Manage systems with FC adapters

Managing systems with FC adapters overview

Commands are available to manage onboard FC adapters and FC adapter cards. These commands can be used to configure the adapter mode, display adapter information, and change the speed.

Most storage systems have onboard FC adapters that can be configured as initiators or targets. You can also use FC adapter cards configured as initiators or targets. Initiators connect to back-end disk shelves, and possibly foreign storage arrays (FlexArray). Targets connect only to FC switches. Both the FC target HBA ports and the switch port speed should be set to the same value and should not be set to auto.

Commands for managing FC adapters

You can use FC commands to manage FC target adapters, FC initiator adapters, and onboard FC adapters for your storage controller. The same commands are used to manage FC adapters for the FC protocol and the FC-NVMe protocol.

FC initiator adapter commands work only at the node level. You must use the `run -node node_name` command before you can use the FC initiator adapter commands.

Commands for managing FC target adapters

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Use this command…</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display FC adapter information on a node</td>
<td>network fcp adapter show</td>
</tr>
<tr>
<td>Modify FC target adapter parameters</td>
<td>network fcp adapter modify</td>
</tr>
<tr>
<td>Display FC protocol traffic information</td>
<td>run -node node_name sysstat -f</td>
</tr>
<tr>
<td>Display how long the FC protocol has been running</td>
<td>run -node node_name uptime</td>
</tr>
<tr>
<td>Display adapter configuration and status</td>
<td>run -node node_name sysconfig -v adapter</td>
</tr>
<tr>
<td>Verify which expansion cards are installed and whether there are any configuration errors</td>
<td>run -node node_name sysconfig -ac</td>
</tr>
<tr>
<td>View a man page for a command</td>
<td>man command_name</td>
</tr>
</tbody>
</table>

Commands for managing FC initiator adapters
<table>

</table>

### Commands for managing onboard FC adapters

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Use this command…</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display the status of the onboard FC ports</td>
<td>system node hardware unified-connect show</td>
</tr>
</tbody>
</table>

### Configure FC adapters for initiator mode

You can configure individual FC ports of onboard adapters and certain FC adapter cards for initiator mode. Initiator mode is used to connect the ports to tape drives, tape libraries, or third-party storage with FlexArray Virtualization or Foreign LUN Import (FLI).

#### What you’ll need
- LIFs on the adapter must be removed from any port sets of which they are members.
- All LIF’s from every storage virtual machine (SVM) using the physical port to be modified must be migrated or destroyed before changing the personality of the physical port from target to initiator.

#### About this task
Each onboard FC port can be individually configured as an initiator or a target. Ports on certain FC adapters can also be individually configured as either a target port or an initiator port, just like the onboard FC ports. A list of adapters that can be configured for target mode is available in NetApp Hardware Universe.

> **i** NVMe/FC does support initiator mode.

#### Steps
1. Remove all LIFs from the adapter:
   ```
   network interface delete -vserver SVM_name -lif lif_name,lif_name
   ```
2. Take your adapter offline:
   ```
   network fcp adapter modify -node node_name -adapter adapter_port -status-admin down
   ```
   If the adapter does not go offline, you can also remove the cable from the appropriate adapter port on the system.
3. Change the adapter from target to initiator:

```bash
system hardware unified-connect modify -t initiator adapter_port
```

4. Reboot the node hosting the adapter you changed.

5. Verify that the FC ports are configured in the correct state for your configuration:

```bash
system hardware unified-connect show
```

6. Bring the adapter back online:

```bash
node run -node node_name storage enable adapter adapter_port
```

## Configure FC adapters for target mode

You can configure individual FC ports of onboard adapters and certain FC adapter cards for target mode. Target mode is used to connect the ports to FC initiators.

### About this task

Each onboard FC port can be individually configured as an initiator or a target. Ports on certain FC adapters can also be individually configured as either a target port or an initiator port, just like the onboard FC ports. A list of adapters that can be configured for target mode is available in the NetApp Hardware Universe.

The same steps are used when configuring FC adapters for the FC protocol and the FC-NVMe protocol. However, only certain FC adapters support FC-NVMe. See the NetApp Hardware Universe for a list of adapters that support the FC-NVMe protocol.

### Steps

1. Take the adapter offline:

```bash
node run -node node_name storage disable adapter adapter_name
```

   If the adapter does not go offline, you can also remove the cable from the appropriate adapter port on the system.

