Performing application-defined restore operations

If you are using VMware, KVM, and Xen plug-ins, you can perform application-defined restore operations by using the Snap Creator GUI.

In certain VMware environments, restore operations can take a long time. In such cases, you can either use the Snap Creator CLI or set up two agents: one for backup and the other for restore.

VMware restore operations using the GUI are supported only for Snap Creator Agent.

1. From the Snap Creator GUI main menu, select **Management > Configurations**.
2. From the **Configurations** tab, in the Profiles and Configuration pane, select the configuration file.
3. Select **Action > Restore**.

The Application Defined Restore dialog box is displayed in the right pane.

4. Enter the restore details and click **OK**:

A screenshot of a dialog box titled "Restore". The dialog box has a title bar with a close button (X) in the top right corner. Below the title bar is a section titled "Application Defined Restore". Inside this section, there are two radio buttons: "Snap Creator Snapshot Copies" (which is selected) and "All Snapshot Copies". Below the radio buttons are two dropdown menus: "Snapshot copy Policy:" and "Snapshot Copy Name:". At the bottom left of the dialog box is a checkbox labeled "Add/Override Parameters". At the bottom center are two buttons: "Ok" and "Cancel".
