Mirror and backup protection on the local cluster

Create a mirror relationship for a new bucket (local cluster)

When you create new S3 buckets, you can protect them immediately to an S3 SnapMirror destination on the same cluster. You can mirror data to a bucket in a different storage VM or the same storage VM as the source.

Before you begin

- Requirements for ONTAP versions, licensing, and S3 server configuration have been completed.
- A peering relationship exists between source and destination storage VMs.
- CA Certificates are needed for the source and destination VMs. You can use self-signed CA certificates or certificates signed by an external CA vendor.
System Manager

1. If this is the first S3 SnapMirror relationship for this storage VM, verify that root user keys exist for both source and destination storage VMs and regenerate them if they do not:
   a. Click Storage > Storage VMs and then select the storage VM.
   b. In the Settings tab, click in the S3 tile.
   c. In the Users tab, verify that there is an access key for the root user.
   d. If there is not, click next to root, then click Regenerate Key. Do not regenerate the key if one already exists.

2. Edit the storage VM to add users, and to add users to groups, in both the source and destination storage VMs:
   Click Storage > storage VMs, click the storage VM, click Settings and then click under S3.

   See Add S3 users and groups for more information.

3. Create an S3 SnapMirror policy if you don’t have an existing one and you don’t want to use the default policy:
   a. Click Protection > Overview, and then click Local Policy Settings.
   b. Click next to Protection Policies, then click Add.
      ▪ Enter the policy name and description.
      ▪ Select the policy scope, cluster or SVM
      ▪ Select Continuous for S3 SnapMirror relationships.
      ▪ Enter your Throttle and Recovery Point Objective values.

4. Create a bucket with SnapMirror protection:
   a. Click Storage > Buckets then click Add.
   b. Enter a name, select the storage VM, enter a size, then click More Options.
   c. Under Permissions, click Add. Verifying permissions is optional but recommended.
      ▪ Principal and Effect - select values corresponding to your user group settings, or accept the defaults.
      ▪ Actions - make sure the following values are shown:

      GetObject, PutObject, DeleteObject, ListBucket, GetBucketAcl, GetObjectAcl, ListBucketMultipartUploads, ListMultipartUploadParts

      ▪ Resources - use the defaults (bucketname, bucketname/*) or other values you need

      See Manage user access to buckets for more information about these fields.
   d. Under Protection, check Enable SnapMirror (ONTAP or Cloud). Then enter the following values:
      ▪ Destination
         ▪ TARGET: ONTAP System
         ▪ CLUSTER: Select the local cluster.
• **STORAGE VM**: Select a storage VM on the local cluster.
• **S3 SERVER CA CERTIFICATE**: Copy and paste the contents of the source certificate.

  • Source
  • **S3 SERVER CA CERTIFICATE**: Copy and paste the contents of the destination certificate.

5. Check **Use the same certificate on the destination** if you are using a certificate signed by an external CA vendor.

6. If you click **Destination Settings**, you can also enter your own values in place of the defaults for bucket name, capacity, and performance service level.

7. Click **Save**. A new bucket is created in the source storage VM, and it is mirrored to a new bucket that is created the destination storage VM.

**Back up locked buckets**
Beginning with ONTAP 9.14.1, you can back up locked S3 buckets and restore them as required.

When defining the protection settings for a new or existing bucket, you can enable object locking on destination buckets, provided that the source and destination clusters run ONTAP 9.14.1 or later, and that object locking is enabled on the source bucket. The object locking mode and lock retention tenure of the source bucket become applicable for the replicated objects on the destination bucket. You can also define a different lock retention period for the destination bucket in the **Destination Settings** section. This retention period is also applied to any non-locked objects replicated from the source bucket and S3 interfaces.

For information about how to enable object locking on a bucket, see **Create a bucket**.

**CLI**

1. If this is the first S3 SnapMirror relationship for this SVM, verify that root user keys exist for both source and destination SVMs and regenerate them if they do not:

   ```
   vserver object-store-server user show
   ```

   Verify that there is an access key for the root user. If there is not, enter:

   ```
   vserver object-store-server user regenerate-keys -vserver svm_name -user root
   ```

   Do not regenerate the key if one already exists.