2. Change the adapter from initiator to target:

```bash
system node hardware unified-connect modify -t target -node node_name adapter adapter_name
```

3. Reboot the node hosting the adapter you changed.

4. Verify that the target port has the correct configuration:

```bash
network fcp adapter show -node node_name
```

5. Bring your adapter online:

```bash
network fcp adapter modify -node node_name -adapter adapter_port -state up
```
Display information about an FC target adapter

You can use the network fcp adapter show command to display system configuration and adapter information for any FC adapter in the system.

Step
1. Display information about the FC adapter by using the network fcp adapter show command.

   The output displays system configuration information and adapter information for each slot that is used.

   network fcp adapter show -instance -node node1 -adapter 0a

Change the FC adapter speed

You should set your adapter target port speed to match the speed of the device to which it connects, instead of using autonegotiation. A port that is set to autonegotiation can take longer time to reconnect after a takeover/giveback or other interruption.

What you’ll need
All LIFs that use this adapter as their home port must be offline.

About this task
Because this task encompasses all storage virtual machines (SVMs) and all LIFs in a cluster, you must use the -home-port and -home-lif parameters to limit the scope of this operation. If you do not use these parameters, the operation applies to all LIFs in the cluster, which might not be desirable.

Steps
1. Take all of the LIFs on this adapter offline:

   network interface modify -vserver * -lif * { -home-node node1 -home-port 0c } -status-admin down

2. Take the adapter offline:

   network fcp adapter modify -node node1 -adapter 0c -state down

   If the adapter does not go offline, you can also remove the cable from the appropriate adapter port on the system.

3. Determine the maximum speed for the port adapter:

   fcp adapter show -instance

   You cannot modify the adapter speed beyond the maximum speed.

4. Change the adapter speed:

   network fcp adapter modify -node node1 -adapter 0c -speed 16

5. Bring the adapter online:
network fcp adapter modify -node node1 -adapter 0c -state up

6. Bring all of the LIFs on the adapter online:

   network interface modify -vserver * -lif * { -home-node node1 -home-port 0c } -status-admin up

---

**Supported FC ports**

The number of onboard FC ports and CNA/UTA2 ports configured for FC varies based on the model of the controller. FC ports are also available through supported FC target expansion adapters or additional UTA2 cards configured with FC SFP+ adapters.

**Onboard FC, UTA, and UTA2 ports**

- Onboard ports can be individually configured as either target or initiator FC ports.
- The number of onboard FC ports differs depending on controller model.

  The [NetApp Hardware Universe](https://netapp.com) contains a complete list of onboard FC ports on each controller model.

- FC ports are only available on FAS2240 systems through the X1150A-R6 expansion adapter.

  FAS2220 and FAS2520 systems do not support FC.

**Target expansion adapter FC ports**

- Available target expansion adapters differ depending on controller model.

  The [NetApp Hardware Universe](https://netapp.com) contains a complete list of target expansion adapters for each controller model.

- The ports on some FC expansion adapters are configured as initiators or targets at the factory and cannot be changed.

  Others can be individually configured as either target or initiator FC ports, just like the onboard FC ports. A complete list is available in [NetApp Hardware Universe](https://netapp.com).

---

**Prevent loss of connectivity when using the X1133A-R6 adapter**

You can prevent loss of connectivity during a port failure by configuring your system with redundant paths to separate X1133A-R6 HBAs.

The X1133A-R6 HBA is a 4-port, 16 Gb FC adapter consisting of two 2-port pairs. The X1133A-R6 adapter can be configured as target mode or initiator mode. Each 2-port pair is supported by a single ASIC (for example, Port 1 and Port 2 on ASIC 1 and Port 3 and Port 4 on ASIC 2). Both ports on a single ASIC must be configured to operate in the same mode, either target mode or initiator mode. If an error occurs with the ASIC supporting a pair, both ports in the pair go offline.

To prevent this loss of connectivity, you configure your system with redundant paths to separate X1133A-R6
Manage X1143A-R6 adapters

Supported port configurations for X1143A-R6 adapters overview

By default the X1143A-R6 adapter is configured in FC target mode, but you can configure its ports as either 10 Gb Ethernet and FCoE (CNA) ports or as 16 Gb FC initiator or target ports. This requires different SFP+ adapters.

