	False	The default is false. If set to true, the records are returned. • Default value:

Name	Type	In	Required	Description
return_timeout	integer	query	False	The number of seconds to allow the call to execute before returning. When doing a POST, PATCH, or DELETE operation on a single record, the default is 0 seconds. This means that if an asynchronous operation is started, the server immediately returns HTTP code 202 (Accepted) along with a link to the job. If a non-zero value is specified for POST, PATCH, or DELETE operations, ONTAP waits that length of time to see if the job completes so it can return something other than 202. • Default value: 0 • Max value: 120 • Min value: 0

Response

```
Status: 200, Ok
```

Name	Type	Description
job	job_link	

Example response

```
{
  "job": {
    "_links": {
      "self": {
        "href": "/api/resourcelink"
      }
    },
    "uuid": "string"
  }
}
```

Response

```
Status: 202, Accepted
```

Error

```
Status: Default
```

ONTAP Error Response Codes

Error Code	Description
203161673	Operation is not supported on a data protection volume.
203162105	Clearing a suspect by specifying the file format is not supported when an attack is detected by encryption_percentage_analysis.

Also see the table of common errors in the Response body overview section of this documentation.

Name	Type	Description
error	returned_error	

Example error

```
{
  "error": {
    "arguments": [
      {
        "code": "string",
        "message": "string"
      }
    ],
    "code": "4",
    "message": "entry doesn't exist",
    "target": "uuid"
  }
}
```

Manage data-entropy statistics

Manage data-entropy statistics

Overview

This API returns the percentage of data classified as encrypted using an entropy algorithm, measured at various time intervals at the volume level. If no volume UUID is specified, entropy statistics of all the volumes will be returned. The entropy_stats_type parameter can be used to retrieve statistics with sub_hourly, hourly, or daily granularity. Additionally, it can be used to identify intervals that exhibited high (high_enc_pct) percentages of encrypted data. If no type is specified, all types of entropy statistics will be returned for the volumes.

Examples

Retrieving volume stats

In this example, the API returns the data-entropy statistics for the volumes.

```
# The API:
/security/anti-ransomware/volume/entropy-stats

# The call:
curl -X GET "https://<mgmt-ip>/api/security/anti-
ransomware/volume/entropy-stats" -H "accept: application/json"

# The response:
{
"records": [
  {
     "volume": {
     "uuid": "61edb8bb-b7d1-11ef-932d-005056bbaeff",
     "name": "v2"
     },
     "entropy_stats_type": "sub_hourly",
     "timestamp": "2024-12-13T03:36:24-05:00",
     "data_written_in_bytes": 13249687,
     "encryption_percentage": 51,
     "duration": "PT10M21S",
     "_links": {
      "self": {
       "href": "/api/security/anti-ransomware/volume/entropy-
stats/61edb8bb-b7d1-11ef-932d-005056bbaeff/sub_hourly/2024-12-
13T03%3A36%3A24-05%3A00"
      }
     }
  },
  {
     "volume": {
     "uuid": "61edb8bb-b7d1-11ef-932d-005056bbaeff",
     "name": "v2"
```

```
      },
      "entropy_stats_type": "hourly",
      "timestamp": "2024-12-13T04:16:06-05:00",
      "data_written_in_bytes": 13249687,
      "encryption_percentage": 51,
      "duration": "PT1H2M36S",

  }
 }
}
```

Retrieve data-entropy statistics for volumes

GET `/security/anti-ransomware/volume/entropy-stats`

Introduced In: 9.17

Retrieves the data-entropy statistics for the volumes.

Parameters

Name	Type	In	Required	Description
volume.name	string	query	False	Filter by volume.name
volume.uuid	string	query	False	Filter by volume.uuid
timestamp	string	query	False	Filter by timestamp
data_written_in_bytes	integer	query	False	Filter by data_written_in_bytes

Name	Type	In	Required	Description
encryption_percentage	integer	query	False	Filter by encryption_percentage
duration	string	query	False	Filter by duration
entropy_stats_type	string	query	False	Filter by entropy_stats_type
fields	array[string]	query	False	Specify the fields to return.
max_records	integer	query	False	Limit the number of records returned.
return_records	boolean	query	False	The default is true for GET calls. When set to false, only the number of records is returned. • Default value: 1
return_timeout	integer	query	False	The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached. • Default value: 15 • Max value: 120 • Min value: 0
order_by	array[string]	query	False	Order results by specified fields and optional [asc

Response

```
Status: 200, Ok
```

Name	Type	Description
_links	_links	
num_records	integer	Number of records
records	array[records]	

Example response

```
{
  "_links": {
    "next": {
      "href": "/api/resourcelink"
    },
    "self": {
      "href": "/api/resourcelink"
    }
  },
  "num_records": 1,
  "records": [
    {

Retrieve a data-entropy statistic for a volume

GET `/security/anti-ransomware/volume/entropy-stats/{volume.uuid}/{entropy_stats_type}/{timestamp}`

Introduced In: 9.17

Retrieves a data-entropy statistic for the volumes.

Parameters

Name	Type	In	Required	Description
volume.uuid	string	path	True	The UUID of the volume.
entropy_stats_type	string	path	True	The type of entropy statistics. • enum: ["sub_hourly", "hourly", "daily", "high_enc_pct"]
timestamp	string	path	True	The timestamp of the statistics. • format: date-time
fields	array[string]	query	False	Specify the fields to return.

Response

```
Status: 200, Ok
```

Name	Type	Description
_links	_links	
data_written_in_bytes	integer	The amount of data written.

View and update audit settings

View and update audit settings

Overview

This API controls what is logged to the audit log files. All operations that make changes are always logged and cannot be disabled. The PATCH request updates administrative audit settings for GET requests. All fields are optional for a PATCH request. A GET request retrieves administrative audit settings for GET requests.

Examples

Retrieving administrative audit settings for GET requests

The following example shows the administrative audit settings for GET requests.

```
# The API:
/api/security/audit

# The call:
curl -X GET "https://<cluster-ip>/api/security/audit"

# The response:
{
"cli": false,
"http": false,
"ontapi": false,
"_links": {
    "self": {
        "href": "/api/security/audit"
    }
}
}
```

Updating administrative audit settings for GET requests

The following example updates the administrative audit settings for GET requests

```
# The API:
/api/security/audit

# The call:
curl -X PATCH "https://<cluster-ip>/api/security/audit" -d '{"cli": false,
"http": true, "ontapi": true}'
```

Retrieve administrative audit settings for GET requests

GET `/security/audit`

Introduced In: 9.6

Retrieves administrative audit settings for GET requests.

Parameters

Name	Type	In	Required	Description
fields	array[string]	query	False	Specify the fields to return.

Response

```
Status: 200, Ok
```

Name	Type	Description
_links	_links	
cli	boolean	Enable auditing of CLI GET Operations. Valid in PATCH
http	boolean	Enable auditing of HTTP GET Operations. Valid in PATCH

Name	Type	Description
ontapi	boolean	Enable auditing of ONTAP API GET operations. Valid in PATCH • Introduced in: 9.6 • x-nullable: true

Example response

```
{
  "_links": {
    "self": {
      "href": "/api/resourcelink"
    }
  }
}
```

Error

```
Status: Default, Error
```

Name	Type	Description
error	returned_error	

Example error

```
{
  "error": {
    "arguments": [
      {
        "code": "string",
        "message": "string"
      }
    ],
    "code": "4",
    "message": "entry doesn't exist",
    "target": "uuid"
  }
}
```

Forward audit logs to syslog/splunk servers

Forward audit logs to syslog/splunk servers

Overview

This API controls the forwarding of audit log information to remote syslog/splunk servers. Multiple destinations can be configured and all audit records are forwarded to all destinations.

A GET operation retrieves information about remote syslog/splunk server destinations. A POST operation creates a remote syslog/splunk server destination. A GET operation on /security/audit/destinations/{address}/{port} retrieves information about the syslog/splunk server destination given its address and port number. A PATCH operation on /security/audit/destinations/{address}/{port} updates information about the syslog/splunk server destination given its address and port number. A DELETE operation on /security/audit/destinations/{address}/{port} deletes a syslog/splunk server destination given its address and port number.

Overview of fields used for creating a remote syslog/splunk destination

The fields used for creating a remote syslog/splunk destination fall into the following categories

Required properties

All of the following fields are required for creating a remote syslog/splunk destination

- `address`

Optional properties

All of the following fields are optional for creating a remote syslog/splunk destination

- `port`
- `ipspace`
- `protocol`
- `facility`
- `verify_server`
- `message_format` (Can be either "legacy_netapp" or "rfc_5424")
- `timestamp_format_override` (Can be either "no_override", "rfc_3164", "iso_8601_utc" or "iso_8601_local_time")
- `hostname_format_override` (Can be either "no_override", "fqdn" or "hostname_only") +

Examples

Retrieving remote syslog/splunk server destinations

The following example shows remote syslog/splunk server destinations

---

```
# The API:
/api/security/audit/destinations

# The call:
curl -X GET "https://<cluster-ip>/api/security/audit/destinations"

# The response:
{
"records": [
  {
    "address": "1.1.1.1",
    "port": 514,
    "_links": {
      "self": {
        "href": "/api/security/audit/destinations/1.1.1.1/514"
      }
  }
}
 ],
 "num_records": 1,
 "_links": {
   "self": {
     "href": "/api/security/audit/destinations"
   }
 }
}
```

Creating remote syslog/splunk server destinations

The following example creates remote syslog/splunk server destinations.

```
# The API:
/api/security/audit/destinations

# The call:
curl -X POST "https://<cluster-
ip>/api/security/audit/destinations?force=true" -d '{ "address":
"1.1.1.1", "port": 514, "protocol": "udp_unencrypted", "facility":
"kern"}'
```

Retrieving a remote syslog/splunk server destination given its destination address and port number

The following example retrieves a remote syslog/splunk server destination given its destination address and port number.

```
# The API:
/api/security/audit/destinations/{address}/{port}

# The call:
curl -X GET "https://<cluster-
ip>/api/security/audit/destinations/1.1.1.1/514"

# The response:
{
"address": "1.1.1.1",
"port": 514,
"ipspace": {
  "name": "Default",
  "uuid": "a97a3549-f7ae-11ec-b6bc-005056a7c8ff"
},
"protocol": "udp_unencrypted",
"facility": "kern",
"verify_server": false,
"message_format": "legacy_netapp",
"timestamp_format_override": "no_override",
"hostname_format_override": "no_override",
"_links": {
  "self": {
    "href": "/api/security/audit/destinations/1.1.1.1/514"
  }
}
}
```

Updating a remote syslog/splunk server destination given its destination address and port number

The following example updates a remote syslog/splunk server destination configuration given its destination address and port number.

```
# The API:
/api/security/audit/destinations/{address}/{port}

# The call:
curl -X PATCH "https://<cluster-
ip>/api/security/audit/destinations/1.1.1.1/514" -d '{"facility":
"user"}'
```

Deleting a remote syslog/splunk server destination given its destination address and port number

The following example deletes a remote syslog/splunk server destination configuration given its destination address and port number.

```
# The API:
/api/security/audit/destinations/{address}/{port}

# The call:
curl -X DELETE "https://<cluster-
ip>/api/security/audit/destinations/1.1.1.1/514"
```

Define a remote syslog or splunk server to receive audit information

GET `/security/audit/destinations`

Introduced In: 9.6

Defines a remote syslog/splunk server for sending audit information to.

Parameters

Name	Type	In	Required	Description
port	integer	query	False	Filter by port
message_format	string	query	False	Filter by message_format • Introduced in: 9.13

Name	Type	In	Required	Description
timestamp_format_override	string	query	False	Filter by timestamp_format_override • Introduced in: 9.13
protocol	string	query	False	Filter by protocol
ipspace.name	string	query	False	Filter by ipspace.name • Introduced in: 9.12
ipspace.uuid	string	query	False	Filter by ipspace.uuid • Introduced in: 9.12
address	string	query	False	Filter by address
facility	string	query	False	Filter by facility
verify_server	boolean	query	False	Filter by verify_server
hostname_format_override	string	query	False	Filter by hostname_format_override • Introduced in: 9.13
order_by	array[string]	query	False	Order results by specified fields and optional [asc
desc] direction. Default direction is 'asc' for ascending.	fields	array[string]	query	False
Specify the fields to return.	max_records	integer	query	False
Limit the number of records returned.	return_timeout	integer	query	False

Name	Type	In	Required	Description
The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached. • Default value: 15 • Max value: 120 • Min value: 0	return_records	boolean	query	False

security_audit_log_forward

Name	Type	Description
address	string	Destination syslog|splunk host to forward audit records to. This can be an IP address (IPv4|IPv6) or a hostname.
facility	string	This is the standard Syslog Facility value that is used when sending audit records to a remote server.
hostname_format_override	string	Syslog Hostname Format Override
ipspace	ipspace	

Name	Type	Description
message_format	string	Syslog message format to be used. legacy_netapp format (variation of RFC-3164) is default message format.
port	integer	Destination Port. The default port depends on the protocol chosen: For un-encrypted destinations the default port is 514. For encrypted destinations the default port is 6514.
protocol	string	Log forwarding protocol
timestamp_format_override	string	Syslog Timestamp Format Override.
verify_server	boolean	This is only applicable when the protocol is tcp_encrypted. This controls whether the remote server's certificate is validated. Setting "verify_server" to "true" will enforce validation of remote server's certificate. Setting "verify_server" to "false" will not enforce validation of remote server's certificate.

Define the remote syslog or splunk server information

POST `/security/audit/destinations`

Introduced In: 9.6

Configures remote syslog/splunk server information.

Required properties

All of the following fields are required for creating a remote syslog/splunk destination

- `address`

Optional properties

All of the following fields are optional for creating a remote syslog/splunk destination

- `port` (1 - 65535)
- `ipspace`
- `protocol`
- `facility`
- `verify_server` (Can only be "true" when protocol is "tcp_encrypted")
- `message_format` (Can be either "legacy-netapp" or "rfc-5424")
- `timestamp_format_override` (Can be either "no-override", "rfc-3164", "iso-8601-utc" or "iso-8601-local-time")
- `hostname_format_override` (Can be either "no-override", "fqdn" or "hostname-only")

Parameters

Name	Type	In	Required	Description
force	boolean	query	False	Skip the Connectivity Test • Default value:

Name	Type	In	Required	Description
return_timeout	integer	query	False	The number of seconds to allow the call to execute before returning. When doing a POST, PATCH, or DELETE operation on a single record, the default is 0 seconds. This means that if an asynchronous operation is started, the server immediately returns HTTP code 202 (Accepted) along with a link to the job. If a non-zero value is specified for POST, PATCH, or DELETE operations, ONTAP waits that length of time to see if the job completes so it can return something other than 202. • Default value: 0 • Max value: 120 • Min value: 0
return_records	boolean	query	False	The default is false. If set to true, the records are returned. • Default value:

Request Body

Name	Type	Description
address	string	Destination syslog|splunk host to forward audit records to. This can be an IP address (IPv4|IPv6) or a hostname.

Name	Type	Description
facility	string	This is the standard Syslog Facility value that is used when sending audit records to a remote server.
hostname_format_override	string	Syslog Hostname Format Override
ipspace	ipspace	
message_format	string	Syslog message format to be used. legacy_netapp format (variation of RFC-3164) is default message format.
port	integer	Destination Port. The default port depends on the protocol chosen: For un-encrypted destinations the default port is 514. For encrypted destinations the default port is 6514.
protocol	string	Log forwarding protocol
timestamp_format_override	string	Syslog Timestamp Format Override.
verify_server	boolean	This is only applicable when the protocol is tcp_encrypted. This controls whether the remote server’s certificate is validated. Setting "verify_server" to "true" will enforce validation of remote server’s certificate. Setting "verify_server" to "false" will not enforce validation of remote server’s certificate.

Example request

```
{
  "address": "1.1.1.1",
  "facility": "string",
  "hostname_format_override": "string",
  "ipspace": {
    "name": "Default",
    "uuid": "1cd8a442-86d1-11e0-ae1c-123478563412"
  },
  "message_format": "string",
  "port": 514,
  "protocol": "string",
  "timestamp_format_override": "string"
}
```

Response

```
Status: 202, Accepted
```

Name	Type	Description
num_records	integer	Number of records
records	array[security_audit_log_forward]	

Example response

```
{
  "num_records": 1,
  "records": [
    {
      "address": "1.1.1.1",
      "facility": "string",
      "hostname_format_override": "string",
      "ipspace": {
        "name": "Default",
        "uuid": "1cd8a442-86d1-11e0-ae1c-123478563412"
      },
      "message_format": "string",
      "port": 514,
      "protocol": "string",
      "timestamp_format_override": "string"
    }
  ]
}
```

Headers

Name	Description	Type

View administrative audit logs

View administrative audit logs

Overview

These APIs return audit log records. The GET requests retrieves all audit log records. An audit log record contains information such as timestamp, node name, index and so on.

Example

Retrieving audit log records

The following example shows the audit log records. Note: The index field is used to order the audit log messages before they are displayed. If multiple entries for the same node and timestamp occur simultaneously, the index assigns an order to ensure logical consistency.

```
# The API:
/api/security/audit/messages

# The call:
curl -X GET "https://<cluster-ip>/api/security/audit/messages"

# The response:
{
"records": [
  {
    "timestamp": "2019-03-08T11:03:32-05:00",
    "node": {
      "name": "node1",
      "uuid": "bc9af9da-41bb-11e9-a3db-005056bb27cf",
      "_links": {
        "self": {
          "href": "/api/cluster/nodes/bc9af9da-41bb-11e9-a3db-
005056bb27cf"
        }
      }
    },
    "index": 4294967299,
    "application": "http",
    "location": "172.21.16.89",
    "user": "admin",
    "input": "GET /api/security/audit/destinations/",
    "state": "pending",
    "scope": "cluster",
    "role": "admin"
  }
],
"num_records": 1,
"_links": {
  "self": {
    "href": "/api/security/audit/messages"
  }
}
}
```

Retrieve the administrative audit log viewer

GET `/security/audit/messages`

Introduced In: 9.6

Retrieves the administrative audit log viewer.

Parameters

Name	Type	In	Required	Description
user	string	query	False	Filter by user
location	string	query	False	Filter by location
node.name	string	query	False	Filter by node.name
node.uuid	string	query	False	Filter by node.uuid
state	string	query	False	Filter by state
command_id	string	query	False	Filter by command_id
timestamp	string	query	False	Filter by timestamp
application	string	query	False	Filter by application
scope	string	query	False	Filter by scope
index	integer	query	False	Filter by index
message	string	query	False	Filter by message
session_id	string	query	False	Filter by session_id
input	string	query	False	Filter by input
svm.name	string	query	False	Filter by svm.name
role	string	query	False	Filter by role • Introduced in: 9.17
fields	array[string]	query	False	Specify the fields to return.
max_records	integer	query	False	Limit the number of records returned.

Name	Type	In	Required	Description
return_timeout	integer	query	False	The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached. • Default value: 15 • Max value: 120 • Min value: 0
return_records	boolean	query	False	The default is true for GET calls. When set to false, only the number of records is returned. • Default value: 1
order_by	array[string]	query	False	Order results by specified fields and optional [asc

Response

security_audit_log

Name	Type	Description
_links	_links	
application	string	This identifies the "application" by which the request was processed.

Name	Type	Description
command_id	string	This is the command ID for this request. Each command received on a CLI session is assigned a command ID. This enables you to correlate a request and response.
index	integer	Internal index for accessing records with the same time and node. This is a 64-bit unsigned value that is used to order the audit log messages before they are displayed. If multiple entries for the same node and timestamp occur simultaneously, the index assigns an order to ensure logical consistency.
input	string	The request.
location	string	This identifies the location of the remote user. This is an IP address or "console".
message	string	This is an optional field that might contain "error" or "additional information" about the status of a command.
node	node	Node where the audit message resides.
role	string	Role of the remote user.
scope	string	Set to "svm" when the request is on a data SVM; otherwise set to "cluster".
session_id	string	This is the session ID on which the request is received. Each SSH session is assigned a session ID. Each http/ontapi/snmp request is assigned a unique session ID.
state	string	State of of this request.

Name	Type	Description
svm	svm	This is the SVM through which the user connected.
timestamp	string	Log entry timestamp. Valid in URL
user	string	Username of the remote user.

target	string	The target parameter that caused the error.

Manage data SVM account information

Manage data SVM account information

Overview

This API configures data SVM account information at the Active Directory. For Active Directory domain-based authentication for cluster accounts, a data SVM must be configured and registered as a machine account at the Active Directory. All authentication requests are proxied through this SVM.

Examples

Creating a data SVM proxy for domain-based authentication for cluster accounts

```
# The API:
POST  "/api/security/authentication/cluster/ad-proxy"

# The call:
curl -X POST "https://<mgmt-ip>/api/security/authentication/cluster/ad-
proxy" -d '{"svm.uuid":"13f87d78-70c7-11e9-b722-0050568ec89f"}'
```

Manage LDAP server configuration

Manage LDAP server configuration

Overview

LDAP servers are used to centrally maintain user information. LDAP configurations must be set up to look up information stored in the LDAP directory on the external LDAP servers. This API is used to retrieve and manage cluster LDAP server configurations.

Examples

Retrieving the cluster LDAP information

The cluster LDAP GET request retrieves the LDAP configuration of the cluster.

The following example shows how a GET request is used to retrieve the cluster LDAP information:

```
# The API:
/api/security/authentication/cluster/ldap

# The call:
curl -X GET "https://<mgmt-ip>/api/security/authentication/cluster/ldap"
-H "accept: application/hal+json"

# The response:
{
"servers": [
  "10.10.10.10",
  "domainB.example.com"
],
"schema": "ad_idmu",
"port": 389,
"min_bind_level": "anonymous",
"bind_dn": "cn=Administrators,cn=users,dc=domainA,dc=example,dc=com",
"base_dn": "dc=domainA,dc=example,dc=com",
"base_scope": "subtree",
"use_start_tls": true,
"session_security": "none",
"try_channel_binding": true,
"_links": {
  "self": {
    "href": "/api/security/authentication/cluster/ldap"
  }
}
}
```

Creating the cluster LDAP configuration

The cluster LDAP POST operation creates an LDAP configuration for the cluster.

The following example shows how to issue a POST request with all of the fields specified:

```
# The API:
/api/security/authentication/cluster/ldap

# The call:
curl -X POST "https://<mgmt-ip>/api/security/authentication/cluster/ldap"
-H "accept: application/hal+json" -H "Content-Type: application/json" -d
"{ \"servers\": [ \"10.10.10.10\", \"domainB.example.com\" ], \"schema\":
\"ad_idmu\", \"port\": 389, \"min_bind_level\": \"anonymous\",
\"bind_dn\": \"cn=Administrators,cn=users,dc=domainA,dc=example,dc=com\",
\"bind_password\": \"<BIND-PASSWORD>\", \"base_dn\":
\"dc=domainA,dc=example,dc=com\", \"base_scope\": \"subtree\",
\"use_start_tls\": false, \"session_security\": \"none\"}"
```

The following example shows how to issue a POST request with a number of optional fields not specified:

```
# The API:
/api/security/authentication/cluster/ldap

# The call:
curl -X POST "https://<mgmt-ip>/api/security/authentication/cluster/ldap"
-H "accept: application/hal+json" -H "Content-Type: application/json" -d
"{ \"port\": 389, \"bind_dn\":
\"cn=Administrators,cn=users,dc=domainA,dc=example,dc=com\",
\"bind_password\": \"<BIND-PASSWORD>\", \"base_dn\":
\"dc=domainA,dc=example,dc=com\", \"session_security\": \"none\"}"
```

Updating the cluster LDAP configuration

The cluster LDAP PATCH request updates the LDAP configuration of the cluster.

The following example shows how a PATCH request is used to update the cluster LDAP configuration:

```
# The API:
/api/security/authentication/cluster/ldap

# The call:
curl -X PATCH "https://<mgmt-ip>/api/security/authentication/cluster/ldap"
-H "accept: application/json" -H "Content-Type: application/json" -d "{
\"servers\": [ \"55.55.55.55\" ], \"schema\": \"ad_idmu\", \"port\": 636,
\"use_start_tls\": false }"
```

Deleting the cluster LDAP configuration

The cluster LDAP DELETE request deletes the LDAP configuration of the cluster.

The following example shows how a DELETE request is used to delete the cluster LDAP configuration:

```
# The API:
/api/security/authentication/cluster/ldap

# The call:
curl -X DELETE "https://<mgmt-
ip>/api/security/authentication/cluster/ldap" -H "accept:
application/hal+json"
```

Delete the LDAP configuration for the cluster

DELETE `/security/authentication/cluster/ldap`

Introduced In: 9.6

Deletes the LDAP configuration of the cluster.

Response

```
Status: 200, Ok
```

Error

```
Status: Default, Error
```

Name	Type	Description
error	returned_error	

Example error

```
{
  "error": {
    "arguments": [
      {
        "code": "string",
        "message": "string"
      }
    ],
    "code": "4",
    "message": "entry doesn't exist",
    "target": "uuid"
  }
}
```

target	string	The target parameter that caused the error.

Retrieve the LDAP configuration for the cluster

GET `/security/authentication/cluster/ldap`

Introduced In: 9.6

Retrieves the cluster LDAP configuration.

Related ONTAP commands

- `ldap show`
- `ldap check -vserver vs0`
- `ldap check-ipv6 -vserver vs0`

Important notes

- The status.code, status.dn_message, status.message, and status.state fields have the same status fields that are returned using the "ldap check" CLI command.
- Refer to the ipv4 or ipv6 objects available in the status field to get specific information about the code, dn_messages, or message and state information for ipv4 or ipv6.

Parameters

Name	Type	In	Required	Description
fields	array[string]	query	False	Specify the fields to return.

Response

