Configure SnapLock

Install the license

A SnapLock license entitles you to use both SnapLock Compliance mode and SnapLock Enterprise mode. SnapLock licenses are issued on a per-node basis. You must install a license for each node that hosts a SnapLock aggregate.

What you'll need
You must be a cluster administrator to perform this task.

About this task
You should have received the SnapLock license keys from your sales representative.

Perform this task using ONTAP System Manager or the ONTAP CLI.

System Manager
1. Navigate to Cluster > Settings > Licenses > Add License.
2. Click +Add.
3. Click Browse and locate the NetApp License File.
4. Click Add.

CLI
1. Install the SnapLock license for a node:

   `system license add -license-code license_key`

   The following command installs the license with the key AAAAAAAAAAAAAAAAAAAAAAAAA.

   `cluster1:/> system license add -license-code AAAAAAAAAAAAAAAAAAAAAAAAAAA`

2. Repeat the previous step for each node license.

Initialize the ComplianceClock

The SnapLock ComplianceClock ensures against tampering that might alter the retention period for WORM files. You must initialize the `system ComplianceClock` on each node that hosts a SnapLock aggregate. Once you initialize the ComplianceClock on a node, you cannot initialize it again.

What you'll need
• You must be a cluster administrator to perform this task.
• The SnapLock license must be installed on the node.
About this task
The time on the system ComplianceClock is inherited by the *volume ComplianceClock*, which controls the retention period for WORM files on the volume. The volume ComplianceClock is initialized automatically when you create a new SnapLock volume.

The initial setting of the ComplianceClock is based on the current system clock. For that reason, you should verify that the system time and time zone are correct before initializing the ComplianceClock. Once you initialize the ComplianceClock on a node, you cannot initialize it again.

System Manager
Beginning with ONTAP 9.12.1, you can use System Manager to initialize the SnapLock Compliance Clock.

Steps
1. Navigate to *Cluster > Overview*.
2. In the *Nodes* section, click *Initialize SnapLock Compliance Clock*.
3. To display the Compliance Clock column and to verify that the Compliance Clock is initialized, in the *Cluster > Overview > Nodes* section, click *Show/Hide* and select *SnapLock Compliance Clock*.

CLI
1. Initialize the system ComplianceClock:

   ```
   snaplock compliance-clock initialize -node node_name
   ```

   The following command initializes the system ComplianceClock on *node1*:

   ```
   cluster1::> snaplock compliance-clock initialize -node node1
   ```

2. When prompted, confirm that the system clock is correct and that you want to initialize the ComplianceClock:

   ```
   Warning: You are about to initialize the secure ComplianceClock of the node "node1" to the current value of the node's system clock. This procedure can be performed only once on a given node, so you should ensure that the system time is set correctly before proceeding.
   
   The current node's system clock is: Mon Apr 25 06:04:10 GMT 2016
   
   Do you want to continue? (y|n): y
   ```

3. Repeat this procedure for each node that hosts a SnapLock aggregate.
Create a SnapLock aggregate

You use the volume `--snaplock-type` option to specify a Compliance or Enterprise SnapLock volume type. For releases earlier than ONTAP 9.10.1, you must create a separate SnapLock aggregate. Beginning with ONTAP 9.10.1, SnapLock and non-SnapLock volumes can exist on the same aggregate; therefore, you are no longer required to create a separate SnapLock aggregate if you are using ONTAP 9.10.1.

What you’ll need

• You must be a cluster administrator to perform this task.

• The SnapLock license must be installed on the node.

• The ComplianceClock on the node must be initialized.

• If you have partitioned the disks as “root”, “data1”, and “data2”, you must ensure that spare disks are available.

Upgrade considerations

When upgrading to ONTAP 9.10.1, existing SnapLock and non-SnapLock aggregates are upgraded to support the existence of both SnapLock and non-SnapLock volumes; however, the existing SnapLock volume attributes are not automatically updated. For example, data-compaction, cross-volume-dedupe, and cross-volume-background-dedupe fields remain unchanged. New SnapLock volumes created on existing aggregates have the same default values as non-SnapLock volumes, and the default values for new volumes and aggregates are platform dependent.

Revert considerations

If you need to revert to an ONTAP version earlier than 9.10.1, you must move all SnapLock Compliance, SnapLock Enterprise, and SnapLock volumes to their own SnapLock aggregates.

About this task

• You cannot create Compliance aggregates for FlexArray LUNs, but SnapLock Compliance aggregates are supported with FlexArray LUNs.