2. Create buckets in both the source and destination SVMs:

   ```
   vserver object-store-server bucket create -vserver svm_name -bucket bucket_name [-size integer[KB|MB|GB|TB|PB]] [-comment text] [additional_options]
   ```

3. Add access rules to the default bucket policies in both the source and destination SVMs:

   ```
   vserver object-store-server bucket policy add-statement -vserver svm_name -bucket bucket_name -effect {allow|deny} -action object_store_actions -principal user_and_group_names -resource object_store_resources [-sid text] [-index integer]
   ```
4. Create an S3 SnapMirror policy if you don’t have an existing one and you don’t want to use the default policy:

```
src_cluster::> snapmirror policy create -vserver svm_name -policy policy_name -type continuous [-rpo integer] [-throttle throttle_type] [-comment text] [additional_options]
```

Parameters:

- `continuous` – the only policy type for S3 SnapMirror relationships (required).
- `-rpo` – specifies the time for recovery point objective, in seconds (optional).
- `-throttle` – specifies the upper limit on throughput/bandwidth, in kilobytes/seconds (optional).

**Example**

```
src_cluster::> snapmirror policy create -vserver vs0 -type continuous -rpo 0 -policy test-policy
```

5. Install CA server certificates on the admin SVM:

   a. Install the CA certificate that signed the source S3 server’s certificate on the admin SVM:

```
security certificate install -type server-ca -vserver admin_svm -cert -name src_server_certificate
```

   b. Install the CA certificate that signed the destination S3 server’s certificate on the admin SVM:

```
security certificate install -type server-ca -vserver admin_svm -cert -name dest_server_certificate
```

   If you are using a certificate signed by an external CA vendor, you only need to install this certificate on the admin SVM.

   See the `security certificate install` man page for details.

6. Create an S3 SnapMirror relationship:

```
snapmirror create -source-path src_svm_name:/bucket/bucket_name -destination-path dest_peer_svm_name:/bucket/bucket_name, ...} [-policy policy_name]
```

You can use a policy you created or accept the default.
Create a mirror relationship for an existing bucket (local cluster)

You can begin protecting existing S3 buckets on the same cluster at any time; for example, if you upgraded an S3 configuration from a release earlier than ONTAP 9.10.1. You can mirror data to a bucket in a different storage VM or the same storage VM as the source.

Before you begin

- Requirements for ONTAP versions, licensing, and S3 server configuration have been completed.
- A peering relationship exists between source and destination storage VMs.
- CA Certificates are needed for the source and destination VMs. You can use self-signed CA certificates or certificates signed by an external CA vendor.

Example

```bash
src_cluster::> snapmirror create -source-path vs0-src:/bucket/test-bucket -destination-path vs1-dest:/vs1/bucket/test-bucket-mirror -policy test-policy
```

7. Verify that mirroring is active:

```bash
snapmirror show -policy-type continuous -fields status
```
System Manager

1. If this is the first S3 SnapMirror relationship for this storage VM, verify that root user keys exist for both source and destination storage VMs and regenerate them if they do not:
   a. Click Storage > Storage VMs and then select the storage VM.
   b. In the Settings tab, click in the S3 tile.
   c. In the Users tab, verify that there is an access key for the root user.
   d. If there is not, click next to root, then click Regenerate Key. Do not regenerate the key if one already exists.

2. Verify that user and group access is correct in both the source and destination storage VMs:
   ◦ Click Storage > storage VMs, click the storage VM, click Settings and then click under S3.
     See Add S3 users and groups for more information.

3. Create an S3 SnapMirror policy if you don’t have an existing one and you don’t want to use the default policy:
   a. Click Protection > Overview, and then click Local Policy Setting.
   b. Click next to Protection Policies, then click Add.
      ▪ Enter the policy name and description.
      ▪ Select the policy scope, cluster or SVM
      ▪ Select Continuous for S3 Snapmirror relationships.
      ▪ Enter your Throttle and Recovery Point Objective values.