```
Status: 200, Ok
```

Name	Type	Description
_links	_links	
base_dn	string	Specifies the default base DN for all searches.
base_scope	string	Specifies the default search scope for LDAP queries: • base - search the named entry only • onelevel - search all entries immediately below the DN • subtree - search the named DN entry and the entire subtree below the DN

Name	Type	Description
bind_as_cifs_server	boolean	Specifies whether or not CIFS server's credentials are used to bind to the LDAP server.
bind_dn	string	Specifies the user that binds to the LDAP servers.
group_dn	string	Specifies the group Distinguished Name (DN) that is used as the starting point in the LDAP directory tree for group lookups.
group_membership_filter	string	Specifies the custom filter used for group membership lookups from an LDAP server.
group_scope	string	Specifies the default search scope for LDAP for group lookups: • base - search the named entry only • onelevel - search all entries immediately below the DN • subtree - search the named DN entry and the entire subtree below the DN
is_netgroup_byhost_enabled	boolean	Specifies whether or not netgroup by host querying is enabled.
is_owner	boolean	Specifies whether or not the SVM owns the LDAP client configuration.
ldaps_enabled	boolean	Specifies whether or not LDAPS is enabled.
min_bind_level	string	The minimum bind authentication level. Possible values are: • anonymous - anonymous bind • simple - simple bind • sasl - Simple Authentication and Security Layer (SASL) bind

Name	Type	Description
netgroup_byhost_dn	string	Specifies the netgroup Distinguished Name (DN) that is used as the starting point in the LDAP directory tree for netgroup by host lookups.
netgroup_byhost_scope	string	Specifies the default search scope for LDAP for netgroup by host lookups: • base - search the named entry only • onelevel - search all entries immediately below the DN • subtree - search the named DN entry and the entire subtree below the DN
netgroup_dn	string	Specifies the netgroup Distinguished Name (DN) that is used as the starting point in the LDAP directory tree for netgroup lookups.
netgroup_scope	string	Specifies the default search scope for LDAP for netgroup lookups: • base - search the named entry only • onelevel - search all entries immediately below the DN • subtree - search the named DN entry and the entire subtree below the DN
port	integer	The port used to connect to the LDAP Servers.
query_timeout	integer	Specifies the maximum time to wait for a query response from the LDAP server, in seconds.

Name	Type	Description
schema	string	The name of the schema template used by the SVM. • AD-IDMU - Active Directory Identity Management for UNIX • AD-SFU - Active Directory Services for UNIX • MS-AD-BIS - Active Directory Identity Management for UNIX • RFC-2307 - Schema based on RFC 2307 • Custom schema
servers	array[string]	
session_security	string	Specifies the level of security to be used for LDAP communications: • none - no signing or sealing • sign - sign LDAP traffic • seal - seal and sign LDAP traffic
status	status	
try_channel_binding	boolean	Specifies whether or not channel binding is attempted in the case of TLS/LDAPS.
use_start_tls	boolean	Specifies whether or not to use Start TLS over LDAP connections.
user_dn	string	Specifies the user Distinguished Name (DN) that is used as the starting point in the LDAP directory tree for user lookups.
user_scope	string	Specifies the default search scope for LDAP for user lookups: • base - search the named entry only • onelevel - search all entries immediately below the DN • subtree - search the named DN entry and the entire subtree below the DN

Update the LDAP configuration for the cluster

PATCH `/security/authentication/cluster/ldap`

Introduced In: 9.6

Both mandatory and optional parameters of the LDAP configuration can be updated. IPv6 must be enabled if IPv6 family addresses are specified. Configuring more than one LDAP server is recommended to avoid a single point of failure. Both FQDNs and IP addresses are supported for the `servers` property. The LDAP servers are validated as part of this operation. LDAP validation fails in the following scenarios:

1. The server does not have LDAP installed.
2. The server is invalid.
3. The server is unreachable.

Request Body

Name	Type	Description
base_dn	string	Specifies the default base DN for all searches.
base_scope	string	Specifies the default search scope for LDAP queries: • base - search the named entry only • onelevel - search all entries immediately below the DN • subtree - search the named DN entry and the entire subtree below the DN
bind_as_cifs_server	boolean	Specifies whether or not CIFS server's credentials are used to bind to the LDAP server.
bind_dn	string	Specifies the user that binds to the LDAP servers.
bind_password	string	Specifies the bind password for the LDAP servers.
group_dn	string	Specifies the group Distinguished Name (DN) that is used as the starting point in the LDAP directory tree for group lookups.

Name	Type	Description
group_membership_filter	string	Specifies the custom filter used for group membership lookups from an LDAP server.
group_scope	string	Specifies the default search scope for LDAP for group lookups: • base - search the named entry only • onelevel - search all entries immediately below the DN • subtree - search the named DN entry and the entire subtree below the DN
is_netgroup_byhost_enabled	boolean	Specifies whether or not netgroup by host querying is enabled.
is_owner	boolean	Specifies whether or not the SVM owns the LDAP client configuration.
ldaps_enabled	boolean	Specifies whether or not LDAPS is enabled.
min_bind_level	string	The minimum bind authentication level. Possible values are: • anonymous - anonymous bind • simple - simple bind • sasl - Simple Authentication and Security Layer (SASL) bind
netgroup_byhost_dn	string	Specifies the netgroup Distinguished Name (DN) that is used as the starting point in the LDAP directory tree for netgroup by host lookups.

Name	Type	Description
netgroup_byhost_scope	string	Specifies the default search scope for LDAP for netgroup by host lookups: • base - search the named entry only • onelevel - search all entries immediately below the DN • subtree - search the named DN entry and the entire subtree below the DN
netgroup_dn	string	Specifies the netgroup Distinguished Name (DN) that is used as the starting point in the LDAP directory tree for netgroup lookups.
netgroup_scope	string	Specifies the default search scope for LDAP for netgroup lookups: • base - search the named entry only • onelevel - search all entries immediately below the DN • subtree - search the named DN entry and the entire subtree below the DN
port	integer	The port used to connect to the LDAP Servers.
query_timeout	integer	Specifies the maximum time to wait for a query response from the LDAP server, in seconds.

Name	Type	Description
schema	string	The name of the schema template used by the SVM. • AD-IDMU - Active Directory Identity Management for UNIX • AD-SFU - Active Directory Services for UNIX • MS-AD-BIS - Active Directory Identity Management for UNIX • RFC-2307 - Schema based on RFC 2307 • Custom schema
servers	array[string]	
session_security	string	Specifies the level of security to be used for LDAP communications: • none - no signing or sealing • sign - sign LDAP traffic • seal - seal and sign LDAP traffic
skip_config_validation	boolean	Indicates whether or not the validation for the specified LDAP configuration is disabled.
status	status	
try_channel_binding	boolean	Specifies whether or not channel binding is attempted in the case of TLS/LDAPS.
use_start_tls	boolean	Specifies whether or not to use Start TLS over LDAP connections.
user_dn	string	Specifies the user Distinguished Name (DN) that is used as the starting point in the LDAP directory tree for user lookups.

Name	Type	Description
user_scope	string	Specifies the default search scope for LDAP for user lookups: • base - search the named entry only • onelevel - search all entries immediately below the DN • subtree - search the named DN entry and the entire subtree below the DN

ONTAP Error Response Codes

Error Code	Description
4915203	The specified LDAP schema does not exist.
262222	The specified LDAP servers contain duplicate server entries.
4915229	DNS resolution failed due to an internal error. Contact technical support if this issue persists.
4915231	DNS resolution failed for one or more of the specified LDAP servers. Verify that a valid DNS server is configured.
23724132	DNS resolution failed for all the specified LDAP servers. Verify that a valid DNS server is configured.
4915234	Specified LDAP server is not supported because it is one of the following: multicast, loopback, 0.0.0.0, or broadcast.
4915248	LDAP servers cannot be empty or "-". Specified FQDN is not valid because it is empty or "-" or it contains either special characters or "-" at the start or end of the domain.
4915251	STARTTLS and LDAPS cannot be used together
4915257	The LDAP configuration is not valid. Verify that the Distinguished Names and bind password are correct.
4915258	The LDAP configuration is not valid. Verify that the servers are reachable and that the network configuration is correct.
23724130	Cannot use an IPv6 name server address because there are no IPv6 interfaces.

Error Code	Description
4915252	LDAP referral is not supported with STARTTLS, with session security levels sign, seal or with LDAPS.
4915244	RPC failure occurred during validation of the LDAP configuration.
4915265	The specified bind password or bind DN is invalid

ipv4

Name	Type	Description
code	integer	Code corresponding to the error message. If there is no error, it is 0 to indicate success.
dn_messages	array[string]	
message	string	Provides additional details on the error.
state	string	Status of the LDAP service.

ipv6

Name	Type	Description
code	integer	Code corresponding to the error message. If there is no error, it is 0 to indicate success.
dn_messages	array[string]	
message	string	Provides additional details on the error.
state	string	Status of the LDAP service.

status

Name	Type	Description
code	integer	This field is no longer supported. Use ipv4.code or ipv6.code instead.
dn_message	array[string]	
ipv4	ipv4	

Name	Type	Description
ipv4_state	string	This field is no longer supported. Use ipv4.state instead.
ipv6	ipv6	
ipv6_state	string	This field is no longer supported. Use ipv6.state instead.
message	string	This field is no longer supported. Use ipv4.message or ipv6.message instead.
state	string	The status of the LDAP service for the SVM. The LDAP service is up if either `ipv4_state` or `ipv6_state` is up. The LDAP service is down if both `ipv4_state` and `ipv6_state` are down.

cluster_ldap

Name	Type	Description
base_dn	string	Specifies the default base DN for all searches.
base_scope	string	Specifies the default search scope for LDAP queries: • base - search the named entry only • onelevel - search all entries immediately below the DN • subtree - search the named DN entry and the entire subtree below the DN
bind_as_cifs_server	boolean	Specifies whether or not CIFS server's credentials are used to bind to the LDAP server.
bind_dn	string	Specifies the user that binds to the LDAP servers.
bind_password	string	Specifies the bind password for the LDAP servers.

Name	Type	Description
group_dn	string	Specifies the group Distinguished Name (DN) that is used as the starting point in the LDAP directory tree for group lookups.
group_membership_filter	string	Specifies the custom filter used for group membership lookups from an LDAP server.
group_scope	string	Specifies the default search scope for LDAP for group lookups: • base - search the named entry only • onelevel - search all entries immediately below the DN • subtree - search the named DN entry and the entire subtree below the DN
is_netgroup_byhost_enabled	boolean	Specifies whether or not netgroup by host querying is enabled.
is_owner	boolean	Specifies whether or not the SVM owns the LDAP client configuration.
ldaps_enabled	boolean	Specifies whether or not LDAPS is enabled.
min_bind_level	string	The minimum bind authentication level. Possible values are: • anonymous - anonymous bind • simple - simple bind • sasl - Simple Authentication and Security Layer (SASL) bind
netgroup_byhost_dn	string	Specifies the netgroup Distinguished Name (DN) that is used as the starting point in the LDAP directory tree for netgroup by host lookups.

Name	Type	Description
netgroup_byhost_scope	string	Specifies the default search scope for LDAP for netgroup by host lookups: • base - search the named entry only • onelevel - search all entries immediately below the DN • subtree - search the named DN entry and the entire subtree below the DN
netgroup_dn	string	Specifies the netgroup Distinguished Name (DN) that is used as the starting point in the LDAP directory tree for netgroup lookups.
netgroup_scope	string	Specifies the default search scope for LDAP for netgroup lookups: • base - search the named entry only • onelevel - search all entries immediately below the DN • subtree - search the named DN entry and the entire subtree below the DN
port	integer	The port used to connect to the LDAP Servers.
query_timeout	integer	Specifies the maximum time to wait for a query response from the LDAP server, in seconds.

Name	Type	Description
schema	string	The name of the schema template used by the SVM. • AD-IDMU - Active Directory Identity Management for UNIX • AD-SFU - Active Directory Services for UNIX • MS-AD-BIS - Active Directory Identity Management for UNIX • RFC-2307 - Schema based on RFC 2307 • Custom schema
servers	array[string]	
session_security	string	Specifies the level of security to be used for LDAP communications: • none - no signing or sealing • sign - sign LDAP traffic • seal - seal and sign LDAP traffic
skip_config_validation	boolean	Indicates whether or not the validation for the specified LDAP configuration is disabled.
status	status	
try_channel_binding	boolean	Specifies whether or not channel binding is attempted in the case of TLS/LDAPS.
use_start_tls	boolean	Specifies whether or not to use Start TLS over LDAP connections.
user_dn	string	Specifies the user Distinguished Name (DN) that is used as the starting point in the LDAP directory tree for user lookups.

Name	Type	Description
user_scope	string	Specifies the default search scope for LDAP for user lookups: • base - search the named entry only • onelevel - search all entries immediately below the DN • subtree - search the named DN entry and the entire subtree below the DN

message	string	Error message
target	string	The target parameter that caused the error.

Create the LDAP configuration for the cluster

POST `/security/authentication/cluster/ldap`

Introduced In: 9.6

A cluster can have only one LDAP configuration. IPv6 must be enabled if IPv6 family addresses are specified.

Required properties

- `servers` - List of LDAP servers used for this client configuration.

Recommended optional properties

- `schema` - Schema template name.
- `port` - Port used to connect to the LDAP Servers.
- `ldaps_enabled` - Specifies whether or not LDAPS is enabled.
- `min_bind_level` - Minimum bind authentication level.
- `bind_dn` - Specifies the user that binds to the LDAP servers.
- `base_dn` - Specifies the default base DN for all searches.
- `bind_password` - Specifies the bind password for the LDAP servers.
- `base_scope` - Specifies the default search scope for LDAP queries.
- `use_start_tls` - Specifies whether or not to use Start TLS over LDAP connections.
- `session_security` - Specifies the level of security to be used for LDAP communications.
- `bind_as_cifs_server` - Indicates if CIFS server's credentials are used to bind to the LDAP server.
- `query_timeout` - Maximum time to wait for a query response from the LDAP server, in seconds.
- `user_dn` - User Distinguished Name (DN) used as the starting point in the LDAP directory tree for user lookups.
- `user_scope` - Default search scope for LDAP for user lookups.
- `group_dn` - Group Distinguished Name (DN) used as the starting point in the LDAP directory tree for group lookups.
- `group_scope` - Default search scope for LDAP for group lookups.
- `netgroup_dn` - Netgroup Distinguished Name (DN) used as the starting point in the LDAP directory tree for netgroup lookups.
- `netgroup_scope` - Default search scope for LDAP for netgroup lookups.
- `netgroup_byhost_dn` - Netgroup Distinguished Name (DN) used as the starting point in the LDAP directory tree for netgroup by host lookups.
- `netgroup_byhost_scope` - Default search scope for LDAP for netgroup by host lookups.
- `is_netgroup_byhost_enabled` - Specifies whether netgroup by host querying is enabled.
- `group_membership_filter` - Custom filter used for group membership lookup from an LDAP server.
- `skip_config_validation` - Indicates whether or not the validation for the specified LDAP configuration is disabled.

Default property values

- `schema` - *RFC-2307*
- `port` - *389*
- `ldaps_enabled` - *false*
- `min_bind_level` - *simple*
- `base_scope` - *subtree*

- `use_start_tls` - *false*
- `session_security` - *none*
- `query_timeout` - *3*
- `user_scope` - *subtree*
- `group_scope` - *subtree*
- `netgroup_scope` - *subtree*
- `netgroup_byhost_scope` - *subtree*
- `is_netgroup_byhost_enabled` - *false*
- `skip_config_validation` - *false*
- `try_channel_binding` - *true*

Configuring more than one LDAP server is recommended to avoid a single point of failure. Both FQDNs and IP addresses are supported for the `servers` property. The LDAP servers are validated as part of this operation. LDAP validation fails in the following scenarios:

1. The server does not have LDAP installed.
2. The server is invalid.
3. The server is unreachable.

Request Body

Name	Type	Description
base_dn	string	Specifies the default base DN for all searches.
base_scope	string	Specifies the default search scope for LDAP queries: • base - search the named entry only • onelevel - search all entries immediately below the DN • subtree - search the named DN entry and the entire subtree below the DN
bind_as_cifs_server	boolean	Specifies whether or not CIFS server's credentials are used to bind to the LDAP server.
bind_dn	string	Specifies the user that binds to the LDAP servers.

Name	Type	Description
bind_password	string	Specifies the bind password for the LDAP servers.
group_dn	string	Specifies the group Distinguished Name (DN) that is used as the starting point in the LDAP directory tree for group lookups.
group_membership_filter	string	Specifies the custom filter used for group membership lookups from an LDAP server.
group_scope	string	Specifies the default search scope for LDAP for group lookups: • base - search the named entry only • onelevel - search all entries immediately below the DN • subtree - search the named DN entry and the entire subtree below the DN
is_netgroup_byhost_enabled	boolean	Specifies whether or not netgroup by host querying is enabled.
is_owner	boolean	Specifies whether or not the SVM owns the LDAP client configuration.
ldaps_enabled	boolean	Specifies whether or not LDAPS is enabled.
min_bind_level	string	The minimum bind authentication level. Possible values are: • anonymous - anonymous bind • simple - simple bind • sasl - Simple Authentication and Security Layer (SASL) bind
netgroup_byhost_dn	string	Specifies the netgroup Distinguished Name (DN) that is used as the starting point in the LDAP directory tree for netgroup by host lookups.

Name	Type	Description
netgroup_byhost_scope	string	Specifies the default search scope for LDAP for netgroup by host lookups: • base - search the named entry only • onelevel - search all entries immediately below the DN • subtree - search the named DN entry and the entire subtree below the DN
netgroup_dn	string	Specifies the netgroup Distinguished Name (DN) that is used as the starting point in the LDAP directory tree for netgroup lookups.
netgroup_scope	string	Specifies the default search scope for LDAP for netgroup lookups: • base - search the named entry only • onelevel - search all entries immediately below the DN • subtree - search the named DN entry and the entire subtree below the DN
port	integer	The port used to connect to the LDAP Servers.
query_timeout	integer	Specifies the maximum time to wait for a query response from the LDAP server, in seconds.

Name	Type	Description
schema	string	The name of the schema template used by the SVM. • AD-IDMU - Active Directory Identity Management for UNIX • AD-SFU - Active Directory Services for UNIX • MS-AD-BIS - Active Directory Identity Management for UNIX • RFC-2307 - Schema based on RFC 2307 • Custom schema
servers	array[string]	
session_security	string	Specifies the level of security to be used for LDAP communications: • none - no signing or sealing • sign - sign LDAP traffic • seal - seal and sign LDAP traffic
skip_config_validation	boolean	Indicates whether or not the validation for the specified LDAP configuration is disabled.
status	status	
try_channel_binding	boolean	Specifies whether or not channel binding is attempted in the case of TLS/LDAPS.
use_start_tls	boolean	Specifies whether or not to use Start TLS over LDAP connections.
user_dn	string	Specifies the user Distinguished Name (DN) that is used as the starting point in the LDAP directory tree for user lookups.

Name	Type	Description
user_scope	string	Specifies the default search scope for LDAP for user lookups: • base - search the named entry only • onelevel - search all entries immediately below the DN • subtree - search the named DN entry and the entire subtree below the DN

ONTAP Error Response Codes

Error Code	Description
4915203	The specified LDAP schema does not exist.
262222	The specified LDAP servers contain duplicate server entries.
4915229	DNS resolution failed due to an internal error. Contact technical support if this issue persists.
4915231	DNS resolution failed for one or more of the specified LDAP servers. Verify that a valid DNS server is configured.

Error Code	Description
23724132	DNS resolution failed for all the specified LDAP servers. Verify that a valid DNS server is configured.
4915234	The specified LDAP server is not supported because it is one of the following: multicast, loopback, 0.0.0.0, or broadcast.
4915248	LDAP servers cannot be empty or "-". Specified FQDN is invalid because it is empty or "-" or it contains either special characters or "-" at the start or end of the domain.
4915251	STARTTLS and LDAPS cannot be used together.
4915257	The LDAP configuration is invalid. Verify that bind-dn and bind password are correct.
4915258	The LDAP configuration is invalid. Verify that the servers are reachable and that the network configuration is correct.
13434916	The SVM is in the process of being created. Wait a few minutes, and then try the command again.
23724130	Cannot use an IPv6 name server address because there are no IPv6 interfaces.
4915252	LDAP referral is not supported with STARTTLS, with session security levels sign, seal or with LDAPS.
4915265	The specified bind password or bind DN is invalid

message	string	This field is no longer supported. Use ipv4.message or ipv6.message instead.
state	string	The status of the LDAP service for the SVM. The LDAP service is up if either `ipv4_state` or `ipv6_state` is up. The LDAP service is down if both `ipv4_state` and `ipv6_state` are down.

cluster_ldap

Name	Type	Description
base_dn	string	Specifies the default base DN for all searches.
base_scope	string	Specifies the default search scope for LDAP queries: • base - search the named entry only • onelevel - search all entries immediately below the DN • subtree - search the named DN entry and the entire subtree below the DN
bind_as_cifs_server	boolean	Specifies whether or not CIFS server's credentials are used to bind to the LDAP server.
bind_dn	string	Specifies the user that binds to the LDAP servers.
bind_password	string	Specifies the bind password for the LDAP servers.

Name	Type	Description
group_dn	string	Specifies the group Distinguished Name (DN) that is used as the starting point in the LDAP directory tree for group lookups.
group_membership_filter	string	Specifies the custom filter used for group membership lookups from an LDAP server.
group_scope	string	Specifies the default search scope for LDAP for group lookups: • base - search the named entry only • onelevel - search all entries immediately below the DN • subtree - search the named DN entry and the entire subtree below the DN
is_netgroup_byhost_enabled	boolean	Specifies whether or not netgroup by host querying is enabled.
is_owner	boolean	Specifies whether or not the SVM owns the LDAP client configuration.
ldaps_enabled	boolean	Specifies whether or not LDAPS is enabled.
min_bind_level	string	The minimum bind authentication level. Possible values are: • anonymous - anonymous bind • simple - simple bind • sasl - Simple Authentication and Security Layer (SASL) bind
netgroup_byhost_dn	string	Specifies the netgroup Distinguished Name (DN) that is used as the starting point in the LDAP directory tree for netgroup by host lookups.

Name	Type	Description
netgroup_byhost_scope	string	Specifies the default search scope for LDAP for netgroup by host lookups: • base - search the named entry only • onelevel - search all entries immediately below the DN • subtree - search the named DN entry and the entire subtree below the DN
netgroup_dn	string	Specifies the netgroup Distinguished Name (DN) that is used as the starting point in the LDAP directory tree for netgroup lookups.
netgroup_scope	string	Specifies the default search scope for LDAP for netgroup lookups: • base - search the named entry only • onelevel - search all entries immediately below the DN • subtree - search the named DN entry and the entire subtree below the DN
port	integer	The port used to connect to the LDAP Servers.
query_timeout	integer	Specifies the maximum time to wait for a query response from the LDAP server, in seconds.

Name	Type	Description
schema	string	The name of the schema template used by the SVM. • AD-IDMU - Active Directory Identity Management for UNIX • AD-SFU - Active Directory Services for UNIX • MS-AD-BIS - Active Directory Identity Management for UNIX • RFC-2307 - Schema based on RFC 2307 • Custom schema
servers	array[string]	
session_security	string	Specifies the level of security to be used for LDAP communications: • none - no signing or sealing • sign - sign LDAP traffic • seal - seal and sign LDAP traffic
skip_config_validation	boolean	Indicates whether or not the validation for the specified LDAP configuration is disabled.
status	status	
try_channel_binding	boolean	Specifies whether or not channel binding is attempted in the case of TLS/LDAPS.
use_start_tls	boolean	Specifies whether or not to use Start TLS over LDAP connections.
user_dn	string	Specifies the user Distinguished Name (DN) that is used as the starting point in the LDAP directory tree for user lookups.

Name	Type	Description
user_scope	string	Specifies the default search scope for LDAP for user lookups: • base - search the named entry only • onelevel - search all entries immediately below the DN • subtree - search the named DN entry and the entire subtree below the DN

svm

SVM, applies only to SVM-scoped objects.

Name	Type	Description
name	string	The name of the SVM. This field cannot be specified in a PATCH method.
uuid	string	The unique identifier of the SVM. This field cannot be specified in a PATCH method.

ldap_service

Name	Type	Description
ad_domain	string	This parameter specifies the name of the Active Directory domain used to discover LDAP servers for use by this client. This is mutually exclusive with `servers` during POST and PATCH.
base_dn	string	Specifies the default base DN for all searches.

Name	Type	Description
base_scope	string	Specifies the default search scope for LDAP queries: • base - search the named entry only • onelevel - search all entries immediately below the DN • subtree - search the named DN entry and the entire subtree below the DN
bind_as_cifs_server	boolean	Specifies whether or not CIFS server's credentials are used to bind to the LDAP server.
bind_dn	string	Specifies the user that binds to the LDAP servers.
bind_password	string	Specifies the bind password for the LDAP servers.
group_dn	string	Specifies the group Distinguished Name (DN) that is used as the starting point in the LDAP directory tree for group lookups.
group_membership_filter	string	Specifies the custom filter used for group membership lookups from an LDAP server.
group_scope	string	Specifies the default search scope for LDAP for group lookups: • base - search the named entry only • onelevel - search all entries immediately below the DN • subtree - search the named DN entry and the entire subtree below the DN
is_netgroup_byhost_enabled	boolean	Specifies whether or not netgroup by host querying is enabled.

Name	Type	Description
is_owner	boolean	Specifies whether or not the SVM owns the LDAP client configuration.
ldaps_enabled	boolean	Specifies whether or not LDAPS is enabled.
min_bind_level	string	The minimum bind authentication level. Possible values are: • anonymous - anonymous bind • simple - simple bind • sasl - Simple Authentication and Security Layer (SASL) bind
netgroup_byhost_dn	string	Specifies the netgroup Distinguished Name (DN) that is used as the starting point in the LDAP directory tree for netgroup by host lookups.
netgroup_byhost_scope	string	Specifies the default search scope for LDAP for netgroup by host lookups: • base - search the named entry only • onelevel - search all entries immediately below the DN • subtree - search the named DN entry and the entire subtree below the DN
netgroup_dn	string	Specifies the netgroup Distinguished Name (DN) that is used as the starting point in the LDAP directory tree for netgroup lookups.

Name	Type	Description
netgroup_scope	string	Specifies the default search scope for LDAP for netgroup lookups: • base - search the named entry only • onelevel - search all entries immediately below the DN • subtree - search the named DN entry and the entire subtree below the DN
port	integer	The port used to connect to the LDAP Servers.
preferred_ad_servers	array[string]	
query_timeout	integer	Specifies the maximum time to wait for a query response from the LDAP server, in seconds.
referral_enabled	boolean	Specifies whether or not LDAP referral is enabled.
restrict_discovery_to_site	boolean	Specifies whether or not LDAP server discovery is restricted to site-scope.
schema	string	The name of the schema template used by the SVM. • AD-IDMU - Active Directory Identity Management for UNIX • AD-SFU - Active Directory Services for UNIX • MS-AD-BIS - Active Directory Identity Management for UNIX • RFC-2307 - Schema based on RFC 2307 • Custom schema
servers	array[string]	

Name	Type	Description
session_security	string	Specifies the level of security to be used for LDAP communications: • none - no signing or sealing • sign - sign LDAP traffic • seal - seal and sign LDAP traffic
skip_config_validation	boolean	Indicates whether or not the validation for the specified LDAP configuration is disabled.
status	status	
svm	svm	SVM, applies only to SVM-scoped objects.
try_channel_binding	boolean	Specifies whether or not channel binding is attempted in the case of TLS/LDAPS.
use_start_tls	boolean	Specifies whether or not to use Start TLS over LDAP connections.
user_dn	string	Specifies the user Distinguished Name (DN) that is used as the starting point in the LDAP directory tree for user lookups.
user_scope	string	Specifies the default search scope for LDAP for user lookups: • base - search the named entry only • onelevel - search all entries immediately below the DN • subtree - search the named DN entry and the entire subtree below the DN

Manage NIS configuration

Manage NIS configuration

Overview

NIS servers are used to authenticate user and client computers. NIS domain name and NIS server information is required to configure NIS. This API retrieves and manages NIS server configurations.

Examples

Retrieving cluster NIS information

The cluster NIS GET request retrieves the NIS configuration of the cluster.

The following example shows how a GET request is used to retrieve the cluster NIS configuration:

```
# The API:
/security/authentication/cluster/nis

# The call:
curl -X GET "https://<mgmt-ip>/api/security/authentication/cluster/nis" -H
"accept: application/hal+json"

# The response:
{
"domain": "domainA.example.com",
"servers": [
  "10.10.10.10",
  "example.com"
],
"bound_servers": [
  "10.10.10.10"
]
}
```

Creating the cluster NIS configuration

The cluster NIS POST request creates a NIS configuration for the cluster.

The following example shows how a POST request is used to create a cluster NIS configuration:

```
# The API:
/security/authentication/cluster/nis

# The call:
curl -X POST "https://<mgmt-ip>/api/security/authentication/cluster/nis"
-H "accept: application/json" -H "Content-Type: application/json" -d "{
\"domain\": \"domainA.example.com\", \"servers\": [
\"10.10.10.10\",\"example.com\" ]}"
```

Updating the cluster NIS configuration

The cluster NIS PATCH request updates the NIS configuration of the cluster.

The following example shows how to update the domain:

```
# The API:
/security/authentication/cluster/nis

# The call:
curl -X PATCH "https://<mgmt-ip>/api/security/authentication/cluster/nis"
-H "accept: application/json" -H "Content-Type: application/json" -d "{
\"domain\": \"domainC.example.com\", \"servers\": [ \"13.13.13.13\" ]}"
```

The following example shows how to update the server:

```
# The API:
/security/authentication/cluster/nis

# The call:
curl -X PATCH "https://<mgmt-ip>/api/security/authentication/cluster/nis"
-H "accept: application/json" -H "Content-Type: application/json" -d "{
\"servers\": [ \"14.14.14.14\" ]}"
```

Deleting the cluster NIS configuration

The cluster NIS DELETE request deletes the NIS configuration of the cluster.

The following example shows how a DELETE request is used to delete the cluster NIS configuration:

```
# The API:
/security/authentication/cluster/nis

# The call:
curl -X DELETE "https://<mgmt-ip>/api/security/authentication/cluster/nis"
-H "accept: application/hal+json"
```

Delete the NIS configuration for the cluster

DELETE `/security/authentication/cluster/nis`

Introduced In: 9.6

Deletes the NIS configuration of the cluster. NIS can be removed as a source from ns-switch if NIS is not used for lookups.

Response

```
Status: 200, Ok
```

Update the NIS configuration for the cluster

PATCH `/security/authentication/cluster/nis`

Introduced In: 9.6

Both NIS domain and servers can be updated. Domains and servers cannot be empty. Both FQDNs and IP addresses are supported for the 'servers' field. If the domain is updated, NIS servers must also be specified. IPv6 must be enabled if IPv6 family addresses are specified for the `servers` property.

Request Body

Name	Type	Description
binding_details	array[binding_details]	An array of objects where each object represents the NIS server and it's status for a given NIS domain. It is an advanced field.
bound_servers	array[string]	
domain	string	The NIS domain to which this configuration belongs.
servers	array[string]	A list of hostnames or IP addresses of NIS servers used by the NIS domain configuration.

Example request

```
{
  "binding_details": [

Create the NIS configuration for the cluster

POST `/security/authentication/cluster/nis`

Introduced In: 9.6

The cluster can have one NIS server configuration. Specify the NIS domain and NIS servers as input. The servers field cannot be empty. Both FQDNs and IP addresses are supported for the `server` property. IPv6 must be enabled if IPv6 family addresses are specified in the `server` property. A maximum of ten NIS servers are supported.

Required properties

- `domain` - NIS domain to which this configuration belongs.
- `servers` - List of hostnames or IP addresses of NIS servers used by the NIS domain configuration.

Request Body

Name	Type	Description
binding_details	array[binding_details]	An array of objects where each object represents the NIS server and it's status for a given NIS domain. It is an advanced field.
bound_servers	array[string]	
domain	string	The NIS domain to which this configuration belongs.

View and update OAuth 2.0 status

View and update OAuth 2.0 status

Overview

This API is used to enable and disable OAuth 2.0 in the cluster. The PATCH request enables and disables OAuth 2.0 in the cluster.

Examples

Retrieving the OAuth 2.0 status in the cluster

The following output shows the OAuth 2.0 status of the cluster.

```
# The API:
/api/security/authentication/cluster/oauth2

# The call:
curl -X GET "https://<mgmt-ip>/api/security/authentication/cluster/oauth2"
-H "accept: application/hal+json"

# The response:
{
"enabled": false
}
```

Enabling the OAuth 2.0 in the cluster

The following output shows how to enable the OAuth 2.0 in the cluster.

```
# The API:
/api/security/authentication/cluster/oauth2

# The call:
curl -X PATCH "https://<mgmt-
ip>/api/security/authentication/cluster/oauth2" -H "accept:
application/hal+json" -d '{ "enabled": true }'
```

Retrieve the OAuth 2.0 status

GET `/security/authentication/cluster/oauth2`

Introduced In: 9.14

Retrieves the OAuth 2.0 status.

Related ONTAP commands

- `security oauth2 show`

Parameters

Name	Type	In	Required	Description
enabled	boolean	query	False	Filter by enabled

Name	Type	In	Required	Description
fields	array[string]	query	False	Specify the fields to return.

Response

```
Status: 200, Ok
```

Name	Type	Description
enabled	boolean	Indicates whether OAuth 2.0 is enabled or disabled globally. Default value is false.

Error

```
Status: Default, Error
```

Name	Type	Description
error	returned_error	

Example error

```
{
  "error": {
    "arguments": [
      {
        "code": "string",
        "message": "string"
      }
    ],
    "code": "4",
    "message": "entry doesn't exist",
    "target": "uuid"
  }
}
```

View and create OAuth 2.0 configurations

View and create OAuth 2.0 configurations

Overview

This API is used to retrieve and configure relevant information pertaining to the OAuth 2.0 configuration in the cluster. The POST request creates the OAuth 2.0 configuration if there is none present. Various responses are shown in the examples below.

Examples

Retrieving the OAuth 2.0 configuration in the cluster

The following output shows the OAuth 2.0 configuration in the cluster.

```
# The API:
/api/security/authentication/cluster/oauth2/clients

# The call:
curl -X GET "https://<mgmt-
ip>/api/security/authentication/cluster/oauth2/clients" -H "accept:
application/hal+json"

# The response:
{
 "records": [
{
  "name": "auth0"
}
 ],
 "num_records": 1
}
```

