Cloning databases and using custom plug-in scripts 1

Cloning databases and using custom plug-in scripts

SnapManager provides a method for using your custom scripts before and after a clone operation occurs. For example, you might have created a custom script that validates a clone database SID and ensures the SID is allowed by your naming policy. Using the SnapManager clone plug-in, you can include your custom scripts and have them run automatically before or after a SnapManager clone operation.

1. View sample plug-in scripts.
2. Create a script from scratch or modify one of the sample plug-in scripts.

Create your custom script according to SnapManager plug-in script guidelines.

3. Place your custom script in a specified directory location.
4. Update the clone specification XML file and include information about your custom script that should be used during the cloning process.
5. Using a SnapManager command, verify that the custom scripts are operational.
6. When you initiate the clone operation, include the script name and optional parameters.
