# **Install using Trident operator**

## Manually deploy the Trident operator (Standard mode)

You can manually deploy the Trident operator to install Astra Trident. This process applies to installations where the container images required by Astra Trident are not stored in a private registry. If you do have a private image registry, use the process for offline deployment.

#### Critical information about Astra Trident 23.07

You must read the following critical information about Astra Trident.

#### **Critical information about Astra Trident**

- Kubernetes 1.27 is now supported in Trident. Upgrade Trident prior to upgrading Kubernetes.
- Astra Trident strictly enforces the use of multipathing configuration in SAN environments, with a recommended value of find multipaths: no in multipath.conf file.

Use of non-multipathing configuration or use of find\_multipaths: yes or find\_multipaths: smart value in multipath.conf file will result in mount failures. Trident has recommended the use of find multipaths: no since the 21.07 release.

### Manually deploy the Trident operator and install Trident

Review the installation overview to ensure you've met installation prerequisites and selected the correct installation option for your environment.

#### Before you begin

Before you begin installation, log in to the Linux host and verify it is managing a working, supported Kubernetes cluster and that you have the necessary privileges.

With OpenShift, use oc instead of kubectl in all of the examples that follow, and log in as system:admin first by running oc login -u system:admin or oc login -u kubeadmin.

1. Verify your Kubernetes version:

```
kubectl version
```

2. Verify cluster administrator privileges:

```
kubectl auth can-i '*' '*' --all-namespaces
```

3. Verify you can launch a pod that uses an image from Docker Hub and reach your storage system over the pod network:

```
kubectl run -i --tty ping --image=busybox --restart=Never --rm -- \
   ping <management IP>
```

#### Step 1: Download the Trident installer package

The Astra Trident installer package contains everything you need to deploy the Trident operator and install Astra Trident. Download and extract the latest version of the Trident installer from the *Assets* section on GitHub.

```
wget https://github.com/NetApp/trident/releases/download/v23.07.1/trident-
installer-23.07.1.tar.gz
tar -xf trident-installer-23.07.1.tar.gz
cd trident-installer
```

#### Step 2: Create the TridentOrchestrator CRD

Create the TridentOrchestrator Custom Resource Definition (CRD). You will create a TridentOrchestrator Custom Resources later. Use the appropriate CRD YAML version in deploy/crds to create the TridentOrchestrator CRD.

```
kubectl create -f
deploy/crds/trident.netapp.io_tridentorchestrators_crd_post1.16.yaml
```

#### **Step 3: Deploy the Trident operator**

The Astra Trident installer provides a bundle file that can be used to install the operator and create associated objects. The bundle file is an easy way to deploy the operator and install Astra Trident using a default configuration.

• For clusters running Kubernetes 1.24 or earlier, use bundle pre 1 25.yaml.

• For clusters running Kubernetes 1.25 or later, use bundle post 1 25.yaml.

#### Before you begin

• By default, the Trident installer deploys the operator in the trident namespace. If the trident namespace does not exist, create it using:

```
kubectl apply -f deploy/namespace.yaml
```

- To deploy the operator in a namespace other than the trident namespace, update serviceaccount.yaml, clusterrolebinding.yaml and operator.yaml and generate your bundle file using the kustomization.yaml.
  - 1. Create the kustomization.yaml using the following command where <bur>
    bundle pre 1 25.yaml or bundle post 1 25.yaml based on your Kubernetes version.

```
cp deploy/kustomization_<bundle.yaml> deploy/kustomization.yaml
```

2. Compile the bundle using using the following command where <bur>
bundle pre 1 25.yaml or bundle post 1 25.yaml based on your Kubernetes version.

```
kubectl kustomize deploy/ > deploy/<bundle.yaml>
```

#### Steps

1. Create the resources and deploy the operator:

```
kubectl create -f deploy/<bundle.yaml>
```

2. Verify the operator, deployment, and replicasets were created.

```
kubectl get all -n <operator-namespace>
```

There should only be **one instance** of the operator in a Kubernetes cluster. Do not create multiple deployments of the Trident operator.

