Disk and partition ownership

You can manage the ownership of disks and partitions.

You can perform the following tasks:

- **Display disk and partition ownership**
  
  You can view disk ownership to determine which node controls the storage. You can also view the partition ownership on systems that use shared disks.

- **Change settings for automatic assignment of disk ownership**
  
  You can select a non-default policy for automatically assigning disk ownership or disable automatic assignment of disk ownership.

- **Manually assign ownership of unpartitioned disks**
  
  If your cluster is not configured to use automatic disk ownership assignment, you must assign ownership manually.

- **Manually assign ownership of partitioned disks**
  
  You can set the ownership of the container disk or the partitions manually or by using auto-assignment—just as you do for unpartitioned disks.

- **Remove a failed disk**
  
  A disk that has failed completely is no longer considered by ONTAP to be a usable disk, and you can immediately disconnect the disk from the shelf.

- **Remove ownership from a disk**
  
  ONTAP writes disk ownership information to the disk. Before you remove a spare disk or its shelf from a node, you should remove its ownership information so that it can be properly integrated into another node.

About automatic assignment of disk ownership

The automatic assignment of unowned disks is enabled by default. Automatic disk ownership assignments occur 10 minutes after system initialization and every five minutes during normal system operation.

When you add new disks to a system – for example, when replacing failed disks, responding to a low spares message, or adding capacity – the default auto-assignment policy assigns ownership of the disk to a node as a spare. You can disable automatic assignment or select a different auto-assignment policy using the `storage disk option modify` command.

The default auto-assignment policy is based on platform-specific characteristics, but it uses one of the following methods to assign disk ownership:
<table>
<thead>
<tr>
<th>Assignment method</th>
<th>Effect on node assignments</th>
<th>Platforms</th>
</tr>
</thead>
<tbody>
<tr>
<td>bay</td>
<td>Even-numbered bays are assigned to node A and odd-numbered bays to node B.</td>
<td>Entry-level systems in an HA configuration with a single, shared shelf.</td>
</tr>
<tr>
<td>shelf</td>
<td>All disks in the shelf are assigned to node A.</td>
<td>Entry-level systems in an HA configuration with one stack of two or more shelves, and MetroCluster configurations with one stack per node, two or more shelves.</td>
</tr>
<tr>
<td>split shelf</td>
<td>Disks on the left side of the shelf are assigned to node A and on the right side to Node B. Partial shelves on new systems are shipped from the factory with disks populated from the shelf edge toward the center.</td>
<td>AFF C190 systems and some MetroCluster configurations.</td>
</tr>
<tr>
<td>stack</td>
<td>All disks in the stack are assigned to node A.</td>
<td>Stand-alone entry-level systems and all other configurations.</td>
</tr>
</tbody>
</table>

If the default assignment method is not desirable in your environment, you can specify the bay, shelf, or stack assignment method using the `-autoassign-policy` parameter to the `storage disk option modify` command. Note the following rules:

- If you try to use the `bay autoassign-policy` for a non-entry level platform, it will fail.
- There is no corresponding non-default policy for specifying the split-shelf method.

You can also manage disk assignment manually using the `storage disk assign` command.

- If you disable auto-assignment, new disks are not available as spares until they are assigned to a node with the `storage disk assign` command.
- If you want disks to be auto-assigned and you have multiple stacks or shelves that must have different ownership, one disk must have been manually assigned on each stack or shelf so that automatic ownership assignment works on each stack or shelf.
- If auto-assignment is enabled and you manually assign a single drive to a node that isn’t specified in the active policy, auto-assignment stops working and an EMS message is displayed.

Learn more about manually assigning disk ownership.

You can display the current auto-assignment settings with the `storage disk option show` command.

## Display disk and partition ownership

You can view disk ownership to determine which node controls the storage. You can also view the partition ownership on systems that use shared disks.

**Steps**
1. Display the ownership of physical disks:

```
storage disk show -ownership
```

```
cluster::> storage disk show -ownership

<table>
<thead>
<tr>
<th>Disk</th>
<th>Aggregate</th>
<th>Home</th>
<th>Owner</th>
<th>DR Home</th>
<th>Home ID</th>
<th>Owner ID</th>
<th>DR Home</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.0.0</td>
<td>aggr0_2</td>
<td>node2</td>
<td>node2</td>
<td>-</td>
<td>2014941509</td>
<td>2014941509</td>
<td>-</td>
</tr>
<tr>
<td>1.0.1</td>
<td>aggr0_2</td>
<td>node2</td>
<td>node2</td>
<td>-</td>
<td>2014941509</td>
<td>2014941509</td>
<td>-</td>
</tr>
<tr>
<td>1.0.2</td>
<td>aggr0_1</td>
<td>node1</td>
<td>node1</td>
<td>-</td>
<td>2014941219</td>
<td>2014941219</td>
<td>-</td>
</tr>
<tr>
<td>1.0.3</td>
<td>-</td>
<td>node1</td>
<td>node1</td>
<td>-</td>
<td>2014941219</td>
<td>2014941219</td>
<td>-</td>
</tr>
</tbody>
</table>
```

