Configure ESXi host settings

Configure ESXi server multipath and timeout settings

ONTAP tools for VMware vSphere checks and sets the ESXi host multipath settings and HBA timeout settings that work best with NetApp storage systems.

About this task

This process might take a long time, depending on your configuration and system load. The task progress is displayed in the Recent Tasks panel. As the tasks are completed, the host status Alert icon is replaced by the Normal icon or the Pending Reboot icon.

Steps

1. From the VMware vSphere Web Client home page, click **Hosts and Clusters**.
2. Right-click a host, and then select **NetApp ONTAP tools > Update host data**.
3. In the shortcuts page, click on **NetApp ONTAP tools** under the plug-ins section.
4. Go to ESXi Host compliance card in the Overview (Dashboard) of the ONTAP tools for VMware vSphere plug-in.
5. Select **Apply Recommended Settings** link.
6. In the **Apply recommended host settings** window, select the hosts that you want to comply with NetApp recommended host settings and click **Next**

You can expand the ESXi host to see the current values

7. In the settings page, select the recommended values as required.
8. In the summary pane, check the values and click **Finish** You can track the progress in the Recent task panel.

Set ESXi host values

You can set timeouts and other values on the ESXi hosts using ONTAP tools for VMware vSphere to ensure best performance and successful failover. The values that ONTAP tools for VMware vSphere sets are based on internal NetApp testing.

You can set the following values on an ESXi host:

HBA/CNA Adapter Settings

Sets the recommended HBA timeout settings for NetApp storage systems.

- **Disk.QFullSampleSize**

Set this value to 32 for all configurations. Setting this value helps to prevent I/O errors.

- **Disk.QFullThreshold**

Set this value to 8 for all configurations. Setting this value helps prevent I/O errors.

- **Emulex FC HBA timeouts**

Use the default value.

- **QLogic FC HBA timeouts**

Use the default value.

MPIO Settings

Configures preferred paths for NetApp storage systems. The MPIO settings determine which of the available paths are optimized (as opposed to non-optimized paths that traverse the interconnect cable) and they set the preferred path to one of those paths.

In high-performance environments or when testing performance with a single LUN datastore, consider changing the load balance setting of the round-robin (VMW_PSP_RR) path selection policy (PSP) from the default IOPS setting of 1000 to a value of 1.

NFS settings

- **Net.TcpipHeapSize**

Set this value to 32.

- **Net.TcpipHeapMax**

Set this value to 1024MB.

- **NFS.MaxVolumes**

Set this value to 256.

- **NFS41.MaxVolumes**

Set this value to 256.

- **NFS.MaxQueueDepth**

Set this value to 128 or higher to avoid queuing bottlenecks.

- **NFS.HeartbeatMaxFailures**

Set this value to 10 for all NFS configurations.

- **NFS.HeartbeatFrequency**

Set this value to 12 for all NFS configurations.

- **NFS.HeartbeatTimeout**

Set this value to 5 for all NFS configurations.