#### Step 4: Create the TridentOrchestrator and install Trident

You can now create the TridentOrchestrator and install Astra Trident. Optionally, you can customize your Trident installation using the attributes in the TridentOrchestrator spec.

```
kubectl create -f deploy/crds/tridentorchestrator cr.yaml
tridentorchestrator.trident.netapp.io/trident created
kubectl describe torc trident
           trident
Name:
Namespace:
Labels:
          <none>
Annotations: <none>
API Version: trident.netapp.io/v1
       TridentOrchestrator
Kind:
. . .
Spec:
 Debug:
          true
 Namespace: trident
Status:
 Current Installation Params:
                              false
   Autosupport Hostname:
   Autosupport Image:
                             netapp/trident-autosupport:23.07
   Autosupport Proxy:
   Autosupport Serial Number:
   Debug:
                              true
   Image Pull Secrets:
   Image Registry:
   k8sTimeout:
   Kubelet Dir:
                         /var/lib/kubelet
   Log Format:
                         text
   Silence Autosupport: false
   Trident Image: netapp/trident:23.07.1
 Message:
                           Trident installed Namespace:
trident
 Status:
                           Installed
 Version:
                           v23.07.1
Events:
   Type Reason Age From Message ---- -----Normal
   Installing 74s trident-operator.netapp.io Installing Trident Normal
    Installed 67s trident-operator.netapp.io Trident installed
```

## Verify the installation

There are several ways to verify your installation.

#### Using TridentOrchestrator status

The status of TridentOrchestrator indicates if the installation was successful and displays the version of Trident installed. During the installation, the status of TridentOrchestrator changes from Installing to Installed. If you observe the Failed status and the operator is unable to recover by itself, check the logs.

Status	Description
Installing	The operator is installing Astra Trident using this TridentOrchestrator CR.
Installed	Astra Trident has successfully installed.
Uninstalling	The operator is uninstalling Astra Trident, because spec.uninstall=true.
Uninstalled	Astra Trident is uninstalled.
Failed	The operator could not install, patch, update or uninstall Astra Trident; the operator will automatically try to recover from this state. If this state persists you will require troubleshooting.
Updating	The operator is updating an existing installation.
Error	The TridentOrchestrator is not used. Another one already exists.

#### Using pod creation status

You can confirm if the Astra Trident installation completed by reviewing the status of the created pods:

kubectl get pods -n trident			
NAME	READY	STATUS	RESTARTS
AGE	6.16	-	0
trident-controller-7d466bf5c7-v4cpw 1m	6/6	Running	0
trident-node-linux-mr6zc	2/2	Running	0
1m			
trident-node-linux-xrp7w	2/2	Running	0
1m	- /-		
trident-node-linux-zh2jt	2/2	Running	0
1m	1 /1	D	0
trident-operator-766f7b8658-ldzsv	1/1	Running	0
3m			

### **Using** tridentctl

You can use tridentctl to check the version of Astra Trident installed.

## Manually deploy the Trident operator (Offline mode)

You can manually deploy the Trident operator to install Astra Trident. This process applies to installations where the container images required by Astra Trident are stored in a private registry. If you do not have a private image registry, use the process for standard deployment.

#### Critical information about Astra Trident 23.07

You must read the following critical information about Astra Trident.

#### **Critical information about Astra Trident**

- Kubernetes 1.27 is now supported in Trident. Upgrade Trident prior to upgrading Kubernetes.
- Astra Trident strictly enforces the use of multipathing configuration in SAN environments, with a recommended value of find multipaths: no in multipath.conf file.

Use of non-multipathing configuration or use of find\_multipaths: yes or find\_multipaths: smart value in multipath.conf file will result in mount failures. Trident has recommended the use of find multipaths: no since the 21.07 release.

## Manually deploy the Trident operator and install Trident

Review the installation overview to ensure you've met installation prerequisites and selected the correct installation option for your environment.

#### Before you begin

Log in to the Linux host and verify it is managing a working and supported Kubernetes cluster and that you have the necessary privileges.

With OpenShift, use oc instead of kubectl in all of the examples that follow, and log in as system:admin first by running oc login -u system:admin or oc login -u kubeadmin.