2. If you have a system that uses shared disks, you can display the partition ownership:

```
storage disk show -partition-ownership
```

```
cluster::> storage disk show -partition-ownership

<table>
<thead>
<tr>
<th>Container</th>
<th>Root</th>
<th>Data</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disk</td>
<td>Container</td>
<td>Container</td>
</tr>
<tr>
<td>1.0.0</td>
<td>node1</td>
<td>1886742616</td>
</tr>
</tbody>
</table>
1886742616
| 1.0.1     | node1  | 1886742616 | node1 |
1886742616
```

**Change settings for automatic assignment of disk ownership**

You can use the `storage disk option modify` command to select a non-default policy for automatically assigning disk ownership or to disable automatic assignment of disk ownership.
Learn about automatic assignment of disk ownership.

Steps

1. Modify automatic disk assignment:
   a. If you want to select a non-default policy, enter:

      ```
      storage disk option modify -autoassign-policy autoassign_policy -node node_name
      ```

      - Use stack as the `autoassign_policy` to configure automatic ownership at the stack or loop level.
      - Use shelf as the `autoassign_policy` to configure automatic ownership at the shelf level.
      - Use bay as the `autoassign_policy` to configure automatic ownership at the bay level.

   b. If you want to disable automatic disk ownership assignment, enter:

      ```
      storage disk option modify -autoassign off -node node_name
      ```

2. Verify the automatic assignment settings for the disks:

   ```
   storage disk option show
   ```

   ```
   cluster1::> storage disk option show
   Node           BKg. FW. Upd.  Auto Copy     Auto Assign    Auto Assign Policy
   -------------  -------------  ------------  -------------  --------
   cluster1-1     on             on            on             default
   cluster1-2     on             on            on             default
   ```

**Manually assign disk ownership**

Disks must be owned by a node before they can be used in a local tier (aggregate).

If your cluster is not configured to use automatic disk ownership assignment, you must assign ownership manually.

You cannot reassign ownership of a disk that is in use in a local tier.

Steps

1. Using the CLI, display all unowned disks:

   ```
   storage disk show -container-type unassigned
   ```

2. Assign each disk:

   ```
   storage disk assign -disk disk_name -owner owner_name
   ```
You can use the wildcard character to assign more than one disk at once. If you are reassigning a spare disk that is already owned by a different node, you must use the “-force” option.

Manually assign ownership of partitioned disks overview

Using the CLI, you can set the ownership of the container disk or the partitions manually or by using auto-assignment—just as you do for unpartitioned disks.

If a container disk fails in a half-populated shelf and is replaced, ONTAP will not auto-assign ownership. In this case, any assignment of new disks will need to be done manually. To make auto-assign work on half-populated shelves, place disks equally on lower half and 6 on far right bays to begin with. That is, 6 disks from bays 0-5 and 6 disks from bays 18-23. After the container disk is assigned in an ADP-configured system, ONTAP’s software will handle any partitioning and partition assignments that are required, without user intervention.

You can perform the following tasks in the CLI:
Manually assign disks with root-data partitioning

For root-data partitioning, there are three owned entities (the container disk and the two partitions) collectively owned by the HA pair.

The container disk and the two partitions do not all need to be owned by the same node in the HA pair as long as they are all owned by one of the nodes in the HA pair. However, when you use a partition in a local tier (aggregate), it must be owned by the same node that owns the local tier.

**Steps**

1. Use the CLI to display the current ownership for the partitioned disk:

   ```
   storage disk show -disk disk_name -partition-ownership
   ```

2. Set the CLI privilege level to advanced:

   ```
   set -privilege advanced
   ```

3. Enter the appropriate command, depending on which ownership entity you want to assign ownership for:

<table>
<thead>
<tr>
<th>If you want to assign ownership for the...</th>
<th>Use this command...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Container disk</td>
<td>storage disk assign -disk disk_name -owner owner_name</td>
</tr>
<tr>
<td>Data partition</td>
<td>storage disk assign -disk disk_name -owner owner_name -data true</td>
</tr>
<tr>
<td>Root partition</td>
<td>storage disk assign -disk disk_name -owner owner_name -root true</td>
</tr>
</tbody>
</table>

   If any of the ownership entities are already owned, then you must include the “-force” option.
Manually assign disks with root-data-data partitioning

For root-data-data partitioning, there are four owned entities (the container disk and the three partitions) collectively owned by the HA pair.

