Clusters

ONTAP Select clusters

There are several related tasks you can perform to administer an ONTAP Select cluster.

Move an ONTAP Select cluster offline and online

After you've created a cluster, you can move it offline and online as needed.

Before you begin

After a cluster is created it is initially in the online state.

Steps

1. Sign in to the Deploy utility web user interface using the administrator account.
2. Click the **Clusters** tab at the top of the page and select the desired cluster from the list.
3. Click  on the right of the cluster and select **Take Offline**.

If the offline option is not available, the cluster is already in the offline state.

4. Click **Yes** in the popup window to confirm the request.
5. Click **Refresh** occasionally to confirm the cluster is offline.
6. To bring the cluster back online, click  and select **Bring Online**.
7. Click **Refresh** occasionally to confirm the cluster is online.

Delete an ONTAP Select cluster

You can delete an ONTAP Select cluster when it is no longer needed.

Before you begin

The cluster must be in the offline state.

Steps

1. Sign in to the Deploy utility web user interface using the administrator account.
2. Click the **Clusters** tab at the top of the page and select the desired cluster from the list.
3. Click  on the right of the cluster and select **Delete**.

If the delete option is not available, then the cluster is not in an offline state.

4. Click **Refresh** occasionally to confirm the cluster is removed from the list.

Refresh the Deploy cluster configuration

After creating an ONTAP Select cluster, you can make changes to the cluster or the virtual machine configuration outside of the Deploy utility using the ONTAP or hypervisor administration tools. The configuration of a virtual machine can also change after it is migrated.

When these changes to the cluster or virtual machine occur, the Deploy utility configuration database is not

automatically updated and can become out of sync with the state of the cluster. You should perform a cluster refresh in these and other situations to update the Deploy database based on the current state of the cluster.

Before you begin

Required information

You must have the current configuration information for the cluster, including:

- ONTAP administrator credentials
- Cluster management IP address
- Names of the nodes in the cluster

Stable cluster state

The cluster must be in a stable state. You cannot refresh a cluster when it is in the process of being created or deleted, or when it is in the *create_failed* or *delete_failed* state.

After a VM migration

After a virtual machine running ONTAP Select has been migrated, you must create a new host using the Deploy utility before performing a cluster refresh.

About this task

You can perform a cluster refresh to update the Deploy configuration database using the web user interface.

Instead of using the Deploy GUI, you can use the cluster refresh command in the Deploy CLI shell to refresh a cluster.

Cluster and virtual machine configuration

Some of the configuration values that can change and cause the Deploy database to become out of sync include:

- Cluster and node names
- ONTAP network configuration
- ONTAP version (after an upgrade)
- Virtual machine names
- Host network names
- Storage pool names

Cluster and node states

An ONTAP Select cluster or node can be in a state that prevents it from operating properly. You should perform a cluster refresh operation to correct the following conditions:

- Node in *unknown* state
An ONTAP Select node can be in the *unknown state* for several reasons, including the node is not found.
- Cluster in *degraded* state
If a node is powered off, it might still appear to be online in the Deploy utility. In this situation, the cluster is in a *degraded* state.

Steps

1. Sign in to the Deploy utility web user interface using the administrator account.

2. Click the **Clusters** tab at the top left of the page and select the desired cluster from the list.
3. Click  on the right side of the page and select **Cluster Refresh**.
4. Under **Cluster Credentials**, provide the ONTAP administrator password for the cluster.
5. Click **Refresh**.

After you finish

If the operation is successful, the field *Last Refresh* is updated. You should back up the Deploy configuration data after the cluster refresh operation has completed.

Expand or contract the cluster

Beginning with ONTAP Select 9.15.1, you can increase the size of an existing cluster from six to eight nodes and decrease the cluster size from eight to six nodes. No other cluster expansion or contraction scenarios are supported.

The procedure is initiated from ONTAP Select Deploy using the CLI, API, or web interface.

Hardware and storage requirements

The cluster expansion and contraction functionalities are restricted in the following ways:

- Support is limited to clusters created on ESX hypervisor hosts. The following ESX versions are compatible with ONTAP Select 9.15.1:
 - ESXi 8.0 U3 (Available for ONTAP 9.15.1P4 or any later available patch release)
 - ESXi 8.0 U2
 - ESXi 8.0 U1
 - ESXi 8.0 GA
 - ESXi 7.0 U3
 - ESXi 7.0
- Expansion is only possible from six-node clusters to eight-node clusters.
- Contraction is only possible from eight-node clusters to six-node clusters.

Expand the cluster

You can increase the size of an existing cluster from a six-node to an eight-node cluster with the cluster expansion feature.

About this task

In preparation for the cluster expansion procedure, new ESX hosts are added to the inventory and the details of the new nodes are assigned. Before starting the cluster expansion process, a network precheck verifies the selected internal network.

Before you begin

- When deploying a multi-node cluster, you should be familiar with the [network connectivity checker](#).
- Verify that you have the license details for the new nodes.

Steps

1. Sign in to the Deploy utility web user interface using the administrator account.
2. Select the **Cluster** tab at the top of the page and select the desired cluster from the list.
3. On the cluster details page, select the gear icon at the right of the page and select **Expand Cluster**.
4. Navigate to the **HA Pair 4** section.
5. Choose the high-availability (HA) pair configuration details for the fourth HA pair, including:
 - Instance type
 - Node names
 - Associated hypervisor hosts
 - Node IP addresses
 - Licenses
 - Networking configuration
 - Storage configuration (RAID type and storage pools)
6. Select **Save HA Pair** to save the configuration details.
7. Provide the ONTAP credentials, then select **Expand Cluster**.
8. Select **Next** and run the network pre-check by selecting **Run**.

The network pre-check validates that the internal network selected for the ONTAP cluster traffic is functioning correctly.

9. Select **Expand Cluster** to begin the cluster expansion process, and then select **OK** in the dialog box.

It can take up to 45 minutes for the cluster to be expanded.

10. Monitor the multi-step cluster expansion process to confirm that the cluster expanded successfully.
11. Refer to the **Events** tab for periodic updates on the operation's progress. The page is automatically refreshed at regular intervals.

After you finish

After expanding the cluster, you should back up the ONTAP Select Deploy configuration data.

Contract the cluster

You can decrease the size of an existing cluster from an eight-node to a six-node cluster with the cluster contraction feature.

About this task

The desired HA pair of nodes in the cluster are selected to prepare for cluster contraction during the procedure.

Steps

1. Sign in to the Deploy utility web user interface using the administrator account.
2. Select the **Cluster** tab at the top of the page and select the desired cluster from the list.
3. On the cluster details page, select the gear icon at the right of the page, then select **Contract Cluster**.
4. Select the HA Pair configuration details for any HA Pair you want to remove and provide the ONTAP credentials, then select **Contract Cluster**.

It can take up to 30 minutes for the cluster to be contracted.

5. Monitor the multi-step cluster contraction process to confirm that the cluster contracted successfully.
6. Refer to the **Events** tab for periodic updates on the operation's progress. The page is automatically refreshed at regular intervals.