1. Verify your Kubernetes version:

```
kubectl version
```

2. Verify cluster administrator privileges:

```
kubectl auth can-i '*' '*' --all-namespaces
```

3. Verify you can launch a pod that uses an image from Docker Hub and reach your storage system over the pod network:

```
kubectl run -i --tty ping --image=busybox --restart=Never --rm -- \
   ping <management IP>
```

#### Step 1: Download the Trident installer package

The Astra Trident installer package contains everything you need to deploy the Trident operator and install Astra Trident. Download and extract the latest version of the Trident installer from the *Assets* section on GitHub.

```
wget https://github.com/NetApp/trident/releases/download/v23.07.1/trident-
installer-23.07.1.tar.gz
tar -xf trident-installer-23.07.1.tar.gz
cd trident-installer
```

#### Step 2: Create the TridentOrchestrator CRD

Create the TridentOrchestrator Custom Resource Definition (CRD). You will create a TridentOrchestrator Custom Resources later. Use the appropriate CRD YAML version in deploy/crds to create the TridentOrchestrator CRD:

```
kubectl create -f deploy/crds/<VERSION>.yaml
```

#### Step 3: Update the registry location in the operator

In /deploy/operator.yaml, update image: docker.io/netapp/trident-operator:23.07.1 to reflect the location of your image registry. Your Trident and CSI images can be located in one registry or different registries, but all CSI images must be located in the same registry. For example:

• image: <your-registry>/trident-operator:23.07.1 if your images are all located in one registry.

• image: <your-registry>/netapp/trident-operator:23.07.1 if your Trident image is located in a different registry from your CSI images.

#### **Step 4: Deploy the Trident operator**

The Astra Trident installer provides a bundle file that can be used to install the operator and create associated objects. The bundle file is an easy way to deploy the operator and install Astra Trident using a default configuration.

- For clusters running Kubernetes 1.24 or earlier, use bundle pre 1 25.yaml.
- For clusters running Kubernetes 1.25 or later, use bundle post 1 25.yaml.

#### Before you begin

• By default, the Trident installer deploys the operator in the trident namespace. If the trident namespace does not exist, create it using:

```
kubectl apply -f deploy/namespace.yaml
```

- To deploy the operator in a namespace other than the trident namespace, update serviceaccount.yaml, clusterrolebinding.yaml and operator.yaml and generate your bundle file using the kustomization.yaml.
  - 1. Create the kustomization.yaml using the following command where <bur>
    bundle pre 1 25.yaml or bundle post 1 25.yaml based on your Kubernetes version.

```
cp deploy/kustomization_<bundle.yaml> deploy/kustomization.yaml
```

2. Compile the bundle using using the following command where <bur>
bundle.yaml> is</pr>
bundle pre 1 25.yaml or bundle post 1 25.yaml based on your Kubernetes version.

```
kubectl kustomize deploy/ > deploy/<bundle.yaml>
```

#### Steps

1. Create the resources and deploy the operator:

```
kubectl create -f deploy/<bundle.yaml>
```

2. Verify the operator, deployment, and replicasets were created.

```
kubectl get all -n <operator-namespace>
```

There should only be **one instance** of the operator in a Kubernetes cluster. Do not create multiple deployments of the Trident operator.

#### Step 5: Update the image registry location in the TridentOrchestrator

Your Trident and CSI images can be located in one registry or different registries, but all CSI images must be located in the same registry. Update <code>deploy/crds/tridentorchestrator\_cr.yaml</code> to add the additional location specs based on your registry configuration.

#### Images in one registry

```
imageRegistry: "<your-registry>"
autosupportImage: "<your-registry>/trident-autosupport:23.07"
tridentImage: "<your-registry>/trident:23.07.1"
```

#### Images in different registries

You must append sig-storage to the imageRegistry to use different registry locations.

```
imageRegistry: "<your-registry>/sig-storage"
autosupportImage: "<your-registry>/netapp/trident-autosupport:23.07"
tridentImage: "<your-registry>/netapp/trident:23.07.1"
```

### Step 6: Create the TridentOrchestrator and install Trident

You can now create the TridentOrchestrator and install Astra Trident. Optionally, you can further customize your Trident installation using the attributes in the TridentOrchestrator spec. The following example shows an installation where Trident and CSI images are located in different registries.

