Configure SnapLock
ONTAP 9
NetApp
March 08, 2024
Configure SnapLock

Before you use SnapLock, you need to configure SnapLock by completing various tasks such as install the SnapLock license for each node that hosts an aggregate with a SnapLock volume, initialize the Compliance Clock, create a SnapLock aggregate for clusters running ONTAP releases earlier than ONTAP 9.10.1, create and mount a SnapLock volume, and more.

Initialize the Compliance Clock

SnapLock uses the volume Compliance Clock to ensure against tampering that might alter the retention period for WORM files. You must first initialize the system ComplianceClock on each node that hosts a SnapLock aggregate.

Beginning with ONTAP 9.14.1, you can initialize or reinitialize the system Compliance Clock when there are no SnapLock volumes or no volumes with Snapshot copy locking enabled. The ability to reinitialize enables system administrators to reset the system Compliance Clock in instances where it might have been incorrectly initialized or to correct clock drift on the system. In ONTAP 9.13.1 and earlier releases, once you initialize the Compliance Clock on a node, you cannot initialize it again.

Before you begin

To reinitialize the Compliance Clock:

• All nodes in the cluster must be in the healthy state.
• All volumes must be online.
• No volumes can be present the the recovery queue.
• No SnapLock volumes can be present.
• No volumes with Snapshot copy locking enabled can be present.

General requirements for initializing the Compliance Clock:

• You must be a cluster administrator to perform this task.
• The SnapLock license must be installed on the node.

About this task

The time on the system Compliance Clock is inherited by the volume Compliance Clock, the latter of which controls the retention period for WORM files on the volume. The volume Compliance Clock is initialized automatically when you create a new SnapLock volume.

The initial setting of the system Compliance Clock is based on the current hardware system clock. For that reason, you should verify that the system time and time zone are correct before initializing the system Compliance Clock on each node. Once you initialize the system Compliance Clock on a node, you cannot initialize it again when SnapLock volumes or volumes with locking enabled are present.

Steps
You can use the ONTAP CLI to initialize the Compliance Clock or, beginning with ONTAP 9.12.1, you can use System Manager to initialize the Compliance Clock.

**System Manager**
1. Navigate to **Cluster > Overview**.
2. In the **Nodes** section, click **Initialize SnapLock Compliance Clock**.
3. To display the **Compliance Clock** column and to verify that the Compliance Clock is initialized, in the **Cluster > Overview > Nodes** section, click **Show/Hide** and select **SnapLock Compliance Clock**.

**CLI**
1. Initialize the system Compliance Clock:

```
snaplock compliance-clock initialize -node node_name
```

The following command initializes the system Compliance Clock on node1:

```
cluster1::> snaplock compliance-clock initialize -node node1
```

2. When prompted, confirm that the system clock is correct and that you want to initialize the Compliance Clock:

```
Warning: You are about to initialize the secure ComplianceClock of the node "node1" to the current value of the node's system clock. This procedure can be performed only once on a given node, so you should ensure that the system time is set correctly before proceeding.

The current node's system clock is: Mon Apr 25 06:04:10 GMT 2016

Do you want to continue? (y|n): y
```

3. Repeat this procedure for each node that hosts a SnapLock aggregate.

**Enable Compliance Clock resynchronization for an NTP-configured system**

You can enable the SnapLock Compliance Clock time synchronization feature when an NTP server is configured.

**What you’ll need**
- This feature is available only at the advanced privilege level.
- You must be a cluster administrator to perform this task.
- The SnapLock license must be installed on the node.
- This feature is available only for Cloud Volumes ONTAP, ONTAP Select, and VSIM platforms.
About this task
When the SnapLock secure clock daemon detects a skew beyond the threshold, ONTAP uses the system time to reset both the system and volume Compliance Clocks. A period of 24 hours is set as the skew threshold. This means that the system Compliance Clock is synchronized to the system clock only if the skew is more than a day old.