• You cannot create Compliance aggregates with the SyncMirror option.

• You can create mirrored Compliance aggregates in a MetroCluster configuration only if the aggregate is used to host SnapLock audit log volumes.

In a MetroCluster configuration, SnapLock Enterprise is supported on mirrored and unmirrored aggregates. SnapLock Compliance is supported only on unmirrored aggregates.

Steps

1. Create a SnapLock aggregate:

```
storage aggregate create --aggregate aggregate_name --node node_name --diskcount number_of_disks --snaplock-type compliance|enterprise
```

The man page for the command contains a complete list of options.

The following command creates a SnapLock Compliance aggregate named `aggr1` with three disks on `node1`:
Create a SnapLock volume

You must create a SnapLock volume for the files or Snapshot copies that you want to commit to the WORM state. Beginning with ONTAP 9.10.1, any volume you create, regardless of the aggregate type, is created by default as a non-SnapLock volume. You must use the `-snaplock-type` option to explicitly create a SnapLock volume by specifying either Compliance or Enterprise as the SnapLock type. By default, the SnapLock type is set to non-snaplock.

What you’ll need

- The SnapLock aggregate must be online.
- The SnapLock license must be installed on the node.
- The ComplianceClock on the node must be initialized.

About this task

With the proper SnapLock permissions, you can destroy or rename an Enterprise volume at any time. You cannot destroy a Compliance volume until the retention period has elapsed. You can never rename a Compliance volume.

You can clone SnapLock volumes, but you cannot clone files on a SnapLock volume. The clone volume will be of the same SnapLock type as the parent volume.

LUNs are not supported on SnapLock volumes. Although it is possible to move LUNs onto a SnapLock volume using legacy technology, this is not a supported operation, nor is any other operation involving LUNs on a SnapLock volume.

Perform this task using ONTAP System Manager or the ONTAP CLI.
Beginning with ONTAP 9.12.1, you can use System Manager to create a SnapLock volume.

Steps
1. Navigate to **Storage > Volumes** and click **Add**.
2. In the **Add Volume** window, click **More Options**.
3. Enter the new volume information, including the name and size of the volume.
4. Select **Enable SnapLock** and choose the SnapLock type, either Compliance or Enterprise.
5. In the **Auto-Commit Files** section, select **Modified** and enter the amount of time a file should remain unchanged before it is automatically committed. The minimum value is 5 minutes and the maximum value is 10 years.
6. In the **Data Retention** section, select the minimum and maximum retention period.
7. Select the default retention period.
8. Click **Save**.
9. Select the new volume in the **Volumes** page to verify the SnapLock settings.

CLI
1. Create a SnapLock volume:

   ```bash
   volume create -vserver SVM_name -volume volume_name -aggregate aggregate_name -snaplock-type compliance|enterprise
   ```

   For a complete list of options, see the man page for the command. The following options are not available for SnapLock volumes: `nvfail`, `atime-update`, `is-autobalance-eligible`, `space-mgmt-try-first`, and `vmalign`.

   The following command creates a SnapLock Compliance volume named `vol1` on `aggr1` on `vs1`:

   ```bash
   cluster1::> volume create -vserver vs1 -volume vol1 -aggregate aggr1 -snaplock-type compliance
   ```

**Mount a SnapLock volume**

You can mount a SnapLock volume to a junction path in the SVM namespace for NAS client access.

**What you'll need**
The SnapLock volume must be online.

**About this task**
- You can mount a SnapLock volume only under the root of the SVM.
- You cannot mount a regular volume under a SnapLock volume.

**Steps**
1. Mount a SnapLock volume:

   ```bash
   volume mount -vserver SVM_name -volume volume_name -junction-path path
   ```

   For a complete list of options, see the man page for the command.

   The following command mounts a SnapLock volume named `vol1` to the junction path `/sales` in the `vs1` namespace:

   ```bash
   cluster1::> volume mount -vserver vs1 -volume vol1 -junction-path /sales
   ```

### Set the retention time

#### Set the retention time overview

You can set the retention time for a file explicitly, or you can use the default retention period for the volume to derive the retention time. Unless you set the retention time explicitly, SnapLock uses the default retention period to calculate the retention time.