kubectl create -f deploy/crds/tridentorchestrator cr.yaml tridentorchestrator.trident.netapp.io/trident created kubectl describe torc trident trident Name: Namespace: <none> Labels: Annotations: <none> API Version: trident.netapp.io/v1 TridentOrchestrator Kind: . . . Spec: Autosupport Image: <pour-registry>/netapp/trident-autosupport:23.07 Debua: Image Registry: <your-registry>/sig-storage Namespace: trident Trident Image: <your-registry>/netapp/trident:23.07.1 Status: Current Installation Params: IPv6: false Autosupport Hostname: Autosupport Image: <your-registry>/netapp/tridentautosupport:23.07 Autosupport Proxy: Autosupport Serial Number: Debug: true Http Request Timeout: 90s Image Pull Secrets: Image Registry: <your-registry>/sig-storage k8sTimeout: 30 Kubelet Dir: /var/lib/kubelet Log Format: text Probe Port: 17546 Silence Autosupport: false Trident Image: <your-registry>/netapp/trident:23.07.1 Trident installed Message: trident Namespace: Status: Installed Version: v23.07.1 Events: Type Reason Age From Message ---- ---- ---- Normal Installing 74s trident-operator.netapp.io Installing Trident Normal Installed 67s trident-operator.netapp.io Trident installed

## Verify the installation

There are several ways to verify your installation.

#### Using TridentOrchestrator status

The status of TridentOrchestrator indicates if the installation was successful and displays the version of Trident installed. During the installation, the status of TridentOrchestrator changes from Installing to Installed. If you observe the Failed status and the operator is unable to recover by itself, check the logs.

Status	Description
Installing	The operator is installing Astra Trident using this TridentOrchestrator CR.
Installed	Astra Trident has successfully installed.
Uninstalling	The operator is uninstalling Astra Trident, because spec.uninstall=true.
Uninstalled	Astra Trident is uninstalled.
Failed	The operator could not install, patch, update or uninstall Astra Trident; the operator will automatically try to recover from this state. If this state persists you will require troubleshooting.
Updating	The operator is updating an existing installation.
Error	The TridentOrchestrator is not used. Another one already exists.

#### Using pod creation status

You can confirm if the Astra Trident installation completed by reviewing the status of the created pods:

kubectl get pods -n trident			
NAME	READY	STATUS	RESTARTS
AGE			
trident-controller-7d466bf5c7-v4cpw	6/6	Running	0
1m			
trident-node-linux-mr6zc	2/2	Running	0
1m			
trident-node-linux-xrp7w	2/2	Running	0
1m			
trident-node-linux-zh2jt	2/2	Running	0
1m			
trident-operator-766f7b8658-ldzsv	1/1	Running	0
3m			

#### Using tridentctl

You can use tridentctl to check the version of Astra Trident installed.

## **Deploy Trident operator using Helm (Standard mode)**

You can deploy the Trident operator and install Astra Trident using Helm. This process applies to installations where the container images required by Astra Trident are not stored in a private registry. If you do have a private image registry, use the process for offline deployment.

#### Critical information about Astra Trident 23.07.1

You must read the following critical information about Astra Trident.

#### **Critical information about Astra Trident**

- Kubernetes 1.27 is now supported in Trident. Upgrade Trident prior to upgrading Kubernetes.
- Astra Trident strictly enforces the use of multipathing configuration in SAN environments, with a recommended value of find multipaths: no in multipath.conf file.

Use of non-multipathing configuration or use of find\_multipaths: yes or find\_multipaths: smart value in multipath.conf file will result in mount failures. Trident has recommended the use of find\_multipaths: no since the 21.07 release.

## Deploy the Trident operator and install Astra Trident using Helm

Using the Trident Helm Chart you can deploy the Trident operator and install Trident in one step.

Review the installation overview to ensure you've met installation prerequisites and selected the correct installation option for your environment.

#### Before you begin

In addition to the deployment prerequisites you need Helm version 3.

#### Steps

1. Add the Astra Trident Helm repository:

helm repo add netapp-trident https://netapp.github.io/trident-helm-chart

2. Use helm install and specify a name for your deployment as in the following example where 23.07.1 is the version of Astra Trident you are installing.

```
helm install <name> netapp-trident/trident-operator --version 23.07.1 --create-namespace --namespace <trident-namespace>
```

If you already created a namespace for Trident, the --create-namespace parameter will not create an additional namespace.