When configured for Ethernet and FCoE, X1143A-R6 adapters support concurrent NIC and FCoE target traffic on the same 10-GBE port. When configured for FC, each two-port pair that shares the same ASIC can be individually configured for FC target or FC initiator mode. This means that a single X1143A-R6 adapter can support FC target mode on one two-port pair and FC initiator mode on another two-port pair. Port pairs connected to the same ASIC must be configured in the same mode.

In FC mode, the X1143A-R6 adapter behaves just like any existing FC device with speeds up to 16 Gbps. In CNA mode, you can use the X1143A-R6 adapter for concurrent NIC and FCoE traffic sharing the same 10 GbE port. CNA mode only supports FC target mode for the FCoE function.

Configure the ports

To configure the unified target adapter (X1143A-R6), you must configure the two adjacent ports on the same chip in the same personality mode.

Steps
1. Configure the ports as needed for Fibre Channel (FC) or Converged Network Adapter (CNA) using the system node hardware unified-connect modify command.
2. Attach the appropriate cables for FC or 10 Gb Ethernet.
3. Verify that you have the correct SFP+ installed:
   
   network fcp adapter show -instance -node -adapter

   For CNA, you should use a 10Gb Ethernet SFP. For FC, you should either use an 8 Gb SFP or a 16 Gb SFP, based on the FC fabric being connected to.

Change the UTA2 port from CNA mode to FC mode

You should change the UTA2 port from Converged Network Adapter (CNA) mode to Fibre Channel (FC) mode to support the FC initiator and FC target mode. You should change the personality from CNA mode to FC mode when you need to change the physical medium that connects the port to its network.

Steps
1. Take the adapter offline:
   
   network fcp adapter modify -node node_name -adapter adapter_name -status-admin down
2. Change the port mode:

    ucadmin modify -node node_name -adapter adapter_name -mode fcp

3. Reboot the node, and then bring the adapter online:

    network fcp adapter modify -node node_name -adapter adapter_name -status-admin up

4. Notify your admin or VIF manager to delete or remove the port, as applicable:

   - If the port is used as a home port of a LIF, is a member of an interface group (ifgrp), or hosts VLANs, then an admin should do the following:
     
     i. Move the LIFs, remove the port from the ifgrp, or delete the VLANs, respectively.
     
     ii. Manually delete the port by running the **network port delete** command.

     If the **network port delete** command fails, the admin should address the errors, and then run the command again.

   - If the port is not used as the home port of a LIF, is not a member of an ifgrp, and does not host VLANs, then the VIF manager should remove the port from its records at the time of reboot.

     If the VIF manager does not remove the port, then the admin must remove it manually after the reboot by using the **network port delete** command.

net-f8040-34::> ucadmin modify local 0e fc

Warning: Mode on adapter 0e and also adapter 0f will be changed to fc.
Do you want to continue? {y|n}: y
Any changes will take effect after rebooting the system. Use the "system node reboot" command to reboot.

net-f8040-34::> reboot local
(system node reboot)

Warning: Are you sure you want to reboot node "net-f8040-34-01"? {y|n}: y

5. Verify that you have the correct SFP+ installed:

network fcp adapter show -instance -node -adapter

For CNA, you should use a 10Gb Ethernet SFP. For FC, you should either use an 8 Gb SFP or a 16 Gb SFP, before changing the configuration on the node.
Change the CNA/UTA2 target adapter optical modules

You should change the optical modules on the unified target adapter (CNA/UTA2) to support the personality mode you have selected for the adapter.

Steps
1. Verify the current SFP+ used in the card. Then, replace the current SFP+ with the appropriate SFP+ for the preferred personality (FC or CNA).
2. Remove the current optical modules from the X1143A-R6 adapter.
3. Insert the correct modules for your preferred personality mode (FC or CNA) optics.
4. Verify that you have the correct SFP+ installed:

   network fcp adapter show -instance -node -adapter

Supported SFP+ modules and Cisco-branded Copper (Twinax) cables are listed in the NetApp Hardware Universe.

View adapter settings

To view the settings for your unified target adapter (X1143A-R6), you must run the system hardware unified-connect show command to display all modules on your controller.

Steps
1. Boot your controller without the cables attached.
2. Run the system hardware unified-connect show command to see the port configuration and modules.
3. View the port information before configuring the CNA and ports.