4. Verify that the bucket access policy of the existing bucket continues to meet your needs:
   a. Click Storage > Buckets and then select the bucket you want to protect.
   b. In the Permissions tab, click Edit, then click Add under Permissions.
      ▪ Principal and Effect - select values corresponding to your user group settings, or accept the defaults.
      ▪ Actions - make sure the following values are shown:
        GetObject, PutObject, DeleteObject, ListBucket, GetBucketAcl, GetObjectAcl, ListBucketMultipartUploads, ListMultipartUploadParts
      ▪ Resources - use the defaults (bucketname, bucketname/*) or other values you need.
        See Manage user access to buckets for more information about these fields.

5. Protect an existing bucket with S3 SnapMirror:
   a. Click Storage > Buckets and then select the bucket you want to protect.
   b. Click Protect and enter the following values:
      ▪ Destination
        ▪ TARGET: ONTAP System
        ▪ CLUSTER: Select the local cluster.
• **STORAGE VM**: Select the same or a different storage VM.

• **S3 SERVER CA CERTIFICATE**: Copy and paste the contents of the *source* certificate.

  • Source

  • **S3 SERVER CA CERTIFICATE**: Copy and paste the contents of the *destination* certificate.

6. Check **Use the same certificate on the destination** if you are using a certificate signed by an external CA vendor.

7. If you click **Destination Settings**, you can also enter your own values in place of the defaults for bucket name, capacity, and performance service level.

8. Click **Save**. The existing bucket is mirrored to a new bucket in the destination storage VM.

**Back up locked buckets**

Beginning with ONTAP 9.14.1, you can back up locked S3 buckets and restore them as required.

When defining the protection settings for a new or existing bucket, you can enable object locking on destination buckets, provided that the source and destination clusters run ONTAP 9.14.1 or later, and that object locking is enabled on the source bucket. The object locking mode and lock retention tenure of the source bucket become applicable for the replicated objects on the destination bucket. You can also define a different lock retention period for the destination bucket in the **Destination Settings** section. This retention period is also applied to any non-locked objects replicated from the source bucket and S3 interfaces.

For information about how to enable object locking on a bucket, see [Create a bucket](#).

**CLI**

1. If this is the first S3 SnapMirror relationship for this SVM, verify that root user keys exist for both source and destination SVMs and regenerate them if they do not:

   ```bash
   vserver object-store-server user show
   ```

   Verify that there is an access key for the root user. If there is not, enter:

   ```bash
   vserver object-store-server user regenerate-keys -vserver svm_name -user root
   ```

   Do not regenerate the key if one already exists.

2. Create a bucket on the destination SVM to be the mirror target:

   ```bash
   vserver object-store-server bucket create -vserver svm_name -bucket dest_bucket_name [-size integer[KB|MB|GB|TB|PB]] [-comment text] [additional_options]
   ```

3. Verify that the access rules to the default bucket policies are correct in both the source and destination SVMs:

   ```bash
   vserver object-store-server bucket policy add-statement -vserver svm_name -bucket bucket_name -effect {allow|deny} -action object_store_actions -principal user_and_group_names -resource object_store_resources [-sid text] [-index integer]`
   ```
4. Create an S3 SnapMirror policy if you don’t have an existing one and you don’t want to use the default policy:

   snapmirror policy create -vserver svm_name -policy policy_name -type continuous [-rpo _integer] [-throttle throttle_type] [-comment text] [additional_options]

Parameters:

- `continuous` – the only policy type for S3 SnapMirror relationships (required).
- `-rpo` – specifies the time for recovery point objective, in seconds (optional).
- `-throttle` – specifies the upper limit on throughput/bandwidth, in kilobytes/seconds (optional).

Example

   clusterA::> snapmirror policy create -vserver vs0 -type continuous -rpo 0 -policy test-policy

5. Install CA server certificates on the admin SVM:

   a. Install the CA certificate that signed the source S3 server’s certificate on the admin SVM:

      security certificate install -type server-ca -vserver admin_svm -cert -name src_server_certificate

   b. Install the CA certificate that signed the destination S3 server’s certificate on the admin SVM:

      security certificate install -type server-ca -vserver admin_svm -cert -name dest_server_certificate

   If you are using a certificate signed by an external CA vendor, you only need to install this certificate on the admin SVM.

      See the security certificate install man page for details.