You can use helm list to review installation details such as name, namespace, chart, status, app version, and revision number.

### Pass configuration data during install

There are two ways to pass configuration data during the install:

Option	Description
values (or -f)	Specify a YAML file with overrides. This can be specified multiple times and the rightmost file will take precedence.
set	Specify overrides on the command line.

For example, to change the default value of debug, run the following --set command where 23.07.1 is the version of Astra Trident you are installing:

```
helm install <name> netapp-trident/trident-operator --version 23.07.1 --create-namespace --namespace trident --set tridentDebug=true
```

## **Configuration options**

This table and the values. yaml file, which is part of the Helm chart, provide the list of keys and their default values.

Option	Description	Default
nodeSelector	Node labels for pod assignment	
podAnnotations	Pod annotations	
deploymentAnnotations	Deployment annotations	
tolerations	Tolerations for pod assignment	

Option	Description	Default
affinity	Affinity for pod assignment	
tridentControllerPluginNod eSelector	Additional node selectors for pods. Refer to Understanding controller pods and node pods for details.	
tridentControllerPluginTol erations	Overrides Kubernetes tolerations for pods. Refer to Understanding controller pods and node pods for details.	
tridentNodePluginNodeSelec tor	Additional node selectors for pods. Refer to Understanding controller pods and node pods for details.	
tridentNodePluginTolerations	Overrides Kubernetes tolerations for pods. Refer to Understanding controller pods and node pods for details.	
imageRegistry	Identifies the registry for the trident-operator, trident, and other images. Leave empty to accept the default.	***************************************
imagePullPolicy	Sets the image pull policy for the trident-operator.	IfNotPresent
imagePullSecrets	Sets the image pull secrets for the trident-operator, trident, and other images.	
kubeletDir	Allows overriding the host location of kubelet's internal state.	""/var/lib/kubelet"`
operatorLogLevel	Allows the log level of the Trident operator to be set to: trace, debug, info, warn, error, or fatal.	"info"
operatorDebug	Allows the log level of the Trident operator to be set to debug.	true
operatorImage	Allows the complete override of the image for trident-operator.	""
operatorImageTag	Allows overriding the tag of the trident-operator image.	""
tridentIPv6	Allows enabling Astra Trident to work in IPv6 clusters.	false
tridentK8sTimeout	Overrides the default 30-second timeout for most Kubernetes API operations (if non-zero, in seconds).	0

Option	Description	Default
tridentHttpRequestTimeout	Overrides the default 90-second timeout for the HTTP requests, with 0s being an infinite duration for the timeout. Negative values are not allowed.	"90s"
tridentSilenceAutosupport	Allows disabling Astra Trident periodic AutoSupport reporting.	false
tridentAutosupportImageTag	Allows overriding the tag of the image for Astra Trident AutoSupport container.	<version></version>
tridentAutosupportProxy	Allows Astra Trident AutoSupport container to phone home via an HTTP proxy.	1111
tridentLogFormat	Sets the Astra Trident logging format (text or json).	"text"
tridentDisableAuditLog	Disables Astra Trident audit logger.	true
tridentLogLevel	Allows the log level of Astra Trident to be set to: trace, debug, info, warn, error, or fatal.	"info"
tridentDebug	Allows the log level of Astra Trident to be set to debug.	false
tridentLogWorkflows	Allows specific Astra Trident workflows to be enabled for trace logging or log suppression.	1111
tridentLogLayers	Allows specific Astra Trident layers to be enabled for trace logging or log suppression.	""
tridentImage	Allows the complete override of the image for Astra Trident.	···
tridentImageTag	Allows overriding the tag of the image for Astra Trident.	""
tridentProbePort	Allows overriding the default port used for Kubernetes liveness/readiness probes.	""
windows	Allows Astra Trident to be installed on Windows worker node.	false
enableForceDetach	Allows enabling the force detach feature.	false
excludePodSecurityPolicy	Excludes the operator pod security policy from creation.	false

#### Understanding controller pods and node pods

Astra Trident runs as a single controller pod, plus a node pod on each worker node in the cluster. The node pod must be running on any host where you want to potentially mount an Astra Trident volume.