#### About retention period and retention time

The **retention period** for a WORM file specifies the length of time the file must be retained after it is committed to the WORM state. The **retention time** for a WORM file is the time after which the file no longer needs to be retained. A retention period of 20 years for a file committed to the WORM state on 10 November 2020 6:00 a.m., for example, would yield a retention time of 10 November 2040 6:00 a.m.

```
commit to WORM = 10 November 2020 6:00 a.m.
retention period = 20 years
retention time = 10 November 2040 6:00 a.m.
```

Beginning with ONTAP 9.10.1, you can set a retention time up to October 26, 3058 and a retention period up to 100 years. When you extend retention dates, older policies are converted automatically. In ONTAP 9.9.1 and earlier releases, unless you set the default retention period to infinite, the maximum supported retention time is January 19 2071 (GMT).

#### Important replication considerations

When establishing a SnapMirror relationship with a SnapLock source volume using a retention date later than January 19th 2071 (GMT), the destination cluster must be running ONTAP 9.10.1 or later or the SnapMirror transfer will fail.

#### Important revert considerations

ONTAP prevents you from reverting a cluster from ONTAP 9.10.1 to an earlier ONTAP version when there are any files with a retention period later than “January 19, 2071 8:44:07 AM”.

Understanding the default retention periods

A SnapLock Compliance or Enterprise volume has four retention periods:

- Minimum retention period (\text{min}) with a default of 0
- Maximum retention period (\text{max}) with a default of 30 years
- Default retention period, with a default equal to \text{min} for both Compliance mode and Enterprise mode beginning with ONTAP 9.10.1. In ONTAP releases earlier than ONTAP 9.10.1, the default retention period depends on the mode:
  - For Compliance mode, the default is equal to \text{max}.
  - For Enterprise mode, the default is equal to \text{min}.
- Unspecified retention period.

Beginning with ONTAP 9.8, you can set the retention period on files in a volume to unspecified, to enable the file to be retained until you set an absolute retention time. You can set a file with absolute retention time to unspecified retention and back to absolute retention as long as the new absolute retention time is later than the absolute time you previously set.

Beginning with ONTAP 9.12.1, WORM files with the retention period set to unspecified are guaranteed to have a retention period set to the minimum retention period configured for the SnapLock volume. When you change the file retention period from unspecified to an absolute retention time, the new retention time specified must be greater than the minimum retention time already set on the file.

So, if you do not set the retention time explicitly before committing a Compliance-mode file to the WORM state, and you do not modify the defaults, the file will be retained for 30 years. Similarly, if you do not set the retention time explicitly before committing an Enterprise-mode file to the WORM state, and you do not modify the defaults, the file will be retained for 0 years, or, effectively, not at all.

Set the retention time for a file explicitly

You can set the retention time for a file explicitly by modifying its last access time. You can use any suitable command or program over NFS or CIFS to modify the last access time.

About this task

After a file has been committed to WORM, you can extend but not shorten the retention time. The retention time is stored in the atime field for the file.

You cannot explicitly set the retention time of a file to infinite. That value is only available when you use the default retention period to calculate the retention time.

Steps

1. Use a suitable command or program to modify the last access time for the file whose retention time you want to set.

   In a UNIX shell, use the following command to set a retention time of 21 November 2020 6:00 a.m. on a file named document.txt:
You can use any suitable command or program to modify the last access time in Windows.

**Set the default retention period**

You can use the `volume snaplock modify` command to set the default retention period for files on a SnapLock volume.

**What you'll need**

The SnapLock volume must be online.

**About this task**

The following table shows the possible values for the default retention period option:

- The default retention period must be greater than or equal to (\(\geq\)) the minimum retention period and less than or equal to (\(\leq\)) the maximum retention period.

<table>
<thead>
<tr>
<th>Value</th>
<th>Unit</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 - 65535</td>
<td>seconds</td>
<td></td>
</tr>
<tr>
<td>0 - 24</td>
<td>hours</td>
<td></td>
</tr>
<tr>
<td>0 - 365</td>
<td>days</td>
<td></td>
</tr>
<tr>
<td>0 - 12</td>
<td>months</td>
<td></td>
</tr>
<tr>
<td>0 - 100</td>
<td>years</td>
<td>Beginning with ONTAP 9.10.1. For earlier ONTAP releases, the value is 0 - 70.</td>
</tr>
<tr>
<td>max</td>
<td>-</td>
<td>Use the maximum retention period.</td>
</tr>
<tr>
<td>min</td>
<td>-</td>
<td>Use the minimum retention period.</td>
</tr>
<tr>
<td>infinite</td>
<td>-</td>
<td>Retain the files forever.</td>
</tr>
<tr>
<td>unspecified</td>
<td>-</td>
<td>Retain the files until an absolute retention period is set.</td>
</tr>
</tbody>
</table>

The values and ranges for the maximum and minimum retention periods are identical, except for `max` and `min`, which are not applicable. For more information about this task, see [Set the retention time overview](#).

