Getting started

Overview of the Deploy vCenter plug-in

The VMware vCenter plug-in for ONTAP Select Deploy is designed for ONTAP Select administrators working in the VMware environment. It provides an alternative to the native Deploy user interface.

Packaged with Deploy

The Deploy vCenter plug-in is packaged with the Deploy administration utility. After using the Deploy user interface to install the plug-in to the vCenter server, you can access the plug-in through the vSphere web interface.

Integration with VMware

For many businesses, VMware vCenter is a central platform for administering virtualized data center and cloud resources. Because the Deploy plug-in is tightly integrated with vCenter, administrators can quickly move between the ONTAP Select and vCenter domains to leverage the relationships among the various resources.

Functionality provided by the Deploy vCenter plug-in

After installing the Deploy vCenter plug-in, there are two primary options available through vSphere in the Global Inventory Lists pane.

ONTAP Select Clusters

The ONTAP Select Clusters option is roughly equivalent to the Clusters tab in the native Deploy web user interface. It provides the functionality described in the following table.

<table>
<thead>
<tr>
<th>You perform this operation</th>
<th>By doing this ...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Deploy an ONTAP Select cluster</td>
<td>Click New ONTAP Select.</td>
</tr>
<tr>
<td>View cluster details</td>
<td>Select a cluster, click Summary, and then click Details.</td>
</tr>
<tr>
<td>View cluster event messages</td>
<td>Select a cluster, click Summary, and then click Events.</td>
</tr>
<tr>
<td>Move a cluster online or offline, or delete a cluster</td>
<td>Select a cluster, click Actions, and then click the desired action.</td>
</tr>
<tr>
<td>Launch System Manager</td>
<td>Select a cluster, click Summary, click Details, and then click Launch System Manager.</td>
</tr>
</tbody>
</table>
You perform this operation... By doing this...

View the ESXi hosts used by a cluster
Select a cluster, click More Objects, and then click Hosts. Select a host for more details and further actions.

View the ONTAP VMs used by a cluster
Select a cluster, click More Objects, and then click ONTAP VMs. Select a VM for more details and further actions.

View the datastores used by a cluster
Select a cluster, click More Objects, and then click Datastores. Select a datastore for more details and further actions.

View the networks used by a cluster
Select a cluster, click More Objects, and then click Networks. Select a network for more details and further actions.

ONTAP Select Deploy

The ONTAP Select Deploy option is roughly equivalent to the **Hypervisor Hosts** and **Administration** tabs in the native Deploy web user interface. It provides functionality through three tabs at the top of the page as described in the following table.

<table>
<thead>
<tr>
<th>Tab</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Summary</td>
<td>Describes the characteristics of the Deploy instance, including the host name and IP address.</td>
</tr>
<tr>
<td>Host</td>
<td>Displays information about the ESXi hosts registered with ONTAP Select Deploy. You can add or remove hosts.</td>
</tr>
<tr>
<td>Administration</td>
<td>Allows you to perform administrative tasks through the Deploy utility. This functionality is equivalent to the ONTAP Select Deploy native user interface, except that the <strong>Credentials</strong> and <strong>Plugins</strong> options are not available with the plug-in.</td>
</tr>
</tbody>
</table>

Comparing the vCenter plug-in to the native Deploy user interface

The functionality provided with the vCenter plug-in through vSphere is equivalent to the native Deploy user interface. However, there are a few features that are not provided with the plug-in and are only available with the Deploy user interface.

**Managing the vCenter plug-in**

You cannot install, update, remove, or verify the vCenter plug-in using the vCenter plug-in. You must perform these management tasks through the native Deploy user interface.

**Managing vCenter credentials**

Before installing the vCenter plug-in, you must add the necessary vCenter credentials to Deploy using the native Deploy user interface.
ONTAP Select clusters must be controlled by the same vCenter server

You can only deploy and support the ONTAP Select clusters managed by the single vCenter server where the plug-in is installed. You cannot use the plug-in to access ONTAP Select clusters managed by other vCenter servers or clusters running on standalone ESXi or KVM hosts.

**Plug-in architecture**

The Deploy vCenter plug-in is tightly integrated with ONTAP Select Deploy and VMware vCenter. There are two paths to access the Deploy administration utility through the plug-in using the vSphere interface.

**Planning to use the Deploy vCenter plug-in**

Before installing and using the Deploy vCenter plug-in, you should prepare to assure success.

**Software requirements**

There are several software requirements you should consider as described in the following table.

<table>
<thead>
<tr>
<th>Software</th>
<th>Supported version</th>
</tr>
</thead>
<tbody>
<tr>
<td>ONTAP Select Deploy utility</td>
<td>2.11.2 or later</td>
</tr>
<tr>
<td>Software</td>
<td>Supported version</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>----------------------------------------</td>
</tr>
<tr>
<td>VMware vSphere</td>
<td>6.5 GA or later</td>
</tr>
<tr>
<td>VMware vSphere user interface</td>
<td>HTML5 (Flash-based version is not supported)</td>
</tr>
<tr>
<td>ESXi</td>
<td>6.5U2 or later</td>
</tr>
</tbody>
</table>

**Cluster size restrictions**

There are several restrictions related to the cluster size that you should consider as described in the following table.

<table>
<thead>
<tr>
<th>Item</th>
<th>Maximum supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>ONTAP Select Deploy clusters</td>
<td>100</td>
</tr>
<tr>
<td>Nodes (virtual machines)</td>
<td>1000</td>
</tr>
<tr>
<td>Hosts</td>
<td>800</td>
</tr>
</tbody>
</table>

**RBAC privileges for the vCenter user accounts**

Several different vCenter privileges are required to manage and access the plug-in. These privileges correspond to the actions in the following three categories:

- Managing the plug-in through Deploy:
  - Install
  - Upgrade
  - Remove
- Accessing the plug-in through the vSphere client
- Validating user access to the plug-in through vSphere

See [Preparing the vCenter server accounts](#) for more information.

**AutoSupport limitations**

The Deploy vCenter plug-in provides a minimum amount of usage information in the Deploy administration utility (including the plug-in URL). However, AutoSupport does include a table of the installed plug-ins that can be displayed through the AutoSupport viewer.

You cannot download an AutoSupport package through the vSphere web client using the Deploy plug-in. You must use the native Deploy interface to download AutoSupport packages.
Additional restrictions

There are several additional restrictions that you should consider before installing and using the Deploy vCenter plug-in:

- Each instance of the vCenter plug-in supports only one vCenter server.
- vCenter servers that are configured in linked mode are not supported.
- The Deploy plug-in GUI in vSphere only displays clusters with ONTAP Select virtual machines managed by the same vCenter server. ONTAP Select clusters running on standalone ESXi and KVM hosts are not included.
