Create SVM peer relationships	3

# Configure peer relationships (Beginning with ONTAP 9.3)

A peer relationship defines the network connections that enable clusters and SVMs to exchange data securely. Beginning with ONTAP 9.3, until ONTAP 9.7, you can use the ONTAP System Manager *classic* interface to perform a simplified method to configure peer relationships between clusters and between SVMs.

## **Create intercluster LIFs (Beginning with ONTAP 9.3)**

Beginning with ONTAP 9.3, until ONTAP 9.7, you can use the ONTAP System Manager *classic* interface to create intercluster logical interfaces (LIFs), which enable the cluster network to communicate with a node. You must create an intercluster LIF within each IPspace that will be used for peering, on each node in each cluster for which you want to create a peer relationship.

#### About this task

For example, if you have a four-node cluster that you want to peer with cluster X over IPspace A, and peer with cluster Y over IPspace Y, then you need a total of eight intercluster LIFs; Four on IPspace A (one per node), and four on IPspace Y (one per node).

You must perform this procedure on both clusters for which you want to create a peer relationship.

#### Steps

- 1. Click Configuration > Advanced Cluster Setup.
- 2. In the Setup Advanced Cluster Features window, click Proceed next to the Cluster Peering option.
- 3. Select an IPspace from the **IPspace** list.
- 4. Enter the IP address, port, network mask, and gateway details of each node.

	1.1.4	arenaryos	12			
		IP Address	Port	Netmask	Gateway (Optional)	
sti5	-vsim-ucs103a	10.53.32.1	e0d	 255.255.240.0		🗹 Use same netand gateway

5. Click Submit and Continue.

#### What to do next

You should enter the cluster details in the Cluster Peering window to continue with cluster peering.

## **Create a cluster peer relationship (Beginning with ONTAP 9.3)**

Beginning with ONTAP 9.3, until ONTAP 9.7, you can use the ONTAP System Manager *classic* interface create a cluster peer relationship between two clusters by providing a system-generated passphrase and the IP addresses of the intercluster LIFs of the remote cluster.

#### About this task

Beginning with ONTAP 9.6, cluster peering encryption is enabled by default on all newly created cluster peering relationships. Cluster peering encryption must be enabled manually for peering relationship created prior to upgrading to ONTAP 9.6. Cluster peering encryption is not available for clusters running ONTAP 9.5 or earlier. Therefore, both clusters in the peering relationship must be running ONTAP 9.6 in order to enable cluster peering encryption.

Cluster peering encryption uses the Transport Security Layer (TLS) to secure cross-cluster peering communications for ONTAP features such as SnapMirror and FlexCache.

#### Steps

- 1. In the **Target Cluster Intercluster LIF IP addresses** field, enter the IP addresses of the intercluster LIFs of the remote cluster.
- 2. Generate a passphrase from the remote cluster.
  - a. Specify the management address of the remote cluster.
  - b. Click Management URL to launch ONTAP System Manager on the remote cluster.
  - c. Log in to the remote cluster.
  - d. In the Cluster Peers window, click Generate Peering Passphrase.
  - e. Select the IPspace, validity of the passphrase, and SVM permissions.

You can allow all of the SVMs or selected SVMs for peering. When a SVM peer request is generated, the permitted SVMs are automatically peered with the source SVMs without requiring you to accept the peer relationship from the remote SVMs.

#### f. Click Generate.

The passphrase information is displayed.

#### Generate Peering Passphrase

Passphrase generated successfully							
Use the following information for peering based on the IPspace "Default":							
Intercluster LIF IP Address 172.21.91.12							
Passphrase QS7k+laFYJzdV9	JMPXvHgwD						
Passphrase Validity Valid Until Mon N	lov America/New_Y						
SVM Permissions All							
Email passphra	ase details						
Copy passphra	se details						

- g. Click Copy passphrase details or Email passphrase details.
- h. Click Done.
- 3. In the source cluster, enter the generated passphrase that you obtained in Step 2.
- 4. Click Initiate Cluster Peering.

The cluster peer relationship is successfully created.

5. Click Continue.

#### What to do next

You should specify the SVM details in the SVM Peering window to continue with the peering process.

### **Create SVM peer relationships**

Beginning with ONTAP 9.3, until ONTAP 9.7, you can use the ONTAP System Manager *classic* interface to create SVM peer relationships. The storage virtual machine (SVM) peering enables you to establish a peer relationship between two SVMs for data protection.

Done

#### Steps

- 1. Select the initiator SVM.
- 2. Select the target SVM from the list of permitted SVMs.
- 3. Click Initiate SVM Peering.
- 4. Click Continue.

#### What to do next

You can view the intercluster LIFs, cluster peer relationship, and SVM peer relationship in the Summary window.