You can use the `volume snaplock show` command to view the retention period settings for the volume. For more information, see the man page for the command.
After a file has been committed to the WORM state, you can extend but not shorten the retention period.

Steps

1. Set the default retention period for files on a SnapLock volume:

   ```
   volume snaplock modify -vserver SVM_name -volume volume_name -default
   -retention-period default_retention_period -minimum-retention-period
   min_retention_period -maximum-retention-period max_retention_period
   ```

   For a complete list of options, see the man page for the command.

   The following examples assume that the minimum and maximum retention periods have not been modified previously.

   The following command sets the default retention period for a Compliance or Enterprise volume to 20 days:

   ```
   cluster1::> volume snaplock modify -vserver vs1 -volume vol1 -default
   -retention-period 20days
   ```

   The following command sets the default retention period for a Compliance volume to 70 years:

   ```
   cluster1::> volume snaplock modify -vserver vs1 -volume vol1 -maximum
   -retention-period 70years
   ```

   The following command sets the default retention period for an Enterprise volume to 10 years:

   ```
   cluster1::> volume snaplock modify -vserver vs1 -volume vol1 -default
   -retention-period max -maximum-retention-period 10years
   ```

   The following commands set the default retention period for an Enterprise volume to 10 days:

   ```
   cluster1::> volume snaplock modify -vserver vs1 -volume vol1 -minimum
   -retention-period 10days
   cluster1::> volume snaplock modify -vserver vs1 -volume vol1 -default
   -retention-period min
   ```

   The following command sets the default retention period for a Compliance volume to infinite:

   ```
   cluster1::> volume snaplock modify -vserver vs1 -volume vol1 -default
   -retention-period infinite -maximum-retention-period infinite
   ```
Verify SnapLock settings

You can use the `volume file fingerprint start` and `volume file fingerprint dump` commands to view key information about files and volumes, including the file type (regular, WORM, or WORM appendable), the volume expiration date, and so forth.

**Steps**

1. Generate a file fingerprint:

   ```shell
   volume file fingerprint start -vserver SVM_name -file file_path
   
   svml:~> volume file fingerprint start -vserver svml -file /vol/sle/vol/f1
   File fingerprint operation is queued. Run "volume file fingerprint show -session-id 16842791" to view the fingerprint session status.
   ```

   The command generates a session ID that you can use as input to the `volume file fingerprint dump` command.

   ```shell
   You can use the `volume file fingerprint show` command with the session ID to monitor the progress of the fingerprint operation. Make sure that the operation has completed before attempting to display the fingerprint.
   ```

2. Display the fingerprint for the file:

   ```shell
   volume file fingerprint dump -session-id session_ID
   
   svml:~> volume file fingerprint dump -session-id 33619976
   
   Vserver:svml

Reset the ComplianceClock for an NTP-configured system

When the SnapLock secure clock daemon detects a skew beyond the threshold, the system time is used to reset both the system and volume ComplianceClocks.

What you'll need

• This feature is available only at the advanced privilege level.
• You must be a cluster administrator to perform this task.
• The SnapLock license must be installed on the node.
• This feature is available only for Cloud Volumes ONTAP, ONTAP Select, and VSIM platforms.

**About this task**

When the SnapLock secure clock daemon detects a skew beyond the threshold, the system time is used to reset both the system and volume ComplianceClocks. A period of 24 hours is set as the skew threshold. This means that the system ComplianceClock is synchronized to the system clock only if the skew is more than a day old.

The SnapLock secure clock daemon detects a skew and changes the ComplianceClock to the system time. Any attempt at modifying the system time to force the ComplianceClock to synchronize to the system time fails, since the ComplianceClock synchronizes to the system time only if the system time is synchronized with the NTP time.

**Steps**

1. Enable the SnapLock ComplianceClock time synchronization feature when an NTP server is configured:

   ```
   snaplock compliance-clock ntp
   ```

   The following command enables the system ComplianceClock time synchronization feature:

   ```
   cluster1:*> snaplock compliance-clock ntp modify -is-sync-enabled true
   ```

2. When prompted, confirm that the configured NTP servers are trusted and that the communications channel is secure to enable the feature:

3. Check that the feature is enabled:

   ```
   snaplock compliance-clock ntp show
   ```

   The following command checks that the system ComplianceClock time synchronization feature is enabled:

   ```
   cluster1:*> snaplock compliance-clock ntp show
   Enable clock sync to NTP system time: true
   ```