Creating the OAuth 2.0 configuration

The following output shows how to create the OAuth 2.0 configuration in the cluster.

```
= The API:

/api/security/authentication/cluster/oauth2/clients

= The call:

curl -X POST "https://+++<mgmt-
ip>+++/api/security/authentication/cluster/oauth2/clients?return_records=t
rue" -H "accept: application/hal+json" -d '{ "name": "name",
"application": "http", "issuer": "https://examplelab.customer.com",
"audience": "aud", "client_id": "client_id", "client_secret":
"client_secret", "introspection": {"endpoint_uri":
"https://examplelab.customer.com/server/endpoint", "interval": "PT1H" },
```

```
"remote_user_claim": "user_claim", "outgoing_proxy":
"https://johndoe:somesecret@proxy.example.com:8080",
"use_local_roles_if_present": false, "use_mutual_tls": "required"
}'+++</mgmt-ip>+++

= The response:

{
"job": {
  "uuid": "e45b123b-c228-11e8-aa20-0050568e36bb",
  "_links": {
    "self": {

a|The OAuth 2.0 Audience.

|client_id
|string
a|The OAuth 2.0 client ID. Required in POST operations for remote
introspection.

|hashed_client_secret
|string
a|The OAuth 2.0 client secret as a SHA256 HMAC hashed value created with
the cluster UUID as its HMAC secret key.

|introspection
|link:#introspection[introspection]
a|

|issuer
|string
```

```
a|The OAuth 2.0 Issuer.

|jwks
|link:#jwks[jwks]
a|

|name
|string
a|The configuration name. Required for POST operations.

|outgoing_proxy
|string
a|Outgoing proxy to access external identity providers (IdPs). If not
specified, no proxy is configured.

|provider
|string
a|The Identity Provider type.

|remote_user_claim
|string
a|The remote user claim.

|use_local_roles_if_present
|boolean
a|Indicates whether or not to use locally configured roles, if present.
Default value is false.

|use_mutual_tls
|string
a|OAuth 2.0 mutual TLS authentication setting. Set this value to "none" to
disable mutual TLS authentication. Set this value to "required" to enforce
mutual TLS authentication for all access tokens and reject any token that
does not have x5t#S256 property in the cnf section. The default value is
"request" which means mutual TLS authentication is enforced only if the
x5t#S256 property is present in the cnf section of the access token.

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When doing a POST, PATCH, or DELETE operation on a single record, the
default is 0 seconds.  This means that if an asynchronous operation is
started, the server immediately returns HTTP code 202 (Accepted) along
with a link to the job.  If a non-zero value is specified for POST, PATCH,
or DELETE operations, ONTAP waits that length of time to see if the job
completes so it can return something other than 202.

* Default value: 0
* Max value: 120
* Min value: 0

|return_records
|boolean
|query
|False
a|The default is false.  If set to true, the records are returned.

* Default value:

= View and delete an OAuth 2.0 configuration

:leveloffset: +1

[[ID3b810d86ddebca221a076d4fa0313b87]]
= View and delete an OAuth 2.0 configuration

== Overview

This API is used to retrieve and delete the OAuth 2.0 configuration in the
cluster. The GET request retrieves the OAuth 2.0 configuration. The DELETE
request removes the OAuth 2.0 configuration.  Various responses are shown
in the examples below.
 +

'''

== Examples

=== Retrieving the OAuth 2.0 configuration in the cluster

The following output shows the OAuth 2.0 configuration in the cluster.
 +

'''

----

# The API:
```

```
/api/security/authentication/cluster/oauth2/clients/{name}

# The call:
curl -X GET "https://<mgmt-
ip>/api/security/authentication/cluster/oauth2/clients/auth0" -H "accept:
application/hal+json"

# The response:
{
"name": "auth0",
"application": "http",
"issuer": "https://examplelab.customer.com",
"audience": "aud",
"client_id": "client_id",
"hashed_client_secret": "<HASHED-CLIENT-SECRET>",
"introspection": {
  "endpoint_uri": "https://examplelab.customer.com/server/endpoint",
  "interval": "PT1H"
},
"remote_user_claim": "user_claim",
"jwks": {
  "provider_uri": "https://examplelab.customer.com/pf/JWKS",
  "refresh_interval": "PT1H"
},
"use_local_roles_if_present": false,
"outgoing_proxy": "https://johndoe:secretpass@proxy.example.com:8080",
"_links": {
  "self": {
    "href": "/api/security/authentication/cluster/oauth2/clients"
  }
},
"use_mutual_tls": "required"
}
----

'''

=== Deleting the OAuth 2.0 configuration

'''

----

# The API:
/api/security/authentication/cluster/oauth2/clients/{name}
```

```
# The call:
curl -X DELETE "https://<mgmt-
ip>/api/security/authentication/cluster/oauth2/clients/auth0"
----

'''

[[ID401d0b571eb48191d52a636b4e7cb460]]
= Delete an OAuth 2.0 configuration

[.api-doc-operation .api-doc-operation-delete]#DELETE# [.api-doc-code-

:leveloffset: -1

= Manage SAML service

:leveloffset: +1

[[ID9fb26c0d12e2864497b694adcad65be7]]
= Manage SAML service

== Overview

This API is used to retrieve and display relevant information pertaining
to the SAML service provider configuration in the cluster. The POST
request creates a SAML service provider configuration if there is none
present.  The DELETE request removes the SAML service provider
configuration.  The PATCH request enables and disables SAML in the
cluster.  Various responses are shown in the examples below.
 +

'''

== Examples

=== Retrieving the SAML service provider configuration in the cluster

The following output shows the SAML service provider configuration in the
```

```
cluster.
 +

'''

----

# The API:
/api/security/authentication/cluster/saml-sp

# The call:
curl -X GET "https://<mgmt-ip>/api/security/authentication/cluster/saml-
sp" -H "accept: application/hal+json"

# The response:
{
"idp_uri": "https://examplelab.customer.com/idp/Metadata",
"enabled": true,
"host": "172.21.74.181",
"certificate": {
  "ca": "cluster1",
  "serial_number": "156F10C3EB4C51C1"
},
"_links": {
  "self": {
    "href": "/api/security/authentication/cluster/saml-sp"
  }
}
}
----

'''

=== Creating the SAML service provider configuration

The following output shows how to create a SAML service provider
configuration in the cluster.
 +

'''

----

# The API:
/api/security/authentication/cluster/saml-sp

# The call:
```

```
curl -X POST "https://<mgmt-ip>/api/security/authentication/cluster/saml-
sp?return_records=true" -H "accept: application/hal+json" -d '{ "idp_uri":
"https://examplelab.customer.com/idp/Metadata", "host": "172.21.74.181",
"certificate": { "ca": "cluster1", "serial_number": "156F10C3EB4C51C1" }}'
----

'''

=== Updating the SAML service provider configuration

The following output shows how to enable a SAML service provider
configuration in the cluster.

Disabling the configuration requires the client to be authenticated
through SAML prior to performing the operation.
 +

'''

----

# The API:
/api/security/authentication/cluster/saml-sp

# The call:
curl -X PATCH "https://<mgmt-ip>/api/security/authentication/cluster/saml-
sp/" -d '{ "enabled": true }'
----

'''

=== Deleting the SAML service provider configuration

'''

----

# The API:
/api/security/authentication/cluster/saml-sp

# The call:
curl -X DELETE "https://<mgmt-
ip>/api/security/authentication/cluster/saml-sp/"
----

'''

[[ID534dc1b3ac412d5eebaca0f0abc19072]]
= Create an SAML service provider configuration

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/security/authentication/cluster/saml-sp`#

*Introduced In:* 9.6

Creates a SAML service provider configuration. Note that "common_name" is
mutually exclusive with "serial_number" and "ca" in POST. SAML will
initially be disabled, requiring a patch to set "enabled" to "true", so
that the user has time to complete the setup of the IdP.

== Required properties

* `idp_uri`

== Optional properties

* `certificate`
* `enabled`
* `host`

== Parameters

[cols=5*,options=header]
|===
```

```
|Name
|Type
|In
|Required
|Description

|verify_metadata_server
|boolean
|query
|False
a|Verify IdP metadata server identity.

* Default value: 1

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When doing a POST, PATCH, or DELETE operation on a single record, the
default is 0 seconds.  This means that if an asynchronous operation is
started, the server immediately returns HTTP code 202 (Accepted) along
with a link to the job.  If a non-zero value is specified for POST, PATCH,
or DELETE operations, ONTAP waits that length of time to see if the job
completes so it can return something other than 202.

* Default value: 0
* Max value: 120
* Min value: 0

= Create the SAML default metadata configuration

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/security/authentication/cluster/saml-sp/default-metadata`#

*Introduced In:* 9.17

Creates the SAML default metadata configuration. Note that `common_name`
is mutually exclusive with `serial_number` and `ca` in POST requests.
```

```
== Optional properties

* `certificate`
* `host`

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When doing a POST, PATCH, or DELETE operation on a single record, the
default is 0 seconds.  This means that if an asynchronous operation is
started, the server immediately returns HTTP code 202 (Accepted) along
with a link to the job.  If a non-zero value is specified for POST, PATCH,
or DELETE operations, ONTAP waits that length of time to see if the job
completes so it can return something other than 202.

* Default value: 0
* Max value: 120
* Min value: 0

:leveloffset: -1

= View and create Duo groups

:leveloffset: +1

[[ID0f613569053f9b7bb42beb81e89a4a61]]
= View and create Duo groups

== Overview

This API configures the group to be included in Duo authentication.

== Examples

=== Creating a Duo group

Specify the group name and other necessary information in the body of the
POST request. The owner.uuid or owner.name are not required for a cluster-
```

```
scoped account.

----

# The API:
POST "/api/security/authentication/duo/groups"

# The call:
curl -k https://<mgmt-ip>/api/security/authentication/duo/groups --request
POST --data '{"name": "test",  "comment": "test post"}'

# The response:
{
}
----

=== Creating a Duo group for SVM-scoped account

For an SVM-scoped account, specify either the SVM name as the owner.name
or the SVM UUID as the owner.uuid along with other parameters for the
group. These parameters indicate the SVM that contains the user group and
can be obtained from the response body of the GET request performed on the
API "/api/svm/svms".

----

# The API:
POST "/api/security/authentication/duo/groups"

# The call:
curl -k https://<mgmt-ip>/api/security/authentication/duo/groups --request
POST --data '{"name": "test",  "comment": "test post", "owner.name":"vs0"
}'

# The response:
{
}
----

=== Retrieving the configured Duo groups

Retrieves the Duo groups associated with the owners or filtered list (for
a specific SVM and so on).

----

# The API:
```

```
GET "/api/security/authentication/duo/groups"

# The call to retrieve Duo groups with the cluster or SVM:
curl -k https://<mgmt-ip>/api/security/authentication/duo/groups

# the response:
{
"records": [
{
  "owner": {
  "uuid": "5f618c80-d90a-11ed-a6e6-0050568e8ef2",
  "name": "vs0"
}
},
{
"owner": {
"uuid": "f810005a-d908-11ed-a6e6-0050568e8ef2",
"name": "cluster-1"
}
}
],
"num_records": 2
}
----

[[ID1a13614eabed908b478b1dcdabedf0a8]]
= Retrieve the configured groups

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/security/authentication/duo/groups`#

*Introduced In:* 9.14

Retrieves the configured groups.

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|excluded_users
|string
|query
|False
a|Filter by excluded_users

|name
|string
|query
|False
a|Filter by name

|owner.name
|string
|query
|False
a|Filter by owner.name

|owner.uuid
|string
|query
|False
a|Filter by owner.uuid

|comment
|string
|query
```

```
|False
a|Filter by comment

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 15
* Max value: 120
* Min value: 0

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
```

```
Default direction is 'asc' for ascending.

:leveloffset: -1

= View and create a Duo profile

:leveloffset: +1

[[IDa9ab629cfbd71099924d4661dbed9832]]
= View and create a Duo profile

== Overview

This API configures the Duo profile for secure shell (SSH).

== Examples

=== Creating a Duo profile

Specify the integration key, secret key, API host, and other necessary
information in the body of the POST request. The owner.uuid or owner.name
are not required for a cluster-scoped account.

----

# The API:
POST "/api/security/authentication/duo/profiles"

# The call:
curl -k https://<mgmt-ip>/api/security/authentication/duo/profiles
--request POST --data '{"api_host": "api-******.duosecurity.com",
"comment": "test post",  "fail_mode": "safe",  "integration_key":
"<INTEGRATION-KEY>", "secret_key": "<SECRET-KEY>"}'

# The response:
{
}
```

```
----

=== Creating a Duo profile for an SVM-scoped account

For an SVM-scoped account, specify either the SVM name as the owner.name
or the SVM UUID as the owner.uuid along with other parameters for the Duo
profile. These parameters indicate the SVM that the Duo profile is being
created on and can be obtained from the response body of the GET request
performed on the API "/api/svm/svms".

----

# The API:
POST "/api/security/authentication/duo/profiles"

# The call:
curl -k https://<mgmt-ip>/api/security/authentication/duo/profiles
--request POST --data '{"api_host": "api-******.duosecurity.com",
"comment": "test post",  "fail_mode": "safe",  "integration_key":
"<INTEGRATION-KEY>", "secret_key": "<SECRET-KEY>", "owner.name":"vs0" }'

# The response:
{
}
----

=== Retrieving the configured Duo profile(s)

Retrieves the Duo profiles associated with the owners or filtered list
(for a specific SVM and so on).

----

# The API:
GET "/api/security/authentication/duo/profiles"

# The call to retrieve Duo profiles associated with Duo configured cluster
or SVM:
curl -k https://<mgmt-ip>/api/security/authentication/duo/profiles

# the response:
{
"records": [
{
  "owner": {
  "uuid": "5f618c80-d90a-11ed-a6e6-0050568e8ef2",
  "name": "vs0"
```

```
}
},
{
"owner": {
"uuid": "f810005a-d908-11ed-a6e6-0050568e8ef2",
"name": "tsmithcluster-1"
}
}
],
"num_records": 2
}
----

[[ID8b5d4296aed454f41e58c76f39cfaf04]]
= Retrieve configured Duo profiles

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/security/authentication/duo/profiles`#

*Introduced In:* 9.14

Retrieves the configured Duo profiles.

== Related ONTAP commands

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
```

```
|In
|Required
|Description

|api_host
|string
|query
|False
a|Filter by api_host

|auto_push
|boolean
|query
|False
a|Filter by auto_push

|owner.name
|string
|query
|False
a|Filter by owner.name

|owner.uuid
|string
|query
|False
a|Filter by owner.uuid

|integration_key
|string
|query
|False
a|Filter by integration_key

|comment
|string
|query
|False
a|Filter by comment

|fail_mode
```

```
|string
|query
|False
a|Filter by fail_mode

|fingerprint
|string
|query
|False
a|Filter by fingerprint

|max_prompts
|integer
|query
|False
a|Filter by max_prompts

* Max value: 3
* Min value: 1

|is_enabled
|boolean
|query
|False
a|Filter by is_enabled

|status
|string
|query
|False
a|Filter by status

|push_info
|boolean
|query
|False
a|Filter by push_info

|http_proxy
|string
|query
```

```
|False
a|Filter by http_proxy

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Max value: 120
* Min value: 0
* Default value: 15

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
```

```
Default direction is 'asc' for ascending.

:leveloffset: +1

[[ID7f2e56e078b441de467e30bedde2c27b]]
= Manage Duo profiles for an SVM or cluster
```

```
== Overview

This API configures the Duo profile for an SVM.
Specify the owner UUID. The owner UUID corresponds to the UUID of the SVM
containing the Duo profile and can be obtained from the response body of
the GET request performed on the API "`/api/svm/svms".

== Examples

=== Retrieving the specific configured Duo profile of the cluster or SVM

----

# The API:
GET "/api/security/authentication/duo/profiles/{owner.uuid}"

# The call:
curl -k https://<mgmt-
ip>/api/security/authentication/duo/profiles/f810005a-d908-11ed-a6e6-
0050568e8ef2

# the response:
{
"owner": {
"uuid": "f810005a-d908-11ed-a6e6-0050568e8ef2",
"name": "cluster-1"
},
"integration_key": "<INTEGRATION-KEY>",
"fingerprint": "<FINGERPRINT>",
"api_host": "api-******.duosecurity.com",
"status": "Ok",
"is_enabled": true,
"auto_push": true,
"push_info": true,
"fail_mode": "safe",
"max_prompts": 1,
"comment": "Duo profile for Cserver",
}
----

=== Modifying the Duo profile

----

# The API:
```

```
PATCH "/api/security/authentication/duo/profiles/{owner.uuid}"

# The call:
curl -k "https://<mgmt-
ip>/api/security/authentication/duo/profiles/f810005a-d908-11ed-a6e6-
0050568e8ef2" --request PATCH --data "{  \"comment\": \"Testing\",
\"auto_push\": false}"

# the response:
{}
----

=== Deleting the Duo profile

----

# The API:
DELETE "/api/security/authentication/duo/profiles/{owner.uuid}"

# The call:
curl -k https://<mgmt-
ip>/api/security/authentication/duo/profiles/f810005a-d908-11ed-a6e6-
0050568e8ef2 --request DELETE

# the response:
{}

:leveloffset: -1

= Update the user account password

:leveloffset: +1

[[ID373896be0d434b8c8a5bb2ce58a508cf]]
= Update the user account password
```

```
== Overview

This API changes the password for a local user account.

Only cluster administrators with the _"admin"_ role can change the
password for other cluster or SVM user accounts. If you are not a cluster
administrator, you can only change your own password.

== Examples

=== Changing the password of another cluster or SVM user account by a
cluster administrator

Specify the user account name and the new password in the body of the POST
request. The owner.uuid or owner.name are not required to be specified for
a cluster-scoped user account.

For an SVM-scoped account, along with new password and user account name,
specify either the SVM name as the owner.name or SVM uuid as the
owner.uuid in the body of the POST request. These indicate the SVM for
which the user account is created and can be obtained from the response
body of a GET request performed on the _/api/svm/svms_ API.

----

# The API:
POST "/api/security/authentication/password"

# The call to change the password of another cluster user:
curl -X POST "https://<mgmt-ip>/api/security/authentication/password" -d
'{"name":"cluster_user1","password":"<USER-PASSWORD>"}'
----

----

# The call to change the password of another SVM user:
curl -X POST "https://<mgmt-ip>/api/security/authentication/password" -d
'{"owner.name":"svm1","name":"svm_user1","password":"<USER-PASSWORD>"}'
----

----

# The call to change the password hash algorithm of the cluster user:
curl -X POST "https://<mgmt-ip>/api/security/authentication/password" -d
'{"name":"cluster_user1","password":"<USER-
PASSWORD>","password_hash_algorithm":"sha256"}'
```

```
----

----

# The call to change the password hash algorithm of another SVM user:
curl -X POST "https://<mgmt-ip>/api/security/authentication/password" -d
'{"owner.name":"svm1","name":"svm_user1","password":"<USER-
PASSWORD>","password_hash_algorithm":"sha256"}'
----

=== Changing the password of an SVM-scoped user

NOTE: The IP address in the URI must be same as one of the interfaces
owned by the SVM.

----

# The API:
POST "/api/security/authentication/password"

# The call:
curl -X POST "https://<SVM-ip>/api/security/authentication/password" -d
'{"name":"svm_user1","password":"<USER-PASSWORD>"}'
----

'''

= Update the user account password

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/security/authentication/password`#

*Introduced In:* 9.6

Updates the password for a user account.

== Required parameters

* `name` - User account name.
* `password` - New password for the user account.

== Optional parameters
```

```
* `owner.name` or `owner.uuid` - Name or UUID of the SVM for an SVM-scoped
user account.
* `password_hash_algorithm` - Optional property that specifies the
password hash algorithm used to generate a hash of the user's password for
password matching. Default value is "sha512".

a|Owner name and UUID that uniquely identifies the user account. This
field is optional and valid only when a cluster administrator is executing
the API to uniquely identify the account whose password is being modified.
The "owner" field is not required to be specified for SVM user accounts
trying to modify their password.

|password
|string
a|The password string

|password_hash_algorithm
|string
a|Optional property that specifies the password hash algorithm used to
generate a hash of the user's password for password matching.

= Manage authentication keys (for admins)

:leveloffset: +1

[[IDa98c16a6ee00b9518c8e5bb7ae89a369]]
= Manage authentication keys (for admins)
```

```
== Overview

This API configures the public keys for user accounts.

For secure shell (SSH) access, public-private key pair based
authentication is possible by associating the public key with a user
account.
Prerequisites:
You must have generated the SSH key.
You must be a cluster or SVM administrator to perform the user's public
key.

== Examples

=== Creating a public key for cluster-scoped user accounts

Specify the user account name, public key, index, comment, and optionally
the certificate in the body of the POST request. The owner.uuid or
owner.name are not required for a cluster-scoped user account.

----

# The API:
POST "/api/security/authentication/publickey"

# The call
curl -k https://<mgmt-ip>/api/security/authentication/publickeys --request
POST --data '{ "account": "pubuser2","comment": "Cserver-
Creation","index": 0, "certificate": "<CERTIFICATE-CONTENT>",
"public_key": "<SSH-PUBLIC-KEY>" }'
----

=== Creating a public key for SVM-scoped user accounts

For a SVM-scoped account, specify either the SVM name as the owner.name or
the SVM UUID as the owner.uuid along with other parameters for the user
account. These parameters indicate the SVM that contains the user account
for the public key being created and can be obtained from the response
body of the GET request performed on the API"/api/svm/svms".

----

# The API:
POST "/api/security/authentication/publickey"
```

```
# The call
curl -k https://<mgmt-ip>/api/security/authentication/publickeys --request
POST --data '{ "account": "pubuser4","comment": "Vserver-
Creation","index": 0, "certificate": "<CERTIFICATE-CONTENT>",
"owner.uuid":"513a78c7-8c13-11e9-8f78-
005056bbf6ac","owner.name":"vs0","public_key": "<SSH-PUBLIC-KEY>" }'
----

=== Retrieving the configured public key for user accounts

Retrieves all public keys associated with the user accounts or a filtered
list (for a specific user account name, a specific SVM and so on) of
public keys.

----

# The API:
GET "/api/security/authentication/publickeys"

# The call to retrieve all the user accounts configured in the cluster:
curl -k https://<mgmt-ip>/api/security/authentication/publickeys
----

[[IDcc9cf02ac436b32ef57dd6239a2eaaf7]]
= Retrieve public keys configured for user accounts

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-

|string
|query
|False
a|Filter by scope

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1
```

```
|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Max value: 120
* Min value: 0
* Default value: 15

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

= Manage authentication keys (end-users)

:leveloffset: +1

[[IDcdb6f04944e7a6b420e293b407755116]]
= Manage authentication keys (end-users)

== Overview

This API configures the public keys for end-user (non-cluster admin)
accounts.
Specify the owner UUID, the user account name, and the index in the URI
path. The owner UUID corresponds to the UUID of the SVM containing the
user account associated with the public key and can be obtained from the
response body of the GET request performed on the API "`/api/svm/svms".

The index value corresponds to the public key that needs to be modified or
deleted (it is possible to create more than one public key for the same
user account).
```

```
== Examples

=== Retrieving the specific configured public key for user accounts

----

# The API:
GET
"/api/security/authentication/publickeys/{owner.uuid}/{account.name}/{inde
x}"

# The call:
curl -k https://<mgmt-ip>/api/security/authentication/publickeys/513a78c7-
8c13-11e9-8f78-005056bbf6ac/pubuser4/0
----

=== Updating the public key, certificate, and comment for user accounts

----

# The API:
PATCH
"/api/security/authentication/publickeys/{owner.uuid}/{account.name}/{inde
x}"

# The call:
curl -k https://<mgmt-ip>/api/security/authentication/publickeys/d49de271-
8c11-11e9-8f78-005056bbf6ac/pubuser1/0 --request PATCH --data '{
"comment": "Cserver-modification", "certificate": "<CERTIFICATE-CONTENT>"
, "public_key": "<SSH-PUBLIC-KEY>" }'
----

=== Deleting the public key for user accounts

----

# The API:
DELETE
"/api/security/authentication/publickeys/{owner.uuid}/{account.name}/{inde
x}"

# The call:
curl -k https://<mgmt-ip>/api/security/authentication/publickeys/d49de271-
8c11-11e9-8f78-005056bbf6ac/pubuser1/0 --request DELETE
----
```

```

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Max value: 120
* Min value: 0
* Default value: 15

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

:leveloffset: -1

= Manage AWS KMS

:leveloffset: +1

[[ID6bf12f01550f422c24b3c9347b033cf5]]
= Manage AWS KMS

== Overview

Amazon Web Services Key Management Services (AWS KMS) is a cloud key
management service (KMS) that provides a secure store for secrets. This
feature allows ONTAP to securely store its encryption keys using AWS KMS.
In order to use AWS KMS with ONTAP, you must first create a
Customer Master Key (CMK) in AWS KMS and provide an Access Key ID and
Secret Access Key for a user that has appropriate access to the newly
created CMK in the AWS KMS."

== Examples

=== Enabling AWS KMS for an SVM

The following example shows how to enable AWS KMS at the SVM-scope. Note
the _return_records=true_ query parameter is used to obtain the newly
created key manager configuration.

----

# The API:
POST /api/security/aws-kms
```

```
# The call:
curl -X POST 'https://<mgmt-ip>/api/security/aws-kms?return_records=true'
-H 'accept: application/hal+json' -d '{"svm":{"uuid":"f36ff553-e713-11ea-
bd56-005056bb4222" }, "region": "us-east-1", "key_id": "kmip-aws",
"access_key_id": "<AWS-ACCESS-KEY-ID>", "secret_access_key": "<AWS-SECRET-
ACCESS-KEY>"}'

# The response:
{
"num_records": 1,
"records": [
    {
    "uuid": "f72098a2-e908-11ea-bd56-005056bb4222",
    "svm": {
        "uuid": "f36ff553-e713-11ea-bd56-005056bb4222",
        "name": "vs0"
    },
    "region": "us-east-1",
    "key_id": "kmip-aws",
    "access_key_id": "<AWS-ACCESS-KEY-ID>",
    "_links": {
        "self": {
        "href": "/api/security/aws-kms/f72098a2-e908-11ea-bd56-
005056bb4222"
            }
        }
    }
]
}
----

'''

=== Retrieving all AWS KMS configurations

The following example shows how to retrieve all AWS KMS configurations.

----

# The API:
GET /api/security/aws-kms

# The call:
curl -X GET 'https://<mgmt-ip>/api/security/aws-kms?fields=*'
```

```
# The response:
{
"records": [
    {
    "uuid": "f72098a2-e908-11ea-bd56-005056bb4222",
    "scope": "svm",
    "svm": {
        "uuid": "f36ff553-e713-11ea-bd56-005056bb4222",
        "name": "vs0"

    "href": "/api/security/aws-kms/f72098a2-e908-11ea-bd56-005056bb4222"
    }
}
}
----

'''

=== Retrieving the advanced properties of an AWS configured for a specific
SVM

These values are not retrieved by default with the 'fields=*' option.
The following example retrieves the advanced properties of a configured
AWS for a specific SVM; there is an added computational cost in retrieving
their values. The properties are not populated for either a collection GET
or an instance GET unless they are explicitly requested using the `fields`
query parameter or GET for all advanced properties is enabled.

----

# The API:
GET /api/security/aws-kms

# The call:
curl -X GET 'https://<mgmt-ip>/api/security/aws-kms/7052c6c0-a503-11ec-
```

```
a68f-005056ac75a0/?fields=state,amazon_reachability,ekmip_reachability'

[[ID25ce3e034a04797e0e3970016c5ed420]]
= Configure the AWS KMS configuration for an SVM

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/security/aws-kms`#

*Introduced In:* 9.12

Configures the AWS KMS configuration for the specified SVM.

== Required properties

* `access_key_id` - AWS access key ID of the user who has the appropriate
access to AWS KMS.
* `secret_access_key` - AWS secret access key for the access key ID
provided.
* `svm.uuid` or `svm.name` - Existing SVM in which to create an AWS KMS.
* `region` - AWS region of the AWS KMS.
* `key_id` - AWS Key ID

== Optional properties

* `service` - AWS service type.
* `default_domain` - AWS KMS default domain.
* `host` - AWS KMS host's hostname.
* `port` - AWS KMS port.
* `proxy_type` - Type of proxy (http, https, etc.), if proxy configuration
is used.
* `proxy_host` - Proxy hostname if proxy configuration is used.
* `proxy_port` - Proxy port number if proxy configuration is used.
* `proxy_username` - Proxy username if proxy configuration is used.
```

```
* `proxy_password` - Proxy password if proxy configuration is used.
* `polling_period` - Polling period in minutes.
* `encryption_context` - Additional layer of authentication and logging.

== Related ONTAP commands

* `security key-manager external aws enable`

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When doing a POST, PATCH, or DELETE operation on a single record, the
default is 0 seconds.  This means that if an asynchronous operation is
started, the server immediately returns HTTP code 202 (Accepted) along
with a link to the job.  If a non-zero value is specified for POST, PATCH,
or DELETE operations, ONTAP waits that length of time to see if the job
completes so it can return something other than 202.

* Default value: 0
* Max value: 120
* Min value: 0

|return_records
|boolean
|query
|False
a|The default is false.  If set to true, the records are returned.

* Default value:

|ekmip_reachability
|array[link:#ekmip_reachability[ekmip_reachability]]
a|

|encryption_context
|string
a|Additional layer of authentication and logging.

|host
|string
a|AWS KMS host's hostname.

|key_id
|string
a|AWS Key ID.
```

```
|polling_period
|integer
a|Polling period in minutes.

|port
|integer
a|AWS KMS port.

|proxy_host
|string
a|Proxy host.

|proxy_password
|string
a|Proxy password. Password is not audited.

|proxy_port
|integer
a|Proxy port.

|proxy_type
|string
a|Proxy type.

|proxy_username
|string
a|Proxy username.

|region
|string
a|AWS region of the AWS KMS.

|scope
|string
a|Set to "svm" for interfaces owned by an SVM. Otherwise, set to
"cluster".

|secret_access_key
```

```
|string
a|AWS Secret Access Key for the provided access key ID.

|service
|string
a|AWS service type.

|state
|link:#state[state]
a|Indicates whether or not the Amazon Web Services Key Management Service
(AWS KMS) key protection is available cluster-wide.

|svm
|link:#svm[svm]
a|SVM, applies only to SVM-scoped objects.

|uuid
|string
a|A unique identifier for the AWS KMS.

ONTAP Error Response Codes

|===
| Error Code | Description

| 65537538
| Internal error. Failed to get unwrapped key for a given key ID.

| 65537543
| Internal Error. Missing top-level internal key protection key (KEK) on a
node.

| 65537547
| One or more volume encryption keys for encrypted volumes of this data
SVM are stored in the key manager configured for the admin SVM. Use the
REST API POST method to migrate this data SVM's keys from the admin SVM's
key manager before running the rekey operation.

| 65537610
| Rekey cannot be performed on the SVM while the enabled keystore
configuration is being switched. If a previous attempt to switch the
keystore configuration failed, or was interrupted, the system will
continue to prevent rekeying for the SVM. Use the REST API PATCH method
"/api/security/key-stores/\{uuid}" to re-run and complete the operation.

| 65537919
| External rekey failed on one or more nodes.

| 65537926
| AWS KMS is not configured for the given SVM.

| 65539436
| Rekey cannot be performed on the SVM while the enabled keystore
configuration is being initialized. Wait until the keystore is in the
active state, and rerun the rekey operation.

| 65539437
| Rekey cannot be performed on the SVM while the enabled keystore
configuration is being disabled.

|===
|Name
|Type
|Description

|_links
|link:#_links[_links]
a|

|access_key_id
|string
a|AWS Access Key ID of the user that has appropriate access to AWS KMS.

|amazon_reachability
|link:#amazon_reachability[amazon_reachability]
a|Indicates whether or not the Amazon KMS is reachable from all nodes in
the cluster.
This is an advanced property; there is an added computational cost to
retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

|default_domain
|string
```

```
a|AWS KMS default domain.

|ekmip_reachability
|array[link:#ekmip_reachability[ekmip_reachability]]
a|

|encryption_context
|string
a|Additional layer of authentication and logging.

|host
|string
a|AWS KMS host's hostname.

|key_id
|string
a|AWS Key ID.

|polling_period
|integer
a|Polling period in minutes.

|port
|integer
a|AWS KMS port.

|proxy_host
|string
a|Proxy host.

|proxy_port
|integer
a|Proxy port.

|proxy_type
|string
a|Proxy type.
```

```
|proxy_username
|string
a|Proxy username.

|region
|string
a|AWS region of the AWS KMS.

|scope
|string
a|Set to "svm" for interfaces owned by an SVM. Otherwise, set to
"cluster".

|service
|string
a|AWS service type.

|skip_verify
|boolean
a|Set to true to bypass verification of the user provided access_key_id
and secret_access_key. An error will be returned if 'skip_verify' is
provided but 'access_key_id' is not.

|state
|link:#state[state]
a|Indicates whether or not the Amazon Web Services Key Management Service
(AWS KMS) key protection is available cluster-wide.

|svm
|link:#svm[svm]
a|SVM, applies only to SVM-scoped objects.

|timeout
|integer
a|AWS Connection timeout, in seconds.

|uuid
|string
a|A unique identifier for the AWS KMS.
```

```
|verify
|boolean
a|Set to true to verify the AWS KMS host.

|verify_host
|boolean
a|Set to true to verify the AWS KMS host's hostname.

|verify_ip
|boolean
a|Set to true to verify the AWS KMS host's IP address.

= Update an AWS KMS configuration

[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-
block]#`/security/aws-kms/{uuid}`#

*Introduced In:* 9.12

Updates the AWS KMS configuration.

== Optional properties

* `region` - AWS region of the AWS KMS.
* `service` - AWS service type.
* `default_domain` - AWS KMS default domain.
* `port` - AWS KMS port.
* `proxy_type` - Type of proxy (http, https, etc.), if proxy configuration
is used.
* `proxy_host` - Proxy hostname if proxy configuration is used.
* `proxy_port` - Proxy port number if proxy configuration is used.
* `proxy_username` - Proxy username if proxy configuration is used.
* `proxy_password` - Proxy password if proxy configuration is used.
* `polling_period` - Polling period in minutes.
* `timeout` - AWS Connection timeout, in seconds.
* `verify` - Set to true to verify the AWS KMS host.
* `verify_host` - Set to true to verify the AWS KMS host's hostname.
* `verify_ip` - Set to true to verify the AWS KMS host's IP address.
* `host` - AWS KMS host's hostname.
* `secret_access_key` - AWS secret access key for the access key ID
provided.
* `access_key_id` - AWS access key ID of the user with the appropriate
access to AWS KMS.
* `skip_verify` - Set to true to bypass verification of the user provided
access_key_id and secret_access_key.
* `encryption_context` - Additional layer of authentication and logging.

== Related ONTAP commands

* `security key-manager external aws update-config`
* `security key-manager external aws update-credentials`

== Parameters

[cols=5*,options=header]
|===
```

```
|Name
|Type
|In
|Required
|Description

|uuid
|string
|path
|True
a|AWS KMS UUID

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When doing a POST, PATCH, or DELETE operation on a single record, the
default is 0 seconds.  This means that if an asynchronous operation is
started, the server immediately returns HTTP code 202 (Accepted) along
with a link to the job.  If a non-zero value is specified for POST, PATCH,
or DELETE operations, ONTAP waits that length of time to see if the job
completes so it can return something other than 202.

* Default value: 0
* Max value: 120
* Min value: 0

:leveloffset: -1

= Manage Azure Key Vaults

:leveloffset: +1

[[ID2aa8ac751fa56d4fed3803156154038e]]
= Manage Azure Key Vaults

== Overview

Azure Key Vault (AKV) is a cloud key management service (KMS) that
provides a secure store for secrets. This feature
allows ONTAP to securely store its encryption keys using AKV.
In order to use AKV with ONTAP, you must first deploy an Azure application
with the appropriate access to an AKV and then provide
ONTAP with the necessary details, such as key vault name, application ID
so that ONTAP can communicate with the deployed Azure application.
The properties "state", "azure_reachability" and "ekmip_reachability" are
considered advanced properties and are populated only when explicitly
requested.

== Examples

=== Enabling an AKV configuration for an SVM using the certificate
authentication method

The example AKV configuration is enabled for a specific SVM. Note the
_return_records=true_ query parameter is used to obtain the newly created
key-manager keystore configuration.
```

```
----

# The API:
POST /api/security/azure-key-vaults

# The call:
curl -X POST 'https://<mgmt-ip>/api/security/azure-key-
vaults?return_records=true' -H 'accept: application/hal+json' -d "{
\"svm\": { \"uuid\": \"4f7abf4c-9a07-11ea-8d52-005056bbeba5\" },
\"client_id\": \"client1\", \"tenant_id\": \"tenant1\", \"name\":
\"https://mykeyvault.vault.azure.net/\", \"key_id\": \"https://keyvault-
test.vault.azure.net/keys/key1/a8e619fd8f234db3b0b95c59540e2a74\",
\"client_certificate\" : \"<CERTIFICATE-CONTENT>\" }"

# The response:
{
"num_records": 1,
"records": [
  {
    "uuid": "024cd3cf-9a08-11ea-8d52-005056bbeba5",
    "svm": {
      "uuid": "4f7abf4c-9a07-11ea-8d52-005056bbeba5",
      "name": "vs0"
    },
    "client_id": "client1",
    "tenant_id": "tenant1",
    "name": "https://mykeyvault.vault.azure.net/",
    "key_id": "https://keyvault-

      }
    }
  }
]
}
----

'''

=== Creating an inactive AKV configuration for an SVM using the client
secret authentication method
```

```
The example AKV configuration is created for a specific SVM but is not
enabled.
Note the _create_inactive=true_ parameter that is used to indicate that
the configuration should be created but not enabled.
Note the _return_records=true_ query parameter is used to obtain the newly
created key-manager keystore configuration.

----

# The API:
POST /api/security/azure-key-vaults

# The call:
curl -X POST 'https://<mgmt-ip>/api/security/azure-key-
vaults?create_inactive=true&return_records=true' -H 'accept:
application/hal+json' -d "{ \"svm\": { \"uuid\": \"4f7abf4c-9a07-11ea-
8d52-005056bbeba5\" }, \"configuration\": {\"name\": \"myConfiguration\"},

= Retrieve AKVs configured for all clusters and SVMs

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/security/azure-key-vaults`#

*Introduced In:* 9.8

Retrieves AKVs configured for all clusters and SVMs.

== Related ONTAP commands

* `security key-manager external azure show`
* `security key-manager external azure check`

== Parameters

[cols=5*,options=header]
|===

|Name
```

```
|Type
|In
|Required
|Description

|verify_host
|boolean
|query
|False
a|Filter by verify_host

* Introduced in: 9.14

|tenant_id
|string
|query
|False
a|Filter by tenant_id

|oauth_host
|string
|query
|False
a|Filter by oauth_host

* Introduced in: 9.14

|svm.name
|string
|query
|False
a|Filter by svm.name

|svm.uuid
|string
|query
|False
a|Filter by svm.uuid

|vault_host
|string
|query
```

```
|False
a|Filter by vault_host

* Introduced in: 9.14

|azure_reachability.reachable
|boolean
|query
|False
a|Filter by azure_reachability.reachable

|azure_reachability.code
|string
|query
|False
a|Filter by azure_reachability.code

|azure_reachability.message
|string
|query
|False
a|Filter by azure_reachability.message

|proxy_host
|string
|query
|False
a|Filter by proxy_host

|scope
|string
|query
|False
a|Filter by scope

|client_id
|string
|query
|False
a|Filter by client_id
```

```
|skip_verification
|boolean
|query
|False
a|Filter by skip_verification

* Introduced in: 9.16

|key_id
|string
|query
|False
a|Filter by key_id

|proxy_username
|string
|query
|False
a|Filter by proxy_username

|proxy_port
|integer
|query
|False
a|Filter by proxy_port

|verify_ip
|boolean
|query
|False
a|Filter by verify_ip

* Introduced in: 9.14

|enabled
|boolean
|query
|False
a|Filter by enabled

* Introduced in: 9.14
```

```
|name
|string
|query
|False
a|Filter by name

|state.code
|string
|query
|False
a|Filter by state.code

|state.message
|string
|query
|False
a|Filter by state.message

|state.available
|boolean
|query
|False
a|Filter by state.available

|configuration.uuid
|string
|query
|False
a|Filter by configuration.uuid

* Introduced in: 9.14

|configuration.name
|string
|query
|False
a|Filter by configuration.name

* Introduced in: 9.14
```

```
|authentication_method
|string
|query
|False
a|Filter by authentication_method

* Introduced in: 9.10

|ekmip_reachability.message
|string
|query
|False
a|Filter by ekmip_reachability.message

|ekmip_reachability.node.name
|string
|query
|False
a|Filter by ekmip_reachability.node.name

|ekmip_reachability.node.uuid
|string
|query
|False
a|Filter by ekmip_reachability.node.uuid

|ekmip_reachability.reachable
|boolean
|query
|False
a|Filter by ekmip_reachability.reachable

|ekmip_reachability.code
|string
|query
|False
a|Filter by ekmip_reachability.code

|uuid
|string
```

```
|query
|False
a|Filter by uuid

|proxy_type
|string
|query
|False
a|Filter by proxy_type

|port
|integer
|query
|False
a|Filter by port

* Introduced in: 9.14

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 15
* Max value: 120
* Min value: 0
```

```
|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

[#azure_reachability]
[.api-collapsible-fifth-title]
azure_reachability

Indicates whether or not the AKV service is reachable from all the nodes
in the cluster.
This is an advanced property; there is an added computational cost to
retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|code
```

```
|string
a|Code corresponding to the status message. Returns a 0 if AKV service is
reachable from all nodes in the cluster.

|message
|string
a|Error message set when reachability is false.

|reachable
|boolean
a|Set to true when the AKV service is reachable from all nodes of the
cluster.

|===

[#configuration]
[.api-collapsible-fifth-title]
configuration

Security keystore object reference.

[#ekmip_reachability]
[.api-collapsible-fifth-title]
ekmip_reachability

Provides the connectivity status for the given SVM on the given node to
all EKMIP servers configured on all nodes of the cluster.
This is an advanced property; there is an added computational cost to
retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|code
```

```
|string
a|Code corresponding to the error message. Returns a 0 if a given SVM is
able to communicate to the EKMIP servers of all of the nodes in the
cluster.

|message
|string
a|Error message set when cluster-wide EKMIP server availability from the
given SVM and node is false.

|node
|link:#node[node]
a|

|reachable
|boolean
a|Set to true if the given SVM on the given node is able to communicate to
all EKMIP servers configured on all nodes in the cluster.

|===

[#state]
[.api-collapsible-fifth-title]
state

Indicates whether or not the AKV wrapped internal key is available cluster
wide.
This is an advanced property; there is an added computational cost to
retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|available
|boolean
a|Set to true when an AKV wrapped internal key is present on all nodes of
```

```
the cluster.

|code
|string
a|Code corresponding to the status message. Returns a 0 if AKV wrapped key
is available on all nodes in the cluster.

|message
|string
a|Error message set when top-level internal key protection key (KEK)
availability on cluster is false.

|===

[#svm]
[.api-collapsible-fifth-title]
svm

SVM, applies only to SVM-scoped objects.

[cols=3*,options=header]

[[IDd7d6e6a0e01664606f2c2c62c7d44555]]
= Create an AKV configuration for all clusters and SVMs

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/security/azure-key-vaults`#

*Introduced In:* 9.8

Configures the AKV configuration for all clusters and SVMs.

== Required properties:

* `svm.uuid` or `svm.name` - Existing SVM in which to create a AKV.
* `client_id` - Application (client) ID of the deployed Azure application
with appropriate access to an AKV.
* `tenant_id` - Directory (tenant) ID of the deployed Azure application
with appropriate access to an AKV.
* `client_secret` or `client_certificate` - Secret or PKCS12 Certificate
used by the application to prove its identity to AKV.
```

```
* `key_id`- Key Identifier of AKV encryption key.
* `name` - Name of the deployed AKV used by ONTAP for storing keys.

== Optional properties:

* `port` - Authorization server and vault port number.
* `oauth_host` - Open authorization server host name.
* `vault_host` - AKV host subdomain.
* `proxy_type` - Type of proxy (http, https etc.) if proxy configuration
is used.
* `proxy_host` - Proxy hostname if proxy configuration is used.
* `proxy_port` - Proxy port number if proxy configuration is used.
* `proxy_username` - Proxy username if proxy configuration is used.
* `proxy_password` - Proxy password if proxy configuration is used.
* `configuration.name` - The configuration name to use when also setting
the `create_inactive` flag.

== Optional parameters:

* `create_inactive` - Create an AKV configuration without enabling it.
This flag is set to "false" by default.

== Related ONTAP commands

* `security key-manager external azure enable`
* `security key-manager external azure create-config`
* `security key-manager external azure update-config`

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|create_inactive
|boolean
|query
|False
a|Indicates whether to create an active or inactive configuration.

* Introduced in: 9.16
```

```
|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When doing a POST, PATCH, or DELETE operation on a single record, the
default is 0 seconds.  This means that if an asynchronous operation is
started, the server immediately returns HTTP code 202 (Accepted) along
with a link to the job.  If a non-zero value is specified for POST, PATCH,
or DELETE operations, ONTAP waits that length of time to see if the job
completes so it can return something other than 202.

* Default value: 0
* Max value: 120
* Min value: 0

|return_records
|boolean
|query
|False
a|The default is false.  If set to true, the records are returned.

* Default value:

ONTAP Error Response Codes

|===
| Error Code | Description

| 3735553
| Failed to create self-signed certificate.

| 3735664
| The specified key size is not supported in FIPS mode.

| 3735665
| The specified hash function is not supported in FIPS mode.

| 3735700
| The specified key size is not supported.

| 52559972
| The certificates start date is later than the current date.

| 65537500
| A key manager has already been configured for this SVM.

| 65537504
| Internal error. Failed to store configuration in internal database.

| 65537505
| One or more volume encryption keys of the given SVM are stored on a key
manager configured for the admin SVM.

| 65537506
| AKV is not supported in MetroCluster configurations.

| 65537512
| AKV cannot be configured for the given SVM as not all nodes in the
cluster can enable the Azure Key Vault feature.

| 65537514
| Failed to check if the Azure Key Vault feature is enabled.

| 65537518
```

```
| Failed to find an interface with Cluster role.

| 65537523
| Invalid key ID format. Example key ID format":"
"https://mykeyvault.vault.azure.net/keys/key1/a8e619fd8f234db3b0b95c59540e
2a74".

| 65537526
| Failed to enable Azure Key Vault feature.

| 65537553
| Invalid vault name format. Example vault name format":"
"https://mykeyvault.vault.azure.net".

| 65537567
| No authentication method provided.

| 65537573
| Invalid client certificate.

| 65537589
| The specified configuration.name already exists on the given SVM.

| 65537592
| The configuration.name field requires an ECV of 9.14.0 or greater.

| 65537593
| The create_inactive flag requires an effective cluster version of 9.14.0
or greater.

| 65537594
| The configuration.name field is required when the create_inactive flag
is set to true.

| 65537595
| The configuration.name field can only be specified when the
create_inactive flag is set to true.

| 65538902
| The configuration.name is reserved for use by the system.

| 65538903
| The configuration.name field cannot be an empty string.

| 65539704
| The key manager cannot be configured because the SVM has NAE volumes.

|===
| Error Code | Description

| 65537120
| Azure Key Vault is not configured for the given SVM.

| 65537547
| One or more volume encryption keys for encrypted volumes of this data
```

```
SVM are stored in the key manager configured for the admin SVM. Use the
REST API POST method to migrate this data SVM's keys from the admin SVM's
key manager to this data SVM's key manager before running the rekey
operation.

| 65537610
| Rekey cannot be performed on the SVM while the enabled keystore
configuration is being switched. If a previous attempt to switch the
keystore configuration failed, or was interrupted, the system will
continue to prevent rekeying for the SVM. Use the REST API PATCH method
"/api/security/key-stores/\{uuid}" to re-run and complete the operation.

| 65539436
| Rekey cannot be performed on the SVM while the enabled keystore
configuration is being initialized. Wait until the keystore is in the
active state, and rerun the rekey operation.

| 65539437
| Rekey cannot be performed on the SVM while the enabled keystore
configuration is being disabled.

= Delete an AKV configuration

[.api-doc-operation .api-doc-operation-delete]#DELETE# [.api-doc-code-
block]#`/security/azure-key-vaults/{uuid}`#

*Introduced In:* 9.8

Deletes an AKV configuration.

== Related ONTAP commands

* `security key-manager external azure disable`

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|uuid
|string
|path
|True
a|AKV UUID

|return_timeout
|integer
|query
```

```
|False
a|The number of seconds to allow the call to execute before returning.
When doing a POST, PATCH, or DELETE operation on a single record, the
default is 0 seconds.  This means that if an asynchronous operation is
started, the server immediately returns HTTP code 202 (Accepted) along
with a link to the job.  If a non-zero value is specified for POST, PATCH,
or DELETE operations, ONTAP waits that length of time to see if the job
completes so it can return something other than 202.

* Default value: 0
* Max value: 120
* Min value: 0

|link:#_links[_links]
a|

|authentication_method
|string
a|Authentication method for the AKV instance.

|azure_reachability
|link:#azure_reachability[azure_reachability]
a|Indicates whether or not the AKV service is reachable from all the nodes
in the cluster.
This is an advanced property; there is an added computational cost to
retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

|client_id
|string
a|Application client ID of the deployed Azure application with appropriate
access to an AKV.

|configuration
|link:#configuration[configuration]
a|Security keystore object reference.

|ekmip_reachability
|array[link:#ekmip_reachability[ekmip_reachability]]
a|

|enabled
|boolean
a|Indicates whether the configuration is enabled.

|key_id
|string
```

```
a|Key Identifier of AKV key encryption key.

|name
|string
a|Name of the deployed AKV that will be used by ONTAP for storing keys.

* example: https://kmip-akv-keyvault.vault.azure.net/
* format: uri
* Introduced in: 9.8
* readCreate: 1
* x-nullable: true

|oauth_host
|string
a|Open authorization server host name.

|port
|integer
a|Authorization server and vault port number.

|proxy_host
|string
a|Proxy host.

|proxy_port
|integer
a|Proxy port.

|proxy_type
|string
a|Type of proxy.

|proxy_username
|string
a|Proxy username.

|scope
|string
a|Set to "svm" for interfaces owned by an SVM. Otherwise, set to
```

```
"cluster".

|skip_verification
|boolean
a|Set to true to skip the verification of the updated user credentials
when updating credentials. The default value is false.

|state
|link:#state[state]
a|Indicates whether or not the AKV wrapped internal key is available
cluster wide.
This is an advanced property; there is an added computational cost to
retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

|svm
|link:#svm[svm]
a|SVM, applies only to SVM-scoped objects.

|tenant_id
|string
a|Directory (tenant) ID of the deployed Azure application with appropriate
access to an AKV.

|uuid
|string
a|A unique identifier for the Azure Key Vault (AKV).

|vault_host
|string
a|AKV host subdomain.

|verify_host
|boolean
a|Verify the identity of the AKV host name.

|verify_ip
```

```
|boolean
a|Verify the identity of the AKV IP address.

= Update the AKV configuration

[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-
block]#`/security/azure-key-vaults/{uuid}`#

*Introduced In:* 9.8

Updates the AKV configuration.

== Optional properties

* `client_secret` or `client_certificate` - New secret or new PKCS12
certificate used to prove the application's identity to the AKV.
```

```
* `proxy_type` - Type of proxy (http, https etc.) if proxy configuration
is used.
* `proxy_host` - Proxy hostname if proxy configuration is used.
* `proxy_port` - Proxy port number if proxy configuration is used.
* `port` - Authorization server and vault port number.
* `oauth_host` - Open authorization server host name.
* `vault_host` - AKV host subdomain.
* `verify_host` - Verify the identity of the AKV host name.
* `verify_ip ` - Verify the identity of the AKV IP address.
* `proxy_username` - Proxy username if proxy configuration is used.
* `proxy_password` - Proxy password if proxy configuration is used.
* `client_id` - Application (client) ID of the deployed Azure application
with appropriate access to an AKV.
* `tenant_id` - Directory (tenant) ID of the deployed Azure application
with appropriate access to an AKV.
* `skip_verification` - Skip the verification of the updated credentials,
set to true to bypass the verification. The default value is false.

== Related ONTAP commands

* `security key-manager external azure update-client-secret`
* `security key-manager external azure update-credentials`
* `security key-manager external azure update-config`

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|uuid
|string
|path
|True
a|AKV UUID

|return_timeout
|integer
|query
|False
```

```
a|The number of seconds to allow the call to execute before returning.
When doing a POST, PATCH, or DELETE operation on a single record, the
default is 0 seconds.  This means that if an asynchronous operation is
started, the server immediately returns HTTP code 202 (Accepted) along
with a link to the job.  If a non-zero value is specified for POST, PATCH,
or DELETE operations, ONTAP waits that length of time to see if the job
completes so it can return something other than 202.

* Default value: 0
* Max value: 120
* Min value: 0

= Re-key the internal key in the key hierarchy for an SVM

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/security/azure-key-vaults/{uuid}/rekey-internal`#

*Introduced In:* 9.10

Rekeys the internal key in the key hierarchy for an SVM with an AKV
configuration.

== Related ONTAP commands

* `security key-manager external azure rekey-internal`

== Parameters
```

```
[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|uuid
|string
|path
|True
a|UUID of the existing AKV configuration.

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When doing a POST, PATCH, or DELETE operation on a single record, the
default is 0 seconds.  This means that if an asynchronous operation is
started, the server immediately returns HTTP code 202 (Accepted) along
with a link to the job.  If a non-zero value is specified for POST, PATCH,
or DELETE operations, ONTAP waits that length of time to see if the job
completes so it can return something other than 202.

* Default value: 0
* Max value: 120
* Min value: 0

|return_records
|boolean
|query
|False
a|The default is false.  If set to true, the records are returned.

* Default value:

ONTAP Error Response Codes

|===
| Error Code | Description

| 65537120
| Azure Key Vault is not configured for the given SVM.

| 65537547
| One or more volume encryption keys for encrypted volumes of this data
```

```
SVM are stored in the key manager configured for the admin SVM. Use the
REST API POST method to migrate this data SVM's keys from the admin SVM's
key manager to this data SVM's key manager before running the rekey
operation.

| 65537559
| There are no existing internal keys for the SVM. A rekey operation is
allowed for an SVM with one or more encryption keys.

| 65537610
| Rekey cannot be performed on the SVM while the enabled keystore
configuration is being switched. If a previous attempt to switch the
keystore configuration failed, or was interrupted, the system will
continue to prevent rekeying for the SVM. Use the REST API PATCH method
"/api/security/key-stores/\{uuid}" to re-run and complete the operation.

| 65539436
| Rekey cannot be performed on the SVM while the enabled keystore
configuration is being initialized. Wait until the keystore is in the
active state, and rerun the rekey operation.

| 65539437
| Rekey cannot be performed on the SVM while the enabled keystore
configuration is being disabled.

:leveloffset: -1

= Manage Barbican KMS configurations

:leveloffset: +1

[[IDd36f16490c9257ea5803c2028fe724f4]]
= Manage Barbican KMS configurations
```

```
== Overview

Barbican Key Management Services (KMS) is a key management service that
provides a secure store for encryption keys. This feature
allows ONTAP to securely protect its encryption keys using Barbican KMS.
Before you can use Barbican KMS with ONTAP, you must provide ONTAP with
the necessary details to allow ONTAP to communicate with the deployed
Barbican application.
These details include the key ID URL, Keystone authentication URL, and the
application credentials ID and secret.
The property `barbican_reachability` is considered an advanced property
and is populated only when explicitly requested.

== Examples

=== Creating an inactive Barbican configuration for an SVM

The example Barbican configuration is created for a specific SVM but is
not enabled.
Note the _return_records=true_ query parameter can be used to return the
newly created key-manager keystore configuration.

----

# The API:
POST /api/security/barbican-kms

# The call:
curl -X POST 'https://<mgmt-ip>/api/security/barbican-kms' -H 'accept:
application/hal+json' -H 'Content-Type: application/json' -d '{ "svm": {
"name": "barbican_svm" }, "configuration": {"name": "myConfiguration"},
"application_cred_id": "app1", "application_cred_secret": "secret1",
"key_id": "https://sample.keyid.com:9311/v1/secrets/5c610a4f-ea97-44b5-
8682-f4daeafa9647/", "keystone_url":
"https://sample.keystone.com:5000/v3/auth/tokens" }'

# The response:

|integer
|query
|False
```

```
a|Filter by timeout

|proxy_type
|string
|query
|False
a|Filter by proxy_type

|enabled
|boolean
|query
|False
a|Filter by enabled

|proxy_port
|integer
|query
|False
a|Filter by proxy_port

|barbican_reachability.message
|string
|query
|False
a|Filter by barbican_reachability.message

|barbican_reachability.code
|string
|query
|False
a|Filter by barbican_reachability.code

|barbican_reachability.reachable
|boolean
|query
|False
a|Filter by barbican_reachability.reachable

|configuration.uuid
|string
```

```
|query
|False
a|Filter by configuration.uuid

|configuration.name
|string
|query
|False
a|Filter by configuration.name

|state.cluster_state
|boolean
|query
|False
a|Filter by state.cluster_state

|state.message
|string
|query
|False
a|Filter by state.message

|state.code
|string
|query
|False
a|Filter by state.code

|key_id
|string
|query
|False
a|Filter by key_id

|proxy_host
|string
|query
|False
a|Filter by proxy_host
```

```
|scope
|string
|query
|False
a|Filter by scope

|verify
|boolean
|query
|False
a|Filter by verify

|proxy_username
|string
|query
|False
a|Filter by proxy_username

|application_cred_id
|string
|query
|False
a|Filter by application_cred_id

|verify_host
|boolean
|query
|False
a|Filter by verify_host

|svm.name
|string
|query
|False
a|Filter by svm.name

|svm.uuid
|string
|query
|False
a|Filter by svm.uuid
```

```
|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 15
* Max value: 120
* Min value: 0

|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.
```