Root-data-data partitioning creates one small partition as the root partition and two larger, equally sized partitions for data.

About this task

Parameters must be used with the `disk assign` command to assign the proper partition of a root-data-data partitioned disk. You cannot use these parameters with disks that are part of a storage pool. The default value is “false”.

- The `-data1 true` parameter assigns the “data1” partition of a root-data1-data2 partitioned disk.
- The `-data2 true` parameter assigns the “data2” partition of a root-data1-data2 partitioned disk.

Steps

1. Use the CLI to display the current ownership for the partitioned disk:

   ```
   storage disk show -disk disk_name -partition-ownership
   ```

2. Set the CLI privilege level to advanced:

   ```
   set -privilege advanced
   ```

3. Enter the appropriate command, depending on which ownership entity you want to assign ownership for:

<table>
<thead>
<tr>
<th>If you want to assign ownership for the...</th>
<th>Use this command...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Container disk</td>
<td>storage disk assign -disk disk_name -owner owner_name</td>
</tr>
<tr>
<td>Data1 partition</td>
<td>storage disk assign -disk disk_name -owner owner_name -data1 true</td>
</tr>
<tr>
<td>Data2 partition</td>
<td>storage disk assign -disk disk_name -owner owner_name -data2 true</td>
</tr>
<tr>
<td>Root partition</td>
<td>storage disk assign -disk disk_name -owner owner_name -root true</td>
</tr>
</tbody>
</table>

If any of the ownership entities are already owned, then you must include the “-force” option.
Set up an active-passive configuration on nodes using root-data partitioning

When an HA pair is configured to use root-data partitioning by the factory, ownership of the data partitions is split between both nodes in the pair for use in an active-active configuration. If you want to use the HA pair in an active-passive configuration, you must update partition ownership before creating your data local tier (aggregate).

What you’ll need
- You should have decided which node will be the active node and which node will be the passive node.
- Storage failover must be configured on the HA pair.

About this task
This task is performed on two nodes: Node A and Node B.

This procedure is designed for nodes for which no data local tier (aggregate) has been created from the partitioned disks.

Learn about advanced disk partitioning.

Steps
All commands are inputted at the cluster shell.

1. View the current ownership of the data partitions:

   storage aggregate show-spare-disks

   The output shows that half of the data partitions are owned by one node and half are owned by the other node. All of the data partitions should be spare.

   ```
   cluster1::> storage aggregate show-spare-disks
   Original Owner: cluster1-01
   Pool0
   Partitioned Spares
   Local
   Local
   Data
   Root Physical
   Disk Usable Size Type RPM Checksum Usable
   --------------------------- ----- ------ -------------- --------
   1.0.0                        BSAS    7200 block           753.8GB
   0B  828.0GB
   1.0.1                        BSAS    7200 block           753.8GB
   73.89GB  828.0GB
   1.0.5                        BSAS    7200 block           753.8GB
   ```
2. Enter the advanced privilege level:

```
set advanced
```

3. For each data partition owned by the node that will be the passive node, assign it to the active node:

```
storage disk assign -force -data true -owner active_node_name -disk disk_name
```

You do not need to include the partition as part of the disk name.

You would enter a command similar to the following example for each data partition you need to reassign:

```
storage disk assign -force -data true -owner cluster1-01 -disk 1.0.3
```

4. Confirm that all of the partitions are assigned to the active node.
```markdown
cluster1::*> storage aggregate show-spare-disks

Original Owner: cluster1-01
Pool0
Partitioned Spares

<table>
<thead>
<tr>
<th>Disk</th>
<th>Type</th>
<th>RPM</th>
<th>Checksum</th>
<th>Size</th>
<th>Usable</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.0.0</td>
<td>BSAS</td>
<td>7200</td>
<td>block</td>
<td>753.8GB</td>
<td>828.0GB</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>753.8GB</td>
</tr>
</tbody>
</table>

Original Owner: cluster1-02
Pool0
Partitioned Spares

<table>
<thead>
<tr>
<th>Disk</th>
<th>Type</th>
<th>RPM</th>
<th>Checksum</th>
<th>Size</th>
<th>Usable</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.0.0</td>
<td>BSAS</td>
<td>7200</td>
<td>block</td>
<td>753.8GB</td>
<td>828.0GB</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>753.8GB</td>
</tr>
</tbody>
</table>
```

<table>
<thead>
<tr>
<th>Disk</th>
<th>Type</th>
<th>RPM Checksum</th>
<th>Usable Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.0.8</td>
<td>BSAS</td>
<td>7200 block</td>
<td>73.89GB 828.0GB</td>
</tr>
</tbody>
</table>

13 entries were displayed.