Kubernetes node selectors and tolerations and taints are used to constrain a pod to run on a specific or preferred node. Using the `ControllerPlugin` and <code>NodePlugin</code>, you can specify constraints and overrides.

- The controller plugin handles volume provisioning and management, such as snapshots and resizing.
- The node plugin handles attaching the storage to the node.

## **Deploy Trident operator using Helm (Offline mode)**

You can deploy the Trident operator and install Astra Trident using Helm. This process applies to installations where the container images required by Astra Trident are stored in a private registry. If you do not have a private image registry, use the process for standard deployment.

#### Critical information about Astra Trident 23.07

You must read the following critical information about Astra Trident.

#### **Critical information about Astra Trident**

- Kubernetes 1.27 is now supported in Trident. Upgrade Trident prior to upgrading Kubernetes.
- Astra Trident strictly enforces the use of multipathing configuration in SAN environments, with a recommended value of find multipaths: no in multipath.conf file.

Use of non-multipathing configuration or use of find\_multipaths: yes or find\_multipaths: smart value in multipath.conf file will result in mount failures. Trident has recommended the use of find multipaths: no since the 21.07 release.

## Deploy the Trident operator and install Astra Trident using Helm

Using the Trident Helm Chart you can deploy the Trident operator and install Trident in one step.

Review the installation overview to ensure you've met installation prerequisites and selected the correct installation option for your environment.

#### Before you begin

In addition to the deployment prerequisites you need Helm version 3.

#### Steps

1. Add the Astra Trident Helm repository:

helm repo add netapp-trident https://netapp.github.io/trident-helm-chart

2. Use helm install and specify a name for your deployment and image registry location. Your Trident

and CSI images can be located in one registry or different registries, but all CSI images must be located in the same registry. In the examples, 23.07.1 is the version of Astra Trident you are installing.

#### Images in one registry

```
helm install <name> netapp-trident/trident-operator --version 23.07.1 --set imageRegistry=<your-registry> --create-namespace --namespace <trident-namespace>
```

#### Images in different registries

You must append sig-storage to the imageRegistry to use different registry locations.

```
helm install <name> netapp-trident/trident-operator --version 23.07.1 --set imageRegistry=<your-registry>/sig-storage --set operatorImage=<your-registry>/netapp/trident-operator:23.07.1 --set tridentAutosupportImage=<your-registry>/netapp/trident-autosupport:23.07 --set tridentImage=<your-registry>/netapp/trident:23.07.1 --create-namespace --namespace <trident-namespace>
```

If you already created a namespace for Trident, the --create-namespace parameter will not create an additional namespace.

You can use helm list to review installation details such as name, namespace, chart, status, app version, and revision number.

## Pass configuration data during install

There are two ways to pass configuration data during the install:

Option	Description
values (or -f)	Specify a YAML file with overrides. This can be specified multiple times and the rightmost file will take precedence.
set	Specify overrides on the command line.

For example, to change the default value of debug, run the following --set command where 23.07.1 is the version of Astra Trident you are installing:

```
helm install <name> netapp-trident/trident-operator --version 23.07.1 --create-namespace --namespace trident --set tridentDebug=true
```

## **Configuration options**

This table and the values.yaml file, which is part of the Helm chart, provide the list of keys and their default values.

Option	Description	Default
nodeSelector	Node labels for pod assignment	
podAnnotations	Pod annotations	
deploymentAnnotations	Deployment annotations	
tolerations	Tolerations for pod assignment	
affinity	Affinity for pod assignment	
tridentControllerPluginNod eSelector	Additional node selectors for pods. Refer to Understanding controller pods and node pods for details.	
tridentControllerPluginTol erations	Overrides Kubernetes tolerations for pods. Refer to Understanding controller pods and node pods for details.	
tridentNodePluginNodeSelec tor	Additional node selectors for pods. Refer to Understanding controller pods and node pods for details.	
tridentNodePluginTolerations	Overrides Kubernetes tolerations for pods. Refer to Understanding controller pods and node pods for details.	
imageRegistry	Identifies the registry for the trident-operator, trident, and other images. Leave empty to accept the default.	""
imagePullPolicy	Sets the image pull policy for the trident-operator.	IfNotPresent
imagePullSecrets	Sets the image pull secrets for the trident-operator, trident, and other images.	
kubeletDir	Allows overriding the host location of kubelet's internal state.	""/var/lib/kubelet"`
operatorLogLevel	Allows the log level of the Trident operator to be set to: trace, debug, info, warn, error, or fatal.	"info"
operatorDebug	Allows the log level of the Trident operator to be set to debug.	true
operatorImage	Allows the complete override of the image for trident-operator.	mm