[[ID9c493e61a9b6d84ad16519b0292b69d6]]
= Create a Barbican KMS configuration for an SVM

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/security/barbican-kms`#

*Introduced In:* 9.17

Creates a Barbican KMS configuration for the specified SVM.

== Required properties

* `configuration.name` - Name for the new Barbican configuration.
* `svm.uuid` or `svm.name` - Existing SVM in which to create a Barbican
KMS.
* `key_id` - Barbican key URL.
* `keystone_url` - Keystone authentication URL.
* `application_cred_id` - Keystone authentication application ID with
access to the Barbican KMS.
* `application_cred_secret`- Application credentials secret to
authenticate the application credentials ID with Keystone.

== Optional properties

* `proxy_type` - Type of proxy (http/https) if proxy configuration is
used.
* `proxy_host` - Proxy hostname if proxy configuration is used.
* `proxy_port` - Proxy port number if proxy configuration is used.
* `proxy_username` - Proxy username if proxy configuration is used.
* `proxy_password` - Proxy password if proxy configuration is used.
* `verify` - Verify the identity of the Barbican KMS?
* `verify_host` - Verify the identity of the Barbican KMS host name?
```

```
* `timeout` - Connection timeout in seconds.

== Related ONTAP commands

* `security key-manager external barbican create-config`

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When doing a POST, PATCH, or DELETE operation on a single record, the
default is 0 seconds.  This means that if an asynchronous operation is
started, the server immediately returns HTTP code 202 (Accepted) along
with a link to the job.  If a non-zero value is specified for POST, PATCH,
or DELETE operations, ONTAP waits that length of time to see if the job
completes so it can return something other than 202.

* Default value: 0
* Max value: 120
* Min value: 0

|return_records
|boolean
|query
|False
a|The default is false.  If set to true, the records are returned.

* Default value:

[[IDf10e2f63b144461b5be8764cf1ca208e]]
= Update the Barbican KMS configuration

[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-
block]#`/security/barbican-kms/{uuid}`#

*Introduced In:* 9.17
```

```
Updates the Barbican KMS configuration.

== Optional properties

* `application_cred_id` - New credentials used to verify the application's
identity to the Barbican KMS. You must provide both `application_cred_id`
and `application_cred_secret` to update the credentials.
* `application_cred_secret` - New credentials secret used to verify the
application's identity to the Barbican KMS. You must provide both
`application_cred_id` and `application_cred_secret` to update the
credentials.
* `proxy_type` - Type of proxy (http/https) if proxy configuration is
used.
* `proxy_host` - Proxy hostname if proxy configuration is used.
* `proxy_port` - Proxy port number if proxy configuration is used.
* `proxy_username` - Proxy username if proxy configuration is used.
* `proxy_password` - Proxy password if proxy configuration is used.
* `verify` - Verify the identity of the Barbican KMS?
* `verify_host` - Verify the identity of the Barbican KMS host name?
* `timeout` - Connection timeout in seconds.

== Related ONTAP commands

* `security key-manager external barbican update-credentials`
* `security key-manager external barbican update-config`

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|uuid
|string
|path
|True
a|Barbican KMS UUID

|return_timeout
```

```
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When doing a POST, PATCH, or DELETE operation on a single record, the
default is 0 seconds.  This means that if an asynchronous operation is
started, the server immediately returns HTTP code 202 (Accepted) along
with a link to the job.  If a non-zero value is specified for POST, PATCH,
or DELETE operations, ONTAP waits that length of time to see if the job
completes so it can return something other than 202.

* Default value: 0
* Max value: 120
* Min value: 0

ONTAP Error Response Codes

|===
| Error Code | Description

| 65536205
| Internal error. Failed to generate SVM key in the kernel.

| 65536882
| Internal error. UUID is missing.

| 65536883
```

| Internal error. Volume encryption key is missing.

| 65536884
| Internal error. Volume encryption key is invalid.

| 65536889
| Internal error. Volume has invalid encryption blob.

| 65536973
| Internal error. Volume DSID is missing.

| 65537533
| Internal error. Failed to unwrap SVM key encryption key.

| 65537547
| One or more volume encryption keys (VEKs) for this data SVM's encrypted volumes are stored in the key manager configured for the admin SVM. Use the REST API POST method "/api/security/key-managers/{source.svm.uuid}/migrate" to migrate these keys from the admin SVM's key manager to this data SVM's key manager before running the rekey operation.

| 65537556
| ONTAP is unable to encrypt or decrypt because the configured external key manager is in a blocked state. Possible reasons for a blocked state include the top-level external key protection key is not found, disabled or has insufficient privileges. Resolve the external key manager key issues at the key manager's portal before running the rekey operation.

| 65537565
| Internal error. Failed to update the VDEK blob.

| 65537610
| Rekey cannot be performed while the enabled keystore configuration is being switched. If a previous attempt to switch the keystore configuration failed, or was interrupted, the system will continue to prevent rekeying. Use the REST API PATCH method "/api/security/key-stores/\{uuid}" to re-run and complete the operation.

| 65539200
| The key custodian not provided with an external key value store.

| 65539201
| Failed to encrypt.

| 65539202
| Failed to decrypt.

```
| 65539416
| Internal error. Failed to parse the key value store response.

| 65539436
| Rekey cannot be performed while the enabled keystore configuration is
being initialized. Wait until the keystore is in the active state, and
rerun the rekey operation.

| 65539437
| Rekey cannot be performed while the enabled keystore configuration is
being disabled.

| 65539817
| The Barbican Key Management Service is not configured.

| 65539834
| New Key ID not found.

| 65539836
| No Key Management Service configured.

| 65539844
| Failed to import the SVM-KEK.

| 196608088
| Internal error. Failed to get encryption operation status.

| 196608352
| Internal error. The encryption blob was not found in the RDB table.

= Restore the keys for an SVM from a configured Barbican KMS

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/security/barbican-kms/{uuid}/restore`#

*Introduced In:* 9.17

Restores the keys for an SVM from a configured Barbican KMS.

== Related ONTAP commands

* `security key-manager external barbican restore`

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|uuid
|string
|path
|True
a|UUID of the existing Barbican KMS configuration.

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When doing a POST, PATCH, or DELETE operation on a single record, the
default is 0 seconds.  This means that if an asynchronous operation is
started, the server immediately returns HTTP code 202 (Accepted) along
with a link to the job.  If a non-zero value is specified for POST, PATCH,
or DELETE operations, ONTAP waits that length of time to see if the job
completes so it can return something other than 202.
```

```
* Default value: 0
* Max value: 120
* Min value: 0

|return_records
|boolean
|query
|False
a|The default is false.  If set to true, the records are returned.

* Default value:

[[ID837e7595bf8c1b3e1cc89a7fdc92ece7]]
= Create a certificate signing request

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/security/certificate-signing-request`#

*Introduced In:* 9.8
```

```
This API generates a Certificate Signing Request(CSR) and a private key
pair. A CSR is a message sent securely to a certificate authority (CA) via
any electronic media to apply for a digital identity certificate. This is
a general utility API for users to generate a CSR.

== Required properties

* `subject_name` - Subject details of the certificate, including but not
limited to the common name. Can be omitted if subject_alternatives is
specified.
* `subject_alternatives` - Subject Alternate Name (SAN) extensions. Only
required if a common name is not specified using subject_name.

== Recommended optional properties

* `security_strength` - Key size of the certificate, in bits. Specifying a
stronger security strength in bits is recommended when creating a
certificate. A value of at least 128 is necessary when using EC algorithm
if the certificate is to be used in the context of TLSv1.3.
* `hash_function` -  Hashing function.
* `algorithm` - Asymmetric algorithm. Algorithm used to generate a
public/private key pair when creating a certificate.

== Default property values

If not specified in POST, the following default property values are
assigned:

* `security_strength` - _112_
* `hash_function` - _sha256_
* `algorithm` - _rsa_

== Related ONTAP commands

* `security certificate generate-csr`

# The API:
/api/security/certificates/{uuid}

# The call:
curl -X DELETE "https://<mgmt-ip>/api/security/certificates/dad2363b-8ac0-
11e8-9058-005056b482fc?fields=*" -H "accept: application/hal+json"
----

=== Signing a new certificate signing request using an existing CA
certificate UUID

Once you have created a certificate of type "root_ca", you can use that
certificate to act as a local Certificate Authority to sign new
certificate signing requests. The following example signs a new
certificate signing request using an existing CA certificate UUID. If
successful, the API returns a signed certificate.

----

# The API:
/api/security/certificates/{ca.uuid}/sign

# The call:
curl -X POST "https://<mgmt-ip>/api/security/certificates/253add53-8ac9-
```

```
11e8-9058-005056b482fc/sign" -H  "accept: application/json" -H  "Content-
Type: application/json" -d "{ \"signing_request\": \"<CERTIFICATE-
CONTENT>\",  \"hash_function\": \"sha256\"}"

# The response:
{
"public_certificate": "<CERTIFICATE-CONTENT>"
}
----

=== Generate a new Certificate Signing Request (CSR)

----

# The API:
/api/security/certificate-signing-request

# The call:
curl -X POST "https://<mgmt-ip>/api/security/certificate-signing-request"
-H  "accept: application/json" -H  "Content-Type: application/json" -d "{
\"algorithm\": \"rsa\", \"extended_key_usage\": [\"serverauth\"],
\"hash_function\": \"sha256\",  \"key_usage\": [\"digitalsignature\"],
\"security_strength\": \"112\", \"subject_alternatives\": { \"dns\": [
\"*.example.com\", \"*.example1.com\" ], \"email\": [\"abc@example.com\",

|string
|query
|False
a|Filter by uuid

* Introduced in: 9.8

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_timeout
|integer
|query
|False
```

```
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 15
* Max value: 120
* Min value: 0

|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

|common_name
|string
a|FQDN or custom common name. Provide on POST when creating a self-signed
certificate.

|expiry_time
|string
a|Certificate expiration time, in ISO 8601 duration format or date and
time format. Can be provided on POST if creating self-signed certificate.
The expiration time range is between 1 day to 10 years.

|hash_function
|string
a|Hashing function. Can be provided on POST when creating a self-signed
certificate. Hash functions md5 and sha1 are not allowed on POST.

|key_size
|integer
a|Key size of requested Certificate in bits. One of 512, 1024, 1536, 2048,
3072. Can be provided on POST if creating self-signed certificate with a
minimum permissible value of 2048.

|name
|string
a|Certificate name or name of the certificate to be downloaded from the
Azure Key Vault (AKV). If not provided in POST, a unique name specific to
the SVM is automatically generated.

|public_certificate
|string
a|Public key Certificate in PEM format. If this is not provided in POST, a
self-signed certificate is created.
```

```
|scope
|string
a|Set to "svm" for interfaces owned by an SVM. Otherwise, set to
"cluster".

[[ID8dd75cad006eb674a7d2b22048e711a9]]
= Create or install security certificates

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/security/certificates`#

*Introduced In:* 9.6

Creates or installs a certificate or downloads a certificate from Azure
Key Vault (AKV) and installs it on the ONTAP cluster.

== Required properties

* `svm.uuid` or `svm.name` - Existing SVM in which to create or install
the certificate.
* `common_name` - Common name of the certificate. Required when creating a
certificate.
* `type` - Type of certificate.
* `public_certificate` - Public key certificate in PEM format. Required
when installing a certificate.
* `private_key` - Private key certificate in PEM format. Required when
installing a CA-signed certificate.

== Recommended optional properties

* `expiry_time` - Certificate expiration time. Specifying an expiration
time is recommended when creating a certificate.
```

```
* `key_size` - Key size of the certificate in bits. Specifying a strong
key size is recommended when creating a certificate.
* `name` - Unique certificate name per SVM or the name of the certificate
in AKV, required for downloading AKV certificates. If one is not provided,
it is automatically generated.

== AKV required properties for downloading a certificate

* `azure.key_vault` - URI of the Azure Key Vault.
* `azure.client_id` - Application (client) ID of the deployed Azure
application with appropriate access to an AKV.
* `azure.tenant_id` - Directory (tenant) ID of the deployed Azure
application with appropriate access to an AKV.
* `azure.client_secret` - Secret used by the application to prove its
identity to AKV.
* `azure.client_certificate` - PKCS12 certificate used by the application
to prove its identity to AKV.

== AKV optional properties for downloading a certificate

* `azure.oauth_host` - Open authorization server host name.
* `azure.proxy.type` - Type of proxy (http, https etc.) if proxy
configuration is used.
* `azure.proxy.host` - Proxy hostname if proxy configuration is used.
* `azure.proxy.port` - Proxy port number if proxy configuration is used.
* `azure.proxy.username` - Proxy username if proxy configuration is used.
* `azure.proxy.password` - Proxy password if proxy configuration is used.
* `azure.timeout` - AKV connection timeout in seconds.
* `azure.verify_host` - Verify the identity of the AKV host name.

== Default property values

If not specified in POST, the following default property values are
assigned:

* `key_size` - _2048_
* `expiry_time` - _P365DT_
* `hash_function` - _sha256_

== Related ONTAP commands

* `security certificate create`
* `security certificate install`
* `security certificate azure-install`

== Parameters
```

```

a|

|ca
|string
a|Certificate authority

|common_name
|string
```

```
a|FQDN or custom common name. Provide on POST when creating a self-signed
certificate.

|expiry_time
|string
a|Certificate expiration time, in ISO 8601 duration format or date and
time format. Can be provided on POST if creating self-signed certificate.
The expiration time range is between 1 day to 10 years.

|hash_function
|string
a|Hashing function. Can be provided on POST when creating a self-signed
certificate. Hash functions md5 and sha1 are not allowed on POST.

|intermediate_certificates
|array[string]
a|Chain of intermediate Certificates in PEM format. Only valid in POST
when installing a certificate.

|key_size
|integer
a|Key size of requested Certificate in bits. One of 512, 1024, 1536, 2048,
3072. Can be provided on POST if creating self-signed certificate with a
minimum permissible value of 2048.

|name
|string
a|Certificate name or name of the certificate to be downloaded from the
Azure Key Vault (AKV). If not provided in POST, a unique name specific to
the SVM is automatically generated.

|private_key
|string
a|Private key Certificate in PEM format. Only valid for create when
installing a CA-signed certificate. This is not audited.

|public_certificate
|string
a|Public key Certificate in PEM format. If this is not provided in POST, a
self-signed certificate is created.
```

```
|serial_number
|string
a|Serial number of certificate.

|subject_alternatives
|link:#subject_alternatives[subject_alternatives]
a|

|subject_key_identifier
|string
a|Provides the key identifier used to identify the public key in the SSL
certificate.

|svm
|link:#svm[svm]
a|SVM, applies only to SVM-scoped objects.

|type
|string
a|Type of Certificate. The following types are supported:

* client - a certificate and its private key used by an SSL client in
ONTAP.
* server - a certificate and its private key used by an SSL server in
ONTAP.
* client_ca - a Certificate Authority certificate used by an SSL server in
ONTAP to verify an SSL client certificate.
* server_ca - a Certificate Authority certificate used by an SSL client in
ONTAP to verify an SSL server certificate.
* root_ca - a self-signed certificate used by ONTAP to sign other
certificates by acting as a Certificate Authority.
* enum: ["client", "server", "client_ca", "server_ca", "root_ca"]
* Introduced in: 9.6
* x-nullable: true

|uuid
|string
a|Unique ID that identifies a certificate.

|Description

|client_certificate
|string
a|PKCS12 certificate used by the application to prove its identity to AKV.

|client_id
|string
a|Application client ID of the deployed Azure application with appropriate
access to an AKV.
```

```
|client_secret
|string
a|Secret used by the application to prove its identity to AKV.

|key_vault
|string
a|URI of the deployed AKV that is used by ONTAP for storing keys.

* example: https://kmip-akv-keyvault.vault.azure.net/
* format: uri
* x-ntap-createOnly: true
* Introduced in: 9.14
* x-nullable: true

|oauth_host
|string
a|Open authorization server host name.

|proxy
|link:#proxy[proxy]
a|

|tenant_id
|string
a|Directory (tenant) ID of the deployed Azure application with appropriate
access to an AKV.

|timeout
|integer
a|AKV connection timeout, in seconds. The allowed range is between 0 to 30
seconds.

|verify_host
|boolean
a|Verify the identity of the AKV host name. By default, verify_host is set
to true.

[#security_certificate]
[.api-collapsible-fifth-title]
security_certificate

[cols=3*,options=header]
|===
|Name
|Type
|Description

|authority_key_identifier
|string
a|Provides the key identifier of the issuing CA certificate that signed
the SSL certificate.

|azure
|link:#azure[azure]
a|

|ca
|string
a|Certificate authority

|common_name
|string
a|FQDN or custom common name. Provide on POST when creating a self-signed
certificate.

|expiry_time
|string
a|Certificate expiration time, in ISO 8601 duration format or date and
```

```
time format. Can be provided on POST if creating self-signed certificate.
The expiration time range is between 1 day to 10 years.

|hash_function
|string
a|Hashing function. Can be provided on POST when creating a self-signed
certificate. Hash functions md5 and sha1 are not allowed on POST.

|intermediate_certificates
|array[string]
a|Chain of intermediate Certificates in PEM format. Only valid in POST
when installing a certificate.

|key_size
|integer
a|Key size of requested Certificate in bits. One of 512, 1024, 1536, 2048,
3072. Can be provided on POST if creating self-signed certificate with a
minimum permissible value of 2048.

|name
|string
a|Certificate name or name of the certificate to be downloaded from the
Azure Key Vault (AKV). If not provided in POST, a unique name specific to
the SVM is automatically generated.

|private_key
|string
a|Private key Certificate in PEM format. Only valid for create when
installing a CA-signed certificate. This is not audited.

|public_certificate
|string
a|Public key Certificate in PEM format. If this is not provided in POST, a
self-signed certificate is created.

|serial_number
|string
a|Serial number of certificate.
```

```
|subject_alternatives
|link:#subject_alternatives[subject_alternatives]
a|

|subject_key_identifier
|string
a|Provides the key identifier used to identify the public key in the SSL
certificate.

|svm
|link:#svm[svm]
a|SVM, applies only to SVM-scoped objects.

|type
|string
a|Type of Certificate. The following types are supported:

* client - a certificate and its private key used by an SSL client in
ONTAP.
* server - a certificate and its private key used by an SSL server in
ONTAP.
* client_ca - a Certificate Authority certificate used by an SSL server in
ONTAP to verify an SSL client certificate.
* server_ca - a Certificate Authority certificate used by an SSL client in
ONTAP to verify an SSL server certificate.
* root_ca - a self-signed certificate used by ONTAP to sign other
certificates by acting as a Certificate Authority.
* enum: ["client", "server", "client_ca", "server_ca", "root_ca"]
* Introduced in: 9.6
* x-nullable: true

|uuid
|string
a|Unique ID that identifies a certificate.

[[ID18e1a059313f857becbe080c1848a261]]
= Sign security certificates

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/security/certificates/{ca.uuid}/sign`#

*Introduced In:* 9.6

Signs a certificate.

== Required properties

* `signing_request` - Certificate signing request to be signed by the
given certificate authority.

== Recommended optional properties

* `expiry_time` - Certificate expiration time. Specifying an expiration
time for a signed certificate is recommended.
* `hash_function` - Hashing function. Specifying a strong hashing function
is recommended when signing a certificate.

== Default property values

If not specified in POST, the following default property values are
assigned:

* `expiry_time` - _P365DT_
* `hash_function` - _sha256_

== Related ONTAP commands

* `security certificate sign`
This API is used to sign a certificate request using a pre-existing self-
signed root certificate. The self-signed root certificate acts as a
certificate authority within its scope and maintains the records of its
signed certificates.
```

```
The root certificate can be created for a given SVM or for the cluster
using [`POST security/certificates`].

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|ca.uuid
|string
|path
|True
a|UUID of the existing certificate authority certificate

|return_records
|boolean
|query
|False
a|The default is false.  If set to true, the records are returned.

* Default value:

|===

== Request Body

|expiry_time
|string
a|Certificate expiration time, in ISO 8601 duration format or date and
time format. Can be provided on POST if creating self-signed certificate.
The expiration time range is between 1 day to 10 years.

|hash_function
|string
a|Hashing function. Can be provided on POST when creating a self-signed
certificate. Hash functions md5 and sha1 are not allowed on POST.

|key_size
|integer
a|Key size of requested Certificate in bits. One of 512, 1024, 1536, 2048,
3072. Can be provided on POST if creating self-signed certificate with a
minimum permissible value of 2048.

|name
|string
a|Certificate name or name of the certificate to be downloaded from the
Azure Key Vault (AKV). If not provided in POST, a unique name specific to
the SVM is automatically generated.

|public_certificate
|string
a|Public key Certificate in PEM format. If this is not provided in POST, a
self-signed certificate is created.

|scope
|string
a|Set to "svm" for interfaces owned by an SVM. Otherwise, set to
```

```
"cluster".

|serial_number
|string
a|Serial number of certificate.

|subject_alternatives
|link:#subject_alternatives[subject_alternatives]
a|

|subject_key_identifier
|string
a|Provides the key identifier used to identify the public key in the SSL
certificate.

|svm
|link:#svm[svm]
a|SVM, applies only to SVM-scoped objects.

|type
|string
a|Type of Certificate. The following types are supported:

* client - a certificate and its private key used by an SSL client in
ONTAP.
* server - a certificate and its private key used by an SSL server in
ONTAP.
* client_ca - a Certificate Authority certificate used by an SSL server in
ONTAP to verify an SSL client certificate.
* server_ca - a Certificate Authority certificate used by an SSL client in
ONTAP to verify an SSL server certificate.
* root_ca - a self-signed certificate used by ONTAP to sign other
certificates by acting as a Certificate Authority.
* enum: ["client", "server", "client_ca", "server_ca", "root_ca"]
* Introduced in: 9.6
* x-nullable: true

|uuid
|string
a|Unique ID that identifies a certificate.
```

```

:leveloffset: -1

= Manage cluster network security certificates

:leveloffset: +1

[[ID01209fcff310c3249359fea046c07eb0]]
= Manage cluster network security certificates

== Overview

You can use the security cluster-network certificate API endpoints to
view and modify the certificate configuration for cluster network
security.
The following operations are supported:

* GET to retrieve the certificate configuration for cluster network
security: GET security/cluster-network/certificate
* PATCH to update the certificate configuration for cluster network
security for a given node: PATCH security/cluster-network/certificate
* POST to specify the certificate configuration for cluster network
security for a given node: POST security/cluster-network/certificate
* DELETE to remove the certificate configuration for cluster network
security for a given node: DELETE security/cluster-network/certificate
```

```
[[ID390a204d219cff8a367ded2eda05d23f]]
= Retrieve cluster network security certificate configuration

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/security/cluster-network/certificates`#

*Introduced In:* 9.18

Retrieves the certificate configuration used for cluster network security.

== Related ONTAP commands

* 'security cluster-network certificate show'

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|node.name
|string
|query
|False
a|Filter by node.name

|node.uuid
|string
|query
|False
a|Filter by node.uuid

|certificate.name
|string
|query
|False
```

```
a|Filter by certificate.name

|certificate.uuid
|string
|query
|False
a|Filter by certificate.uuid

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 15
* Max value: 120
* Min value: 0
```

```
|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

:leveloffset: -1

= Manage external-role-mapping entries

:leveloffset: +1

[[ID6adac76ab20c0c87b660682699a13f4e]]
= Manage external-role-mapping entries

=== Overview
```

```
This API is used to map external identity provider roles to ONTAP roles.
The POST request creates an external role to ONTAP role mapping. Various
responses are shown in the examples below.

=== Examples

=== Creating an external role to ONTAP role mapping entry

The following output shows how to create an external role to ONTAP role
mapping entry.

----

# The API
/api/security/external-role-mappings

# The call:
curl -X POST "https://<mgmt-ip>/api/security/external-role-mappings" -d '{
"external_role": "Administrator", "ontap_role": { "name": "admin" },
"provider": "adfs", "comment": "Admin role" }'
----

=== Retrieving all external role to ONTAP role mapping entries

The following output shows all external role to ONTAP role mapping
entries.

----

# The API
/api/security/external-role-mappings

# The call:
curl -X GET "https://<mgmt-ip>/api/security/external-role-mappings"

# The response:
{
 "records": [
 {
   "external_role": "Administrator",
   "provider": "adfs"
 }
 ],
 "num_records": 1
}
----
```

```
[[ID277fc0ff5e4fe2e7e33015cb0fdb3c75]]
= Retrieve all external-role-mapping entries

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/security/external-role-mappings`#

*Introduced In:* 9.16

Retrieves all external-role-mapping entries.

== Related ONTAP commands

* `security login external-role-mapping show`

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|comment
|string
|query
|False
a|Filter by comment

|provider
|string
|query
|False
a|Filter by provider

|ontap_role.name
|string
```

```
|query
|False
a|Filter by ontap_role.name

|timestamp
|string
|query
|False
a|Filter by timestamp

|external_role
|string
|query
|False
a|Filter by external_role

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

|return_timeout
|integer
|query
|False
```

```
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 15
* Max value: 120
* Min value: 0

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

:leveloffset: -1

= Manage Google Cloud KMS

:leveloffset: +1

[[IDcfc41b9e42b3b5deeb34f1769bf79a3f]]
= Manage Google Cloud KMS

== Overview

Google Cloud Key Management Services is a cloud key management service
(KMS) that provides a secure store for encryption keys. This feature
allows ONTAP to securely protect its encryption keys using Google Cloud
KMS.
In order to use Google Cloud KMS with ONTAP, a user must first deploy a
Google Cloud application with appropriate access to the Google Cloud KMS
and then provide
ONTAP with the necessary details, such as, project ID, key ring name,
location, key name and application credentials to allow ONTAP to
communicate
with the deployed Google Cloud application.
The properties `state`, `google_reachability` and `ekmip_reachability` are
considered advanced properties and are populated only when explicitly
requested.

== Examples
```

```
=== Enabling GCKMS for an SVM

The following example shows how to enable GCKMS at the SVM-scope. Note the
_return_records=true_ query parameter is used to obtain the newly created
key manager configuration.

----

# The API:
POST /api/security/gcp-kms

# The call:
curl -X POST 'https://<mgmt-ip>/api/security/gcp-kms?return_records=true'
-H 'accept: application/hal+json' -d '{"svm":{"uuid":"f36ff553-e713-11ea-
bd56-005056bb4222" }, "project_id": "testProj",
"key_ring_name":"testKeyRing", "key_ring_location": "global", "key_name":
"key1", "application_credentials": "{\"client_email\":
\"my@account.email.com\", \"private_key\": \"ValidPrivateKey\"}"}'

# The response:
{
"num_records": 1,
"records": [
    {
    "uuid": "f72098a2-e908-11ea-bd56-005056bb4222",
    "svm": {
        "uuid": "f36ff553-e713-11ea-bd56-005056bb4222",
        "name": "vs0"
    },
    "project_id": "testProj",
    "key_ring_name": "testKeyRing",
    "key_ring_location": "global",
    "key_name": "key1",
    "_links": {
        "self": {
        "href": "/api/security/gcp-kms/f72098a2-e908-11ea-bd56-
005056bb4222"
            }
        }
    }
]
}
----

'''
```

```
=== Retrieving all GCKMS configurations

The following example shows how to retrieve all GCKMS configurations.

----

# The API:
GET /api/security/gcp-kms

# The call:
curl -X GET 'https://<mgmt-ip>/api/security/gcp-kms?fields=*'

# The response:
{
"records": [
    {
    "uuid": "f72098a2-e908-11ea-bd56-005056bb4222",
    "scope": "svm",
    "svm": {
        "uuid": "f36ff553-e713-11ea-bd56-005056bb4222",

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.
```

```
* Default value: 15
* Max value: 120
* Min value: 0

|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

[#ekmip_reachability]
[.api-collapsible-fifth-title]
ekmip_reachability

Provides the connectivity status for the given SVM on the given node to
all EKMIP servers configured on all nodes of the cluster.
This is an advanced property; there is an added computational cost to
retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|code
|string
a|Code corresponding to the error message. Returns a 0 if a given SVM is
able to communicate to the EKMIP servers of all of the nodes in the
cluster.

|message
|string
a|Error message set when cluster-wide EKMIP server availability from the
given SVM and node is false.

|node
|link:#node[node]
a|

|reachable
|boolean
a|Set to true if the given SVM on the given node is able to communicate to
all EKMIP servers configured on all nodes in the cluster.

[[ID09b1f09408fd524170b64293b0e8dc09]]
= Create a Google Cloud KMS configuration for an SVM
```

```
[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/security/gcp-kms`#

*Introduced In:* 9.9

Configures the Google Cloud KMS configuration for the specified SVM.

== Required properties

* `svm.uuid` or `svm.name` - Existing SVM in which to create a Google
Cloud KMS.
* `project_id` - Google Cloud project (application) ID of the deployed
Google Cloud application with appropriate access to the Google Cloud KMS.
* `key_ring_name` - Google Cloud KMS key ring name of the deployed Google
Cloud application with appropriate access to the specified Google Cloud
KMS.
* `key_ring_location` - Google Cloud KMS key ring location.
* `key_name`- Key Identifier of the Google Cloud KMS key encryption key.
* `application_credentials` - The Google Cloud application's service
account credentials required to access the specified KMS. This is a JSON
file containing an email address and the private key of the service
account holder. The field is required if the `authentication_method` is
set to `application_credentials_key`.

== Optional properties

* `proxy_type` - Type of proxy (http/https) if proxy configuration is
used.
* `proxy_host` - Proxy hostname if proxy configuration is used.
* `proxy_port` - Proxy port number if proxy configuration is used.
* `proxy_username` - Proxy username if proxy configuration is used.
* `proxy_password` - Proxy password if proxy configuration is used.
* `port` - Authorization server and Google Cloud KMS port number.
* `cloudkms_host` - Google Cloud KMS host subdomain.
* `oauth_host` - Open authorization server host name.
* `oauth_url` - Open authorization URL for the access token.
* `privileged_account` - Account used to impersonate Google Cloud KMS
requests.
* `verify_ip` - Verify identity of Google Cloud KMS IP address.
* `verify_host` - Verify the identity of the Google Cloud KMS host name.
* `authentication_method` - The authentication method to use for
retrieving short lived authentication tokens.
* `gce_metadata_server` - A custom metadata server URL used for retrieving
short lived authentication tokens if the default service account is not
used. This is only applicable when the `authentication_method` is set to
```

```
`sa_credentials_attachment`.

== Related ONTAP commands

* `security key-manager external gcp enable`

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When doing a POST, PATCH, or DELETE operation on a single record, the
default is 0 seconds.  This means that if an asynchronous operation is
started, the server immediately returns HTTP code 202 (Accepted) along
with a link to the job.  If a non-zero value is specified for POST, PATCH,
or DELETE operations, ONTAP waits that length of time to see if the job
completes so it can return something other than 202.

