Configure protected and recovery site resources

Configure network mappings

You must configure your resource mappings like VM networks, ESXi hosts, and folders on both sites to enable the mapping of each resource from the protected site to the appropriate resource at the recovery site.

You must complete the following resource configurations:

- Network mappings
- Folder mappings
- Resource mappings
- Placeholder datastores

What you will need

You must have connected the protected and recovery sites.

Steps

1. Log in to your vCenter Server and click on Site Recovery > Sites.
2. Select your protected site, and then click Manage.
3. In the Manage tab, select Network Mappings.
4. Click the icon to create a new network mapping.
   The Create Network Mapping wizard appears.
5. In the Create Network Mapping wizard, perform the following:
   a. Select Automatically Prepare Mappings for Networks with Matching Names, and click Next.
   b. Select the required data center objects for the protected and recovery sites, and click Add Mappings.
   c. Click Next after mappings are created successfully.
   d. Select the object that was used earlier to create reverse mapping, and then click Finish.

Result

The Network Mappings page displays the protected site resources and the recovery site resources. You can follow the same steps for other networks in your environment.

Configure folder mappings

You must map your folders on the protected site and recovery site to enable communication between them.

What you will need
You must have connected the protected and recovery sites.

**Steps**

1. Log in to your vCenter Server, and click on **Site Recovery > Sites**.
2. Select your protected site, and then click **Manage**.
3. In the Manage tab, select **Folder Mappings**.
4. Click the 📁 icon to create a new folder mapping.

   The Create Folder Mapping wizard appears.

5. In the Create Folder Mapping wizard, perform the following:
   
   a. Select **Automatically Prepare Mappings for Folders with Matching Names**, and click **Next**.
   
   b. Select the required data center objects for the protected and recovery sites, and click **Add Mappings**.
   
   c. Click **Next** after mappings are created successfully.
   
   d. Select the object that was used earlier to create reverse mapping, and then click **Finish**.

**Result**

The Folder Mappings page displays the protected site resources and the recovery site resources. You can follow the same steps for other networks in your environment.

**Configure resource mappings**

You must map your resources on the protected site and recovery site so that virtual machines are configured to fail over into one group of hosts or the other.

**What you will need**

You must have connected the protected and recovery sites.

> In Site Recovery Manager (SRM), resources can be resource pools, ESXi hosts, or vSphere clusters.

**Steps**

1. Log in to your vCenter Server, and click on **Site Recovery > Sites**.
2. Select your protected site, and then click **Manage**.
3. In the Manage tab, select **Resource Mappings**.
4. Click the 📁 icon to create a new resource mapping.

   The Create Resource Mapping wizard appears.

5. In the Create Resource Mapping wizard, perform the following:
   
   a. Select **Automatically Prepare Mappings for Resource with Matching Names**, and click **Next**.
   
   b. Select the required data center objects for the protected and recovery sites, and click **Add Mappings**.
   
   c. Click **Next** after mappings are created successfully.
d. Select the object that was used earlier to create reverse mapping, and then click **Finish**.

**Result**

The Resource Mappings page displays the protected site resources and the recovery site resources. You can follow the same steps for other networks in your environment.

**Map storage policies**

You should map the storage policies on the protected site to the storage policies on the recovery site for your recovery plan to place the recovered virtual machines on the appropriate datastores based on your mappings. After the virtual machine is recovered on recovery site, mapped VM Storage Policy will be assigned to virtual machine.

**Steps**

1. On the vSphere Client, click **Site Recovery > Open Site Recovery**.
2. In the Site Pair tab, click **Configure > Storage Policy Mappings**.
3. Select the required site, and then click **New** to create a new mapping.
4. Select the option **Automatically prepare mappings for storage policies with matching names**, and then click **NEXT**.

SRM will select storage policies on the protected site for which a storage policy with the same name exists on the recovery site. You can also select the manual mapping option to select multiple storage policies.

5. Click **Add mappings**, and the click **NEXT**.
6. In the **Reverse mapping** section, select the required check boxes for mapping, and then click **NEXT**.
7. In the **Ready to complete** section, review your selections and click **FINISH**.

**Configure placeholder datastores**

You must configure a placeholder datastore to hold a place in the vCenter inventory at the recovery site for the protected virtual machine (VM). The placeholder datastore does not need to be large as the placeholder VMs are small and use only a few hundred or fewer kilobytes.

**What you will need**

- You must have connected the protected and recovery sites.
- You must have configured your resource mappings.

**Steps**

1. Log in to your vCenter Server, and click on **Site Recovery > Sites**.
2. Select your protected site, and then click **Manage**.
3. In the Manage tab, select **Placeholder Datastores**.
4. Click the icon to create a new placeholder datastore.
5. Select the appropriate datastore, and then click **OK**.

   Placeholder datastores can be local or remote and should not be replicated.

6. Repeat the steps 3 to 5 to configure a placeholder datastore for the recovery site.

### Configure SRA using array manager

You can configure Storage Replication Adapter (SRA) by using the Array Manager wizard of Site Recovery Manager (SRM) to enable interactions between SRM and storage virtual machines (SVMs).

**What you will need**

- You must have paired the protected sites and recovery sites in SRM.
- You must have configured your storage before configuring the array manager.
- You must have configured and replicated the SnapMirror relationships between the protected sites and recovery sites.
- You must have enabled the SVM management LIFs to enable multitenancy.

SRA supports cluster-level management and SVM-level management. If you add storage at a cluster level, then you can discover and perform operations on all of the SVMs in the cluster. If you add storage at an SVM level, then you can manage only that specific SVM.

VMware does not support NFS4.1 protocol for SRM.

**Steps**

1. In SRM, click **Array Managers**, and then click **Add Array Manager**.

2. Enter the following information to describe the array in SRM:
   a. Enter a name to identify the array manager in the **Display Name** field.
   b. In the **SRA Type** field, select **NetApp Storage Replication Adapter for ONTAP**.
   c. Enter the information to connect to the cluster or the SVM:
      - If you are connecting to a cluster, you should enter the cluster management LIF.
      - If you are connecting directly to an SVM, you should enter the IP address of the SVM management LIF.
   d. If you are connecting to a cluster, enter the name of the SVM in the **SVM name** field.

      You can also leave this field blank.

   e. Enter the volumes to be discovered in the **Volume include list** field.
You can enter the source volume at the protected site and the replicated destination volume at the recovery site. You can enter either the full volume name or the partial volume name.

For example, if you want to discover volume src_vol1 that is in a SnapMirror relationship with volume dst_vol1, you must specify src_vol1 in the protected site field and dst_vol1 in the recovery site field.

f. **(Optional) Enter the volumes to be excluded from discovery in the Volume exclude list field.**

You can enter the source volume at the protected site and the replicated destination volume at the recovery site. You can enter either the full volume name or the partial volume name.

For example, if you want to exclude volume src_vol1 that is in a SnapMirror relationship with volume dst_vol1, you must specify src_vol1 in the protected site field and dst_vol1 in the recovery site field.

g. **(Optional) Enter the user name of the cluster-level account or SVM-level account in the Username field.**

h. Enter the password of the user account in the Password field.

3. Click **Next**.

4. Verify that the array is discovered and displayed at the bottom of the Add Array Manager window.

5. Click **Finish**.

You can follow the same steps for the recovery site by using the appropriate SVM management IP addresses and credentials. On the Enable Array Pairs screen of the Add Array Manager wizard, you should verify that the correct array pair is selected, and that it shows as ready to be enabled.
