# Audit log file format

The audit log files are found on every Admin Node and contain a collection of individual audit messages.

Each audit message contains the following:

- The Coordinated Universal Time (UTC) of the event that triggered the audit message (ATIM) in ISO 8601 format, followed by a space:

*YYYY-MM-DDTHH:MM:SS.UUUUUU*, where *UUUUUU* are microseconds.

- The audit message itself, enclosed within square brackets and beginning with `AUDT`.

The following example shows three audit messages in an audit log file (line breaks added for readability). These messages were generated when a tenant created an S3 bucket and added two objects to that bucket.

2019-08-07T18:43:30.247711

```

In their default format, the audit messages in the audit log files are not easy to read or interpret. You can use the `audit-explain` tool to obtain simplified summaries of the audit messages in the audit log. You can use the `audit-sum` tool to summarize how many write, read, and delete operations were logged and how long these operations took.

### Related information

[Use audit-explain tool](#)

[Use audit-sum tool](#)

# Use audit-explain tool

You can use the `audit-explain` tool to translate the audit messages in the audit log into an easy-to-read format.

## What you'll need

- You must have specific access permissions.
- You must have the `Passwords.txt` file.
- You must know the IP address of the primary Admin Node.

## About this task

The `audit-explain` tool, available on the primary Admin Node, provides simplified summaries of the audit messages in an audit log.

The `audit-explain` tool is primarily intended for use by technical support during troubleshooting operations. Processing `audit-explain` queries can consume a large amount of CPU power, which might impact StorageGRID operations.

This example shows typical output from the `audit-explain` tool. These four SPUT audit messages were generated when the S3 tenant with account ID 92484777680322627870 used S3 PUT requests to create a bucket named "bucket1" and add three objects to that bucket.

```
SPUT S3 PUT bucket bucket1 account:92484777680322627870 usec:124673
SPUT S3 PUT object bucket1/part1.txt tenant:92484777680322627870
cbid:9DCB157394F99FE5 usec:101485
SPUT S3 PUT object bucket1/part2.txt tenant:92484777680322627870
cbid:3CFBB07AB3D32CA9 usec:102804
SPUT S3 PUT object bucket1/part3.txt tenant:92484777680322627870
cbid:5373D73831ECC743 usec:93874
```

The `audit-explain` tool can process plain or compressed audit logs. For example:

```
audit-explain audit.log
```

```
audit-explain 2019-08-12.txt.gz
```

The `audit-explain` tool can also process multiple files at once. For example:

```
audit-explain audit.log 2019-08-12.txt.gz 2019-08-13.txt.gz
```

```
audit-explain /var/local/audit/export/*
```

Finally, the `audit-explain` tool can accept input from a pipe, which allows you to filter and preprocess the input using the `grep` command or other means. For example:

```
grep SPUT audit.log | audit-explain
```

```
grep bucket-name audit.log | audit-explain
```

Since audit logs can be very large and slow to parse, you can save time by filtering parts that you want to look at and running `audit-explain` on the parts, instead of the entire file.

The `audit-explain` tool does not accept compressed files as piped input. To process compressed files, provide their file names as command-line arguments, or use the `zcat` tool to decompress the files first. For example:

```
zcat audit.log.gz | audit-explain
```

Use the `help` (`-h`) option to see the available options. For example:

```
$ audit-explain -h
```

## Steps

1. Log in to the primary Admin Node:
  - a. Enter the following command: `ssh admin@primary_Admin_Node_IP`
  - b. Enter the password listed in the `Passwords.txt` file.
2. Enter the following command, where `/var/local/audit/export/audit.log` represents the name and the location of the file or files you want to analyze:

```
$ audit-explain /var/local/audit/export/audit.log
```

The `audit-explain` tool prints human-readable interpretations of all messages in the specified file or files.

To reduce line lengths and to aid readability, timestamps are not shown by default. If you want to see the timestamps, use the `timestamp` (`-t`) option.

[SPUT: S3 PUT](#)

## Use audit-sum tool

You can use the `audit-sum` tool to count the write, read, head, and delete audit messages and to see the minimum, maximum, and average time (or size) for each

operation type.

### What you'll need

- You must have specific access permissions.
- You must have the `Passwords.txt` file.
- You must know the IP address of the primary Admin Node.

### About this task

The `audit-sum` tool, available on the primary Admin Node, summarizes how many write, read, and delete operations were logged and how long these operations took.

The `audit-sum` tool is primarily intended for use by technical support during troubleshooting operations. Processing `audit-sum` queries can consume a large amount of CPU power, which might impact StorageGRID operations.

This example shows typical output from the `audit-sum` tool. This example shows how long protocol operations took.