Note that cluster1-02 still owns a spare root partition.

5. Return to administrative privilege:

```
set admin
```

6. Create your data aggregate, leaving at least one data partition as spare:

```
storage aggregate create new_aggr_name -diskcount number_of_partitions -node active_node_name
```

The data aggregate is created and is owned by the active node.

**Set up an active-passive configuration on nodes using root-data-data partitioning**

When an HA pair is configured to use root-data-data partitioning by the factory, ownership of the data partitions is split between both nodes in the pair for use in an active-active configuration. If you want to use the HA pair in an active-passive configuration, you must update partition ownership before creating your data local tier (aggregate).

**What you’ll need**

- You should have decided which node will be the active node and which node will be the passive node.
- Storage failover must be configured on the HA pair.

**About this task**

This task is performed on two nodes: Node A and Node B.

This procedure is designed for nodes for which no data local tier (aggregate) has been created from the partitioned disks.

Learn about [advanced disk partitioning](#).

**Steps**

All commands are input at the cluster shell.

1. View the current ownership of the data partitions:

```
storage aggregate show-spare-disks -original-owner passive_node_name -fields local-usable-data1-size, local-usable-data2-size
```
The output shows that half of the data partitions are owned by one node and half are owned by the other node. All of the data partitions should be spare.

2. Enter the advanced privilege level:

   set advanced

3. For each data1 partition owned by the node that will be the passive node, assign it to the active node:

   storage disk assign -force -data1 -owner active_node_name -disk disk_name

   You do not need to include the partition as part of the disk name

4. For each data2 partition owned by the node that will be the passive node, assign it to the active node:

   storage disk assign -force -data2 -owner active_node_name -disk disk_name

   You do not need to include the partition as part of the disk name

5. Confirm that all of the partitions are assigned to the active node:

   storage aggregate show-spare-disks

   cluster1::*> storage aggregate show-spare-disks

   Original Owner: cluster1-01
   Pool0
       Partitioned Spares

   Local
   Data

   Root Physical
   Disk Usable Size Type RPM Checksum Usable
   --------------------------- ----- ------ -------------- --------
   1.0.0 828.0GB  BSAS  7200 block  753.8GB
Note that cluster1-02 still owns a spare root partition.

6. Return to administrative privilege:

   set admin

7. Create your data aggregate, leaving at least one data partition as spare:

   storage aggregate create new_aggr_name -diskcount number_of_partitions -node active_node_name

   The data aggregate is created and is owned by the active node.

8. Alternatively, you can use ONTAP’s recommend aggregate layout which includes best practices for RAID group layout and spare counts:

   storage aggregate auto-provision

**Remove ownership from a disk**

ONTAP writes disk ownership information to the disk. Before you remove a spare disk or
its shelf from a node, you should remove its ownership information so that it can be properly integrated into another node.

What you’ll need
The disk you want to remove ownership from must meet the following requirements:

- It must be a spare disk.
  
  You cannot remove ownership from a disk that is being used in an local tier (aggregate).

- It cannot be in the maintenance center.
- It cannot be undergoing sanitization.
- It cannot have failed.

  It is not necessary to remove ownership from a failed disk.

About this task
If you have automatic disk assignment enabled, ONTAP could automatically reassign ownership before you remove the disk from the node. For this reason, you disable the automatic ownership assignment until the disk is removed, and then you re-enable it.

Steps
1. If disk ownership automatic assignment is on, use the CLI to turn it off:

   ```shell
   storage disk option modify -node node_name -autoassign off
   ```

2. If needed, repeat the previous step for the node’s HA partner.

3. Remove the software ownership information from the disk:

   ```shell
   storage disk removeowner disk_name
   ```

   To remove ownership information from multiple disks, use a comma-separated list.

   Example:

   ```shell
   storage disk removeowner sys1:0a.23,sys1:0a.24,sys1:0a.25
   ```

4. If the disk is partitioned for root-data partitioning, remove ownership from the partitions by entering both of the following commands:

   ```shell
   storage disk removeowner -disk disk_name -root true
   storage disk removeowner -disk disk_name -data true
   ```

   Both partitions are no longer owned by any node.

5. If you previously turned off automatic assignment of disk ownership, turn it on after the disk has been removed or reassigned:

   ```shell
   storage disk option modify -node node_name -autoassign on
   ```
6. If needed, repeat the previous step for the node’s HA partner.