The SnapLock secure clock daemon detects a skew and changes the Compliance Clock to the system time. Any attempt at modifying the system time to force the Compliance Clock to synchronize to the system time fails, since the Compliance Clock synchronizes to the system time only if the system time is synchronized with the NTP time.

Steps
1. Enable the SnapLock Compliance Clock time synchronization feature when an NTP server is configured:

   snaplock compliance-clock ntp

   The following command enables the system Compliance Clock time synchronization feature:

   cluster1::*> snaplock compliance-clock ntp modify -is-sync-enabled true

2. When prompted, confirm that the configured NTP servers are trusted and that the communications channel is secure to enable the feature:

3. Check that the feature is enabled:

   snaplock compliance-clock ntp show

   The following command checks that the system Compliance Clock time synchronization feature is enabled:

   cluster1::*> snaplock compliance-clock ntp show

   Enable clock sync to NTP system time: true

Create a SnapLock aggregate

You use the volume -snaplock-type option to specify a Compliance or Enterprise SnapLock volume type. For releases earlier than ONTAP 9.10.1, you must create a separate SnapLock aggregate. Beginning with ONTAP 9.10.1, SnapLock and non-SnapLock volumes can exist on the same aggregate; therefore, you are no longer required to create a separate SnapLock aggregate if you are using ONTAP 9.10.1.

Before you begin
- You must be a cluster administrator to perform this task.
- The SnapLock license must be installed on the node.
- The Compliance Clock on the node must be initialized.
- If you have partitioned the disks as “root”, “data1”, and “data2”, you must ensure that spare disks are available.
Upgrade considerations

When upgrading to ONTAP 9.10.1, existing SnapLock and non-SnapLock aggregates are upgraded to support the existence of both SnapLock and non-SnapLock volumes; however, the existing SnapLock volume attributes are not automatically updated. For example, data-compaction, cross-volume-dedupe, and cross-volume-background-dedupe fields remain unchanged. New SnapLock volumes created on existing aggregates have the same default values as non-SnapLock volumes, and the default values for new volumes and aggregates are platform dependent.

Revert considerations

If you need to revert to an ONTAP version earlier than 9.10.1, you must move all SnapLock Compliance, SnapLock Enterprise, and SnapLock volumes to their own SnapLock aggregates.

About this task

- You cannot create Compliance aggregates for FlexArray LUNs, but SnapLock Compliance aggregates are supported with FlexArray LUNs.
- You cannot create Compliance aggregates with the SyncMirror option.
- You can create mirrored Compliance aggregates in a MetroCluster configuration only if the aggregate is used to host SnapLock audit log volumes.

In a MetroCluster configuration, SnapLock Enterprise is supported on mirrored and unmirrored aggregates. SnapLock Compliance is supported only on unmirrored aggregates.

Steps

1. Create a SnapLock aggregate:

   ```
   storage aggregate create -aggregate <aggregate_name> -node <node_name> -diskcount <number_of_disks> -snaplock-type <compliance|enterprise>
   ```

   The man page for the command contains a complete list of options.

   The following command creates a SnapLock Compliance aggregate named `aggr1` with three disks on `node1`:

   ```
   cluster1::> storage aggregate create -aggregate aggr1 -node node1 -diskcount 3 -snaplock-type compliance
   ```

Create and mount SnapLock volumes

You must create a SnapLock volume for the files or Snapshot copies that you want to commit to the WORM state. Beginning with ONTAP 9.10.1, any volume you create, regardless of the aggregate type, is created by default as a non-SnapLock volume. You must use the `-snaplock-type` option to explicitly create a SnapLock volume by specifying either Compliance or Enterprise as the SnapLock type. By default, the SnapLock type is set to `non-snaplock`. 
What you’ll need

• The SnapLock aggregate must be online.
• The SnapLock license must be installed on the node.
• The Compliance Clock on the node must be initialized.