* Default value: 0
* Max value: 120
* Min value: 0

|return_records
|boolean
|query
|False
a|The default is false.  If set to true, the records are returned.

* Default value:

[#ekmip_reachability]
[.api-collapsible-fifth-title]
ekmip_reachability

Provides the connectivity status for the given SVM on the given node to
all EKMIP servers configured on all nodes of the cluster.
This is an advanced property; there is an added computational cost to
retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|code
|string
a|Code corresponding to the error message. Returns a 0 if a given SVM is
able to communicate to the EKMIP servers of all of the nodes in the
cluster.

|message
|string
a|Error message set when cluster-wide EKMIP server availability from the
given SVM and node is false.

|node
|link:#node[node]
a|

|reachable
|boolean
```

```
a|Set to true if the given SVM on the given node is able to communicate to
all EKMIP servers configured on all nodes in the cluster.

[[ID5fd07194d6f9ff319aaa7cf933f02914]]
= Re-key the external key in the key hierarchy for an SVM

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/security/gcp-kms/{gcp_kms.uuid}/rekey-external`#

*Introduced In:* 9.11

Rekeys the external key in the key hierarchy for an SVM with a Google
Cloud KMS configuration.

== Required properties
```

```
* `key_name` - Google Cloud KMS key name.

== Optional properties

* `project_id` - Google Cloud KMS project ID.
* `key_ring_location` - Google Cloud KMS key ring location.
* `key_ring_name` - Google Cloud KMS key ring name.

== Related ONTAP commands

* `security key-manager external gcp rekey-external`

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|gcp_kms.uuid
|string
|path
|True
a|UUID of the existing Google Cloud KMS configuration.

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When doing a POST, PATCH, or DELETE operation on a single record, the
default is 0 seconds.  This means that if an asynchronous operation is
started, the server immediately returns HTTP code 202 (Accepted) along
with a link to the job.  If a non-zero value is specified for POST, PATCH,
or DELETE operations, ONTAP waits that length of time to see if the job
completes so it can return something other than 202.

* Default value: 0
* Max value: 120
* Min value: 0
```

```
|return_records
|boolean
|query
|False
a|The default is false.  If set to true, the records are returned.

* Default value:

ONTAP Error Response Codes

|===
| Error Code | Description

| 65537547
| One or more volume encryption keys for encrypted volumes of this data
SVM are stored in the key manager configured for the admin SVM. Use the
REST API POST method to migrate this data SVM's keys from the admin SVM's
key manager to this data SVM's key manager before running the rekey
operation.

| 65537556
| ONTAP is not able to successfully encrypt or decrypt because the
configured external key manager for this SVM is in a blocked state.
Possible reasons for a blocked state include the top-level external key
protection key not found, disabled or having insufficient privileges.

| 65537610
| Rekey cannot be performed on the SVM while the enabled keystore
configuration is being switched. If a previous attempt to switch the
keystore configuration failed, or was interrupted, the system will
continue to prevent rekeying for the SVM. Use the REST API PATCH method
"/api/security/key-stores/\{uuid}" to re-run and complete the operation.

| 65537721
| Google Cloud KMS is not configured for the given SVM.

| 65537729
| External rekey failed on one or more nodes. Use the REST API POST method
"/api/security/gcp-kms/\{uuid}/rekey-external" to try the rekey operation
again.

| 65537753
| The "key_name" value contains invalid characters. A forward slash '/' is
not allowed in the key name.

| 65537755
| Google Cloud KMS configuration details were not found for the SVM.

| 65539436
| Rekey cannot be performed on the SVM while the enabled keystore
configuration is being initialized. Wait until the keystore is in the
active state, and rerun the rekey operation.

| 65539437
```

```
| Rekey cannot be performed on the SVM while the enabled keystore
configuration is being disabled.

[#ekmip_reachability]
[.api-collapsible-fifth-title]
ekmip_reachability

Provides the connectivity status for the given SVM on the given node to
all EKMIP servers configured on all nodes of the cluster.
This is an advanced property; there is an added computational cost to
retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|code
|string
a|Code corresponding to the error message. Returns a 0 if a given SVM is
able to communicate to the EKMIP servers of all of the nodes in the
cluster.

|message
|string
a|Error message set when cluster-wide EKMIP server availability from the
given SVM and node is false.

|node
|link:#node[node]
a|

|reachable
|boolean
a|Set to true if the given SVM on the given node is able to communicate to
all EKMIP servers configured on all nodes in the cluster.

[[IDa60e4d8948b3d1f15981d4df2c32e9c1]]
= Update the Google Cloud KMS configuration

[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-
block]#`/security/gcp-kms/{uuid}`#

*Introduced In:* 9.9

Updates the Google Cloud KMS configuration.

== Optional properties

* `application_credentials` - New credentials used to verify the
```

```
application's identity to the Google Cloud KMS.
* `proxy_type` - Type of proxy (http/https) if proxy configuration is
used.
* `proxy_host` - Proxy hostname if proxy configuration is used.
* `proxy_port` - Proxy port number if proxy configuration is used.
* `port` - Authorization server and Google Cloud KMS port number.
* `proxy_username` - Proxy username if proxy configuration is used.
* `proxy_password` - Proxy password if proxy configuration is used.
* `project_id` - Google Cloud project (application) ID of the deployed
Google Cloud application with appropriate access to the Google Cloud KMS.
* `key_ring_name` - Google Cloud KMS key ring name of the deployed Google
Cloud application with appropriate access to the specified Google Cloud
KMS.
* `key_ring_location` - Google Cloud KMS key ring location.
* `cloudkms_host` - Google Cloud KMS host subdomain.
* `oauth_host` - Open authorization server host name.
* `oauth_url` - Open authorization URL for the access token.
* `verify_host` - Verify the identity of the Google Cloud KMS host name.
* `verify_ip ` - Verify identity of Google Cloud KMS IP address.
* `privileged_account` - Account used to impersonate Google Cloud KMS
requests.
* `authentication_method` - The authentication method to use for
retrieving short lived authentication tokens.
* `gce_metadata_server` - A custom metadata server URL used for retrieving
short lived authentication tokens if the default service account is not
used. This is only applicable when the `authentication_method` is set to
`sa_credentials_attachment`.

== Related ONTAP commands

* `security key-manager external gcp update-credentials`
* `security key-manager external gcp update-config`

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|uuid
```

```
|string
|path
|True
a|Google Cloud KMS UUID

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When doing a POST, PATCH, or DELETE operation on a single record, the
default is 0 seconds.  This means that if an asynchronous operation is
started, the server immediately returns HTTP code 202 (Accepted) along
with a link to the job.  If a non-zero value is specified for POST, PATCH,
or DELETE operations, ONTAP waits that length of time to see if the job
completes so it can return something other than 202.

* Default value: 0
* Max value: 120
* Min value: 0

|===

|False
a|The number of seconds to allow the call to execute before returning.
When doing a POST, PATCH, or DELETE operation on a single record, the
default is 0 seconds.  This means that if an asynchronous operation is
started, the server immediately returns HTTP code 202 (Accepted) along
with a link to the job.  If a non-zero value is specified for POST, PATCH,
or DELETE operations, ONTAP waits that length of time to see if the job
completes so it can return something other than 202.

* Default value: 0
* Max value: 120
* Min value: 0

|return_records
|boolean
|query
|False
a|The default is false.  If set to true, the records are returned.

* Default value:

ONTAP Error Response Codes

|===
| Error Code | Description

| 65537547
| One or more volume encryption keys for encrypted volumes of this data
SVM are stored in the key manager configured for the admin SVM. Use the
REST API POST method to migrate this data SVM's keys from the admin SVM's
key manager to this data SVM's key manager before running the rekey
operation.
```

```
| 65537556
| ONTAP is not able to successfully encrypt or decrypt because the
configured external key manager for this SVM is in a blocked state.
Possible reasons for a blocked state include the top-level external key
protection key not found, disabled or having insufficient privileges.

| 65537559
| There are no existing internal keys for the SVM. A rekey operation is
allowed for an SVM with one or more encryption keys.

| 65537610
| Rekey cannot be performed on the SVM while the enabled keystore
configuration is being switched. If a previous attempt to switch the
keystore configuration failed, or was interrupted, the system will
continue to prevent rekeying for the SVM. Use the REST API PATCH method
"/api/security/key-stores/\{uuid}" to re-run and complete the operation.

| 65537721
| Google Cloud KMS is not configured for the given SVM.

| 65539436
| Rekey cannot be performed on the SVM while the enabled keystore
configuration is being initialized. Wait until the keystore is in the
active state, and rerun the rekey operation.

| 65539437
| Rekey cannot be performed on the SVM while the enabled keystore
configuration is being disabled.

= Manage group-to-role mapping entries

:leveloffset: +1
```

```
[[ID22cc5f3a5e073d4f9dc70794bf3e7508]]
= Manage group-to-role mapping entries

=== Overview

This API is used to manage and map groups to ONTAP roles. The POST request
creates a group to role mapping. Various responses are shown in the
examples below.
 +

== Examples

=== Creating a group to role mapping entry

The following output shows how to create a group to role mapping entry.

----

# The API:
/api/security/group/role-mappings

# The call:
curl -X POST "https://<mgmt-ip>/api/security/group/role-mappings" -d '{
"group_id": 1, "ontap_role": { "name": "admin" }, "comment": "Group1 admin
role"}'
----

=== Retrieving all group to role mapping entries

The following output shows all group to role mapping entries.

----

# The API:
/api/security/group/role-mappings

# The call:
curl -X GET "https://<mgmt-ip>/api/security/group/role-mappings"

# The response:
{
 "records": [
 {
```

```
   "group_id": 1,
   "ontap_role": {
     "name": "admin"
   }
 }
 ],
 "num_records": 1
}
----
```

```
[[ID728de9b153e1830854d6c0417cfe78ec]]
= Retrieve all group-to-role mapping entries

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/security/group/role-mappings`#

*Introduced In:* 9.16

Retrieves all the group to role mapping entries.

== Related ONTAP commands

* `security login group role-mapping show`

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|ontap_role.name
|string
|query
|False
a|Filter by ontap_role.name
```

```
|comment
|string
|query
|False
a|Filter by comment

|group_id
|integer
|query
|False
a|Filter by group_id

* Max value: 4294967295
* Min value: 1

|scope
|string
|query
|False
a|Filter by scope

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1
```

```
|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Max value: 120
* Min value: 0
* Default value: 15

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

:leveloffset: -1

= Manage group configurations

:leveloffset: +1

[[ID7cf73f80b029e49bcfd658a720c027d8]]
= Manage group configurations
```

```
=== Overview

This API is used to manage group configurations in ONTAP. The POST request
creates a group configuration. Various responses are shown in the examples
below.
 +

== Examples

=== Creating a group configuration

The following output shows how to create a group configuration.

----

# The API:
/api/security/groups

# The call:
curl -X POST "https://<mgmt-ip>/api/security/groups"  -d '{ "name":
"AzureGroup1", "owner": { "name": "C1_sti213-vsim-sr023a_1718680001",
"uuid": "116127b1-2d21-11ef-a5e1-005056ae1bc2" }, "type": "entra", "uuid":
"3fa85f64-5717-4562-b3fc-2c963f66afa6", "comment": "Azure Group"}'
----

=== Retrieving all group configurations

The following output shows all group configurations.

----

# The API:
/api/security/groups

# The call:
curl -X GET "https://<mgmt-ip>/api/security/groups"

# The response:
{
"records": [
  {
    "owner": {
      "uuid": "116127b1-2d21-11ef-a5e1-005056ae1bc2",
      "name": "C1_sti213-vsim-sr023a_1718680001"
    },
    "name": "AzureGroup1",
```

```
    "type": "entra",
    "id": 1,
    "uuid": "3fa85f64-5717-4562-b3fc-2c963f66afa6"
  }
],
"num_records": 1
}
----
```

```
[[IDb0453a8a51567fe4b00713c322231af4]]
= Retrieve all group entries

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/security/groups`#

*Introduced In:* 9.16

Retrieves all group entries.

== Related ONTAP commands

* `security login group show`

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|type
|string
|query
|False
a|Filter by type

|id
```

```
|integer
|query
|False
a|Filter by id

|name
|string
|query
|False
a|Filter by name

* maxLength: 64
* minLength: 1

|scope
|string
|query
|False
a|Filter by scope

|uuid
|string
|query
|False
a|Filter by uuid

|comment
|string
|query
|False
a|Filter by comment

|owner.name
|string
|query
|False
a|Filter by owner.name

|owner.uuid
|string
|query
```

```
|False
a|Filter by owner.uuid

|create_time
|string
|query
|False
a|Filter by create_time

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 15
* Max value: 120
* Min value: 0
```

```
|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 15
* Max value: 120
* Min value: 0

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

= Add a CA certificate to IPsec

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/security/ipsec/ca-certificates`#

*Introduced In:* 9.10

Add CA certificate to IPsec. The CA certificate should already be
installed on the cluster prior to adding them to IPsec.
The CA certificate can be installed on the cluster using the
/security/certificates endpoint.
The svm.uuid or svm.name should not be supplied for certificates that have
a scope of cluster.

|===
|Name
|Type
|Description

|action
|string
a|Action for the IPsec policy.

|authentication_method
|string
a|Authentication method for the IPsec policy.

|certificate
|link:#certificate[certificate]
a|Certificate for the IPsec policy.
```

```
|certificate_modify_keepsa
|boolean
a|Indicates whether old security associations are kept upon certificate
modification.

|enabled
|boolean
a|Indicates whether or not the policy is enabled.

|ipspace
|link:#ipspace[ipspace]
a|Applies to both SVM and cluster-scoped objects. Either the UUID or name
may be supplied on input.

|local_endpoint
|link:#local_endpoint[local_endpoint]
a|Local endpoint for the IPsec policy.

|local_identity
|string
a|Local Identity

|name
|string
a|IPsec policy name.

|ppk
|link:#ppk[ppk]
a|Post-quantum pre-shared key information.

|protocol
|string
a|Lower layer protocol to be covered by the IPsec policy.

|remote_endpoint
|link:#remote_endpoint[remote_endpoint]
a|Remote endpoint for the IPsec policy.
```

```
|remote_identity
|string
a|Remote Identity

|scope
|string
a|Set to "svm" for interfaces owned by an SVM. Otherwise, set to
"cluster".

|svm
|link:#svm[svm]
a|SVM, applies only to SVM-scoped objects.

|uuid
|string
a|Unique identifier of the IPsec policy.

```
ONTAP Error Response Codes

|===
| Error Code | Description

| 66257099
| Only one protocol can be specified.

| 66257100
| Only one local port can be specified.

| 66257101
| Only one remote port can be specified.

| 66257102
| Internet Key Exchange version 1 (IKEv1) is not supported.

| 66257104
| IPsec policy with same name already exists in this SVM.

| 66257107
| The specified pre-shared key is not a valid hexadecimal string.

| 66257109
| The specified pre-shared key is not a valid Base64 encoded binary
string.

| 66257110
| Failed to a create policy sequencing value.

| 66257112
| The IPsec policy with the action specified does not provide packet
protection and the authentication method provided for the policy will be
ignored.

| 66257113
| Only one local IP subnet can be specified.

| 66257114
| Only one remote IP subnet can be specified.

| 66257115
| Port ranges containing more than one port are not supported.

| 66257117
| IPsec is not supported on the SVM specified in the policy, IPsec is
supported on data SVMs only.
```

```
| 66257120
| The subnet selector must be a host address (An IPv4 address with a 32-
bit netmask or an IPv6 address with a 128-bit netmask).

| 66257121
| The maximum limit of IPsec policies has been reached for the specified
SVM.

| 66257125
| The local_endpoint.address must be specified with
local_endpoint.netmask.

| 66257126
| The remote_endpoint.address must be specified with
remote_endpoint.netmask.

| 66257127
| The local subnet must be configured as a non-zero subnet.

| 66257128
| Invalid ANY wildcard subnet.

| 66257129
| A specific local or remote port number is required when the remote
subnet is configured as an ANY wildcard subnet.

| 66257130
| The maximum limit of IPsec policies has been reached for the cluster.

| 66257131
| ESP in UDPv6 Encapsulation is not supported.

| 66257132
| Invalid value for port field. Value should be in range <0-65535>.

| 66257133
| A pre-shared key is needed for the PSK authentication method. Use the
secret_key option to specify a key.

| 66257134
| An end-entity certificate is needed for the PKI authentication method.
Use the certificate.uuid option to specify an end-entity certificate.

| 66257135
| The specified certificate is not found on the SVM.
```

```
| 66257136
| A certificate is not needed for the PSK authentication method.

| 66257137
| A pre-shared key is not needed for the PKI authentication method.

| 66257138
| Remote identity is required when using certificate verification.

| 66257139
| Certificate with the specified UUID was not found.

| 66257140
| Only certificates with a client or server type are supported.

| 66257142
| Failed to create IPsec policy because the specified SVM is being
migrated.

| 66257143
| Invalid IPsec policy provided. The subnet must be non-empty.

| 66257144
| The IPsec policy actions ESP TRANSPORT and ESP UDP each provide packet
protection and requires a secret key or certificate for authentication.

| 66257148
| The policy name does not meet required ASCII-range characters length.

| 66257153
| The policy requires a post-quantum pre-shared key because ppk-identity
is specified for this policy.

| 66257154
| The policy requires a post-quantum pre-shared identity because ppk-
shared-key is specified for this policy.

| 66257199
| Not all of the nodes in the cluster are running a version that supports
the IPsec feature.

| 66257200
| The shared key does not meet required ASCII-range characters length.

| 66257201
| Support for the feature available with effective cluster version or
later.
```

```
| 66257202
| The specified SVM name is invalid.

| 66257203
| The specified SVM UUID is invalid.

| 66257204
| The specified IPspace UUID and IPspace name refer to different IPspaces.

| 66257205
| The specified SVM must exist in the specified IPspace.

| 66257305
| The certificate UUID does not match the provided certificate name.

| 66257396
| IPsec is not supported for the admin SVM in a MetroCluster
configuration.

```
ONTAP Error Response Codes

|===
| Error Code | Description

| 66257097
| Internal error. Failed to update the IPsec policy.

| 66257099
| Only one protocol can be specified.

| 66257100
| Only one local port can be specified.

| 66257101
| Only one remote port can be specified.

| 66257110
| Failed to create a policy sequencing value.

| 66257113
| Only one local IP subnet can be specified.

| 66257114
| Only one remote IP subnet can be specified.

| 66257115
| Port ranges containing more than one port are not supported.
```

```
| 66257120
| The subnet selector must be a host address (An IPv4 address with a 32-
bit netmask or an IPv6 address with a 128-bit netmask).

| 66257125
| The local_endpoint.address must be specified with
local_endpoint.netmask.

| 66257126
| The remote_endpoint.address must be specified with
remote_endpoint.netmask.

| 66257127
| The local subnet must be configured as a non-zero subnet.

| 66257128
| Invalid ANY wildcard subnet.

| 66257129
| A specific local or remote port number is required when the remote
subnet is configured as an ANY wildcard subnet.

| 66257131
| ESP in UDPv6 Encapsulation is not supported.

| 66257135
| The specified certificate is not found on the SVM.

| 66257136
| A certificate is not needed for the PSK authentication method.

| 66257138
| Remote identity is required when using certificate verification.

| 66257139
| Certificate with the specified UUID was not found.

| 66257140
| Only certificates with a client or server type are supported.

| 66257142
| Failed to create IPsec policy because the specified SVM is being
migrated.

| 66257143
| Invalid IPsec policy provided. The subnet must be non-empty.
```

```
| 66257153
| The policy requires a post-quantum pre-shared key because ppk-identity
is specified for this policy.

| 66257154
| The policy requires a post-quantum pre-shared identity because ppk-
shared-key is specified for this policy.

| 66257199
| Not all of the nodes in the cluster are running a version that supports
the IPsec feature.

| 66257200
| The shared key does not meet required ASCII-range characters length.

| 66257201
| Support for the feature available with effective cluster version or
later.

| 66257305
| The certificate UUID does not match the provided certificate name.

|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 15
* Max value: 120
* Min value: 0

|order_by
|array[string]
|query
```

```
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

:leveloffset: -1

= Manage JIT privilege user configurations

:leveloffset: +1

[[ID8b48eb41a1a8a75a5c6e8d7426d60966]]
= Manage JIT privilege user configurations

== Overview

This API is used to create, retrieve, and delete relevant information
related to user-specific JIT privilege session configurations.
Prerequisites:
  You must create a user that has a JIT supported login method configured
on the SVM that you want to create the elevated session configurations.

== Examples

=== Creating the JIT session configuration for a user

----

# The API:
POST "/api/security/jit-privilege-users"

# The call:
```

```
curl -X POST "https://<mgmt-ip>/api/security/jit-privilege-
users?return_records=true" -H "accept: application/hal+json" -d '{
"owner": { "name": "Cserver"} , "account": { "name": "joe"},
"application": "ssh","role": {"name": "admin"},"session_validity":
"PT30M","jit_validity": "PT2H10M20S"}'

# The response:
{}
----

=== Retrieving the configured JIT privilege sessions for users

Retrieves the JIT privilege user session configurations or a filtered list
(for a specific SVM, user, etc).

----

# The API:
GET "/api/security/jit-privilege-users"

# The call:
curl -X GET  "https://<mgmt-ip>/api/security/jit-privilege-users" -H
"accept: application/hal+json"

# The response:
{
  "records": [
    {
      "owner": {
        "uuid": "b009a9e7-4081-b576-7575-ada21efcaf16",
        "name": "Cserver",
        "_links": {
          "self": {
            "href": "/api/svm/svms/b009a9e7-4081-b576-7575-ada21efcaf16"
          }
        }
      },
      "account": {
        "name": "testUser"
      },
      "application": "ssh",

```

```
[[ID2b3f9ce692b5cd3b3df6f4c5165b4567]]
= Retrieve the JIT privilege user configurations for an SVM

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/security/jit-privilege-users`#

*Introduced In:* 9.17

Retrieves the JIT privilege user configurations for an SVM.

== Related ONTAP commands

* `security jit-privilege user show`

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|start_time
|string
|query
|False
a|Filter by start_time
```

```
|role.name
|string
|query
|False
a|Filter by role.name

|jit_state
|string
|query
|False
a|Filter by jit_state

|account.name
|string
|query
|False
a|Filter by account.name

|application
|string
|query
|False
a|Filter by application

|jit_validity
|string
|query
|False
a|Filter by jit_validity

|session_validity
|string
|query
|False
a|Filter by session_validity

|end_time
|string
|query
```

```
|False
a|Filter by end_time

|owner.name
|string
|query
|False
a|Filter by owner.name

|owner.uuid
|string
|query
|False
a|Filter by owner.uuid

|comment
|string
|query
|False
a|Filter by comment

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
```

```
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 15
* Max value: 120
* Min value: 0

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

|fields
|array[string]
|query
|False
a|Specify the fields to return.

= Manage global JIT privilege configurations

:leveloffset: +1

[[ID619560ef6fb9862fa03c606cc9ff93cc]]
= Manage global JIT privilege configurations

== Overview

This API is used to retrieve and configure relevant information related to
the Global JIT (Just In Time) privilege configuration in the cluster.

== Examples

=== Retrieving the configured JIT privilege settings for the cluster

Retrieves the JIT privileges for the cluster or a filtered list (for a
```

```
specific SVM).

----

# The API:
GET "/api/security/jit-privileges"

# The call
curl -k https://<mgmt-ip>/api/security/jit-privileges

= Retrieve global JIT privilege configurations for an SVM

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/security/jit-privileges`#

*Introduced In:* 9.17
```

```
Retrieves global JIT privilege configurations on an SVM.

== Related ONTAP commands

* `security jit-privilege show`

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|default_session_validity_period
|string
|query
|False
a|Filter by default_session_validity_period

|max_jit_validity_period
|string
|query
|False
a|Filter by max_jit_validity_period

|owner.name
|string
|query
|False
a|Filter by owner.name

|owner.uuid
|string
|query
|False
a|Filter by owner.uuid

|application
```

```
|string
|query
|False
a|Filter by application

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 15
* Max value: 120
* Min value: 0

|order_by
|array[string]
|query
```

```
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

|===

:leveloffset: +1
```

```
[[ID635982b12e2d0b9e46a9c256e0e89f9a]]
= View and update key manager configurations

== Overview

Retrieves or modifies the key management configuration options. The
following operations are supported:

* GET
* PATCH

== Examples

=== Retrieving cluster-level key manager configurations

The following example shows how to retrieve cluster-level manager
configurations.

----

# The API:
GET /api/security/key-manager-configs

# The call:
curl -X GET 'https://<mgmt-ip>/api/security/key-manager-configs' -H
'accept: application/hal+json'

# The response:
{
"cc_mode_enabled": false,
"health_monitor_polling_interval": 15,
"cloud_kms_retry_count": 3,
"health_monitor_policy": {
  "akv": {
    "enabled": true,
    "manage_volume_offline": true
  },
  "gcp": {
    "enabled": true,
    "manage_volume_offline": true
  },
  "aws": {
    "enabled": true,
    "manage_volume_offline": true
```

```
  },
  "ikp": {
    "enabled": true,
    "manage_volume_offline": true
  },
  "okm": {
    "enabled": true,
    "manage_volume_offline": true
  },
  "kmip": {
    "enabled": true,
    "manage_volume_offline": true
  }
},
"_links": {
  "self": {
    "href": "/api/security/key-manager-configs"
  }
}
}
----

'''

=== Updating the cluster-level key manager configurations

The following example shows how to modify the
"health_monitor_polling_interval" and "cloud_kms_retry_count" fields.

----

# The API:
PATCH /api/security/key-manager-configs

# The call:
curl -X PATCH 'https://<mgmt-ip>/api/security/key-manager-configs' -H
'accept: application/hal+json' -d "{ \"health_monitor_polling_interval\" :
\"20\", \"cloud_kms_retry_count\" : \"5\" }"
----

'''

=== Updating the cluster-level key manager configurations

The following example shows how to modify the "cc_mode" and "passphrase"
fields.
```

```
----

# The API:
PATCH /api/security/key-manager-configs

# The call:
curl -X PATCH 'https://<mgmt-ip>/api/security/key-manager-configs' -H
'accept: application/hal+json' -d "{ \"cc_mode_enabled\" : \"true\",
\"passphrase\": \"current_passphrase\" }"
----

'''

=== Shows the keystore level health monitor policy

The following example shows how to retrieve the health monitor policies
for Amazon Web Services and Google Cloud.

----

# The API:
GET /api/security/key-manager-configs

# The call:
curl -X GET 'https://<mgmt-ip>/api/security/key-manager-
configs?fields=health_monitor_policy.aws,health_monitor_policy.gcp' -H
'accept: application/hal+json'

# The response:
{
"health_monitor_policy": {
  "gcp": {
    "enabled": false,
    "manage_volume_offline": false
  },
  "aws": {
    "enabled": false,
    "manage_volume_offline": false
  }
},
"_links": {
  "self": {
    "href": "/api/security/key-manager-configs"
  }
}
}
```

```
----

'''

=== Updates the keytore level health monitor policy

The following example shows how to modify the Amazon Web Services
"enabled" field and the Google Cloud "manage_volume_offline" field of the
health monitor policy.

----

# The API:
PATCH /api/security/key-manager-configs

# The call:
curl -X PATCH 'https://<mgmt-ip>/api/security/key-manager-configs' -H
'accept: application/hal+json' -d '{"health_monitor_policy": {"aws":
{"enabled": "false"}, "gcp": {"manage_volume_offline": "false"}}}'
----

'''

= Manage key managers

:leveloffset: +1

[[ID83dcc3b99fda49b39958d55f2bf388cb]]
= Manage key managers

== Overview

A key manager is a key management solution (software or dedicated
hardware) that enables other ONTAP client modules to securely and
persistently store keys for various uses. For example, WAFL uses the key
management framework to store and retrieve the volume encryption keys that
it uses to encrypt/decrypt data on NVE volumes. A key manager can be
configured at both cluster scope and SVM, with one key manager allowed per
SVM. The key management framework in ONTAP supports two mutually exclusive
modes for persisting keys: external and onboard.

When an SVM is configured with external key management, the keys are
```

```
stored on up to four primary key servers that are external to the system.

Once external key management is enabled for an SVM, primary key servers
can be added or removed using the _/api/security/key-managers/\{uuid}/key-
servers_ endpoint. See [`+POST /security/key-managers/{uuid}/key-
servers+`] and [`+DELETE /security/key-managers/{uuid}/key-
servers/{server}+`] for more details.

Setting up external key management dictates that the required certificates
for securely communicating with the key server are installed prior to
configuring the key manager. To install the required client and server_ca
certificates, use the _/api/security/certificates/_ endpoint.

See [`POST /security/certificates`], [`GET /security/certificates/uuid`]
and [`+DELETE /security/certificates/{uuid}+`] for more details.

When an SVM is configured with the Onboard Key Manager, the keys are
stored in ONTAP in wrapped format using a key hierarchy created using the
salted hash of the passphrase entered when configuring the Onboard Key
Manager. This model fits well for customers who use ONTAP to store their
own data.

== Examples

=== Creating an external key manager with 1 primary key server for a
cluster

The example key manager is configured at the cluster-scope with one
primary key server. Note that the UUIDs of the certificates are those that
are already installed at the cluster-scope. Note the _return_records=true_
query parameter is used to obtain the newly created key manager
configuration.

----

# The API:
POST /api/security/key-managers

# The call:
curl -X POST 'https://<mgmt-ip>/api/security/key-
managers?return_records=true' -H 'accept: application/hal+json' -d "{
\"external\": { \"client_certificate\": { \"uuid\": \"5fb1701a-d922-11e8-

= Retrieve key managers

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/security/key-managers`#

*Introduced In:* 9.6

Retrieves key managers.

== Expensive properties

There is an added computational cost to retrieving these properties. They
are excluded from default GET results and must be explicitly requested
using the `fields` query parameter. For more details, see
xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requestin
g_specific_fields[Requesting specific fields]. Additionally, these fields
are unavailable for inactive configurations as they are only relevant to
active configurations.

* `status.message`
* `status.code`

== Examples

* To retrieve basic information about a key manager:

----
GET /security/key-managers
----

* To retrieve specific fields, including expensive properties:

----
GET /security/key-managers/?fields=status.code,status.message
----

== Related ONTAP commands

* `security key-manager show-key-store`
* `security key-manager external show`
* `security key-manager external show-status`
* `security key-manager onboard show-backup`
```

```
== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|configuration.uuid
|string
|query
|False
a|Filter by configuration.uuid

* Introduced in: 9.16

|configuration.name
|string
|query
|False
a|Filter by configuration.name

* Introduced in: 9.16

|svm.name
|string
|query
|False
a|Filter by svm.name

|svm.uuid
|string
|query
|False
a|Filter by svm.uuid

|policy
|string
|query
```

```
|False
a|Filter by policy

* Introduced in: 9.9

|status.code
|integer
|query
|False
a|Filter by status.code

* Introduced in: 9.7

|status.message
|string
|query
|False
a|Filter by status.message

* Introduced in: 9.7

|onboard.enabled
|boolean
|query
|False
a|Filter by onboard.enabled

|onboard.key_backup
|string
|query
|False
a|Filter by onboard.key_backup

* Introduced in: 9.7

|enabled
|boolean
|query
|False
a|Filter by enabled

* Introduced in: 9.16
```

```
|is_default_data_at_rest_encryption_disabled
|boolean
|query
|False
a|Filter by is_default_data_at_rest_encryption_disabled

* Introduced in: 9.7

|volume_encryption.message
|string
|query
|False
a|Filter by volume_encryption.message

* Introduced in: 9.7

|volume_encryption.supported
|boolean
|query
|False
a|Filter by volume_encryption.supported

* Introduced in: 9.7

|volume_encryption.code
|integer
|query
|False
a|Filter by volume_encryption.code

* Introduced in: 9.7

|external.client_certificate.name
|string
|query
|False
a|Filter by external.client_certificate.name

* Introduced in: 9.8
```

```
|external.client_certificate.uuid
|string
|query
|False
a|Filter by external.client_certificate.uuid

|external.servers.connectivity.node_states.node.name
|string
|query
|False
a|Filter by external.servers.connectivity.node_states.node.name

* Introduced in: 9.13

|external.servers.connectivity.node_states.node.uuid
|string
|query
|False
a|Filter by external.servers.connectivity.node_states.node.uuid

* Introduced in: 9.13

|external.servers.connectivity.node_states.state
|string
|query
|False
a|Filter by external.servers.connectivity.node_states.state

* Introduced in: 9.13

|external.servers.connectivity.cluster_availability
|boolean
|query
|False
a|Filter by external.servers.connectivity.cluster_availability

* Introduced in: 9.7

|external.servers.username
|string
|query
|False
```

```
a|Filter by external.servers.username

|external.servers.server
|string
|query
|False
a|Filter by external.servers.server

|external.servers.timeout
|integer
|query
|False
a|Filter by external.servers.timeout

* Max value: 60
* Min value: 1

|external.servers.secondary_key_servers
|string
|query
|False
a|Filter by external.servers.secondary_key_servers

* Introduced in: 9.8

|external.server_ca_certificates.name
|string
|query
|False
a|Filter by external.server_ca_certificates.name

* Introduced in: 9.8

|external.server_ca_certificates.uuid
|string
|query
|False
a|Filter by external.server_ca_certificates.uuid

|uuid
|string
```

```
|query
|False
a|Filter by uuid

|scope
|string
|query
|False
a|Filter by scope

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Max value: 120
* Min value: 0
* Default value: 15

|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.
```

```
* Default value: 1

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

[#connectivity]
[.api-collapsible-fifth-title]
connectivity

This property contains the key server connectivity state of all nodes in
the cluster.
This is an advanced property; there is an added computational cost to
retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|cluster_availability
|boolean
a|Set to true when key server connectivity state is available on all nodes
of the cluster.
```

```
|node_states
|array[link:#key_server_state[key_server_state]]
a|An array of key server connectivity states for each node.

|===

retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

|secondary_key_servers
|string
a|A comma delimited string of the secondary key servers associated with
the primary key server.

|server
|string
a|External key server for key management. If no port is provided, a
default port of 5696 is used.

|timeout
|integer
```

```
a|I/O timeout in seconds for communicating with the key server.

|username
|string
a|Username credentials for connecting with the key server.

|===

[#external]
[.api-collapsible-fifth-title]
external

Configures external key management

|Type
|Description

|client_certificate
|link:#client_certificate[client_certificate]
a|Client certificate (name and UUID)

|server_ca_certificates
|array[link:#server_ca_certificates[server_ca_certificates]]
a|The array of certificates that are common for all the keyservers per
SVM.

|servers
|array[link:#key_server_readcreate[key_server_readcreate]]
a|The set of external key servers.

|===

[#onboard]
[.api-collapsible-fifth-title]
onboard
```

```
Configures onboard key management. After configuring onboard key
management, save the encrypted configuration data in a safe location so
that you can use it if you need to perform a manual recovery operation.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|enabled
|boolean
a|Is the onboard key manager enabled?

|existing_passphrase
|string
a|The cluster-wide passphrase. This is not audited.

|key_backup
|string
a|Backup of the onboard key manager's key hierarchy. It is required to
save this backup after configuring the onboard key manager to help in the
recovery of the cluster in case of catastrophic failures.

|===

[#status]
[.api-collapsible-fifth-title]
status

Optional status information on the current state of the key manager
indicating if it is fully setup or requires more action.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|code
|integer
```

```
a|Code corresponding to the status message. Returns 0 if the setup is
complete. This is an advanced property; there is an added computational
cost to retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

|message
|string
a|Current state of the key manager indicating any additional steps to
perform to finish the setup. This is an advanced property; there is an
added computational cost to retrieving its value. The property is not
populated for either a collection GET or an instance GET unless it is
explicitly requested using the `fields` query parameter or GET for all
advanced properties is enabled.

|===

[#svm]
[.api-collapsible-fifth-title]
svm

SVM, applies only to SVM-scoped objects.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|_links
|link:#_links[_links]
a|

|name
|string
a|The name of the SVM. This field cannot be specified in a PATCH method.

|uuid
|string
a|The unique identifier of the SVM. This field cannot be specified in a
PATCH method.
```

```
|===

[#volume_encryption]
[.api-collapsible-fifth-title]
volume_encryption

Indicates whether volume encryption is supported in the cluster.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|code
|integer
a|Code corresponding to the status message. Returns a 0 if volume
encryption is supported in all nodes of the cluster.

|message
|string
a|Reason for not supporting volume encryption.

|supported
|boolean
a|Set to true when volume encryption support is available on all nodes of
the cluster.

|===

[#security_key_manager]

//end collapsible .Definitions block
====

[[IDae6c0e5b752fd132157ad8a4d4c6adf5]]
= Create a key manager

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/security/key-managers`#
```

```
*Introduced In:* 9.6

Creates a key manager.

== Required properties

* `svm.uuid` or `svm.name` - Existing SVM in which to create a key
manager.
* `external.client_certificate` - Client certificate. Required only when
creating an external key manager.
* `external.server_ca_certificates` - Server CA certificates. Required
only when creating an external key manager.
* `external.servers.server` - Primary Key servers. Required only when
creating an external key manager.
* `onboard.passphrase` - Cluster-wide passphrase. Required only when
creating an Onboard Key Manager.
* `synchronize` - Synchronizes missing onboard keys on any node in the
cluster. Required only when creating an Onboard Key Manager at the partner
site of a MetroCluster configuration.

