Linux Unified Host Utilities 7.1 Release Notes

The release notes describe new features and enhancements, known problems and limitations, and important cautions for configuring and managing your specific host with your ONTAP storage system.

For specific information about the operating system versions and updates that the Host Utilities support, see the NetApp Interoperability Matrix Tool.

What's New

The Linux Host Utilities 7.1 release contains the following new features and enhancements:

- Linux Host Utilities is now called *Linux Unified Host Utilities* because it supports NetApp E-Series storage systems running SANtricity as well as AFF, FAS, and ASA systems running ONTAP.

  Any mention of Host Utilities or Linux Host Utilities in this document refers to Linux Unified Host Utilities.

- The following operating systems are now supported:
  - SUSE Linux Enterprise Server 15 series
  - Oracle VM 3.2 series
  - Oracle Linux 6 and 7 series
  - Red Hat Enterprise Linux 6 and 7 series
  - SUSE Linux Enterprise Server 11 SP4
  - KVM and XEN, RHEV 6.4 and 6.5
  - Citrix XenServer
- On Red Hat Enterprise Linux (RHEL) 6 and RHEL 7 hosts, a tuned package for setting server profiles is now supported. You can use the `tuned-adm` command to set different profiles, depending on the environment. For example, you can also use the virtual guest profile as a guest virtual machine and you can use the enterprise storage profile for configurations where LUNs from enterprise storage arrays are used. Using these tuned packages can result in improvement in throughput and latency in ONTAP.
- Adds support for 32GB FC adapters from Broadcom Emulex and Marvell Qlogic.

NetApp continues to work with the Host Utilities to add support for features after the initial release. For latest information about the features that are supported and the new features that have been added, see the NetApp Interoperability Matrix Tool.

Fixed in this release

The intermittent host OS failure issue that occurs when running the `sanlun lun show -p` command in SLES12SP1, OL7.2, RHEL7.2, and RHEL 6.8 is fixed in this release.

Known problems and limitations

The Linux Host Utilities 7.1 release has the following known problems and limitations.

NetApp Bug ID	Title	Description
1457017	`sanlun` installation issues warning messages related to `libdevmapper.so` and `libnl.so` libraries. These warnings do not affect the functionality of `sanlun` kit.	When you execute the Linux Unified Host Utilities CLI command - "sanlun fcp show adapter -v" on a SAN host, the command fails with an error message displaying that the library dependencies required for an host bus adapter (HBA) discovery cannot be located: [root@hostname ~]# sanlun fcp show adapter -v Unable to locate /usr/lib64/libHBAAPI.so library Make sure the package installing the library is installed & loaded Refer to the public report 1508554.

NetApp Bugs Online provides complete information for most known issues, including suggested workarounds where possible.

Install Linux Unified Host Utilities 7.1

The Linux Unified Host Utilities (LUHU) assists you to manage NetApp ONTAP storage attached to a Linux host. NetApp strongly recommends installing the Linux Unified Host Utilities, but it is not mandatory. The utilities do not change any settings on your Linux host. The utilities improve management and assist NetApp customer support in gathering information about your configuration.

The following Linux distributions are supported:

- Red Hat Enterprise Linux
- SUSE Linux Enterprise Server
- Oracle Linux
- Oracle VM
- Citrix XenServer

What you'll need

The NetApp Linux Unified Host Utilities software package is available on the NetApp Support Site in a 32-bit or 64-bit .rpm file.

- For reliable operation, you must verify that your entire iSCSI, FC, or FCoE configuration is supported.

  You can use the NetApp Interoperability Matrix Tool to verify your configuration.

- You must install the host bus adapter (HBA) management packages available on the vendor support site.

The management software enables the SAN toolkit commands to gather information about the FC HBAs, such as their WWPNs. For the `sanlun fcp show adapter` command to work, verify that the following packages are correctly installed:

  - Marvell QLogic HBA – QConvergeConsole CLI
  - Broadcom Emulex HBA - OneCommand Manager core application CLI
  - Marvell Brocade HBA – Brocade Command Utility CLI

- RPM Packages "libhbaapi" and "libhbalinux" available for each Linux distribution should be installed on the host OS.

> Linux Unified Host Utilities software does not support NVMe over Fibre Channel (NVMe/FC) and NVMe over TCP (NVMe/TCP) host protocols.

Steps

1. If you have a version of Linux Unified Host Utilities currently installed, use the following command to remove it:

   ```
   rpm -e netapp_linux_unified_host_utilities-7-1
   ```

   For older versions of Linux Host Utilities, go to the directory where the host utility software is installed and enter the uninstall command to remove the installed package.

2. Download the 32-bit or 64-bit Linux Unified Host Utilities software package from the NetApp Support Site to your host.
3. Go to the directory to which you downloaded the software package and use the following command to install it:

   ```
   rpm -ivh netapp_linux_unified_host_utilities-7-1.x86_xx.rpm
   ```

   Example output

   ```
   Verifying...                          ##################################
   [100%]
   Preparing...                          ##################################
   [100%]
   Updating / installing...
      1:netapp_linux_unified_host_utiliti##################################
   [100%]
   ```

4. Verify the installation:

   ```
   sanlun version
   ```

   Example output

```
sanlun version 7.1.386.1644
```

Recommended driver settings with Linux kernel

When you configure an FC environment that uses native inbox drivers that are bundled with the Linux kernel, you can use the default values for the drivers.

SAN Toolkit

Linux Unified Host Utilities is a NetApp host software that provides a command line tool kit on your Linux host.

The toolkit is installed automatically when you install the NetApp Host Utilities package. This kit provides the `sanlun` utility, which helps you manage LUNs and HBAs. The `sanlun` command returns information about the LUNs mapped to your host, multipathing, and information necessary to create initiator groups.

Example

In the following example, the `sanlun lun show` command returns LUN information.

```
# sanlun lun show all
```

Example output:

```
controller(7mode/E-Series)/            device     host               lun
vserver(cDOT/FlashRay)   lun-pathname  filename   adapter  protocol  size
Product
------------------------------------------------------------------------
data_vserver          /vol/vol1/lun1   /dev/sdb   host16   FCP
120.0g  cDOT
data_vserver          /vol/vol1/lun1   /dev/sdc   host15   FCP
120.0g  cDOT
data_vserver          /vol/vol2/lun2   /dev/sdd   host16   FCP
120.0g  cDOT
data_vserver          /vol/vol2/lun2   /dev/sde   host15   FCP
120.0g  cDOT
```

- This toolkit is common across all configurations and protocols of the Host Utilities. As a result, some of its contents apply to one configuration, but not another. Having unused components does not affect your system performance.
- The SAN toolkit is not supported on Citrix XenServer, Oracle VM, and Red Hat Enterprise Virtualization Hypervisor.

Linux Unified Host Utilities 7.1 command reference

You can use the Linux Unified Host Utilities 7.1 sample command reference for an end-to-

end validation of the NetApp storage configuration using the host utilities tool.

List all host initiators mapped to host

You can retrieve a list of all host initiators mapped to a host.

```
# sanlun fcp show adapter -v
```

Example output

```
adapter name:      host15
WWPN:              10000090fa022736
WWNN:              20000090fa022736
