Configure node-scoped NDMP

Enable node-scoped NDMP on the cluster

You can back up volumes hosted on a single node by enabling node-scoped NDMP, enabling the NDMP service, and configuring a LIF for data and control connection. This can be done for all nodes of the cluster.

Node-scoped NDMP is deprecated in ONTAP 9.

About this task
When using NDMP in node-scope mode, authentication must be configured on a per-node basis. For more information, see the Knowledge Base article "How to configure NDMP authentication in the 'node-scope' mode".

Steps
1. Enable node-scoped NDMP mode by using the `system services ndmp node-scope-mode` command with the `node-scope-mode` parameter.

   ```
   cluster1::> system services ndmp node-scope-mode on
   NDMP node-scope-mode is enabled.
   ```

2. Enable NDMP service on all nodes in the cluster by using the `system services ndmp on` command.
   
   Using the wildcard "*" enables NDMP service on all nodes at the same time.
   
   You must specify a password for authentication of the NDMP connection by the backup application.

   ```
   cluster1::> system services ndmp on -node *
   Please enter password:
   Confirm password:
   2 entries were modified.
   ```

3. Disable the `-clear-text` option for secure communication of the NDMP password by using the `system services ndmp modify` command.
   
   Using the wildcard "*" disables the `-clear-text` option on all nodes at the same time.

   ```
   cluster1::> system services ndmp modify -node * -clear-text false
   2 entries were modified.
   ```

4. Verify that NDMP service is enabled and the `-clear-text` option is disabled by using the `system services ndmp show` command.

   ```
   ```
Configure a LIF

You must identify a LIF that will be used for establishing a data connection and control connection between the node and the backup application. After identifying the LIF, you must verify that firewall and failover policies are set for the LIF.

Steps

1. Identify the intercluster LIF hosted on the nodes by using the `network interface show` command with the `-role` parameter.

2. Ensure that the firewall policy is enabled for NDMP on the intercluster LIFs:
   a. Verify that the firewall policy is enabled for NDMP by using the `system services firewall policy show` command.

   The following command displays the firewall policy for the intercluster LIF:
b. If the firewall policy is not enabled, enable the firewall policy by using the `system services firewall policy modify` command with the `-service` parameter.

The following command enables firewall policy for the intercluster LIF:

```
cluster1::> system services firewall policy modify -vserver cluster1 -policy intercluster -service ndmp 0.0.0.0/0
```

3. Ensure that the failover policy is set appropriately for the intercluster LIFs:

a. Verify that the failover policy for the intercluster LIFs is set to `local-only` by using the `network interface show -failover` command.

```
cluster1::> network interface show -failover

<table>
<thead>
<tr>
<th>Vserver</th>

<td>Default</td>
</tr>
</tbody>
</table>
```

Failover Targets:
```
.......           
```

Failover Targets:
```
.......           
```

Failover Targets:
```
.......           
```
b. If the failover policy is not set appropriately, modify the failover policy by using the `network interface modify` command with the `-failover-policy` parameter.

```
cluster1::> network interface modify -vserver cluster1 -lif IC1 -failover-policy local-only
```