== Optional parameters:

* `create_inactive` - Create a configuration without enabling it. This
flag is set to "false" by default.

== Related ONTAP commands

* `security key-manager external enable`
* `security key-manager onboard enable`
* `security key-manager onboard sync`

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|create_inactive
|boolean
|query
|False
```

```
a|Indicates whether to create an active or inactive configuration.

* Introduced in: 9.16

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When doing a POST, PATCH, or DELETE operation on a single record, the
default is 0 seconds.  This means that if an asynchronous operation is
started, the server immediately returns HTTP code 202 (Accepted) along
with a link to the job.  If a non-zero value is specified for POST, PATCH,
or DELETE operations, ONTAP waits that length of time to see if the job
completes so it can return something other than 202.

* Default value: 0
* Max value: 120
* Min value: 0

|return_records
|boolean
|query
|False
a|The default is false.  If set to true, the records are returned.

* Default value:

|===

== Request Body

ONTAP Error Response Codes

|===
| Error Code | Description

| 262224
| Failed to contact the peer cluster.

| 262228
| Failed to contact the peer cluster.

| 65536038
| A maximum of 4 active primary key servers are allowed.

| 65536214
| Failed to generate cluster key encryption key.

| 65536216
| Failed to add cluster key encryption key.

| 65536310
| Failed to setup the Onboard Key Manager because the MetroCluster peer is
unhealthy.

| 65536341
| Failed to setup the Onboard Key Manager because the MetroCluster peer is
unhealthy.

| 65536508
| The platform does not support data at rest encryption.

| 65536821
| The certificate is not installed.

| 65536823
| The SVM has key manager already configured.

| 65536824
| Multitenant key management is not supported in MetroCluster
configurations.
```

```
| 65536834
| Failed to get existing key-server details for the SVM.

| 65536852
| Failed to query supported KMIP protocol versions.

| 65536870
| Key management servers already configured.

| 65536871
| Duplicate key management servers exist.

| 65536876
| External key management requires client and server CA certificates
installed and with one or more key servers provided.

| 65536878
| External key management cannot be configured as one or more volume
encryption keys of the SVM are stored in cluster key management server.

| 65536895
| External key manager cannot be configured because this cluster is part
of a MetroCluster configuration and the partner site of this MetroCluster
configuration has Onboard Key Manager configured.

| 65536900
| The Onboard Key Manager cannot be configured because this cluster is
part of a MetroCluster configuration and the partner site has the external
key manager configured.

| 65536903
| The Onboard Key Manager has failed to configure on some nodes in the
cluster. Use the CLI to sync the Onboard Key Manager configuration on
failed nodes.

| 65536906
| The Onboard Key Manager has already been configured at the partner site.
Use the CLI to sync the Onboard Key Manager with the same passphrase.

| 65536916
| The Onboard Key Manager is only supported for an admin SVM.

| 65536920
| The Onboard Key Manager passphrase length is incorrect.

| 65537240
| The Onboard Key Manager passphrase must be provided when performing a
```

```
POST/synchronize operation.

| 65537241
| The Onboard Key Manager existing_passphrase must not be provided when
performing a POST/synchronize operation.

| 65537244
| Unable to sync/create Onboard Key Manager on the local cluster; Onboard
Key Manager is already configured on the cluster.

| 65537245
| Unable to sync/create Onboard Key Manager on the local cluster; Onboard
Key Manager is not configured on the partner cluster.

| 65537246
| Unable to sync/create Onboard Key Manager on local cluster. This cluster
is not part of a MetroCluster configuration.

| 65537247
| Internal error. Unable to sync the Onboard Key Manager on local cluster.

| 65537248
| Unable to sync the Onboard Key Manager on local cluster.

| 65538111
| The key manager policy is invalid.

| 65538120
| The key manager policy is not supported on the admin SVM.

| 65539216
| The Admin SVM has a key manager already configured.

| 65539221
| Failed to configure the Onboard Key Manager because the MetroCluster
peer cluster is unhealthy. Verify that the peer cluster is online and
healthy.

| 65539500
| Cannot create an inactive external key manager on this SVM because
inactive external key managers can only be created on the admin SVM.

| 65539501
| Cannot create an inactive external key manager on the admin SVM because
an external key manager already exists on the admin SVM.

| 65539503
```

```
| Cannot create an inactive external key manager on the admin SVM while
MetroCluster is configured.

| 65539504
| An effective cluster version of ONTAP 9.16.1 or later is required to
create an inactive external key manager on the admin SVM.

| 65539511
| Cannot create an inactive Onboard Key Manager on the admin SVM while
MetroCluster is configured.

| 65539512
| An effective cluster version of ONTAP 9.16.1 or later is required to
create an inactive Onboard Key Manager configuration on the admin SVM.

| 65539580
| Failed to create inactive Onboard Key Manager configuration.

| 65539581
| Cannot create an inactive Onboard Key Manager on the admin SVM because
an inactive Onboard Key Manager configuration already exists on the admin
SVM.

| 65539582
| Cannot specify the configuration name parameter. Only one Onboard Key
Manager is supported for the admin SVM.

| 65539704
| The key manager cannot be configured because the SVM has NAE volumes.

| 65539706
| The Onboard Key Manager is already configured. Use the PATCH to sync all
nodes with the Onboard Key Manager configuration.

| 66060338
| Failed to establish secure connection for a key management server due to
incorrect server_ca certificates.

| 66060339
| Failed to establish secure connection for a key management server due to
incorrect client certificates.

| 66060340
| Failed to establish secure connection for a key management server due to
Cryptsoft error.

[.api-collapsible-fifth-title]
key_server_readcreate

[cols=3*,options=header]
|===
|Name
|Type
|Description

|secondary_key_servers
|string
a|A comma delimited string of the secondary key servers associated with
the primary key server.

|server
|string
a|External key server for key management. If no port is provided, a
default port of 5696 is used.

|timeout
|integer
a|I/O timeout in seconds for communicating with the key server.

|username
|string
a|Username credentials for connecting with the key server.

|===

[#external]
[.api-collapsible-fifth-title]
external

Configures external key management

[cols=3*,options=header]
```

```
|===
|Name
|Type
|Description

|client_certificate

a|The array of certificates that are common for all the keyservers per
SVM.

|servers
|array[link:#key_server_readcreate[key_server_readcreate]]
a|The set of external key servers.

|===

[#onboard]
[.api-collapsible-fifth-title]
onboard

Configures onboard key management. After configuring onboard key
management, save the encrypted configuration data in a safe location so
that you can use it if you need to perform a manual recovery operation.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|enabled
|boolean
a|Is the onboard key manager enabled?

|existing_passphrase
|string
a|The cluster-wide passphrase. This is not audited.
```

```
|key_backup
|string
a|Backup of the onboard key manager's key hierarchy. It is required to
save this backup after configuring the onboard key manager to help in the
recovery of the cluster in case of catastrophic failures.

|passphrase
|string
a|The cluster-wide passphrase. This is not audited.

|synchronize
|boolean
a|Synchronizes missing onboard keys on any node in the cluster. If a node
is added to a cluster that has onboard key management configured, the
synchronize operation needs to be performed in a PATCH operation. In a
MetroCluster configuration, if onboard key management is enabled on one
site, then the synchronize operation needs to be run as a POST operation
on the remote site providing the same passphrase.

|===

[#status]
[.api-collapsible-fifth-title]
status

Optional status information on the current state of the key manager
indicating if it is fully setup or requires more action.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|code
|integer
a|Code corresponding to the status message. Returns 0 if the setup is
complete. This is an advanced property; there is an added computational
cost to retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
```

```
the `fields` query parameter or GET for all advanced properties is
enabled.

|message
|string
a|Current state of the key manager indicating any additional steps to
perform to finish the setup. This is an advanced property; there is an
added computational cost to retrieving its value. The property is not
populated for either a collection GET or an instance GET unless it is
explicitly requested using the `fields` query parameter or GET for all
advanced properties is enabled.

|===

[#svm]
[.api-collapsible-fifth-title]
svm

SVM, applies only to SVM-scoped objects.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|name
|string
a|The name of the SVM. This field cannot be specified in a PATCH method.

|uuid
|string
a|The unique identifier of the SVM. This field cannot be specified in a
PATCH method.

|===

[#volume_encryption]
[.api-collapsible-fifth-title]
volume_encryption
```

```
Indicates whether volume encryption is supported in the cluster.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|code
|integer
a|Code corresponding to the status message. Returns a 0 if volume
encryption is supported in all nodes of the cluster.

|message
|string
a|Reason for not supporting volume encryption.

|supported
|boolean
a|Set to true when volume encryption support is available on all nodes of
the cluster.

|===

[#security_key_manager]
[.api-collapsible-fifth-title]
security_key_manager

[cols=3*,options=header]
|===
|Name
|Type
|Description

|configuration
|link:#configuration[configuration]
a|Security keystore object reference.

|enabled
|boolean
```

```
a|Indicates whether the configuration is enabled.

|external
|link:#external[external]
a|Configures external key management

|onboard
|link:#onboard[onboard]
a|Configures onboard key management. After configuring onboard key
management, save the encrypted configuration data in a safe location so
that you can use it if you need to perform a manual recovery operation.

|policy
|string
a|Security policy associated with the key manager. This value is currently
ignored if specified for the onboard key manager.

|svm
|link:#svm[svm]
a|SVM, applies only to SVM-scoped objects.

|uuid
|string
a|

|===

[#job_link]
[.api-collapsible-fifth-title]
job_link

[cols=3*,options=header]
|===
|Name
|Type
|Description

|uuid
|string
a|The UUID of the asynchronous job that is triggered by a POST, PATCH, or
DELETE operation.
```

```
|===

[[ID4890eb16044f6754546f515b140c3ea8]]
= Retrieve key managers

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/security/key-managers/{uuid}`#

*Introduced In:* 9.6

Retrieves key managers.

== Expensive properties

There is an added computational cost to retrieving these properties. They
are excluded from default GET results and must be explicitly requested
```

```
using the `fields` query parameter. For more details, see
xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requestin
g_specific_fields[Requesting specific fields]. Additionally, these fields
are unavailable for inactive configurations as they are only relevant to
active configurations.

* `status.message`
* `status.code`

== Examples

* To retrieve basic information about a key manager:

----
GET /security/key-managers/{uuid}
----

* To retrieve specific fields, including expensive properties:

----
GET /security/key-managers/{uuid}?fields=status.message
----

== Related ONTAP commands

* `security key-manager show-key-store`
* `security key-manager external show`
* `security key-manager external show-status`
* `security key-manager onboard show-backup`

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|uuid
|string
|path
|True
a|Key manager UUID
```

```
|fields
|array[string]
|query
|False
a|Specify the fields to return.

|===

== Response
```

Status: 200, Ok

```
[cols=3*,options=header]
|===
|Name
|Type
|Description

|_links
|link:#_links[_links]
a|

|configuration
|link:#configuration[configuration]
a|Security keystore object reference.

|enabled
|boolean
a|Indicates whether the configuration is enabled.

|external
|link:#external[external]
a|Configures external key management

|is_default_data_at_rest_encryption_disabled
|boolean
a|Indicates whether default data-at-rest encryption is disabled in the
cluster. This field is deprecated in ONTAP 9.8 and later. Use the
"software_data_encryption.disabled_by_default" of /api/security endpoint.

* Default value: 1
```

```
* Introduced in: 9.7
* x-ntap-readModify: true
* x-nullable: true

|onboard
|link:#onboard[onboard]
a|Configures onboard key management. After configuring onboard key
management, save the encrypted configuration data in a safe location so
that you can use it if you need to perform a manual recovery operation.

|policy
|string
a|Security policy associated with the key manager. This value is currently
ignored if specified for the onboard key manager.

|scope
|string
a|Set to "svm" for interfaces owned by an SVM. Otherwise, set to
"cluster".

|status
|link:#status[status]
a|Optional status information on the current state of the key manager
indicating if it is fully setup or requires more action.

|svm
|link:#svm[svm]
a|SVM, applies only to SVM-scoped objects.

|uuid
|string
a|

|array[link:#key_server_readcreate[key_server_readcreate]]
a|The set of external key servers.

|===
```

```
[#onboard]
[.api-collapsible-fifth-title]
onboard

Configures onboard key management. After configuring onboard key
management, save the encrypted configuration data in a safe location so
that you can use it if you need to perform a manual recovery operation.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|enabled
|boolean
a|Is the onboard key manager enabled?

|existing_passphrase
|string
a|The cluster-wide passphrase. This is not audited.

|key_backup
|string
a|Backup of the onboard key manager's key hierarchy. It is required to
save this backup after configuring the onboard key manager to help in the
recovery of the cluster in case of catastrophic failures.

|===

[#status]
[.api-collapsible-fifth-title]
status

Optional status information on the current state of the key manager
indicating if it is fully setup or requires more action.

[cols=3*,options=header]
|===
|Name
```

```
|Type
|Description

|code
|integer
a|Code corresponding to the status message. Returns 0 if the setup is
complete. This is an advanced property; there is an added computational
cost to retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

|message
|string
a|Current state of the key manager indicating any additional steps to
perform to finish the setup. This is an advanced property; there is an
added computational cost to retrieving its value. The property is not
populated for either a collection GET or an instance GET unless it is
explicitly requested using the `fields` query parameter or GET for all
advanced properties is enabled.

[[IDd1c623f4bd46583a9502cfabbb635523]]
= Update key managers

[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-
block]#`/security/key-managers/{uuid}`#

*Introduced In:* 9.6

Updates a key manager.
*Note:* When validate_certificates is set, the API returns a 202 status
code for successful creation of the job, otherwise an error is returned.

== Required properties (when patching the Onboard Key Manager)

* `onboard.existing_passphrase` - Cluster-wide passphrase. Required only
when synchronizing the passphrase of the Onboard Key Manager.
* `synchronize` - Synchronizes missing Onboard Key Manager keys on any
node in the cluster. Required only when synchronizing the Onboard Key
Manager keys in a local cluster.

== Required properties (when patching an external key manager)

* `external.client_certificate` or `external.server_ca_certificates` -
Client certificate or Server CA certificate. Required when modifying an
external key manager.

== Optional parameters (when patching an external key manager):

* `validate_certificates` - Validate certificates by testing the
connection to the KMIP server using them. This flag is set to "false" by
default.

== Related ONTAP commands

* `security key-manager external modify`
* `security key-manager onboard sync`
* `security key-manager onboard update-passphrase`
```

```
== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|uuid
|string
|path
|True
a|Key manager UUID

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When doing a POST, PATCH, or DELETE operation on a single record, the
default is 0 seconds.  This means that if an asynchronous operation is
started, the server immediately returns HTTP code 202 (Accepted) along
with a link to the job.  If a non-zero value is specified for POST, PATCH,
or DELETE operations, ONTAP waits that length of time to see if the job
completes so it can return something other than 202.

* Default value: 0
* Max value: 120
* Min value: 0

|===

== Request Body

[cols=3*,options=header]
|===
|Name
|Type
|Description
```

```
|enabled
|boolean
a|Indicates whether the configuration is enabled.

|external
|link:#external[external]
a|Configures external key management

|is_default_data_at_rest_encryption_disabled
|boolean
a|Indicates whether default data-at-rest encryption is disabled in the
cluster. This field is deprecated in ONTAP 9.8 and later. Use the
"software_data_encryption.disabled_by_default" of /api/security endpoint.

* Default value: 1
* Introduced in: 9.7
* x-ntap-readModify: true
* x-nullable: true

|onboard
|link:#onboard[onboard]
a|Configures onboard key management. After configuring onboard key
management, save the encrypted configuration data in a safe location so
that you can use it if you need to perform a manual recovery operation.

[#onboard]
[.api-collapsible-fifth-title]
onboard

Configures onboard key management. After configuring onboard key
management, save the encrypted configuration data in a safe location so
that you can use it if you need to perform a manual recovery operation.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|enabled
|boolean
a|Is the onboard key manager enabled?

|existing_passphrase
|string
a|The cluster-wide passphrase. This is not audited.

|key_backup
|string
a|Backup of the onboard key manager's key hierarchy. It is required to
save this backup after configuring the onboard key manager to help in the
recovery of the cluster in case of catastrophic failures.

|passphrase
|string
a|The cluster-wide passphrase. This is not audited.

|synchronize
|boolean
a|Synchronizes missing onboard keys on any node in the cluster. If a node
is added to a cluster that has onboard key management configured, the
synchronize operation needs to be performed in a PATCH operation. In a
```

```
MetroCluster configuration, if onboard key management is enabled on one
site, then the synchronize operation needs to be run as a POST operation
on the remote site providing the same passphrase.

|===

[#status]
[.api-collapsible-fifth-title]
status

Optional status information on the current state of the key manager
indicating if it is fully setup or requires more action.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|code
|integer
a|Code corresponding to the status message. Returns 0 if the setup is
complete. This is an advanced property; there is an added computational
cost to retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

|message
|string
a|Current state of the key manager indicating any additional steps to
perform to finish the setup. This is an advanced property; there is an
added computational cost to retrieving its value. The property is not
populated for either a collection GET or an instance GET unless it is
explicitly requested using the `fields` query parameter or GET for all
advanced properties is enabled.

= Manage authentication keys

:leveloffset: +1

[[ID4e77d8161572ce583b25d92e59f40650]]
= Manage authentication keys

:doctype: book

== Overview

Used to create and list authentication keys (NSE-AK).

== Example

=== Creates an authentication key.
```

```
NOTE: an external key  manager must be configured on the admin SVM, as the
authentication key will be associated with the admin SVM.
The following example shows how to create an authentication key.

----

# The API:
POST /api/security/key-managers/{security_key_manager.uuid}/auth-keys

# The call:
curl -X POST 'https://<mgmt-ip>/api/security/key-managers/5fb1701a-d922-
11e8-bfe8-005056bb017d/auth-keys?return_timeout=15&return_records=true' -H
'accept: application/hal+json'

# The response:
{
"num_records": 1,
"records": [
  {
    "key_id":
"00000000000000000020000000000100531d8cdc38437c2627b6b1726dd2675c000000000
0000000",
    "key_tag": "vsim1"
  }
]
}
----

'''

=== Retrieving a list of all of the authentication keys associated with
the admin SVM.

The following example shows how to retrieve a list of all of the
authentication keys associated with the admin SVM.

----

# The API:
GET /api/security/key-managers/{security_key_manager.uuid}/auth-keys

# The call:
curl -X GET 'https://<mgmt-ip>/api/security/key-managers/5fb1701a-d922-
11e8-bfe8-005056bb017d/auth-keys?fields=*' -H 'accept:
application/hal+json'

# The response:
```

```
{
"num_records": 2,
"records": [
  {
    "security_key_manager": {
      "uuid": "d36a654d-14b4-11ed-b82e-005056bb8f59"
    },
    "key_id":
"000000000000000002000000000000100052ab79fc51a430dbb16f1c0d2054cfe000000000
0000000",
    "key_tag": "vsim1"
  },
  {
    "security_key_manager": {
      "uuid": "d36a654d-14b4-11ed-b82e-005056bb8f59"

"000000000000000002000000000001003f32ce2dc55d2764c07da74e722c179b000000000
0000000",
    "key_tag": "vsim1"
  }
]
}
----

'''

=== Retrieving a specific authentication key associated with the admin
SVM.

The following example shows how to a specific authentication key
associated with the admin SVM and return the key-tag.
```

The API:

GET /api/security/key-managers/{security_key_manager.uuid}/auth-keys/{key-id}

The call:

curl -X GET 'https://<mgmt-ip>/api/security/key-managers/5fb1701a-d922-11e8-bfe8-005056bb017d/auth-keys/0000000000000000020000000000010041a2dda969b0d179db8f1c78d629d0f10000000000000000?fields=key_tag' -H 'accept: application/hal+json'</mgmt-ip>

The response:

{ "security_key_manager": { "uuid": "d36a654d-14b4-11ed-b82e-005056bb8f59" }, "key_id": "0000000000000000020000000000010041a2dda969b0d179db8f1c78d629d0f10000000000000000",

"key_tag": "vsim1" }

Retrieve authentication keys associated with the admin SVM

GET `/security/key-managers/{security_key_manager.uuid}/auth-keys`

Introduced In: 9.12

Retrieves a list of all authentication keys associated with the admin SVM.

Related ONTAP commands

- `security key-manager key query`

Required properties

- `security_key_manager.uuid` - UUID of the external key manager.

Parameters

Name	Type	In	Required	Description
key_tag	string	query	False	Filter by key_tag
key_id	string	query	False	Filter by key_id
security_key_manager.uuid	string	path	True	External key manager UUID
fields	array[string]	query	False	Specify the fields to return.
max_records	integer	query	False	Limit the number of records returned.

Name	Type	In	Required	Description
return_timeout	integer	query	False	The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached. • Default value: 15 • Max value: 120 • Min value: 0
return_records	boolean	query	False	The default is true for GET calls. When set to false, only the number of records is returned. • Default value: 1
order_by	array[string]	query	False	Order results by specified fields and optional [asc

Response

[[ID96459ba7edbe5ac63d2003872cad33e6]]
= Retrieve and restore unrestored keys

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/security/key-managers/{security_key_manager.uuid}/restore`#

*Introduced In:* 9.13

Retrieves and restores any current unrestored keys (associated with the
storage controller) from the specified key management server.

== Required properties

* `security_key_manager.uuid` - UUID of the key management server.
The UUID of the external key manager can be retrieved using [`GET
/api/security/key-managers`].
```

```
== Related ONTAP commands

* `security key-manager external restore`

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|security_key_manager.uuid
|string
|path
|True
a|Key manager UUID.

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When doing a POST, PATCH, or DELETE operation on a single record, the
default is 0 seconds.  This means that if an asynchronous operation is
started, the server immediately returns HTTP code 202 (Accepted) along
with a link to the job.  If a non-zero value is specified for POST, PATCH,
or DELETE operations, ONTAP waits that length of time to see if the job
completes so it can return something other than 202.

* Default value: 0
* Max value: 120
* Min value: 0

|return_records
|boolean
|query
|False
a|The default is false.  If set to true, the records are returned.
```

```
* Default value:

= Migrate SVM keys between security key managers

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/security/key-managers/{source.uuid}/migrate`#

*Introduced In:* 9.7

Migrates the keys belonging to an SVM between the cluster's key manager
```

```
and the SVM's key manager. This operation can run for several minutes.

== Required properties

* `source.uuid` - UUID of the source key manager.
* `uuid` - UUID of the destination key manager.
The UUID of onboard and external KMIP key manager can be fetched using
[`GET /api/security/key-managers`].
The UUID of Azure Key Vault key manager can be fetched using [`GET
/api/security/azure-key-vaults`].
The UUID of Google Cloud key manager can be fetched using [`GET
/api/security/gcp-kms`].
The UUID of Amazon Web Services key manager can be fetched using [`GET
/api/security/aws-kms`].

== Related ONTAP commands

* `security key-manager key migrate`

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|source.uuid
|string
|path
|True
a|Migration source key manager UUID

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When doing a POST, PATCH, or DELETE operation on a single record, the
default is 0 seconds.  This means that if an asynchronous operation is
started, the server immediately returns HTTP code 202 (Accepted) along
with a link to the job.  If a non-zero value is specified for POST, PATCH,
```

```
or DELETE operations, ONTAP waits that length of time to see if the job
completes so it can return something other than 202.

* Default value: 0
* Max value: 120
* Min value: 0

|return_records
|boolean
|query
|False
a|The default is false.  If set to true, the records are returned.

* Default value:

```
ONTAP Error Response Codes

|===
| Error Code | Description

| 65536886
| The specified migration option is not supported in this release.

| 65536959
| The source-uuid and UUID must be different values.
```

| 65536968
| Check that all nodes of the cluster are healthy and retry the operation.

| 65537117
| The migrate operation cannot be started because a UUID cannot be converted to an SVM name.

| 65537117
| Cannot start migration because a key manager referenced by a provided UUID does not exist.

| 65537551
| Top-level internal key protection key (KEK) is unavailable on one or more nodes.

| 65537552
| Embedded KMIP server status is not available.

| 65537564
| Check that the Azure Key Vault Service is healthy and retry the operation.

| 65537611
| Key migration cannot be performed on the SVM while the enabled keystore configuration is being switched. If a previous attempt to switch the keystore configuration failed, or was interrupted, the system will continue to prevent key migration for the SVM. Use the REST API PATCH method "/api/security/key-stores/\{uuid}" to re-run and complete the operation.

| 65537720
| Failed to configure the Google Cloud Key Management Service for an SVM because a key manager is already configured.

| 65537736
| Check that the Google Cloud Key Management Service is healthy and retry the operation.

| 65538107
| Key migration to an IBM Key Lore key manager is not supported.

| 65539434
| Cannot perform key migration on the SVM while the keystore is being initialized. Wait until the keystore is in the active state, and rerun the key migration operation.

```
| 65539435
| Cannot perform key migration on the SVM while the keystore is being
disabled.

= List key servers configured in an external key manager
```

```
[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/security/key-managers/{uuid}/key-servers`#

*Introduced In:* 9.6

Retrieves the list of key servers configured in an external key manager.

== Expensive properties

There is an added computational cost to retrieving these properties. They
are excluded from default GET results and must be explicitly requested
using the `fields` query parameter. For more details, see
xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requestin
g_specific_fields[Requesting specific fields]. Additionally, these fields
are unavailable for inactive configurations as they are only relevant to
active configurations.

* `connectivity.cluster_availability`
* `connectivity.node_states.node.name`
* `connectivity.node_states.node.uuid`
* `connectivity.node_states.state`

== Examples

* To retrieve basic information about a key server:
+
----
GET /security/key-managers/{uuid}/key-servers
----

* To retrieve specific fields, including expensive properties:
+
----
GET /security/key-managers/{uuid}/key-
servers?fields=connectivity.cluster_availability,connectivity.node_states.
node.name
----

== Related ONTAP commands

* `security key-manager external show`
* `security key-manager external show-status`

== Parameters

a|Filter by connectivity.node_states.state

* Introduced in: 9.13

|connectivity.cluster_availability
|boolean
|query
|False
a|Filter by connectivity.cluster_availability

* Introduced in: 9.7
```

```
|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Max value: 120
* Min value: 0
* Default value: 15

|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

```
ONTAP Error Response Codes

|===
| Error Code | Description

| 65536600
| Cannot remove a key server while a node is out of quorum.

| 65536700
| The key server contains keys that are currently in use and not available
from any other configured key server in the SVM.

| 65536843
| The key management server is not configured for the SVM.
|===

= Retrieve key servers configured in an external key manager

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/security/key-managers/{uuid}/key-servers/{server}`#
```

```
*Introduced In:* 9.6

Retrieves key servers configured in an external key manager.

== Expensive properties

There is an added computational cost to retrieving these properties. They
are excluded from default GET results and must be explicitly requested
using the `fields` query parameter. For more details, see
xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requestin
g_specific_fields[Requesting specific fields]. Additionally, these fields
are unavailable for inactive configurations as they are only relevant to
active configurations.

* `connectivity.cluster_availability`
* `connectivity.node_states.node.name`
* `connectivity.node_states.node.uuid`
* `connectivity.node_states.state`

== Examples

* To retrieve basic information about a key server:
+
----
GET /security/key-managers/{uuid}/key-servers/{server}
----

* To retrieve specific fields, including expensive properties:
+
----
GET /security/key-managers/{uuid}/key-
servers/{server}?fields=connectivity.cluster_availability,connectivity.nod
e_states.node.name
----

== Related ONTAP commands

* `security key-manager external show`
* `security key-manager external show-status`

== Parameters

[cols=5*,options=header]
|===
```

```
|Name
|Type
|In
|Required
|Description

|uuid
|string
|path
|True
a|External key manager UUID

|server
|string
|path
|True
a|Primary Key server configured in the key manager.

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|===

== Response
```

Status: 200, Ok

```

|Description

|_links
|link:#_links[_links]
a|

|connectivity
|link:#connectivity[connectivity]
a|This property contains the key server connectivity state of all nodes in
the cluster.
```

```
This is an advanced property; there is an added computational cost to
retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

|create_remove_timeout
|integer
a|The key server timeout for create and remove operations.
-1 indicates that the server will wait indefinitely for the event to
occur. 0 indicates that the server will not wait and will immediately
timeout if it does not receive a response.

|password
|string
a|Password credentials for connecting with the key server. This is not
audited.

|secondary_key_servers
|array[string]
a|A list of the secondary key servers associated with the primary key
server.

|server
|string
a|External key server for key management. If no port is provided, a
default port of 5696 is used. Not valid in POST if `records` is provided.

|timeout
|integer
a|I/O timeout in seconds for communicating with the key server.
-1 indicates that the server will wait indefinitely for the event to
occur. 0 indicates that the server will not wait and will immediately
timeout if it does not receive a response.

|username
|string
a|KMIP username credentials for connecting with the key server.

= Manage keystores

:leveloffset: +1

[[ID2255dac52e0e6e336362eaa81a1e9e16]]
= Manage keystores

== Overview

A keystore describes a key-manager configuration, specifically the type of
key-manager and whether the configuration is currently enabled for the
configured SVM.

== Examples

'''

=== Retrieving information for all configured key managers

The following example shows how to retrieve information about all
configured key managers.
```

```
----

# The API:
GET /api/security/key-stores

# The call:
curl -X GET 'https://<mgmt-ip>/api/security/key-stores?fields=*' -H
'accept: application/hal+json'

# The response:
{
"records": [
  {
    "type": "okm",
    "configuration": {
      "name": "default",
      "uuid": "ec8711c9-4e9f-11ef-b477-005056bb677e"
    },
    "uuid": "ec8711c9-4e9f-11ef-b477-005056bb677e",
    "enabled": true,
    "location": "onboard",
    "scope": "cluster",
    "state": "active"
  },
  {
    "type": "kmip",
    "configuration": {
      "name": "default",
      "uuid": "d81f43cd-4e9f-11ef-b477-005056bb677e"
    },
    "uuid": "d81f43cd-4e9f-11ef-b477-005056bb677e",
    "enabled": false,
    "location": "external",
    "scope": "cluster"
  },
  {
    "type": "kmip",
    "configuration": {
      "name": "default",
      "uuid": "7da22185-4ea0-11ef-b477-005056bb677e"
    },
    "uuid": "7da22185-4ea0-11ef-b477-005056bb677e",
    "enabled": true,
    "location": "external",
    "scope": "svm",
```

```
    "svm": {
      "name": "vs0",
      "uuid": "3cbe691b-4ea0-11ef-b477-005056bb677e"
    },
    "state": "active"
  }
],
"num_records": 3
}
----

'''

=== Retrieving a specific keystore by its UUID

The following example shows how to retrieve information about a specific
keystore.

----

# The API:
GET /api/security/key-stores/{uuid}

# The call:
curl -X GET 'https://<mgmt-ip>/api/security/key-stores/33421d82-0a8d-11ec-
ae88-005056bb5955?fields=*' -H 'accept: application/hal+json'

# The response:
{
"type": "okm",
"configuration": {
  "name": "default",
  "uuid": "ec8711c9-4e9f-11ef-b477-005056bb677e"
},
"uuid": "ec8711c9-4e9f-11ef-b477-005056bb677e",
"enabled": true,
"location": "onboard",
"scope": "cluster",
"state": "active"
}
----

'''

=== Enabling a specific keystore configuration

The following example shows how to enable a specific keystore
```

```
configuration.

----

# The API:
PATCH /api/security/key-stores/{uuid}

# The call:
curl -X PATCH 'https://<mgmt-ip>/api/security/key-stores/33421d82-0a8d-
11ec-ae88-005056bb5955' -H 'accept: application/hal+json' -d "{
\"enabled\": true }"
----

'''

=== Deleting a specific keystore configuration

The following example shows how to delete a specific keystore
configuration. Only an inactive configuration can be deleted.

----

# The API:
DELETE /api/security/key-stores/{uuid}

# The call:
curl -X DELETE 'https://<mgmt-ip>/api/security/key-stores/33421d82-0a8d-
11ec-ae88-005056bb5955' -H 'accept: application/hal+json'
----

'''

|enabled
|boolean
|query
|False
a|Filter by enabled

* Introduced in: 9.14

|type
|string
|query
|False
a|Filter by type

|location
|string
|query
|False
a|Filter by location

|uuid
|string
|query
|False
a|Filter by uuid

|scope
|string
|query
|False
a|Filter by scope

* Introduced in: 9.14
```

```
|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 15
* Max value: 120
* Min value: 0

|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

[[ID9f928d94fc6ef3bdc43c8590a2b81753]]
= Enable a keystore configuration

[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-
block]#`/security/key-stores/{uuid}`#

*Introduced In:* 9.14

Enables a keystore configuration

== Related ONTAP commands

* `security key-manager keystore enable`
* `security key-manager keystore disable`

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description
```

```
|uuid
|string
|path
|True
a|Keystore configuration UUID

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When doing a POST, PATCH, or DELETE operation on a single record, the
default is 0 seconds.  This means that if an asynchronous operation is
started, the server immediately returns HTTP code 202 (Accepted) along
with a link to the job.  If a non-zero value is specified for POST, PATCH,
or DELETE operations, ONTAP waits that length of time to see if the job
completes so it can return something other than 202.

* Default value: 0
* Max value: 120
* Min value: 0

ONTAP Error Response Codes

|===
| Error Code | Description

| 262155
| This operation requires an effective cluster version of 9.14.0 or later.

| 65536203
| Internal error. Failed to generate SVM key. Cluster key database is not
initialized.

| 65536204
| Internal error. Failed to generate SVM key. Cluster key encryption key
is not found.

| 65536207
| Internal error. Failed to store SVM key.

| 65536212
| Internal error. Failed to delete SVM volume key.

| 65536217
| Internal error. Failed to delete key from cryptomod.

| 65536602
| Cannot perform enable/switch while nodes are out of quorum.

| 65536856
| No external key management server configured for SVM.

| 65536882
| Internal error. UUID is missing for the volume.

| 65536883
| Internal error. Volume encryption key is missing.

| 65536884
| Internal error. Volume encryption key is invalid for the volume.

| 65536889
```

| Internal error. The volume has an invalid encryption blob.

| 65536890
| Internal error. Failed to generate VDEK blob.

| 65536973
| Internal error. Volume DSID is missing for the volume.

| 65536987
| One or more key servers are unavailable.

| 65537527
| Internal error. Failed to rewrap SVM key encryption key.

| 65537533
| Internal error. Failed to unwrap SVM key encryption key.

| 65537605
| Failed to establish connectivity with the cloud key management service.

| 65538908
| The specified keystore configuration UUID either does not exist or corresponds to a keystore configuration that is not supported by this operation.

| 65538909
| A value for enabled is required.

| 65538910
| Disabling an enabled configuration through this method is currently not supported.

| 65539200
| The key custodian was not provided with an external key value store.

| 65539201
| Failed to encrypt.

| 65539205
| This command does not support enabling key manager configurations with the specified keystore type.