6. Create an S3 SnapMirror relationship:

   snapmirror create -source-path src_svm_name:/bucket/bucket_name -destination-path dest_peer_svm_name:/bucket/bucket_name, …} [-policy policy_name]

   You can use a policy you created or accept the default.
Takeover and serve data from the destination bucket (local cluster)

If the data in a source bucket becomes unavailable, you can break the SnapMirror relationship to make the destination bucket writable and begin serving data.

About this task
When a takeover operation is performed, source bucket is converted to read-only and original destination bucket is converted to read-write, thereby reversing the S3 SnapMirror relationship.

When the disabled source bucket is available again, S3 SnapMirror automatically resynchronizes the contents of the two buckets. You don’t need to explicitly resynchronize the relationship, as is required for standard volume SnapMirror deployments.

If the destination bucket is on a remote cluster, the takeover operation must be initiated from the remote cluster.

System Manager
Failover from the unavailable bucket and begin serving data:

1. Click Protection > Relationships, then select S3 SnapMirror.
2. Click ☰, select Failover, then click Failover.

CLI
1. Initiate a failover operation for the destination bucket:
   `snapmirror failover start -destination-path svm_name:/bucket/bucket_name`
2. Verify the status of the failover operation:
   `snapmirror show -fields status`

Example
`clusterA::> snapmirror failover start -destination-path vs1:/bucket/test-bucket-mirror`
Restore a bucket from the destination storage VM (local cluster)

When data in a source bucket is lost or corrupted, you can repopulate your data by restoring objects from a destination bucket.

**About this task**

You can restore the destination bucket to an existing bucket or a new bucket. The target bucket for the restore operation must be larger than the destination bucket's logical used space.

If you use an existing bucket, it must be empty when starting a restore operation. Restore does not "roll back" a bucket in time; rather, it populates an empty bucket with its previous contents.

The restore operation must be initiated from the local cluster.
System Manager
Restore the back-up data:

1. Click Protection > Relationships, then select the bucket.
2. Click Restore and then select Restore.
3. Under Source, select Existing Bucket (the default) or New Bucket.
   - To restore to an Existing Bucket (the default), complete these actions:
     1. Select the cluster and storage VM to search for the existing bucket.
     2. Select the existing bucket.
4. Copy and paste the contents of the destination S3 server CA certificate.
   - To restore to a New Bucket, enter the following values:
     1. The cluster and storage VM to host the new bucket.
     2. The new bucket’s name, capacity, and performance service level. See Storage service levels for more information.
     3. The contents of the destination S3 server CA certificate.
5. Under Destination, copy and paste the contents of the source S3 server CA certificate.
6. Click Protection > Relationships to monitor the restore progress.

Restore locked buckets
Beginning with ONTAP 9.14.1, you can back up locked buckets and restore them as needed.

You can restore an object-locked bucket to a new or existing bucket. You can select an object-locked bucket as the destination in the following scenarios:

- **Restore to a new bucket**: When object locking is enabled, a bucket can be restored by creating a bucket that also has object locking enabled. When you restore a locked bucket, the object locking mode and retention period of the original bucket are replicated. You can also define a different lock retention period for the new bucket. This retention period is applied to non-locked objects from other sources.

- **Restore to an existing bucket**: An object-locked bucket can be restored to an existing bucket, as long as versioning and a similar object-locking mode are enabled on the existing bucket. The retention tenure of the original bucket is maintained.

- **Restore non-locked bucket**: Even if object locking is not enabled on a bucket, you can restore it to a bucket that has object locking enabled and is on the source cluster. When you restore the bucket, all the non-locked objects become locked, and the retention mode and tenure of the destination bucket become applicable to them.

CLI
1. If you are restoring objects to a new bucket, create the new bucket. For more information, see Create a backup relationship for a new bucket (cloud target).
2. Initiate a restore operation for the destination bucket:
   ```bash
   snapmirror restore -source-path svm_name:/bucket/bucket_name -destination -path svm_name:/bucket/bucket_name
   ```
Example

clusterA:~> snapmirror restore -source-path vs0:/bucket/test-bucket
       -destination-path vs1:/bucket/test-bucket-mirror