Option	Description	Default
operatorImageTag	Allows overriding the tag of the trident-operator image.	""
tridentIPv6	Allows enabling Astra Trident to work in IPv6 clusters.	false
tridentK8sTimeout	Overrides the default 30-second timeout for most Kubernetes API operations (if non-zero, in seconds).	0
tridentHttpRequestTimeout	Overrides the default 90-second timeout for the HTTP requests, with 0s being an infinite duration for the timeout. Negative values are not allowed.	"90s"
tridentSilenceAutosupport	Allows disabling Astra Trident periodic AutoSupport reporting.	false
tridentAutosupportImageTag	Allows overriding the tag of the image for Astra Trident AutoSupport container.	<version></version>
tridentAutosupportProxy	Allows Astra Trident AutoSupport container to phone home via an HTTP proxy.	1111
tridentLogFormat	Sets the Astra Trident logging format (text or json).	"text"
tridentDisableAuditLog	Disables Astra Trident audit logger.	true
tridentLogLevel	Allows the log level of Astra Trident to be set to: trace, debug, info, warn, error, or fatal.	"info"
tridentDebug	Allows the log level of Astra Trident to be set to debug.	false
tridentLogWorkflows	Allows specific Astra Trident workflows to be enabled for trace logging or log suppression.	1111
tridentLogLayers	Allows specific Astra Trident layers to be enabled for trace logging or log suppression.	1111
tridentImage	Allows the complete override of the image for Astra Trident.	""
tridentImageTag	Allows overriding the tag of the image for Astra Trident.	""
tridentProbePort	Allows overriding the default port used for Kubernetes liveness/readiness probes.	1111

Option	Description	Default
windows	Allows Astra Trident to be installed on Windows worker node.	false
enableForceDetach	Allows enabling the force detach feature.	false
excludePodSecurityPolicy	Excludes the operator pod security policy from creation.	false

#### What's next

## **Customize Trident operator installation**

The Trident operator allows you to customize Astra Trident installation using the attributes in the TridentOrchestrator spec. If you want to customize the installation beyond what TridentOrchestrator arguments allow, consider using tridentctl to generate custom YAML manifests to modify as needed.

### Understanding controller pods and node pods

Astra Trident runs as a single controller pod, plus a node pod on each worker node in the cluster. The node pod must be running on any host where you want to potentially mount an Astra Trident volume.

Kubernetes node selectors and tolerations and taints are used to constrain a pod to run on a specific or preferred node. Using the `ControllerPlugin` and <code>NodePlugin</code>, you can specify constraints and overrides.

- The controller plugin handles volume provisioning and management, such as snapshots and resizing.
- The node plugin handles attaching the storage to the node.

## **Configuration options**

spec.namespace is specified in TridentOrchestrator to signify the namespace where Astra Trident is installed. This parameter cannot be updated after Astra Trident is installed. Attempting to do so causes the TridentOrchestrator status to change to Failed. Astra Trident is not intended to be migrated across namespaces.

This table details TridentOrchestrator attributes.

Parameter	Description	Default
namespace	Namespace to install Astra Trident in	"default"
debug	Enable debugging for Astra Trident	false