| 65539206
| The SVM associated with the supplied keystore UUID already has a keystore configuration enabled. This command does not support migrating from configurations of that keystore type".

```
| 65539207
| The specified keystore configuration does not exist.

| 65539212
| Cannot switch the enabled keystore configuration when it is not in the
'active' or 'switching' state.

| 65539218
| The specified keystore configuration is already enabled.

| 65539222
| Switching between configurations of different keystore types is not
supported for data SVMs.

| 65539416
| Internal error. Failed to parse key value store response.

| 65539442
| Internal error. Failed to generate AES blob.

| 65539444
| Internal error. Failed to update the VDEK blob.

| 65539513
| An effective cluster version of ONTAP 9.16.1 or later is required to
enable an inactive key manager on the admin SVM.

| 65539514
| This command does not support enabling key manager configurations with
the specified keystore type on the admin SVM.

| 65539515
| Cannot switch keystore types on the admin SVM. The keystore type for the
invalid configuration must be OKM and the enabled configuration must be
KMIP, or vice versa.

| 65539518
| Internal error. Cannot find the enabled configuration.

| 65539520
| Cannot enable the Onboard Key Manager on the admin SVM because an
inactive Onboard Key Manager already exists on the admin SVM.

| 65539534
| Cannot switch admin SVM Key Manager when system root volumes are
present.
```

```
| 65539535
| Failed to find unwrapped key on any nodes.

| 65539536
| Internal error. Failed to find the existing wrapped key blob for the
volume.

| 65539538
| SVM-KEK not created for the SVM.

| 65539539
| SVM-KEK not restored for SVM.

| 65539583
| Cannot switch to the Onboard Key Manager when the external key manager
has a policy associated with it

| 65539585
| Cannot enable an external key manager on the admin SVM because an
inactive external key manager already exists on the admin SVM.

| 65539590
| Cannot switch to the Onboard Key Manager if there are more than two NSE-
AKs in the cluster.

| 65539591
| Cannot switch to the Onboard Key Manager if there are fewer than two
NSE-AKs in the cluster.

| 65539622
| CKEK not restored for SVM.

| 65539704
| The key manager cannot be configured because the SVM has NAE volumes.

| 65539837
| The key manager configured does not have any volumes to migrate.

| 65539838
| Cannot migrate to a cloud key manager when the external key manager has
a policy associated with it.

| 65539839
| Cannot migrate to a cloud key manager when the key manager is not in a
mixed state.

| 65539840
```

```
| Failed to clean up the keys stored on the external key servers.

| 65539842
| Failed to restore the SVM-KEK.

| 65539845
| Cannot migrate SVM volumes to the Onboard Key Manager when the key
manager is not in the mixed or active state.

= Manage security login messages

:leveloffset: +1

[[ID482be3d5d99cc488bc2dde37772672ae]]
= Manage security login messages

== Overview

You can use this API to display and manage the login messages
configuration. The GET request retrieves all of the login messages in the
cluster. GET operations on /security/login/messages/\{uuid} retrieve the
login messages configuration by UUID. PATCH operations on
/security/login/messages/\{uuid} update the login messages configuration
by UUID.
 +

'''

== Examples

=== Retrieving all of the login messages in the cluster

[[ID7d1560760ff25eaa4e4fbaf5c6791c7c]]
= Retrieve the login banner and messages of the day

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/security/login/messages`#

*Introduced In:* 9.6

Retrieves the login banner and messages of the day (MOTD) configured in
the cluster
and in specific SVMs.

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|banner
|string
|query
|False
a|Filter by banner

* maxLength: 2048
* minLength: 0
```

```
|uuid
|string
|query
|False
a|Filter by uuid

|scope
|string
|query
|False
a|Filter by scope

|message
|string
|query
|False
a|Filter by message

* maxLength: 2048
* minLength: 0

|show_cluster_message
|boolean
|query
|False
a|Filter by show_cluster_message

|svm.name
|string
|query
|False
a|Filter by svm.name

|svm.uuid
|string
|query
|False
a|Filter by svm.uuid

|fields
|array[string]
```

```
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 15
* Max value: 120
* Min value: 0

|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

[#login_messages]
[.api-collapsible-fifth-title]
login_messages

The login banner and message of the day (MOTD) configuration.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|_links
|link:#_links[_links]
a|

|banner
|string
a|The login banner text. This message is displayed during SSH and console
device
login just before the password prompt displays. When configured, a
cluster-level
login banner is used for every incoming connection. Each data SVM can
override
the cluster-level banner to instead display when you log into the SVM. To
restore
the default setting for a data SVM, set the banner to an empty string.
New lines are supplied as either LF or CRLF but are always returned as LF.
Optional in the PATCH body.

|message
|string
a|The message of the day (MOTD). This message appears just before the
clustershell
prompt after a successful login. When configured, the cluster message
displays first. If you log in as a data SVM administrator, the
SVM message is then printed. The cluster-level MOTD can be disabled
for a given data SVM using the "show_cluster_message" property.
```

```
New lines are supplied as either LF or CRLF but are always returned as LF.
Optional in the PATCH body.

|scope
|string
a|Set to "svm" for interfaces owned by an SVM. Otherwise, set to
"cluster".

|show_cluster_message
|boolean
a|Specifies whether to show a cluster-level message before the SVM message
when logging in as an SVM administrator.
This setting can only be modified by cluster administrators.
Optional in the PATCH body.

|svm
|link:#svm[svm]
a|SVM, applies only to SVM-scoped objects.

|uuid
|string
a|The unique identifier (ID) of the login messages configuration.

= Update a login message configuration

[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-
block]#`/security/login/messages/{uuid}`#

*Introduced In:* 9.6

Updates the login messages configuration.
There are no required fields. An empty body makes no modifications.

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|uuid
|string
|path
|True
```

```
a|Login messages configuration UUID

|===

== Request Body

[cols=3*,options=header]
|===
|Name
|Type
|Description

|banner
|string
a|The login banner text. This message is displayed during SSH and console
device
login just before the password prompt displays. When configured, a
cluster-level
login banner is used for every incoming connection. Each data SVM can
override
the cluster-level banner to instead display when you log into the SVM. To
restore
the default setting for a data SVM, set the banner to an empty string.
New lines are supplied as either LF or CRLF but are always returned as LF.
Optional in the PATCH body.

|message
|string
a|The message of the day (MOTD). This message appears just before the
clustershell
prompt after a successful login. When configured, the cluster message
displays first. If you log in as a data SVM administrator, the
SVM message is then printed. The cluster-level MOTD can be disabled
for a given data SVM using the "show_cluster_message" property.
New lines are supplied as either LF or CRLF but are always returned as LF.
Optional in the PATCH body.

|scope
|string
a|Set to "svm" for interfaces owned by an SVM. Otherwise, set to
"cluster".
```

```
|show_cluster_message
|boolean
a|Specifies whether to show a cluster-level message before the SVM message
when logging in as an SVM administrator.
This setting can only be modified by cluster administrators.
Optional in the PATCH body.

|uuid
|string
a|The unique identifier (ID) of the login messages configuration.

:leveloffset: -1

= View and create TOTP profiles

:leveloffset: +1

[[ID98ba32c8e2c590d58c301cf7dbcaeffd]]
```

```
= View and create TOTP profiles

== Overview

This API configures the TOTP(Time based OTP) profile for user accounts for
secure shell (SSH) access.
Prerequisites:
  You must configure TOTP as a secondary authentication method in
/security/accounts when creating users.
  You must have a TOTP application that you can use to get TOTP keys.
  You are only allowed to create a TOTP profile for yourself, not for
others.
  Admin cannot create TOTP profiles for any users.

== Examples

=== Creating a TOTP profile for cluster-scoped user accounts

Specify the user account name and comment in the body of the POST request.
The owner.uuid or owner.name are not required for a cluster-scoped user
account.

----

# The API:
POST "/api/security/login/totps"

# The call:
curl -k https://<mgmt-ip>/api/security/login/totps --request POST --data
'{ "account": { "name": "pubuser2" },"comment": "Cserver-Creation"}'

# The response:
{
"num_records": 1,
"records": [
{
  "owner": {
    "uuid": "b009a9e7-4081-b576-7575-ada21efcaf16",
    "name": "Default",
    "_links": {
      "self": {
        "href": "/api/svm/svms/b009a9e7-4081-b576-7575-ada21efcaf16"
      }
    }
  },
```

```
  "account": {
    "name": "pubuser2"
  },
  "secret_key": "<ACCOUNT-TOTP-SECRET-KEY>"
  "install_url":
"https://www.google.com/chart?chs=200x200&chld=M&#124;0&cht=qr&chl=otpauth
://totp/root@node1%3Fsecret%3DDRY5CAJGTQCL5TV4D3UAMYXJFM%26issuer%3Dnode1"
,
  "verification_code": "946090",
  "emergency_codes": [
    "54200192",
    "10418385",
    "52726505",
    "41704451",
    "20744310"
  ],
  "_links": {
    "self": {
      "href": "/api/security/login/totps/b009a9e7-4081-b576-7575-
ada21efcaf16/pubuser2"
    }
  }
}
 ]
}
----

=== Creating a TOTP profile for SVM-scoped user accounts

For an SVM-scoped account, specify either the SVM name as the owner.name
or the SVM UUID as the owner.uuid along with other parameters for the user
account. These parameters indicate the SVM that contains the user account
for the TOTP profile being created and can be obtained from the response
body of the GET request performed on the API "/api/svm/svms".

----

# The API:
POST "/api/security/login/totps"

# The call:
curl -k https://<mgmt-ip>/api/security/login/totps --request POST --data
'{ "account": { "name": "pubuser4" },"comment": "Vserver-
Creation","owner.name":"vs0" }'

# The response:
```

```
{
"num_records": 1,
"records": [
{
  "owner": {
    "uuid": "b019a9e7-4081-b576-7575-ada21efcaf16",
    "name": "vs0",
    "_links": {
      "self": {
        "href": "/api/svm/svms/b019a9e7-4081-b576-7575-ada21efcaf16"
      }
    }
  },
  "account": {
    "name": "pubuser4"
  },
  "secret_key": "<ACCOUNT-TOTP-SECRET-KEY>",
  "install_url":
"https://www.google.com/chart?chs=200x200&chld=M&#124;0&cht=qr&chl=otpauth
://totp/root@node1%3Fsecret%3DDRY5CAJGTQCL5TV4D3UAMYXJFM%26issuer%3Dnode1"
,
  "verification_code": "946090",
  "emergency_codes": [
    "54200192",
    "10418385",
    "52726505",
    "41704451",
    "20744310"
  ],
  "_links": {
    "self": {
      "href": "/api/security/login/totps/b019a9e7-4081-b576-7575-
ada21efcaf16/pubuser4"
    }
  }
}
 ]
}
----

=== Retrieving the configured TOTP profile for user accounts

Retrieves the TOTP profiles associated with the user accounts or a
filtered list (for a specific user account name, a specific SVM and so
on).
```

```
----

# The API:
GET "/api/security/login/totps"

# The call to retrieve TOTP profiles associated with TOTP configured user
accounts in the cluster:
curl -k https://<mgmt-ip>/api/security/login/totps

# the response:
{
"records": [
{
  "owner": {

|===

|Name
|Type
|In
|Required
|Description

|account.name
|string
|query
|False
a|Filter by account.name

|owner.name
```

```
|string
|query
|False
a|Filter by owner.name

|owner.uuid
|string
|query
|False
a|Filter by owner.uuid

|comment
|string
|query
|False
a|Filter by comment

|enabled
|boolean
|query
|False
a|Filter by enabled

|sha_fingerprint
|string
|query
|False
a|Filter by sha_fingerprint

|scope
|string
|query
|False
a|Filter by scope

|fields
|array[string]
|query
|False
a|Specify the fields to return.
```

```
|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 15
* Max value: 120
* Min value: 0

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

:leveloffset: -1

= Manage TOTP profiles

:leveloffset: +1

[[ID6488cd472cfc3012c5417a5c391636a5]]
= Manage TOTP profiles

== Overview

This API configures the TOTP profile for user accounts.
Specify the owner UUID and the account user name. The owner UUID
corresponds to the UUID of the SVM containing the user account associated
with the TOTP profile and can be obtained from the response body of the
GET request performed on the API "`/api/svm/svms".

== Examples

=== Retrieving the specific configured TOTP profile for user accounts

----

# The API:
GET "/api/security/login/totps/{owner.uuid}/{account.name}"

# The call:
curl -k https://<mgmt-ip>/api/security/login/totps/513a78c7-8c13-11e9-
8f78-005056bbf6ac/pubuser4

# the response:
{
"owner": {
```

```
    "uuid": "b009a9e7-4081-b576-7575-ada21efcaf16",
    "name": "Default",
  "_links": {
    "self": {
      "href": "/api/svm/svms/b009a9e7-4081-b576-7575-ada21efcaf16"
    }
  }
},
"account": {
  "name": "pubuser2",
  "_links": {
    "self": {
      "href": "/api/security/accounts/b009a9e7-4081-b576-7575-
ada21efcaf16/pubuser2"
    }
  }
},
"sha_fingerprint":
"21364f5417600e3d9d6a7ac6c05dd244aed9f15dce6786a2c89399a41ff0fdb0",
"scope": "cluster",
"_links": {
  "self": {
    "href": "/api/security/login/totps/b009a9e7-4081-b576-7575-
ada21efcaf16/pubuser2"
  }
}
}
----

=== Modifying the TOTP profile for a user account

----

# The API:
PATCH "/api/security/login/totps/{owner.uuid}/{account.name}"

# The call:
curl -k "https://<mgmt-ip>/api/security/login/totps/6865196a-8b59-11ed-
874c-0050568e36ed/ysadmin" --request PATCH --data "{  \"comment\":
\"Testing\",  \"enabled\": false}"

# the response:
{}
----

=== Deleting the TOTP profile for user accounts
```

```
----

# The API:
DELETE "/api/security/login/totps/{owner.uuid}/{account.name}"

# The call:
curl -k https://<mgmt-ip>/api/security/login/totps/d49de271-8c11-11e9-
8f78-005056bbf6ac/pubuser1 --request DELETE

:leveloffset: -1

= Manage the multi-admin-verify global setting

:leveloffset: +1

[[ID7d3050c9e784103e1fd5de8ba32a9ee9]]
= Manage the multi-admin-verify global setting

== Overview

These APIs provide information on the multi-admin verification global
setting.
The GET API retrieves the object store that contains the global setting
values of the multi-admin-verify feature.
The PATCH request is used to modify the multi-admin-verify global setting.
All fields are optional for the PATCH request.
Note it is recommended that multi-admin-verify is enabled equally on
peered ONTAP clusters.
 +

'''

== Examples

=== Retrieving the multi-admin-verify global setting

Retrieves the current multi-admin-verify global setting. If the global
setting is not set, default values are returned.
 +

'''

----

# The API:
/api/security/multi-admin-verify
```

```
# The call:
curl -X GET "https://<cluster-ip>/api/security/multi-admin-verify"

# The response:
{
"approval_groups": [
],
"required_approvers": 1,
"enabled": false,
"execution_expiry": "PT1H",
"approval_expiry": "PT1H",
"_links": {
  "self": {
    "href": "/api/security/multi-admin-verify"
  }
}
}
----

'''

=== Updating the multi-admin-verify global setting

The following example updates the multi-admin-verify global settings.
Note that the approval_groups needs to be available in /security/multi-
admin-verify/approval-groups before it is set in the global setting.
Note that the total number of approvers in an approval group must be a
positive integer more than the number of required approvers. For example,
if there are a total of 10 approvers in a group, the required approvers
can be set between 1 and 9.
 +

'''

----

# The API:
/api/security/multi-admin-verify

# The call:
curl -X PATCH "https://<cluster-ip>/api/security/multi-admin-verify" -d
'{"required_approvers": "1", "enabled": "true", "execution_expiry": "2h",
"approval_expiry": "3h"}'
----

'''
```

```
[[IDa9afe14a6b1a61ceb9770cc8e2469e77]]
= Retrieve a multi-admin-verify configuration

= Modify a multi-admin-verify configuration

[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-
block]#`/security/multi-admin-verify`#

*Introduced In:* 9.11

Modifies the multi-admin-verify configuration.

== Request Body

[cols=3*,options=header]
|===
|Name
|Type
|Description

|approval_expiry
|string
a|Default time for requests to be approved, in ISO-8601 duration format.

|approval_groups
|array[string]
a|List of approval groups that are allowed to approve requests for rules
that don't have approval groups.

|enabled
|boolean
a|

|execution_expiry
|string
a|Default time for requests to be executed once approved, in ISO-8601
duration format.
```

```
|required_approvers
|integer
a|The number of required approvers, excluding the user that made the
request.

```

Status: Default

```
ONTAP Error Response Codes

|===
| Error Code | Description

| 262309
| The feature must be enabled first.

| 262311
| Value must be greater than zero.

| 262312
| Number of required approvers must be less than the total number of
unique approvers in the approval-groups.
```

```
| 262313
| Number of unique approvers in the approval-groups must be greater than
the number of required approvers.

| 262314
| One or more approval groups added do not exist.

| 262315
| Approval-groups must be specified when enabling this feature.

| 262316
| Value must be in the range two minutes to two weeks.

| 262318
| multi-admin-verify requires an effective cluster version of ONTAP 9.11.1
or later.

= View and create multi-admin-verify approval groups

:leveloffset: +1

[[ID73ca2815dd5f62601269a38655c0df62]]
```

```
= View and create multi-admin-verify approval groups

== Overview

A group of users can be defined in a cluster server context.
Approval groups can be associated with a rule or global setting from which
the associated request can retrieve approvals.
 +

'''

== Examples

=== Creating a multi-admin-verify approval group

Creates an approval group for a specified SVM for a specified list of
ONTAP users.
 +

'''

----

# The API:
/api/security/multi-admin-verify/approval-groups

# The call:
curl -X POST "https://<mgmt-ip>/api/security/multi-admin-verify/approval-
groups?return_records=true" -H "accept: application/hal+json" -d '{"name":
"group1", "approvers": ["admin"], "email":
["group1.approvers@email.com"]}'

# The response:
{
"num_records": 1,
"records": [
  {
    "owner": {
      "uuid": "c109634f-7011-11ec-a23d-005056a78fd5",

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/security/multi-admin-verify/approval-groups`#

*Introduced In:* 9.11

Retrieves multi-admin-verify approval groups.

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
```

```
|Required
|Description

|approvers
|string
|query
|False
a|Filter by approvers

|email
|string
|query
|False
a|Filter by email

|name
|string
|query
|False
a|Filter by name

|owner.uuid
|string
|query
|False
a|Filter by owner.uuid

|owner.name
|string
|query
|False
a|Filter by owner.name

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
```

```
|query
|False
a|Limit the number of records returned.

|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 15
* Max value: 120
* Min value: 0

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

= Manage multi-admin-verify approval groups

:leveloffset: +1

[[IDeb52579258c2640e1e1dd2cfe8e8695b]]
= Manage multi-admin-verify approval groups

== Overview

These APIs provide information about a specific multi-admin verification
approval-group.
A group of users can be defined in a cluster server context.
Approval groups can be associated with a rule or global setting from which
the associated request can retrieve approvals.
 +

'''

== Examples

=== Retrieving a multi-admin-verify approval group

Displays information about a specific approval group and the users that
are registered within that group.
 +

'''

----

# The API:
/api/security/multi-admin-verify/approval-groups/{owner.uuid}/{name}

# The call:
curl -X GET "https://<cluster-ip>/api/security/multi-admin-
verify/approval-groups/52b75787-7011-11ec-a23d-005056a78fd5/group1"

# The response:
{
"owner": {
```

```
  "uuid": "52b75787-7011-11ec-a23d-005056a78fd5",
  "name": "cluster1",
  "_links": {
    "self": {
      "href": "/api/svm/svms/52b75787-7011-11ec-a23d-005056a78fd5"
    }
  }
},
"name": "group1",
"approvers": [
  "admin"
],
"email": [
  "group1.approvers@email.com"

:leveloffset: -1

= Manage multi-admin-verify approval requests

:leveloffset: +1

[[ID00e8afc39f3dc7febbc9d78076209d5a]]
= Manage multi-admin-verify approval requests

== Overview

These APIs provide information about multi-admin verification requests.
If you need to execute a command that is protected by a multi-admin rule,
you must first submit a request to be allowed to execute the command.
The request must then be approved by the designated approvers according to
the rule associated with the command.
 +

'''

== Examples

=== Creating a multi-admin-verify request

Creates a request for the specified ONTAP operation.
 +

'''

----

# The API:
/api/security/multi-admin-verify/requests

# The call:
curl -X POST "https://<mgmt-ip>/api/security/multi-admin-
```

```
verify/requests?return_records=true" -H "accept: application/hal+json" -d
'{"operation": "volume delete", "query": "-vserver vs0 -volume v1",
"permitted_users": ["user1","user2"]}'

# The response:
{
"num_records": 1,
"records": [
  {
    "index": 10,
    "operation": "volume delete",
    "query": "-vserver vs0 -volume v1",
    "state": "pending",
    "required_approvers": 2,
    "pending_approvers": 2,
    "execute_on_approval": false,
    "permitted_users": [
      "user1",
      "user2"
    ],
    "user_requested": "admin",
    "owner": {
      "uuid": "c1483186-6e73-11ec-bc92-005056a7ad04",
      "name": "cluster1",
      "_links": {
        "self": {
          "href": "/api/svm/svms/c1483186-6e73-11ec-bc92-005056a7ad04"
        }
      }
    },
    "create_time": "2022-01-06T16:59:49-05:00",
    "approve_expiry_time": "2022-01-06T19:59:49-05:00",
    "_links": {

= Retrieve multi-admin-verify requests

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/security/multi-admin-verify/requests`#

*Introduced In:* 9.11

Retrieves multi-admin-verify requests.

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|approved_users
|string
|query
|False
a|Filter by approved_users

|index
|integer
|query
|False
a|Filter by index

|create_time
|string
|query
|False
a|Filter by create_time

|execution_expiry_time
|string
```

```
|query
|False
a|Filter by execution_expiry_time

|potential_approvers
|string
|query
|False
a|Filter by potential_approvers

|approve_time
|string
|query
|False
a|Filter by approve_time

|query
|string
|query
|False
a|Filter by query

|approve_expiry_time
|string
|query
|False
a|Filter by approve_expiry_time

|user_vetoed
|string
|query
|False
a|Filter by user_vetoed

|user_requested
|string
|query
|False
a|Filter by user_requested
```

```
|permitted_users
|string
|query
|False
a|Filter by permitted_users

|pending_approvers
|integer
|query
|False
a|Filter by pending_approvers

|comment
|string
|query
|False
a|Filter by comment

|owner.name
|string
|query
|False
a|Filter by owner.name

|owner.uuid
|string
|query
|False
a|Filter by owner.uuid

|execute_on_approval
|boolean
|query
|False
a|Filter by execute_on_approval

* Introduced in: 9.13

|required_approvers
|integer
|query
```

```
|False
a|Filter by required_approvers

|operation
|string
|query
|False
a|Filter by operation

|state
|string
|query
|False
a|Filter by state

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
```

```
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 15
* Max value: 120
* Min value: 0

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

== Error
```

Status: Default

```
ONTAP Error Response Codes
```

```
|===
| Error Code | Description

| 262148
| The specified command is not recognized.

| 262279
| Invalid field set.

| 262304
| Too many requests. Delete one before creating another.

| 262305
| Can't approve non-pending request.

| 262306
| Can't veto an expired request.

| 262308
| The specified command is not supported by this feature.

| 262309
| The feature must be enabled first.

| 262311
| Value must be greater than zero.

| 262312
| Number of required approvers must be less than the total number of
unique approvers in the approval-groups.

| 262313
| Number of unique approvers in the approval-groups must be greater than
the number of required approvers.

| 262326
| Failed to parse query.

| 262327
| Failed to crate the request.

| 262328
| There is no matching rule for this request.

| 262330
| Cannot approve/veto a request multiple times.
```

```
| 262334
| The parameter specified in the command is not supported.

| 262337
| Cannot approve/veto the user's own request.

```

```
:leveloffset: +1

[[ID280a0ec62afb0865cfe33862651f490c]]
= Manage a multi-admin-verify approval request

== Overview

These APIs provide information about a specific multi-admin verification
request.
If you need to execute a command that is protected by a multi-admin rule,
you must first submit a request to be allowed to execute the command.
The request must then be approved by the designated approvers according to
the rule associated with the command.
 +

'''

== Examples

=== Retrieving a multi-admin-verify request

Retrieves information about a specific multi-admin verification request.
 +

'''

----

# The API:
/api/security/multi-admin-verify/requests/{index}

# The call:
curl -X GET "https://<cluster-ip>/api/security/multi-admin-
verify/requests/1"

# The response:
{
"index": 1,
"operation": "security multi-admin-verify modify",
"query": "",
"state": "expired",

= Manage multi-admin-verify rules

:leveloffset: +1

[[ID2808fe00e215e71ba2d8c59cdcbfb123]]
= Manage multi-admin-verify rules

== Overview

Rules define the ONTAP commands (operations) that should be protected by
multi-admin approval.
While the feature is turned on, any ONTAP operation that is defined with a
rule will be enforced with multi-admin approval to execute the command
(operation).
 +

'''

== Examples

=== Creating a multi-admin-verify rule

Creates a rule for the specified ONTAP operation.
 +

'''

----

# The API:
/api/security/multi-admin-verify/rules

# The call:
curl -X POST "https://<mgmt-ip>/api/security/multi-admin-
verify/rules?return_records=true" -H "accept: application/hal+json" -d
'{"operation": "volume delete", "query": "-vserver vs0",
"required_approvers": 1}'

# The response:
{

= Retrieve multi-admin-verify rules

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/security/multi-admin-verify/rules`#

*Introduced In:* 9.11

Retrieves multi-admin-verify rules.

== Parameters

[cols=5*,options=header]
|===
```

```
|Name
|Type
|In
|Required
|Description

|approval_expiry
|string
|query
|False
a|Filter by approval_expiry

|operation
|string
|query
|False
a|Filter by operation

|required_approvers
|integer
|query
|False
a|Filter by required_approvers

|query
|string
|query
|False
a|Filter by query

|execution_expiry
|string
|query
|False
a|Filter by execution_expiry

|system_defined
|boolean
|query
|False
a|Filter by system_defined
```

```
|auto_request_create
|boolean
|query
|False
a|Filter by auto_request_create

|approval_groups.name
|string
|query
|False
a|Filter by approval_groups.name

|create_time
|string
|query
|False
a|Filter by create_time

|owner.uuid
|string
|query
|False
a|Filter by owner.uuid

|owner.name
|string
|query
|False
a|Filter by owner.name

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
```

```
|False
a|Limit the number of records returned.

|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 15
* Max value: 120
* Min value: 0

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

ONTAP Error Response Codes

|===
| Error Code | Description

| 262148
| The specified command is not recognized.

| 262308
| The specified command is not supported by this feature.

| 262309
| The feature must be enabled first.

| 262311
| Value must be greater than zero.

| 262312
| Number of required approvers must be less than the total number of
unique approvers in the approval-groups.

| 262313
| Number of unique approvers in the approval-groups must be greater than
```

```
the number of required approvers.

| 262314
| Some approval-groups were not found.

| 262316
| Value must be in the range two minutes to two weeks.

| 262326
| Failed to parse query.

| 262335
| The query string must be contained in either the "operation" or "query"
parameters but not in both.

= Manage a multi-admin-verify rule

:leveloffset: +1
```

```
[[ID2bed6f05fcd9e0e207759a8fbe16c59d]]
= Manage a multi-admin-verify rule

== Overview

These APIs provide information about a specific multi-admin verification
rule.
Rules define the ONTAP commands (operations) that should be protected by
multi-admin approval.
While the feature is turned on, any ONTAP operation that is defined with a
rule will be enforced with multi-admin approval to execute the command
(operation).
 +

'''

== Examples

=== Retrieving a multi-admin-verify rule

Displays information about a specific multi admin verification rule.
 +

'''

----

# The API:
/api/security/multi-admin-verify/rules/{owner.uuid}/{operation}

# The call:
curl -X GET "https://<cluster-ip>/api/security/multi-admin-
verify/rules/52b75787-7011-11ec-a23d-005056a78fd5/volume+delete"

# The response:
{
"owner": {
  "uuid": "52b75787-7011-11ec-a23d-005056a78fd5",
  "name": "cluster1",

:leveloffset: -1

= Manage security roles

:leveloffset: +1

[[IDc7838d42fcf3e20ff09fbc63cbee0ef5]]
= Manage security roles

== Overview

ONTAP supports Role Based Access Control (RBAC) wherein a user account
must be associated with a role and that role defines the privileges and
rights for that user account. A privilege defines the access level of the
API or command/command directory path. If a privilege tuple refers to a
command/command directory path, it can also be associated with an optional
query. The access level specifies the subset of operations a user account
can perform from the complete set of API methods {GET, POST, PATCH, and
DELETE} or command operations {create, delete, modify, and show}. The
optional query specifies the subset of objects that the role is allowed to
access. The query can be specified, only if the privilege tuple refers to
a command/command directory path. It is defined using one or more
parameters of the command/command directory path.

A role can comprise of multiple privilege tuples and each privilege tuple
consists of a REST API or command/command directory path, its access
level, and an optional query. For a given role, only one type of privilege
tuple can be defined. All privilege tuples for a role must contain REST
API paths or all privilege tuples for the role must contain
command/command directory paths. However, predefined/built-in roles (those
```

```
defined later) are an exception to this rule.

For example, "role1" might be a role that has a tuple
{"access":"all","path":"/api/network/ip"}, which means that a user account
with "role1" can perform GET, POST, PATCH, and DELETE requests on the
_api/network/ip_ API or derived APIs that have _api/network/ip_ as the
prefix.

In other examples, "role2" might be a role that has a tuple
{"access":"read_create_modify","path":"/api/storage/volumes"}, which means
that a user account with "role2" can perform GET, POST and PATCH (but not
DELETE) requests on the _api/storage/volumes_ API or derived APIs that
have _api/storage/volumes_ as the prefix.

"role3" might be a role that has a tuple
{"access":"read_create","path":"vserver nfs"}, which means that a user
account with "role3" can perform "show" and "create" operations on
_vserver nfs_ command or derived commands that have _vserver nfs_ as the
prefix. There is no query associated with "role3".

"role4" might be a role that has a tuple
{"access":"all","path":"snapmirror policy","query":"-policy !CustomPol*"},
which means that a user account with "role4" can perform "show",
"create","modify" and "delete" operations on _snapmirror policy_ command
or derived commands that have _snapmirror policy_ as the prefix. However,
a user is not authorized to perform the above set of operations on
SnapMirror policies starting with the name "CustomPol".

In cases where a role has tuples with multiple APIs having the same prefix
or multiple commands/command directories having the same prefix, the
highest match wins out. For example, if "role5" has the following tuples:
{"access":"readonly","path":"/api/cluster"} and
{"access":"all","path":"/api/cluster/schedules"}, then only a GET request
is allowed on APIs with _api/cluster_ as the prefix; while GET, POST,
PATCH and DELETE requests are possible on the _api/cluster/schedules_ API.
Similarly, if "role6" has the following tuples:
{"access":"readonly","path":"volume"} and
{"access":"read_create_delete","path":"volume snapshot"}, then only a
"show" operation is allowed on commands/command directories with _volume_
but not _volume snapshot_ as the prefix; while "show", "create" and
"delete" operations are possible on the _volume snapshot_ command
directory or any other command/command directory under _volume snapshot_.

=== Predefined (built-in) roles

Related REST APIs and related commands/command directories are used to
```

```
form predefined cluster-scoped and SVM-scoped roles, such as: "admin",
"backup", "readonly" for cluster and "vsadmin", "vsadmin-backup",
"vsadmin-protocol" for SVMs.

All of the above predefined roles can be retrieved by calling a GET
request on the _/api/security/roles_ API and can be assigned to user
accounts. See the examples for _api/security/accounts_.

A GET request on _/api/security/roles/{owner.uuid}/\{name}_ or
_/api/security/roles/{owner.uuid}/\{name}/privileges_, where "name" refers
to a predefined (built-in) role, returns privilege tuples containing REST
API paths along with privilege tuples containing command/command directory
paths.

These predefined roles cannot be modified or deleted.

=== Mapped roles

Before REST APIs, the RBAC roles (legacy roles) were defined to contain
the CLI commands and their access levels. Now, almost all REST APIs map to
one or more CLI commands. When a role is created using a POST request on
_/api/security/roles_, a mapped legacy role is created. This legacy role
has the same access level (as that of the REST API) for the mapped CLI
commands. However, if a legacy role with the same name already exists, the
POST operation fails and you need to choose a unique name for the role.
Legacy roles are also managed using the REST endpoint
_/api/security/roles_ and its derivatives. In CLI, legacy roles are
managed using the "security login role <create \| modify \| delete> -role
+++<rolename>+++" commands.+++</rolename>+++

Note that the mapped legacy role (for the REST API role created) cannot be
manipulated using either REST API or the CLI.

The reverse case is not true; the creation of a legacy role will not
create a mapped role with equivalent REST APIs.

=== API restrictions

A role can be a REST role or a legacy role but not both. A role cannot be
defined to have a mix of privilege tuples with REST API paths and
privilege tuples with command/command directory paths. However, predefined
(built-in) roles are an exception to this rule.
Numerous APIs are scoped for the cluster level only. This results in an
access error if assigned to an SVM-scoped role. For example,
_api/cluster/nodes_ does not work when added as a tuple entry for an SVM-
scoped role.
```

A number of APIs allowed for an SVM-scoped role might have restrictions on the access level. For example, _/api/network/ethernet/ports_ cannot have an access level of "all" for an SVM-scoped role; this results in an access error when a POST or PATCH request is made.

Roles created with a REST API path prefix which is common to many APIs might have restrictions based on the scope of the role; cluster or SVM. For example, {"access":"all","path":"/api/security"} might be a tuple entry for an SVM role. Any GET, POST, PATCH, or DELETE operation fails on API _/api/security/accounts_ while the same on _/api/security/login/messages_ succeeds. However, a role with exactly the same tuple when created at the cluster-scope level allows the operations.

Numerous APIs have restrictions on the objects that can be operated on based on the context of the SVM or cluster. For example, a POST request on _/api/security/authentication/password_ API changes the password for a user account. If executed in the context of an SVM (POST request on an SVM interface), only the password of the user executing the POST can be modified, and attempts to modify the password of any other user results in an access error. However, if a POST request is performed by a cluster administrator account, the password for any user account (cluster or SVM) can be modified.