About this task
With the proper SnapLock permissions, you can destroy or rename an Enterprise volume at any time. You cannot destroy a Compliance volume until the retention period has elapsed. You can never rename a Compliance volume.

You can clone SnapLock volumes, but you cannot clone files on a SnapLock volume. The clone volume will be of the same SnapLock type as the parent volume.

LUNs are not supported in SnapLock volumes. LUNs are supported in SnapLock volumes only in scenarios where Snapshot copies created on a non-SnapLock volume are transferred to a SnapLock volume for protection as part of SnapLock vault relationship. LUNs are not supported in read/write SnapLock volumes. Tamperproof Snapshot copies however are supported on both SnapMirror source volumes and destination volumes that contain LUNs.

Perform this task using ONTAP System Manager or the ONTAP CLI.
System Manager
Beginning with ONTAP 9.12.1, you can use System Manager to create a SnapLock volume.

Steps
1. Navigate to Storage > Volumes and click Add.
2. In the Add Volume window, click More Options.
3. Enter the new volume information, including the name and size of the volume.
4. Select Enable SnapLock and choose the SnapLock type, either Compliance or Enterprise.
5. In the Auto-Commit Files section, select Modified and enter the amount of time a file should remain unchanged before it is automatically committed. The minimum value is 5 minutes and the maximum value is 10 years.
6. In the Data Retention section, select the minimum and maximum retention period.
7. Select the default retention period.
8. Click Save.
9. Select the new volume in the Volumes page to verify the SnapLock settings.

CLI
1. Create a SnapLock volume:

   ```
   volume create -vserver <SVM_name> -volume <volume_name> -aggregate <aggregate_name> -snaplock-type <compliance|enterprise>
   ```

   For a complete list of options, see the man page for the command. The following options are not available for SnapLock volumes: -nvfail, -atime-update, -is-autobalance-eligible, -space-mgmt-try-first, and vmalign.

   The following command creates a SnapLock Compliance volume named voll on aggr1 on vs1:

   ```
   cluster1::> volume create -vserver vs1 -volume voll -aggregate aggr1 -snaplock-type compliance
   ```

Mount a SnapLock volume
You can mount a SnapLock volume to a junction path in the SVM namespace for NAS client access.

What you'll need
The SnapLock volume must be online.

About this task
- You can mount a SnapLock volume only under the root of the SVM.
- You cannot mount a regular volume under a SnapLock volume.

Steps
1. Mount a SnapLock volume:

```
volume mount -vserver SVM_name -volume volume_name -junction-path path
```

For a complete list of options, see the man page for the command.

The following command mounts a SnapLock volume named `vol1` to the junction path `/sales` in the `vs1` namespace:

```
cluster1::> volume mount -vserver vs1 -volume vol1 -junction-path /sales
```

## Set the retention time

You can set the retention time for a file explicitly, or you can use the default retention period for the volume to derive the retention time. Unless you set the retention time explicitly, SnapLock uses the default retention period to calculate the retention time. You can also set file retention after an event.

### About retention period and retention time

The **retention period** for a WORM file specifies the length of time the file must be retained after it is committed to the WORM state. The **retention time** for a WORM file is the time after which the file no longer needs to be retained. A retention period of 20 years for a file committed to the WORM state on 10 November 2020 6:00 a.m., for example, would yield a retention time of 10 November 2040 6:00 a.m.

![Diagram](http://example.com/retention-diagram.png)

Beginning with ONTAP 9.10.1, you can set a retention time up to October 26, 3058 and a retention period up to 100 years. When you extend retention dates, older policies are converted automatically. In ONTAP 9.9.1 and earlier releases, unless you set the default retention period to infinite, the maximum supported retention time is January 19 2071 (GMT).

### Important replication considerations

When establishing a SnapMirror relationship with a SnapLock source volume using a retention date later than January 19th 2071 (GMT), the destination cluster must be running ONTAP 9.10.1 or later or the SnapMirror transfer will fail.

