Connecting Snapshot copies on mirrored storage systems

In the case of a Snapshot copy on a mirrored storage system, you can connect the Snapshot copy on the source storage system and the destination system.

When you create a Snapshot copy on a mirrored storage system, the Snapshot copy is automatically replicated, from the source system where it is created, to the destination (mirrored) storage system. SnapDrive for UNIX allows you to connect the Snapshot copy on the source storage system. You can also connect the Snapshot copy on the destination storage system.

Connecting multiple storage entities

You can connect a Snapshot copy containing multiple storage entities.

To connect a Snapshot copy that contains storage entities that reside on multiple destination storage systems you must meet the following requirements:

- The storage entities you specify at the command prompt must reside on a single storage system, or on a HA pair.
- The name of the volume of the source storage system must match the name of the volume of the destination storage system.
- You must set the `snapmirror-dest-multiple-filevolumes-enabled` variable in the `snapdrive.conf` file to “on”.

You can use one command to connect storage entities that reside on a single storage system or on a HA pair.