Resource-qualified endpoints are now supported. At present, the only supported resource-qualified endpoints are the following:

==== Snapshots APIs

– _/api/storage/volumes/{volume.uuid}/snapshots_

==== File System Analytics APIs

– _/api/storage/volumes/{volume.uuid}/files_

– _/api/storage/volumes/{volume.uuid}/top-metrics/clients_

– _/api/storage/volumes/{volume.uuid}/top-metrics/directories_

– _/api/storage/volumes/{volume.uuid}/top-metrics/files_

– _/api/storage/volumes/{volume.uuid}/top-metrics/users_

– _/api/svm/svms/{svm.uuid}/top-metrics/clients_

– _/api/svm/svms/{svm.uuid}/top-metrics/directories_

– _/api/svm/svms/{svm.uuid}/top-metrics/files_

```
&ndash; _/api/svm/svms/{svm.uuid}/top-metrics/users_

==== ONTAP S3 APIs

&ndash; _/api/protocols/s3/services/{svm.uuid}/users_

In the APIs above, and in the context of REST roles, the wildcard
character &#42; can be used in place of _{volume.uuid}_ or _{svm.uuid}_ to
represent _all_ volumes or _all_ SVMs, depending on whether the REST
endpoint references volumes or SVMs. The _{volume.uuid}_ corresponds to
the _-instance-uuid_ field in the output of the "volume show" command at
the diagnostic privilege level. It can also be retrieved through the REST
endpoint _/api/storage/volumes_.

== Examples

=== Creating a cluster-scoped custom role of REST API tuples

Specify the role name and the tuples (of REST APIs and their access
levels) in the body of the POST request. The owner.uuid or owner.name are
not required to be specified for a cluster-scoped role.

----

# The API:
POST "/api/security/roles"

# The call:
curl -X POST "https://<mgmt-ip>/api/security/roles" -d
'{"name":"cluster_role1", "privileges" :
[{"access":"readonly","path":"/api/cluster/jobs"},{"access":"all","path":"
/api/application/applications"},{"access":"readonly","path":"/api/applicat
ion/templates"}]}'
----

=== Creating a cluster-scoped custom role of command and/or command
directory tuples

Specify the role name and the tuples (of commands/command directories,
their access levels and associated optional queries) in the body of the
POST request. The owner.uuid or owner.name are not required to be
specified for a cluster-scoped role.

----

# The API:
```

```
POST "/api/security/roles"

# The call:
curl -X POST "https://<mgmt-ip>/api/security/roles" -d
'{"name":"cluster_role2", "privileges" :
[{"access":"readonly","path":"volume
qtree","query":""},{"access":"all","path":"security
certificate"},{"access":"readonly","path":"snapmirror policy","query":"-
policy !CustomPol*"}]}'
----

=== Creating an SVM-scoped custom role of REST API tuples

For an SVM-scoped role, specify either owner.name or owner.uuid in the
request body along with other parameters for the role. These correspond to
the name or UUID of the SVM for which the role is being created and can be
obtained from the response body of the GET request performed on the
_/api/svm/svms_ API.

----

# The API:
POST "/api/security/roles"

# The call:
curl -X POST "https://<mgmt-ip>/api/security/roles" -d '{"owner": {"uuid"
: "9f93e553-4b02-11e9-a3f9-005056bb7acd"},"name":"svm_role1", "privileges"
:
[{"access":"readonly","path":"/api/cluster/jobs"},{"access":"all","path":"
/api/application/applications"},{"access":"readonly","path":"/api/applicat
ion/templates"}]}'
----

=== Creating an SVM-scoped custom role of command and/or command directory
tuples

For an SVM-scoped role, specify either owner.name or owner.uuid in the
request body along with other parameters for the role. These correspond to
the name or UUID of the SVM for which the role is being created and can be
obtained from the response body of the GET request performed on the
_/api/svm/svms_ API.

----

# The API:
POST "/api/security/roles"
```

```
# The call:
curl -X POST "https://<mgmt-ip>/api/security/roles" -d '{"owner": {"uuid"
: "9f93e553-4b02-11e9-a3f9-005056bb7acd"},"name":"svm_role2", "privileges"
: [{"access":"readonly","path":"job schedule interval","query":"-days
>1"},{"access":"all","path":"application
snapshot"},{"access":"none","path":"volume move"}]}'
----

=== Creating a custom role with a resource-qualified endpoint

Specify the role name and the tuples (of REST APIs and their access
levels) in the body of the POST request. One or more of the tuples can now
contain a resource-qualified endpoint. At present, the only supported
resource-qualified endpoints are the _Snapshots_, _ONTAP S3_, and _File
System Analytics_ endpoints listed above in the _Overview_ section.

----

# The API:
POST "/api/security/roles"

# The call:
curl -X POST "https://<mgmt-ip>/api/security/roles" -d
'{"name":"cluster_role", "privileges" :
[{"access":"readonly","path":"/api/cluster/jobs"},{"access":"all","path":"
/api/storage/volumes/4ae77149-7752-11eb-8d4e-
0050568ed6bd/snapshots"},{"access":"all","path":"/api/storage/volumes/6519
986e-7752-11eb-8d4e-
0050568ed6bd/snapshots"},{"access":"readonly","path":"/api/storage/volumes
/8823c869-9ea1-11ec-8771-005056bb1a7c/top-
metrics/users"},{"access":"readonly","path":"/api/application/templates"}]
}'
----

=== Creating a custom role with a private CLI endpoint

----

# The API:
POST "/api/security/roles"

# The call:
curl -X POST "https://<mgmt-ip>/api/security/roles" -d
'{"name":"cluster_role3", "privileges" :
[{"access":"readonly","path":"/api/private/cli/cluster"}]}'
----
```

```
=== Retrieving the configured roles

All of the roles or a filtered list of roles (for example by name,
predefined, and so on) can be retrieved.

----

# The API:
GET "/api/security/roles?fields=%2A"

# The call to retrieve all the roles configured in the cluster:
curl -X GET "https://<mgmt-ip>/api/security/roles"

# The response:

=== Using a scoped call to retrieve the configured roles

----
```

```
# Scoped call to retrieve all the roles for a particular SVM using
owner.uuid:
curl -X GET "https://<mgmt-ip>/api/security/roles/?owner.uuid=aaef7c38-
4bd3-11e9-b238-0050568e2e25"

# Scoped call to retrieve all the roles for a particular SVM using
owner.name:
curl -X GET "https://<mgmt-ip>/api/security/roles/?owner.name=svm1"

# Scoped call to retrieve the roles having vsadmin as the prefix in the
role name:
curl -X GET "https://<mgmt-ip>/api/security/roles/?name=vsadmin*"

# Scoped call to retrieve the predefined roles:
curl -X GET "https://<mgmt-ip>/api/security/roles/?builtin=true"

# Scoped call to retrieve the custom roles:
curl -X GET "https://<mgmt-ip>/api/security/roles/?builtin=false"
----

[[IDc9fe5d70823907ca4cf352d91d4d2720]]
= Retrieve a list of roles configured in the cluster

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/security/roles`#

*Introduced In:* 9.6

Retrieves a list of roles configured in the cluster.

== Related ONTAP commands

* `security login rest-role show`
* `security login role show`

== Parameters
```

```
[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|owner.name
|string
|query
|False
a|Filter by owner.name

* Introduced in: 9.7

|owner.uuid
|string
|query
|False
a|Filter by owner.uuid

* Introduced in: 9.7

|name
|string
|query
|False
a|Filter by name

* Introduced in: 9.7

|builtin
|boolean
|query
|False
a|Filter by builtin

* Introduced in: 9.7

|scope
|string
```

```
|query
|False
a|Filter by scope

* Introduced in: 9.7

|privileges.path
|string
|query
|False
a|Filter by privileges.path

* Introduced in: 9.7

|privileges.access
|string
|query
|False
a|Filter by privileges.access

* Introduced in: 9.7

|privileges.query
|string
|query
|False
a|Filter by privileges.query

* Introduced in: 9.11

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.
```

```
|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 15
* Max value: 120
* Min value: 0

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

|===

[#role_privilege]
[.api-collapsible-fifth-title]
role_privilege

A tuple containing a REST endpoint or a command/command directory path and
the access level assigned to that endpoint or command/command directory.
If the "path" attribute refers to a command/command directory path, the
tuple could additionally contain an optional query. The REST endpoint can
be a resource-qualified endpoint. At present, the only supported resource-
qualified endpoints are the following

Snapshots APIs

* _/api/storage/volumes/{volume.uuid}/snapshots_

File System Analytics APIs

* _/api/storage/volumes/{volume.uuid}/files_
* _/api/storage/volumes/{volume.uuid}/top-metrics/clients_
* _/api/storage/volumes/{volume.uuid}/top-metrics/directories_
* _/api/storage/volumes/{volume.uuid}/top-metrics/files_
* _/api/storage/volumes/{volume.uuid}/top-metrics/users_
* _/api/svm/svms/{svm.uuid}/top-metrics/clients_
* _/api/svm/svms/{svm.uuid}/top-metrics/directories_
* _/api/svm/svms/{svm.uuid}/top-metrics/files_
* _/api/svm/svms/{svm.uuid}/top-metrics/users_
* _/api/protocols/s3/services/{svm.uuid}/users_

In the above APIs, wildcard character * could be used in place of
_{volume.uuid}_ or _{svm.uuid}_ to denote _all_ volumes or _all_ SVMs,
depending upon whether the REST endpoint references volumes or SVMs. The
_{volume.uuid}_ refers to the _-instance-uuid_ field value in the "volume
show" command output at diagnostic privilege level. It can also be fetched
through REST endpoint _/api/storage/volumes_.

a|

|access
|string
a|Access level for the REST endpoint or command/command directory path. If
it denotes the access level for a command/command directory path, the only
supported enum values are 'none','readonly' and 'all'.

|path
|string
a|Either of REST URI/endpoint OR command/command directory path.

|query
|string
a|Optional attribute that can be specified only if the "path" attribute
refers to a command/command directory path. The privilege tuple implicitly
defines a set of objects the role can or cannot access at the specified
access level. The query further reduces this set of objects to a subset of
objects that the role is allowed to access. The query attribute must be
applicable to the command/command directory specified by the "path"
attribute. It is defined using one or more parameters of the
command/command directory path specified by the "path" attribute.

= Create a new cluster-scoped or SVM-scoped role

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/security/roles`#

*Introduced In:* 9.6

Creates a new cluster-scoped role or an SVM-scoped role. For an SVM-scoped
role, specify either the SVM name as the owner.name or SVM UUID as the
owner.uuid in the request body along with other parameters for the role.
The owner.uuid or owner.name are not required to be specified for a
cluster-scoped role.

== Required parameters

* `name` - Name of the role to be created.
* `privileges` - Array of privilege tuples. Each tuple consists of a REST
API or command/command directory path and its desired access level. If the
tuple refers to a command/command directory path, it could optionally
contain a query.

== Optional parameters

* `owner.name` or `owner.uuid`  - Name or UUID of the SVM for an SVM-
scoped role.

== Related ONTAP commands

* `security login rest-role create`
* `security login role create`

:leveloffset: -1

= View or delete a role

:leveloffset: +1

[[IDe90394aedd30a5e4a6dd5ce9ae7dc6db]]
= View or delete a role

== Overview

This API is used to retrieve or delete a role. The role can be SVM-scoped
or cluster-scoped.

Specify the owner UUID and the role name in the URI path. The owner UUID
corresponds to the UUID of the SVM for which the role has been created and
can be obtained from the response body of a GET call performed on one of
the following APIs:
_/api/security/roles_ for all roles
_/api/security/roles/?scope=svm_ for SVM-scoped roles
_/api/security/roles/?owner.name=+++<svm-name>+++</i> for roles in a
specific SVM This API response contains the complete URI for each role
that can be used for retrieving or deleting a role.+++</svm-name>+++_

NOTE: The pre-defined roles can be retrieved but cannot be deleted.

== Examples

=== Retrieving the role configuration for a REST role

----

# The API:
GET "/api/security/roles/{owner.uuid}/{name}"

# The call:
curl -X GET "https://<mgmt-ip>/api/security/roles/aaef7c38-4bd3-11e9-b238-
0050568e2e25/secure_role"

# The response:
{
```

```

[#role_privilege]
[.api-collapsible-fifth-title]
role_privilege

A tuple containing a REST endpoint or a command/command directory path and
the access level assigned to that endpoint or command/command directory.
If the "path" attribute refers to a command/command directory path, the
tuple could additionally contain an optional query. The REST endpoint can
be a resource-qualified endpoint. At present, the only supported resource-
qualified endpoints are the following

Snapshots APIs

* _/api/storage/volumes/{volume.uuid}/snapshots_

File System Analytics APIs

* _/api/storage/volumes/{volume.uuid}/files_
* _/api/storage/volumes/{volume.uuid}/top-metrics/clients_
* _/api/storage/volumes/{volume.uuid}/top-metrics/directories_
* _/api/storage/volumes/{volume.uuid}/top-metrics/files_
* _/api/storage/volumes/{volume.uuid}/top-metrics/users_
* _/api/svm/svms/{svm.uuid}/top-metrics/clients_
* _/api/svm/svms/{svm.uuid}/top-metrics/directories_
* _/api/svm/svms/{svm.uuid}/top-metrics/files_
* _/api/svm/svms/{svm.uuid}/top-metrics/users_
* _/api/protocols/s3/services/{svm.uuid}/users_

In the above APIs, wildcard character * could be used in place of
_{volume.uuid}_ or _{svm.uuid}_ to denote _all_ volumes or _all_ SVMs,
depending upon whether the REST endpoint references volumes or SVMs. The
_{volume.uuid}_ refers to the _-instance-uuid_ field value in the "volume
```

```
show" command output at diagnostic privilege level. It can also be fetched
through REST endpoint _/api/storage/volumes_.

|===
|Name
|Type
|Description

|_links
|link:#_links[_links]
a|

|access
|string
a|Access level for the REST endpoint or command/command directory path. If
it denotes the access level for a command/command directory path, the only
supported enum values are 'none','readonly' and 'all'.

|path
|string
a|Either of REST URI/endpoint OR command/command directory path.

|query
|string
a|Optional attribute that can be specified only if the "path" attribute
refers to a command/command directory path. The privilege tuple implicitly
defines a set of objects the role can or cannot access at the specified
access level. The query further reduces this set of objects to a subset of
objects that the role is allowed to access. The query attribute must be
applicable to the command/command directory specified by the "path"
attribute. It is defined using one or more parameters of the
command/command directory path specified by the "path" attribute.

:leveloffset: -1

= Manage role privilege details

:leveloffset: +1

[[IDa7276728a8c31517b1655d06d7e0900e]]
= Manage role privilege details

== Overview

This API is used to configure the role privileges (tuples of REST URI
paths or command/command directory paths, their access levels and optional
queries, where the tuples refer to command/command directory paths). It
also retrieves all of the privilege tuples for a role and can add a tuple
to an existing role or creates a new role with the provided tuple. The
"path" attribute can be a resource-qualified endpoint. Currently, the only
supported resource-qualified endpoints are the following&#58;

=== Snapshots APIs

&ndash; _/api/storage/volumes/{volume.uuid}/snapshots_

=== File System Analytics APIs

&ndash; _/api/storage/volumes/{volume.uuid}/files_

&ndash; _/api/storage/volumes/{volume.uuid}/top-metrics/clients_

&ndash; _/api/storage/volumes/{volume.uuid}/top-metrics/directories_

&ndash; _/api/storage/volumes/{volume.uuid}/top-metrics/files_

&ndash; _/api/storage/volumes/{volume.uuid}/top-metrics/users_
```

```
&ndash; _/api/svm/svms/{svm.uuid}/top-metrics/clients_

&ndash; _/api/svm/svms/{svm.uuid}/top-metrics/directories_

&ndash; _/api/svm/svms/{svm.uuid}/top-metrics/files_

&ndash; _/api/svm/svms/{svm.uuid}/top-metrics/users_

==== ONTAP S3 APIs

&ndash; _/api/protocols/s3/services/{svm.uuid}/users_

In the APIs above, and in the context of REST roles, the wildcard
character &#42; can be used in place of _{volume.uuid}_ or _{svm.uuid}_ to
represent _all_ volumes or _all_ SVMs, depending on whether the REST
endpoint references volumes or SVMs. The _{volume.uuid}_ corresponds to
the _-instance-uuid_ field in the output of the "volume show" command at
the diagnostic privilege level. It can also be retrieved through the REST
endpoint _/api/storage/volumes_.

The role can be SVM-scoped or cluster-scoped.

Specify the owner UUID and the role name in the URI path. The owner UUID
corresponds to the UUID of the SVM for which the role has been created and
can be obtained from the response body of a GET request performed on one
of the following APIs&#58;

* _/api/security/roles_ for all the roles
* _/api/security/roles/?scope=svm_ for SVM-scoped roles
* _/api/security/roles/?owner.name=+++<svm-name>+++</i> for roles in a
specific SVM This API response contains the complete URI for each role and
can be used after suffixing it with _"privileges"_.+++</svm-name>+++_

NOTE: The pre-defined roles can be retrieved but cannot be updated.

== Examples

=== Adding a privilege tuple for a REST URI/endpoint to an existing custom
role

----

# The API:
POST "/security/roles/{owner.uuid}/{name}/privileges"

# The call:
curl -X POST "https://<mgmt-ip>/api/security/roles/aaef7c38-4bd3-11e9-
```

```
b238-0050568e2e25/svm_role1/privileges" -d
'{"access":"readonly","path":"/api/protocols"}'
----

=== Adding a privilege tuple for a command or command directory to an
existing custom role

----

# The API:
POST "/security/roles/{owner.uuid}/{name}/privileges"

# The call:
curl -X POST "https://<mgmt-ip>/api/security/roles/aaef7c38-4bd3-11e9-
b238-0050568e2e25/svm_role1/privileges" -d
'{"access":"all","path":"statistics volume show","query":"-vserver
vs1&#124;vs2 -aggregate aggr1&#124;aggr2"}'
----

=== Retrieving all the privilege tuples for a REST role

----

# The API:
GET "/api/security/roles/{owner.uuid}/{name}/privileges"

# The call:
curl -X GET "https://<mgmt-ip>/api/security/roles/aaef7c38-4bd3-11e9-b238-
0050568e2e25/svm_role1/privileges"

[#role_privilege]
[.api-collapsible-fifth-title]
role_privilege

A tuple containing a REST endpoint or a command/command directory path and
the access level assigned to that endpoint or command/command directory.
If the "path" attribute refers to a command/command directory path, the
tuple could additionally contain an optional query. The REST endpoint can
be a resource-qualified endpoint. At present, the only supported resource-
qualified endpoints are the following

Snapshots APIs
```

```
* _/api/storage/volumes/{volume.uuid}/snapshots_

File System Analytics APIs

* _/api/storage/volumes/{volume.uuid}/files_
* _/api/storage/volumes/{volume.uuid}/top-metrics/clients_
* _/api/storage/volumes/{volume.uuid}/top-metrics/directories_
* _/api/storage/volumes/{volume.uuid}/top-metrics/files_
* _/api/storage/volumes/{volume.uuid}/top-metrics/users_
* _/api/svm/svms/{svm.uuid}/top-metrics/clients_
* _/api/svm/svms/{svm.uuid}/top-metrics/directories_
* _/api/svm/svms/{svm.uuid}/top-metrics/files_
* _/api/svm/svms/{svm.uuid}/top-metrics/users_
* _/api/protocols/s3/services/{svm.uuid}/users_

In the above APIs, wildcard character * could be used in place of
_{volume.uuid}_ or _{svm.uuid}_ to denote _all_ volumes or _all_ SVMs,
depending upon whether the REST endpoint references volumes or SVMs. The
_{volume.uuid}_ refers to the _-instance-uuid_ field value in the "volume
show" command output at diagnostic privilege level. It can also be fetched
through REST endpoint _/api/storage/volumes_.

[[ID81300c631e66d5077c71850b7a08dbc6]]
= Add a privilege tuple to an existing role

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/security/roles/{owner.uuid}/{name}/privileges`#

*Introduced In:* 9.6

Adds a privilege tuple (of REST URI or command/command directory path, its
access level and an optional query, if the "path" refers to a
command/command directory path) to an existing role or creates a new role
with the provided tuple.

== Required parameters

* `owner.uuid` - UUID of the SVM that houses this role.
* `name` - Name of the role to be updated.
* `path` - REST URI path (example: _/api/storage/volumes_) or
command/command directory path (example: _snaplock compliance-clock_). Can
be a resource-qualified endpoint (example: _/api/storage/volumes/43256a71-
```

```
be02-474d-a2a9-9642e12a6a2c/snapshots_). Currently, resource-qualified
endpoints are limited to the following&#58;

== Snapshots APIs

&ndash; _/api/storage/volumes/{volume.uuid}/snapshots_

== File System Analytics APIs

&ndash; _/api/storage/volumes/{volume.uuid}/files_

&ndash; _/api/storage/volumes/{volume.uuid}/top-metrics/clients_

&ndash; _/api/storage/volumes/{volume.uuid}/top-metrics/directories_

&ndash; _/api/storage/volumes/{volume.uuid}/top-metrics/files_

&ndash; _/api/storage/volumes/{volume.uuid}/top-metrics/users_

&ndash; _/api/svm/svms/{svm.uuid}/top-metrics/clients_

&ndash; _/api/svm/svms/{svm.uuid}/top-metrics/directories_

&ndash; _/api/svm/svms/{svm.uuid}/top-metrics/files_

&ndash; _/api/svm/svms/{svm.uuid}/top-metrics/users_

In the APIs above, and in the context of REST roles, the wildcard
character &#42; can be used in place of _{volume.uuid}_ or _{svm.uuid}_ to
represent _all_ volumes or _all_ SVMs, depending on whether the REST
endpoint references volumes or SVMs. The _{volume.uuid}_ corresponds to
the _-instance-uuid_ field in the output of the "volume show" command at
the diagnostic privilege level. It can also be retrieved through the REST
endpoint _/api/storage/volumes_.

* `access` - Desired access level for the REST URI path or command/command
directory.

[#role_privilege]
[.api-collapsible-fifth-title]
role_privilege

A tuple containing a REST endpoint or a command/command directory path and
the access level assigned to that endpoint or command/command directory.
If the "path" attribute refers to a command/command directory path, the
tuple could additionally contain an optional query. The REST endpoint can
be a resource-qualified endpoint. At present, the only supported resource-
qualified endpoints are the following

Snapshots APIs

* _/api/storage/volumes/{volume.uuid}/snapshots_

File System Analytics APIs

* _/api/storage/volumes/{volume.uuid}/files_
* _/api/storage/volumes/{volume.uuid}/top-metrics/clients_
* _/api/storage/volumes/{volume.uuid}/top-metrics/directories_
* _/api/storage/volumes/{volume.uuid}/top-metrics/files_
* _/api/storage/volumes/{volume.uuid}/top-metrics/users_
* _/api/svm/svms/{svm.uuid}/top-metrics/clients_
* _/api/svm/svms/{svm.uuid}/top-metrics/directories_
* _/api/svm/svms/{svm.uuid}/top-metrics/files_
* _/api/svm/svms/{svm.uuid}/top-metrics/users_
* _/api/protocols/s3/services/{svm.uuid}/users_

In the above APIs, wildcard character * could be used in place of
_{volume.uuid}_ or _{svm.uuid}_ to denote _all_ volumes or _all_ SVMs,
depending upon whether the REST endpoint references volumes or SVMs. The
_{volume.uuid}_ refers to the _-instance-uuid_ field value in the "volume
show" command output at diagnostic privilege level. It can also be fetched
through REST endpoint _/api/storage/volumes_.

= Manage role privilege path

:leveloffset: +1

[[IDe00dd14712d0ea45cc262d6130795e18]]
= Manage role privilege path
```

```
== Overview

A role can comprise of multiple tuples and each tuple consists of a REST
API path or command/command directory path and its access level. If the
tuple refers to a command/command directory path, it may optionally be
associated with a query. These APIs can be used to retrieve or modify the
associated access level and optional query. They can also be used to
delete one of the constituent REST API paths or command/command directory
paths within a role. The REST API path can be a resource-qualified
endpoint. Currently, the only supported resource-qualified endpoints are
the following&#58;

=== Snapshots APIs

&ndash; _/api/storage/volumes/{volume.uuid}/snapshots_

=== File System Analytics APIs

&ndash; _/api/storage/volumes/{volume.uuid}/files_

&ndash; _/api/storage/volumes/{volume.uuid}/top-metrics/clients_

&ndash;  _/api/storage/volumes/{volume.uuid}/top-metrics/directories_

&ndash; _/api/storage/volumes/{volume.uuid}/top-metrics/files_

&ndash; _/api/storage/volumes/{volume.uuid}/top-metrics/users_

&ndash; _/api/svm/svms/{svm.uuid}/top-metrics/clients_

&ndash; _/api/svm/svms/{svm.uuid}/top-metrics/directories_

&ndash; _/api/svm/svms/{svm.uuid}/top-metrics/files_

&ndash; _/api/svm/svms/{svm.uuid}/top-metrics/users_

==== ONTAP S3 APIs

&ndash; _/api/protocols/s3/services/{svm.uuid}/users_

In the APIs above, and in the context of REST roles, the wildcard
character &#42; can be used in place of _{volume.uuid}_ or _{svm.uuid}_ to
represent _all_ volumes or _all_ SVMs, depending on whether the REST
endpoint references volumes or SVMs. The _{volume.uuid}_ corresponds to
```

```
the _-instance-uuid_ field in the output of the "volume show" command at
the diagnostic privilege level. It can also be retrieved through the REST
endpoint _/api/storage/volumes_.

The role can be SVM-scoped or cluster-scoped.

Specify the owner UUID and the role name in the URI path. The owner UUID
corresponds to the UUID of the SVM for which the role has been created and
can be obtained from the response body of a GET request performed on one
of the following APIs&#58;
_/api/security/roles_ for all roles
_/api/security/roles/?scope=svm_ for SVM-scoped roles
_/api/security/roles/?owner.name=+++<svm-name>+++</i> for roles in a
specific SVM This API response contains the complete URI for each tuple of
the role and can be used for GET, PATCH, or DELETE operations.+++</svm-
name>+++_

NOTE: The access level for paths in pre-defined roles cannot be updated.

== Examples

=== Updating the access level for a REST API path in the privilege tuple
of an existing role

----

# The API:
PATCH "/api/security/roles/{owner.uuid}/{name}/privileges/{path}"

# The call:
curl -X PATCH "https://<mgmt-ip>/api/security/roles/aaef7c38-4bd3-11e9-
b238-0050568e2e25/svm_role1/privileges/%2Fapi%2Fprotocols" -d
'{"access":"all"}'
----

= Delete a privilege tuple from the role

[.api-doc-operation .api-doc-operation-delete]#DELETE# [.api-doc-code-
block]#`/security/roles/{owner.uuid}/{name}/privileges/{path}`#

*Introduced In:* 9.6

Deletes a privilege tuple (of REST URI or command/command directory path,
its access level and an optional query) from the role. The REST URI can be
a resource-qualified endpoint. Currently, the only supported resource-
qualified endpoints are the following&#58;

== Snapshots APIs

&ndash; _/api/storage/volumes/{volume.uuid}/snapshots_

== File System Analytics APIs

&ndash; _/api/storage/volumes/{volume.uuid}/files_

&ndash; _/api/storage/volumes/{volume.uuid}/top-metrics/clients_

&ndash; _/api/storage/volumes/{volume.uuid}/top-metrics/directories_

&ndash; _/api/storage/volumes/{volume.uuid}/top-metrics/files_

&ndash; _/api/storage/volumes/{volume.uuid}/top-metrics/users_

&ndash; _/api/svm/svms/{svm.uuid}/top-metrics/clients_

&ndash; _/api/svm/svms/{svm.uuid}/top-metrics/directories_

&ndash; _/api/svm/svms/{svm.uuid}/top-metrics/files_
```

```
&ndash; _/api/svm/svms/{svm.uuid}/top-metrics/users_

== ONTAP S3 APIs

&ndash; _/api/protocols/s3/services/{svm.uuid}/users_

In the APIs above, and in the context of REST roles, the wildcard
character &#42; can be used in place of _{volume.uuid}_ or _{svm.uuid}_ to
represent _all_ volumes or _all_ SVMs, depending on whether the REST
endpoint references volumes or SVMs. The _{volume.uuid}_ corresponds to
the _-instance-uuid_ field in the output of the "volume show" command at
the diagnostic privilege level. It can also be retrieved through the REST
endpoint _/api/storage/volumes_.

== Required parameters

* `owner.uuid` - UUID of the SVM which houses this role.
* `name` - Name of the role to be updated.
* `path` - Constituent REST API path or command/command directory path to
be deleted from this role. Can be a resource-qualified endpoint (example:
_/api/svm/svms/43256a71-be02-474d-a2a9-9642e12a6a2c/top-metrics/users_).
Currently, resource-qualified endpoints are limited to the _Snapshots_,
_File System Analytics_ and _ONTAP S3_ endpoints listed above in the
description.

= Update the access level for a REST API path or command/command directory
path

[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-
block]#`/security/roles/{owner.uuid}/{name}/privileges/{path}`#
```

```
*Introduced In:* 9.6

Updates the access level for a REST API path or command/command directory
path. Optionally updates the query, if 'path' refers to a command/command
directory path. The REST API path can be a resource-qualified endpoint.
Currently, the only supported resource-qualified endpoints are the
following&#58;

== Snapshots APIs

&ndash; _/api/storage/volumes/{volume.uuid}/snapshots_

== File System Analytics APIs

&ndash; _/api/storage/volumes/{volume.uuid}/files_

&ndash; _/api/storage/volumes/{volume.uuid}/top-metrics/clients_

&ndash; _/api/storage/volumes/{volume.uuid}/top-metrics/directories_

&ndash; _/api/storage/volumes/{volume.uuid}/top-metrics/files_

&ndash; _/api/storage/volumes/{volume.uuid}/top-metrics/users_

&ndash; _/api/svm/svms/{svm.uuid}/top-metrics/clients_

&ndash; _/api/svm/svms/{svm.uuid}/top-metrics/directories_

&ndash; _/api/svm/svms/{svm.uuid}/top-metrics/files_

&ndash; _/api/svm/svms/{svm.uuid}/top-metrics/users_

== ONTAP S3 APIs

&ndash; _/api/protocols/s3/services/{svm.uuid}/users_

In the APIs above, and in the context of REST roles, the wildcard
character &#42; can be used in place of _{volume.uuid}_ or _{svm.uuid}_ to
represent _all_ volumes or _all_ SVMs, depending on whether the REST
endpoint references volumes or SVMs. The _{volume.uuid}_ corresponds to
the _-instance-uuid_ field in the output of the "volume show" command at
the diagnostic privilege level. It can also be retrieved through the REST
endpoint _/api/storage/volumes_.

== Required parameters
```

```
* `owner.uuid` - UUID of the SVM that houses this role.
* `name` - Name of the role to be updated.
* `path` - Constituent REST API path or command/command directory path,
whose access level and/or query are/is to be updated. Can be a resource-
qualified endpoint (example: _/api/storage/volumes/43256a71-be02-474d-
a2a9-9642e12a6a2c/snapshots_). Currently, resource-qualified endpoints are
limited to the _Snapshots_, _File System Analytics_ and _ONTAP S3_
endpoints listed above in the description.

== Optional parameters

* `access` - Access level for the path.
* `query` - Optional query, if the path refers to a command/command
directory path.

== Related ONTAP commands

* `security login rest-role modify`
* `security login role modify`

|path
|True
a|Role owner UUID
```

```
|name
|string
|path
|True
a|Role name

|path
|string
|path
|True
a|REST API path or command/command directory path

|===

== Request Body

[cols=3*,options=header]
|===
|Name
|Type
|Description

|access
|string
a|Access level for the REST endpoint or command/command directory path. If
it denotes the access level for a command/command directory path, the only
supported enum values are 'none','readonly' and 'all'.

|query
|string
a|Optional attribute that can be specified only if the "path" attribute
refers to a command/command directory path. The privilege tuple implicitly
defines a set of objects the role can or cannot access at the specified
access level. The query further reduces this set of objects to a subset of
objects that the role is allowed to access. The query attribute must be
applicable to the command/command directory specified by the "path"
attribute. It is defined using one or more parameters of the
command/command directory path specified by the "path" attribute.

|string
a|

|===

[#_links]
[.api-collapsible-fifth-title]
_links
[#role_privilege]
[.api-collapsible-fifth-title]
role_privilege

A tuple containing a REST endpoint or a command/command directory path and
the access level assigned to that endpoint or command/command directory.
If the "path" attribute refers to a command/command directory path, the
tuple could additionally contain an optional query. The REST endpoint can
be a resource-qualified endpoint. At present, the only supported resource-
qualified endpoints are the following

Snapshots APIs

* _/api/storage/volumes/{volume.uuid}/snapshots_

File System Analytics APIs

* _/api/storage/volumes/{volume.uuid}/files_
* _/api/storage/volumes/{volume.uuid}/top-metrics/clients_
* _/api/storage/volumes/{volume.uuid}/top-metrics/directories_
* _/api/storage/volumes/{volume.uuid}/top-metrics/files_
* _/api/storage/volumes/{volume.uuid}/top-metrics/users_
* _/api/svm/svms/{svm.uuid}/top-metrics/clients_
```

```
* _/api/svm/svms/{svm.uuid}/top-metrics/directories_
* _/api/svm/svms/{svm.uuid}/top-metrics/files_
* _/api/svm/svms/{svm.uuid}/top-metrics/users_
* _/api/protocols/s3/services/{svm.uuid}/users_

In the above APIs, wildcard character * could be used in place of
_{volume.uuid}_ or _{svm.uuid}_ to denote _all_ volumes or _all_ SVMs,
depending upon whether the REST endpoint references volumes or SVMs. The
_{volume.uuid}_ refers to the _-instance-uuid_ field value in the "volume
show" command output at diagnostic privilege level. It can also be fetched
through REST endpoint _/api/storage/volumes_.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|access
|string
a|Access level for the REST endpoint or command/command directory path. If

:leveloffset: -1

= Manage SSH server

:leveloffset: +1

[[IDcf401b81252566b072a07c01b08092bb]]
= Manage SSH server

== Overview

ONTAP supports SSH server that can be accessed from any standard SSH
client. A user account needs to be associated with SSH as the application
(refer the documentation for _api/security/accounts_
xref:{relative_path}security_accounts_endpoint_overview.html[DOC
/security/accounts] . Upon connecting from a client, the user is
authenticated and a command line shell is presented.

This endpoint is used to retrieve or modify the SSH configuration at the
cluster level. The configuration consists of SSH security parameters
(security algorithms, maximum authentication retry attempts allowed before
closing the connection, SSH connection login grace time and _ssh-rsa_
enabled status for public key algorithms) and SSH connection limits.

The security algorithms include SSH key exchange algorithms, ciphers for
payload encryption, MAC algorithms and host key algorithms. This
configuration is the default for all newly created SVMs; existing SVM
configurations are not impacted.
The SSH connection limits include maximum connections per second, maximum
simultaneous sessions from the same client host, and overall maximum SSH
connections at any given point in time. The connection limits are per node
and will be the same for all nodes in the cluster.

== Examples
```

```
=== Updating the SSH security parameters

Specify the algorithms in the body of the PATCH request.

----

# The API:
PATCH "/api/security/ssh"

# The call:
curl -X PATCH "https://<mgmt-ip>/api/security/ssh" -d '{ "ciphers": [
"aes256_ctr", "aes192_ctr" ], "key_exchange_algorithms": [
"diffie_hellman_group_exchange_sha256", "ecdh_sha2_nistp256",
"diffie_hellman_group18_sha512" ], "mac_algorithms": [
"hmac_sha2_512_etm", "umac_128_etm" ], "host_key_algorithms": [
"ecdsa_sha2_nistp256", "ssh_rsa", "ssh_ed25519", "rsa_sha2_256",
"rsa_sha2_512"], "max_authentication_retry_count": 3,
"is_rsa_in_publickey_algorithms_enabled": true , "login_grace_time": 30 }'
----

=== Updating the SSH connection limits

Specify the connection limits in the body of the PATCH request.

----

# The API:
PATCH "/api/security/ssh"

# The call:
curl -X PATCH "https://<mgmt-ip>/api/security/ssh" -d '{
"connections_per_second": 8, "max_instances": 10, "per_source_limit": 5 }'
----

=== Retrieving the cluster SSH server configuration

----

# The API:
GET "/api/security/ssh"

# The call:
curl -X GET "https://<mgmt-ip>/api/security/ssh"

# The response:

:leveloffset: -1

= View SSH SVMs

:leveloffset: +1

[[ID2788c167a93b1d118e48baed85c953da]]
= View SSH SVMs

=== Overview

This endpoint is used to retrieve the SSH security configuration for all
data SVMs. The configuration consists of SSH security parameters. The
security algorithms include SSH key exchange algorithms, ciphers for
payload encryption, MAC algorithms, host key algorithms, maximum
authentication retry attempts allowed before closing the connection, SSH
connection login grace time, and _ssh-rsa_ enabled status for public key
algorithms. The SSH configuration for a newly created SVM is the same as
the SSH configuration at cluster level. When the cluster SSH configuration
is updated using _/security/ssh_ endpoint, the SSH configuration of
existing SVMs is not impacted. To customize the SSH security parameters
for a particular data SVM, perform a PATCH operation on the
_api/security/ssh/svms/{svm.uuid}_ endpoint.

== Example

=== Retrieving the SSH security configuration of all SVMs.

Retrieves the SSH security configurations associated with the owners or
filtered list (for a specific data SVM and so on).

:leveloffset: -1

= Manage SSH security configuration

:leveloffset: +1

[[ID48fa7d46fb90c7d1dd80d76d0661688a]]
= Manage SSH security configuration

== Overview
```

```
This endpoint is used to retrieve or modify the SSH security configuration
of a data SVM.

The SSH security algorithms include key exchange algorithms, ciphers for
payload encryption, MAC algorithms, host key algorithms, SSH connection
login grace time, and the maximum authentication retry attempts allowed
before closing the connection. svm.uuid corresponds to the UUID of the SVM
for which the SSH security setting is being retrieved or modified and it
is obtained from the response body of a GET operation performed on the
_api/security/ssh/svms_ API.

== Examples

=== Updating the SSH security parameters

Specify the algorithms in the body of the PATCH request.

----

# The API:
PATCH "/api/security/ssh/svms/{svm.uuid}"

# The call:
curl -X PATCH "https://<mgmt-ip>/api/security/ssh/svms/02c9e252-41be-11e9-
81d5-00a0986138f7" -d '{ "ciphers": [ "aes256_ctr", "aes192_ctr" ],
"key_exchange_algorithms": [ "diffie_hellman_group_exchange_sha256",
"ecdh_sha2_nistp256", "diffie_hellman_group16_sha512" ], "mac_algorithms":
[ "hmac_sha2_512_etm", "umac_128_etm" ], "host_key_algorithms": [
"ecdsa_sha2_nistp256", "ssh_ed25519", "rsa_sha2_256", "rsa_sha2_512"
],"is_rsa_in_publickey_algorithms_enabled": false,
"max_authentication_retry_count": 3 }'
----

| Error Code | Description

| 10682372
| There must be at least one key exchange algorithm associated with the
SSH configuration.
```

```
| 10682373
| There must be at least one cipher associated with the SSH configuration.

| 10682375
| Failed to modify SSH key exchange algorithms.

| 10682378
| Failed to modify SSH ciphers.

| 10682399
| Key exchange algorithm not supported in FIPS-enabled mode.

| 10682400
| Failed to modify SSH MAC algorithms.

| 10682401
| MAC algorithm not supported in FIPS-enabled mode.

| 10682403
| There must be at least one MAC algorithm with the SSH configuration.

| 10682413
| Failed to modify maximum authentication retry attempts.

| 10682418
| Cipher not supported in FIPS-enabled mode.

| 10682420
| To modify the SSH configuration of the admin SVM, use the
/api/security/ssh REST API.

| 10682423
| There must be at least one host key algorithm associated with the SSH
configuration.

| 10682424
| Host key algorithm not supported in FIPS enabled mode.

| 10682425
| Failed to modify Host key algorithms.

| 10682426
| Failed to modify _ssh-rsa_ enabled status for publickey algorithms
configuration.

| 10682428
| Cipher not supported in FIPS enabled mode.
```

```
| 10682429
| Adding 'diffie_hellman_group16_sha512' or
'diffie_hellman_group18_sha512' to the SSH key exchange algorithms list
requires an effective cluster version of ONTAP 9.16.1 or later.

| 10682430
| Failed to modify the login grace time.

= Manage WebAuthn credentials

== Overview

This API is used to retrieve all WebAuthn credentials entries.

== Examples

=== Retrieving all Webauthn credentials entries

The following output shows all WebAuthn credentials entries.

----

## The API:
/api/security/webauthn/credentials

## The call:
curl -X GET "https://<mgmt-ip>/api/security/webauthn/credentials"

# The response:
{
"records": [
  {
    "owner": {
      "uuid": "389758ee-40cd-11ef-bb21-005056aeae31",
      "_links": {
        "self": {
          "href": "/api/svm/svms/389758ee-40cd-11ef-bb21-005056aeae31"
        }
      }
    },
    "username": "user_1",
    "index": 0,
    "relying_party": {
```

```
      "id": "ontap1.example.com",
      "name": "ontap1.example.com"
    },
    "_links": {
      "self": {
        "href": "/api/security/webauthn/credentials/389758ee-40cd-11ef-

= Retrieve all WebAuthn credentials entries

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/security/webauthn/credentials`#

*Introduced In:* 9.16

Retrieves all WebAuthn credentials entries.

== Related ONTAP commands

* `security webauthn credentials show`

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
```

```
|Required
|Description

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 15
* Max value: 120
* Min value: 0

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.
```

= View all WebAuthn supported algorithms

== Overview

This API endpoint retrieves the list of supported algorithms for WebAuthn
authentication.

== Examples

=== Retrieving the list of supported algorithms

This endpoint retrieves all of the supported algorithms for WebAuthn
authentication. The following table lists the supported algorithms:

|===
| Algorithm ID | Algorithm Name | Description

| -7
| ES256
| ECDSA w/ SHA-256

| -35
| ES384
| ECDSA w/ SHA-384

| -257
| RS256
| RSASSA-PKCS1-v1_5 using SHA-256
|===

----

# The API:
GET "/api/security/webauthn/supported-algorithms"

# The call to retrieve the list of supported algorithms:
curl -k https://<mgmt-ip>/api/security/webauthn/supported-algorithms
```

```