### Important revert considerations

ONTAP prevents you from reverting a cluster from ONTAP 9.10.1 to an earlier ONTAP version when there are any files with a retention period later than “January 19, 2071 8:44:07 AM”.

### Understanding the retention periods

A SnapLock Compliance or Enterprise volume has four retention periods:

- **Minimum retention period**\(^\text{min}\), with a default of 0
• Maximum retention period (max), with a default of 30 years

• Default retention period, with a default equal to min for both Compliance mode and Enterprise mode beginning with ONTAP 9.10.1. In ONTAP releases earlier than ONTAP 9.10.1, the default retention period depends on the mode:
  ◦ For Compliance mode, the default is equal to max.
  ◦ For Enterprise mode, the default is equal to min.

• Unspecified retention period.

Beginning with ONTAP 9.8, you can set the retention period on files in a volume to unspecified, to enable the file to be retained until you set an absolute retention time. You can set a file with absolute retention time to unspecified retention and back to absolute retention as long as the new absolute retention time is later than the absolute time you previously set.

Beginning with ONTAP 9.12.1, WORM files with the retention period set to unspecified are guaranteed to have a retention period set to the minimum retention period configured for the SnapLock volume. When you change the file retention period from unspecified to an absolute retention time, the new retention time specified must be greater than the minimum retention time already set on the file.

So, if you do not set the retention time explicitly before committing a Compliance-mode file to the WORM state, and you do not modify the defaults, the file will be retained for 30 years. Similarly, if you do not set the retention time explicitly before committing an Enterprise-mode file to the WORM state, and you do not modify the defaults, the file will be retained for 0 years, or, effectively, not at all.

Set the default retention period

You can use the volume snaplock modify command to set the default retention period for files on a SnapLock volume.

What you'll need
The SnapLock volume must be online.

About this task
The following table shows the possible values for the default retention period option:

<table>
<thead>
<tr>
<th>Value</th>
<th>Unit</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 - 65535</td>
<td>seconds</td>
<td></td>
</tr>
<tr>
<td>0 - 24</td>
<td>hours</td>
<td></td>
</tr>
<tr>
<td>0 - 365</td>
<td>days</td>
<td></td>
</tr>
<tr>
<td>0 - 12</td>
<td>months</td>
<td></td>
</tr>
</tbody>
</table>

The default retention period must be greater than or equal to (>=) the minimum retention period and less than or equal to (<=) the maximum retention period.
<table>
<thead>
<tr>
<th>Value</th>
<th>Unit</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 - 100</td>
<td>years</td>
<td>Beginning with ONTAP 9.10.1. For earlier ONTAP releases, the value is 0 - 70.</td>
</tr>
<tr>
<td>max</td>
<td>-</td>
<td>Use the maximum retention period.</td>
</tr>
<tr>
<td>min</td>
<td>-</td>
<td>Use the minimum retention period.</td>
</tr>
<tr>
<td>infinite</td>
<td>-</td>
<td>Retain the files forever.</td>
</tr>
<tr>
<td>unspecified</td>
<td>-</td>
<td>Retain the files until an absolute retention period is set.</td>
</tr>
</tbody>
</table>

The values and ranges for the maximum and minimum retention periods are identical, except for max and min, which are not applicable. For more information about this task, see Set the retention time overview.

You can use the `volume snaplock show` command to view the retention period settings for the volume. For more information, see the man page for the command.

![Info](https://example.com/info_icon.png)

After a file has been committed to the WORM state, you can extend but not shorten the retention period.

**Steps**

1. Set the default retention period for files on a SnapLock volume:

   ```
   volume snaplock modify -vserver SVM_name -volume volume_name -default-retention-period default_retention_period -minimum-retention-period min_retention_period -maximum-retention-period max_retention_period
   ```

   For a complete list of options, see the man page for the command.

   ![Info](https://example.com/info_icon.png)

   The following examples assume that the minimum and maximum retention periods have not been modified previously.