```
message group          count      min(sec)      max(sec)
average(sec)
=====
=====
IDEL                   274
SDEL                   213371      0.004         20.934
0.352
SGET                   201906      0.010         1740.290
1.132
SHEA                   22716       0.005         2.349
0.272
SPUT                   1771398     0.011         1770.563
0.487
```

The `audit-sum` tool provides counts and times for the following S3, Swift, and ILM audit messages in an audit log:

| Code | Description   | Refer to   |
|------|---|--|
| ARCT | Archive Retrieve from Cloud-Tier  | <a href="#">ARCT: Archive Retrieve from Cloud-Tier</a> |
| ASCT | Archive Store Cloud-Tier  | <a href="#">ASCT: Archive Store Cloud-Tier</a>         |
| IDEL | ILM Initiated Delete: Logs when ILM starts the process of deleting an object. | <a href="#">IDEL: ILM Initiated Delete</a>             |
| SDEL | S3 DELETE: Logs a successful transaction to delete an object or bucket.       | <a href="#">SDEL: S3 DELETE</a>                        |

| Code | Description  | Refer to                           |
|------|--|------------------------------------|
| SGET | S3 GET: Logs a successful transaction to retrieve an object or list the objects in a bucket.       | <a href="#">SGET: S3 GET</a>       |
| SHEA | S3 HEAD: Logs a successful transaction to check for the existence of an object or bucket.          | <a href="#">SHEA: S3 HEAD</a>      |
| SPUT | S3 PUT: Logs a successful transaction to create a new object or bucket.                            | <a href="#">SPUT: S3 PUT</a>       |
| WDEL | Swift DELETE: Logs a successful transaction to delete an object or container.                      | <a href="#">WDEL: Swift DELETE</a> |
| WGET | Swift GET: Logs a successful transaction to retrieve an object or list the objects in a container. | <a href="#">WGET: Swift GET</a>    |
| WHEA | Swift HEAD: Logs a successful transaction to check for the existence of an object or container.    | <a href="#">WHEA: Swift HEAD</a>   |
| WPUT | Swift PUT: Logs a successful transaction to create a new object or container.                      | <a href="#">WPUT: Swift PUT</a>    |

The `audit-sum` tool can process plain or compressed audit logs. For example:

```
audit-sum audit.log
```

```
audit-sum 2019-08-12.txt.gz
```

The `audit-sum` tool can also process multiple files at once. For example:

```
audit-sum audit.log 2019-08-12.txt.gz 2019-08-13.txt.gz
```

```
audit-sum /var/local/audit/export/*
```

Finally, the `audit-sum` tool can also accept input from a pipe, which allows you to filter and preprocess the input using the `grep` command or other means. For example:

```
grep WGET audit.log | audit-sum
```

```
grep bucket1 audit.log | audit-sum
```

```
grep SPUT audit.log | grep bucket1 | audit-sum
```

This tool does not accept compressed files as piped input. To process compressed files, provide their file names as command-line arguments, or use the `zcat` tool to decompress the files first. For example:

```
audit-sum audit.log.gz
```

```
zcat audit.log.gz | audit-sum
```

You can use command-line options to summarize operations on buckets separately from operations on objects or to group message summaries by bucket name, by time period, or by target type. By default, the summaries show the minimum, maximum, and average operation time, but you can use the `size (-s)` option to look at object size instead.

Use the `help (-h)` option to see the available options. For example:

```
$ audit-sum -h
```

## Steps

1. Log in to the primary Admin Node:
  - a. Enter the following command: `ssh admin@primary_Admin_Node_IP`
  - b. Enter the password listed in the `Passwords.txt` file.
2. If you want to analyze all messages related to write, read, head, and delete operations, follow these steps:
  - a. Enter the following command, where `/var/local/audit/export/audit.log` represents the name and the location of the file or files you want to analyze:

```
$ audit-sum /var/local/audit/export/audit.log
```

This example shows typical output from the `audit-sum` tool. This example shows how long protocol operations took.

| message group | count   | min(sec) | max(sec) |
|---------------|---------|----------|----------|
| average(sec)  |         |          |          |
| =====         | =====   | =====    | =====    |
| =====         |         |          |          |
| IDEL          | 274     |          |          |
| SDEL          | 213371  | 0.004    | 20.934   |
| 0.352         |         |          |          |
| SGET          | 201906  | 0.010    | 1740.290 |
| 1.132         |         |          |          |
| SHEA          | 22716   | 0.005    | 2.349    |
| 0.272         |         |          |          |
| SPUT          | 1771398 | 0.011    | 1770.563 |
| 0.487         |         |          |          |

In this example, SGET (S3 GET) operations are the slowest on average at 1.13 seconds, but SGET and SPUT (S3 PUT) operations both show long worst-case times of about 1,770 seconds.

- b. To show the slowest 10 retrieval operations, use the `grep` command to select only SGET messages and add the long output option (`-l`) to include object paths: `grep SGET audit.log | audit-sum -l`

The results include the type (object or bucket) and path, which allows you to `grep` the audit log for other messages relating to these particular objects.

```

Total:          201906 operations
Slowest:       1740.290 sec
Average:       1.132 sec
Fastest:       0.010 sec
Slowest operations:
  time(usec)      source ip          type          size(B) path
  =====
1740289662    10.96.101.125    object      5663711385
backup/r9010aQ8JB-1566861764-4519.iso
1624414429    10.96.101.125    object      5375001556

70839        10.96.101.125    object        28338
bucket3/dat.1566861764-6619
68487        10.96.101.125    object        27890
bucket3/dat.1566861764-6615
67798        10.96.101.125    object        27671
bucket5/dat.1566861764-6617
67027        10.96.101.125    object        27230
bucket5/dat.1566861764-4517
60922        10.96.101.125    object        26118
bucket3/dat.1566861764-4520
35588        10.96.101.125    object        11311
bucket3/dat.1566861764-6616
23897        10.96.101.125    object        10692
bucket3/dat.1566861764-4516

```

From this example output, you can see that the three slowest S3 GET requests were for objects about 5 GB in size, which is much larger than the other objects. The large size accounts for the slow worst-case retrieval times.

3. If you want to determine what sizes of objects are being ingested into and retrieved from your grid, use the size option (-s):

```
audit-sum -s audit.log
```

| message group | count   | min (MB) | max (MB) |
|---------------|---------|----------|----------|
| average (MB)  |         |          |          |
| =====         | =====   | =====    | =====    |
| =====         |         |          |          |
| IDEL          | 274     | 0.004    | 5000.000 |
| 1654.502      |         |          |          |
| SDEL          | 213371  | 0.000    | 10.504   |
| 1.695         |         |          |          |
| SGET          | 201906  | 0.000    | 5000.000 |
| 14.920        |         |          |          |
| SHEA          | 22716   | 0.001    | 10.504   |
| 2.967         |         |          |          |
| SPUT          | 1771398 | 0.000    | 5000.000 |
| 2.495         |         |          |          |

In this example, the average object size for SPUT is under 2.5 MB, but the average size for SGET is much larger. The number of SPUT messages is much higher than the number of SGET messages, indicating that most objects are never retrieved.

4. If you want to determine if retrievals were slow yesterday:

- a. Issue the command on the appropriate audit log and use the group-by-time option (-gt), followed by the time period (for example, 15M, 1H, 10S):

```
grep SGET audit.log | audit-sum -gt 1H
```

| message group<br>average(sec) | count   | min(sec) | max(sec) |
|-------------------------------|---------|----------|----------|
| =====                         | =====   | =====    | =====    |
| 2019-09-05T00<br>1.254        | 7591    | 0.010    | 1481.867 |
| 2019-09-05T01<br>1.115        | 4173    | 0.011    | 1740.290 |
| 2019-09-05T02<br>1.562        | 20142   | 0.011    | 1274.961 |
| 2019-09-05T03<br>1.254        | 57591   | 0.010    | 1383.867 |
| 2019-09-05T04<br>1.405        | 124171  | 0.013    | 1740.290 |
| 2019-09-05T05<br>1.562        | 420182  | 0.021    | 1274.511 |
| 2019-09-05T06<br>5.562        | 1220371 | 0.015    | 6274.961 |
| 2019-09-05T07<br>2.002        | 527142  | 0.011    | 1974.228 |
| 2019-09-05T08<br>1.105        | 384173  | 0.012    | 1740.290 |
| 2019-09-05T09<br>1.354        | 27591   | 0.010    | 1481.867 |

These results show that S3 GET traffic spiked between 06:00 and 07:00. The max and average times are both considerably higher at these times as well, and they did not ramp up gradually as the count increased. This suggests that capacity was exceeded somewhere, perhaps in the network or in the grid's ability to process requests.

- b. To determine what size objects were being retrieved each hour yesterday, add the size option (-s) to the command:

```
grep SGET audit.log | audit-sum -gt 1H -s
```

| message group<br>average (B) | count   | min (B) | max (B)        |
|------------------------------|---------|---------|----------------|
| =====                        | =====   | =====   | =====          |
| 2019-09-05T00<br>1.976       | 7591    | 0.040   | 1481.867       |
| 2019-09-05T01<br>2.062       | 4173    | 0.043   | 1740.290       |
| 2019-09-05T02<br>2.303       | 20142   | 0.083   | 1274.961       |
| 2019-09-05T03<br>1.182       | 57591   | 0.912   | 1383.867       |
| 2019-09-05T04<br>1.528       | 124171  | 0.730   | 1740.290       |
| 2019-09-05T05<br>2.398       | 420182  | 0.875   | 4274.511       |
| 2019-09-05T06<br>51.328      | 1220371 | 0.691   | 5663711385.961 |
| 2019-09-05T07<br>2.147       | 527142  | 0.130   | 1974.228       |
| 2019-09-05T08<br>1.878       | 384173  | 0.625   | 1740.290       |
| 2019-09-05T09<br>1.354       | 27591   | 0.689   | 1481.867       |

These results indicate that some very large retrievals occurred when the overall retrieval traffic was at its maximum.

- c. To see more detail, use the `audit-explain` tool to review all the SGET operations during that hour:

```
grep 2019-09-05T06 audit.log | grep SGET | audit-explain | less
```

If the output of the `grep` command is expected to be many lines, add the `less` command to show the contents of the audit log file one page (one screen) at a time.

- 5. If you want to determine if SPUT operations on buckets are slower than SPUT operations for objects:
  - a. Start by using the `-go` option, which groups messages for object and bucket operations separately:

```
grep SPUT sample.log | audit-sum -go
```

| message group | count | min(sec) | max(sec) |
|---------------|-------|----------|----------|
| average(sec)  |       |          |          |
| =====         | ===== | =====    | =====    |
| =====         |       |          |          |
| SPUT.bucket   | 1     | 0.125    | 0.125    |
| 0.125         |       |          |          |
| SPUT.object   | 12    | 0.025    | 1.019    |
| 0.236         |       |          |          |

The results show that SPUT operations for buckets have different performance characteristics than SPUT operations for objects.

- b. To determine which buckets have the slowest SPUT operations, use the `-gb` option, which groups messages by bucket:

```
grep SPUT audit.log | audit-sum -gb
```

| message group           | count   | min(sec) | max(sec) |
|-------------------------|---------|----------|----------|
| average(sec)            |         |          |          |
| =====                   | =====   | =====    | =====    |
| =====                   |         |          |          |
| SPUT.cho-non-versioning | 71943   | 0.046    | 1770.563 |
| 1.571                   |         |          |          |
| SPUT.cho-versioning     | 54277   | 0.047    | 1736.633 |
| 1.415                   |         |          |          |
| SPUT.cho-west-region    | 80615   | 0.040    | 55.557   |
| 1.329                   |         |          |          |
| SPUT.ldt002             | 1564563 | 0.011    | 51.569   |
| 0.361                   |         |          |          |

- c. To determine which buckets have the largest SPUT object size, use both the `-gb` and the `-s` options:

```
grep SPUT audit.log | audit-sum -gb -s
```

| message group<br>average (B)      | count   | min (B) | max (B)  |
|-----------------------------------|---------|---------|----------|
| =====                             | =====   | =====   | =====    |
| SPUT.cho-non-versioning<br>21.672 | 71943   | 2.097   | 5000.000 |
| SPUT.cho-versioning<br>21.120     | 54277   | 2.097   | 5000.000 |
| SPUT.cho-west-region<br>14.433    | 80615   | 2.097   | 800.000  |
| SPUT.ldt002<br>0.352              | 1564563 | 0.000   | 999.972  |