Parameter	Description	Default
enableForceDetach	ontap-san and ontap-san-economy only.  Works with Kubernetes Non-Graceful Node Shutdown (NGNS) to grant cluster administrators ability to safely migrate workloads with mounted volumes to new nodes should a node become unhealthy.  This is an experimental feature in 23.04. Refer to Details about force detach for important details.	false
windows	Setting to true enables installation on Windows worker nodes.	false
IPv6	Install Astra Trident over IPv6	false
k8sTimeout	Timeout for Kubernetes operations	30sec
silenceAutosupport	Don't send autosupport bundles to NetApp automatically	false
autosupportImage	The container image for Autosupport Telemetry	"netapp/trident- autosupport:23.07"
autosupportProxy	The address/port of a proxy for sending Autosupport Telemetry	"http://proxy.example.com: 8888"
uninstall	A flag used to uninstall Astra Trident	false
logFormat	Astra Trident logging format to be used [text,json]	"text"
tridentImage	Astra Trident image to install	"netapp/trident:23.07"
imageRegistry	<pre>Path to internal registry, of the format <registry fqdn="">[:port][/subpath]</registry></pre>	"k8s.gcr.io/sig-storage" (k8s 1.19+) or "quay.io/k8scsi"
kubeletDir	Path to the kubelet directory on the host	"/var/lib/kubelet"
wipeout	A list of resources to delete to perform a complete removal of Astra Trident	
imagePullSecrets	Secrets to pull images from an internal registry	
imagePullPolicy	Sets the image pull policy for the the Trident operator. Valid values are:  Always to always pull the image.  IfNotPresent to pull the image only if it does not	IfNotPresent
	already exist on the node.  Never to never pull the image.	
controllerPluginNod eSelector	Additional node selectors for pods. Follows same format as pod.spec.nodeSelector.	No default; optional

Parameter	Description	Default
controllerPluginTol erations	Overrides Kubernetes tolerations for pods. Follows the same format as pod.spec.Tolerations.	No default; optional
nodePluginNodeSelec tor	Additional node selectors for pods. Follows same format as pod.spec.nodeSelector.	No default; optional
nodePluginToleratio ns	Overrides Kubernetes tolerations for pods. Follows the same format as pod.spec.Tolerations.	No default; optional

For more information on formatting pod parameters, see Assigning Pods to Nodes.

#### Details about force detach

Force detach is available for ontap-san and ontap-san-economy only. Before enabling force detach, non-graceful node shutdown (NGNS) must be enabled on the Kubernetes cluster. For more information, refer to Kubernetes: Non Graceful node shutdown.

Because Astra Trident relies on Kubernetes NGNS, do not remove out-of-service taints from an unhealthy node until all non-tolerable workloads are rescheduled. Recklessly applying or removing the taint can jeopardize backend data protection.

When the Kubernetes cluster administrator has applied the node.kubernetes.io/out-of-service=nodeshutdown:NoExecute taint to the node and enableForceDetach is set to true, Astra Trident will determine the node status and:

- 1. Cease backend I/O access for volumes mounted to that node.
- 2. Mark the Astra Trident node object as dirty (not safe for new publications).

The Trident controller will reject new publish volume requests until the node is re-qualified (after having been marked as dirty) by the Trident node pod. Any workloads scheduled with a mounted PVC (even after the cluster node is healthy and ready) will be not be accepted until Astra Trident can verify the node clean (safe for new publications).

When node health is restored and the taint is removed, Astra Trident will:

- 1. Identify and clean stale published paths on the node.
- 2. If the node is in a cleanable state (the out-of-service taint has been removed and the node is in Ready state) and all stale, published paths are clean, Astra Trident will readmit the node as clean and allow new published volumes to the node.

## Sample configurations

You can use the attributes mentioned above when defining TridentOrchestrator to customize your installation.

#### **Example 1: Basic custom configuration**

This is an example for a basic custom configuration.

```
cat deploy/crds/tridentorchestrator_cr_imagepullsecrets.yaml
apiVersion: trident.netapp.io/v1
kind: TridentOrchestrator
metadata:
   name: trident
spec:
   debug: true
   namespace: trident
   imagePullSecrets:
   - thisisasecret
```

#### **Example 2: Deploy with node selectors**

This example illustrates how Trident can be deployed with node selectors:

```
apiVersion: trident.netapp.io/v1
kind: TridentOrchestrator
metadata:
   name: trident
spec:
   debug: true
   namespace: trident
   controllerPluginNodeSelector:
      nodetype: master
   nodePluginNodeSelector:
      storage: netapp
```

### **Example 3: Deploy on Windows worker nodes**

This example illustrates deployment on a Windows worker node.

```
\verb|cat| deploy/crds/tridentorchestrator_cr.yaml|\\
```

apiVersion: trident.netapp.io/v1

kind: TridentOrchestrator

metadata:

name: trident

spec:

debug: true

namespace: trident

windows: true
