Considerations for performing data protection 1

Considerations for performing data protection

You must be aware of certain considerations for performing data protection.

- To perform clone or restore operations from secondary systems, you must mount the destination volume in the namespace and export it properly.
- You must disable the SnapDrive configuration parameter `check-export-permission-nfs-clone` by setting the value to off.

The SnapDrive for UNIX documentation on the NetApp Support Site contains additional information about the `check-export-permission-nfs-clone` parameter.

- You must configure the SnapMirror relationship for the requested secondary storage volumes in the secondary storage system.
- You must configure the SnapVault relationship for the requested secondary storage qtrees in the secondary storage system for Data ONTAP operating in 7-Mode.
- You must define a policy and rules for the user-defined SnapMirror label if you are using SnapVault post-script for clustered Data ONTAP.

SnapVault post-script supports clustered Data ONTAP volumes and the SnapMirror relation types DP and XDP. The ONTAP documentation on the NetApp Support Site contains information about configuring SnapMirror and SnapVault.

- In NAS environments, you must configure the primary and secondary NAS data path by using the `snapdrive config set -mgmtpath management_pathmanagement_pathmanagement_pathdatapath_path` command.

For example, `snapdrive config set -mgmtpath f3050-197-91 f3050-197-91 f3050-197-91 f3050-220-91`, where `f3050-197-91` is the management path and `f3050-220-91` is the data path.