   The following command sets the default retention period for a Compliance or Enterprise volume to 20 days:

   ```
   cluster1::> volume snaplock modify -vserver vs1 -volume vol1 -default-retention-period 20days
   ```

   The following command sets the default retention period for a Compliance volume to 70 years:

   ```
   cluster1::> volume snaplock modify -vserver vs1 -volume vol1 -maximum-retention-period 70years
   ```

   The following command sets the default retention period for an Enterprise volume to 10 years:
The following commands set the default retention period for an Enterprise volume to 10 days:

```
cluster1::> volume snaplock modify -vserver vs1 -volume voll -default -retention-period max -maximum-retention-period 10years
```

The following commands set the default retention period for a Compliance volume to infinite:

```
cluster1::> volume snaplock modify -vserver vs1 -volume voll -default -retention-period infinite -maximum-retention-period infinite
```

## Set the retention time for a file explicitly

You can set the retention time for a file explicitly by modifying its last access time. You can use any suitable command or program over NFS or CIFS to modify the last access time.

**About this task**

After a file has been committed to WORM, you can extend but not shorten the retention time. The retention time is stored in the `atime` field for the file.

> You cannot explicitly set the retention time of a file to `infinite`. That value is only available when you use the default retention period to calculate the retention time.

**Steps**

1. Use a suitable command or program to modify the last access time for the file whose retention time you want to set.

   In a UNIX shell, use the following command to set a retention time of 21 November 2020 6:00 a.m. on a file named `document.txt`:

   ```
touch -a -t 202011210600 document.txt
   ```

   You can use any suitable command or program to modify the last access time in Windows.

## Set the file retention period after an event

Beginning with ONTAP 9.3, you can define how long a file is retained after an event occurs by using the SnapLock `Event Based Retention (EBR)` feature.
What you’ll need
• You must be a SnapLock administrator to perform this task.

Create a SnapLock administrator account
• You must have logged in on a secure connection (SSH, console, or ZAPI).

About this task
The event retention policy defines the retention period for the file after the event occurs. The policy can be applied to a single file or all the files in a directory.

• If a file is not a WORM file, it will be committed to the WORM state for the retention period defined in the policy.
• If a file is a WORM file or a WORM appendable file, its retention period will be extended by the retention period defined in the policy.

You can use a Compliance-mode or Enterprise-mode volume.

EBR policies cannot be applied to files under a Legal Hold.

For advanced usage, see Compliant WORM Storage Using NetApp SnapLock.

Using EBR to extend the retention period of already existing WORM files
EBR is convenient when you want to extend the retention period of already existing WORM files. For example, it might be your firm’s policy to retain employee W-4 records in unmodified form for three years after the employee changes a withholding election. Another company policy might require that W-4 records be retained for five years after the employee is terminated.

In this situation, you could create an EBR policy with a five-year retention period. After the employee is terminated (the “event”), you would apply the EBR policy to the employee’s W-4 record, causing its retention period to be extended. That will usually be easier than extending the retention period manually, particularly when a large number of files is involved.

Steps
1. Create an EBR policy:

```bash
snaplock event-retention policy create -vserver SVM_name -name policy_name -retention-period retention_period
```

The following command creates the EBR policy employee_exit on vs1 with a retention period of ten years:

```bash
cluster1::>snaplock event-retention policy create -vserver vs1 -name employee_exit -retention-period 10years
```

2. Apply an EBR policy:

```bash
snaplock event-retention apply -vserver SVM_name -name policy_name -volume volume_name -path path_name
```
The following command applies the EBR policy employee_exit on vs1 to all the files in the directory d1:

```
cluster1::>snaplock event-retention apply -vserver vs1 -name employee_exit -volume v01 -path /d1
```

## Create an audit log

If you are using ONTAP 9.9.1 or earlier, you must first create a SnapLock aggregate and then you must create a SnapLock-protected audit log before performing a privileged delete or SnapLock volume move. The audit log records the creation and deletion of SnapLock administrator accounts, modifications to the log volume, whether privileged delete is enabled, privileged delete operations, and SnapLock volume move operations.

Beginning with ONTAP 9.10.1, you no longer create a SnapLock aggregate. You must use the -snaplock-type option to explicitly create a SnapLock volume by specifying either Compliance or Enterprise as the SnapLock type.

### Before you begin

If you are using ONTAP 9.9.1 or earlier, you must be a cluster administrator to create a SnapLock aggregate.

### About this task

You cannot delete an audit log until the log file retention period has elapsed. You cannot modify an audit log even after the retention period has elapsed. This is true for both SnapLock Compliance and Enterprise modes.

In ONTAP 9.4 and earlier, you cannot use a SnapLock Enterprise volume for audit logging. You must use a SnapLock Compliance volume. In ONTAP 9.5 and later, you can use either a SnapLock Enterprise volume or a SnapLock Compliance volume for audit logging. In all cases, the audit log volume must be mounted at the junction path /snaplock_audit_log. No other volume can use this junction path.

You can find the SnapLock audit logs in the /snaplock_log directory under the root of the audit log volume, in subdirectories named `privdel_log` (privileged delete operations) and `system_log` (everything else). Audit log file names contain the timestamp of the first logged operation, making it easy to search for records by the approximate time that operations were executed.

- You can use the `snaplock log file show` command to view the log files on the audit log volume.
- You can use the `snaplock log file archive` command to archive the current log file and create a new one, which is useful in cases where you need to record audit log information in a separate file.

For more information, see the man pages for the commands.

- A data protection volume cannot be used as a SnapLock audit log volume.

### Steps

1. Create a SnapLock aggregate.

   [Create a SnapLock aggregate]
2. On the SVM that you want to configure for audit logging, create a SnapLock volume.

Create a SnapLock volume

3. Configure the SVM for audit logging:

   ```bash
   snaplock log create -vserver SVM_name -volume snaplock_volume_name -max-log-size size -retention-period default_retention_period
   ```

   The minimum default retention period for audit log files is six months. If the retention period of an affected file is longer than the retention period of the audit log, the retention period of the log inherits the retention period of the file. So, if the retention period for a file deleted using privileged delete is 10 months, and the retention period of the audit log is 8 months, the retention period of the log is extended to 10 months. For more information about retention time and default retention period, see Set the retention time.

The following command configures SVM1 for audit logging using the SnapLock volume logVol. The audit log has a maximum size of 20 GB and is retained for eight months.

   ```bash
   SVM1::> snaplock log create -vserver SVM1 -volume logVol -max-log-size 20GB -retention-period 8months
   ```

4. On the SVM that you configured for audit logging, mount the SnapLock volume at the junction path /snaplock_audit_log.

   Mount a SnapLock volume

Verify SnapLock settings

You can use the volume file fingerprint start and volume file fingerprint dump commands to view key information about files and volumes, including the file type (regular, WORM, or WORM appendable), the volume expiration date, and so forth.

Steps

1. Generate a file fingerprint:

   ```bash
   volume file fingerprint start -vserver SVM_name -file file_path
   ```

   ```bash
   svm1::> volume file fingerprint start -vserver svm1 -file /vol/sle/vol/f1
   File fingerprint operation is queued. Run "volume file fingerprint show -session-id 16842791" to view the fingerprint session status.
   ```

   The command generates a session ID that you can use as input to the volume file fingerprint dump command.
You can use the `volume file fingerprint show` command with the session ID to monitor the progress of the fingerprint operation. Make sure that the operation has completed before attempting to display the fingerprint.

2. Display the fingerprint for the file:

```
volume file fingerprint dump -session-id session_ID
```

```
svml:~> volume file fingerprint dump -session-id 33619976
  Vserver:svml
  Session-ID:33619976
  Volume:slc_vol
  Path:/vol/slc_vol/f1
