Google Cloud NetApp Volumes

Configure a Google Cloud NetApp Volumes backend

You can now configure Google Cloud NetApp Volumes as the backend for Trident. You can attach NFS and SMB volumes using a Google Cloud NetApp Volumes backend.

Google Cloud NetApp Volumes driver details

Trident provides the `google-cloud-netapp-volumes` driver to communicate with the cluster. Supported access modes are: *ReadWriteOnce* (RWO), *ReadOnlyMany* (ROX), *ReadWriteMany* (RWX), *ReadWriteOncePod* (RWOP).

Driver	Protocol	volumeMode	Access modes supported	File systems supported
google-cloud-netapp-volumes	NFS SMB	Filesystem	RWO, ROX, RWX, RWOP	nfs, smb

Cloud identity for GKE

Cloud identity enables Kubernetes pods to access Google Cloud resources by authenticating as a workload identity instead of by providing explicit Google Cloud credentials.

To take advantage of cloud identity in Google Cloud, you must have:

- A Kubernetes cluster deployed using GKE.
- Workload identity configured on the GKE cluster and GKE MetaData Server configured on the node pools.
- A GCP Service account with the Google Cloud NetApp Volumes Admin (roles/netapp.admin) role or a custom role.
- Trident installed that includes the cloudProvider to specify "GCP" and cloudIdentity specifying the new GCP service account. An example is given below.

Trident operator

To install Trident using the Trident operator, edit `tridentorchestrator_cr.yaml` to set `cloudProvider` to "GCP" and set `cloudIdentity` to `iam.gke.io/gcp-service-account: cloudvolumes-admin-sa@mygcpproject.iam.gserviceaccount.com`.

For example:

```
apiVersion: trident.netapp.io/v1
kind: TridentOrchestrator
metadata:
  name: trident
spec:
  debug: true
  namespace: trident
  imagePullPolicy: IfNotPresent
  cloudProvider: "GCP"
  cloudIdentity: 'iam.gke.io/gcp-service-account: cloudvolumes-
admin-sa@mygcpproject.iam.gserviceaccount.com'
```

Helm

Set the values for **cloud-provider (CP)** and **cloud-identity (CI)** flags using the following environment variables:

```
export CP="GCP"
export ANNOTATION="'iam.gke.io/gcp-service-account: cloudvolumes-admin-
sa@mygcpproject.iam.gserviceaccount.com'"
```

The following example installs Trident and sets `cloudProvider` to GCP using the environment variable `$CP` and sets the `cloudIdentity` using the environment variable `$ANNOTATION`:

```
helm install trident trident-operator-100.2502.0.tgz --set
cloudProvider=$CP --set cloudIdentity="$ANNOTATION"
```

`tridentctl`

Set the values for **cloud provider** and **cloud identity** flags using the following environment variables:

```
export CP="GCP"
export ANNOTATION="'iam.gke.io/gcp-service-account: cloudvolumes-admin-
sa@mygcpproject.iam.gserviceaccount.com'"
```

The following example installs Trident and sets the `cloud-provider` flag to `$CP`, and `cloud-identity` to `$ANNOTATION`:

```
tridentctl install --cloud-provider=$CP --cloud
-identity="$ANNOTATION" -n trident
```

Prepare to configure a Google Cloud NetApp Volumes backend

Before you can configure your Google Cloud NetApp Volumes backend, you need to ensure the following requirements are met.

Prerequisites for NFS volumes

If you are using Google Cloud NetApp Volumes for the first time or in a new location, some initial configuration is required to set up Google Cloud NetApp Volumes and create an NFS volume. Refer to [Before you begin](#).

Ensure that you have the following before configuring Google Cloud NetApp Volumes backend:

- A Google Cloud account configured with Google Cloud NetApp Volumes service. Refer to [Google Cloud NetApp Volumes](#).
- Project number of your Google Cloud account. Refer to [Identifying projects](#).
- A Google Cloud service account with the NetApp Volumes Admin (`roles/netapp.admin`) role. Refer to [Identity and Access Management roles and permissions](#).
- API key file for your GCNV account. Refer to [Create a service account key](#)
- A storage pool. Refer to [Storage pools overview](#).

For more information about how to set up access to Google Cloud NetApp Volumes, refer to [Set up access to Google Cloud NetApp Volumes](#).

Google Cloud NetApp Volumes backend configuration options and examples

Learn about backend configuration options for Google Cloud NetApp Volumes and review configuration examples.

Backend configuration options

Each backend provisions volumes in a single Google Cloud region. To create volumes in other regions, you can define additional backends.

Parameter	Description	Default
version		Always 1

Parameter	Description	Default
storageDriverName	Name of the storage driver	The value of storageDriverName must be specified as "google-cloud-netapp-volumes".
backendName	(Optional) Custom name of the storage backend	Driver name + "_" + part of API key
storagePools	Optional parameter used to specify storage pools for volume creation.	
projectNumber	Google Cloud account project number. The value is found on the Google Cloud portal home page.	
location	The Google Cloud location where Trident creates GCNV volumes. When creating cross-region Kubernetes clusters, volumes created in a location can be used in workloads scheduled on nodes across multiple Google Cloud regions. Cross-region traffic incurs an additional cost.	
apiKey	API key for the Google Cloud service account with the netapp.admin role. It includes the JSON-formatted contents of a Google Cloud service account's private key file (copied verbatim into the backend configuration file). The apiKey must include key-value pairs for the following keys: type, project_id, client_email, client_id, auth_uri, token_uri, auth_provider_x509_cert_url, and client_x509_cert_url.	
nfsMountOptions	Fine-grained control of NFS mount options.	"nfsvers=3"
limitVolumeSize	Fail provisioning if the requested volume size is above this value.	"" (not enforced by default)
serviceLevel	The service level of a storage pool and its volumes. The values are flex, standard, premium, or extreme.	
network	Google Cloud network used for GCNV volumes.	
debugTraceFlags	Debug flags to use when troubleshooting. Example, {"api":false, "method":true}. Do not use this unless you are troubleshooting and require a detailed log dump.	null

Parameter	Description	Default
<code>nasType</code>	Configure NFS or SMB volumes creation. Options are <code>nfs</code> , <code>smb</code> or <code>null</code> . Setting to <code>null</code> defaults to NFS volumes.	<code>nfs</code>
<code>supportedTopologies</code>	Represents a list of regions and zones that are supported by this backend. For more information, refer to Use CSI Topology . For example: <code>supportedTopologies:</code> - <code>topology.kubernetes.io/region: asia-east1</code> <code>topology.kubernetes.io/zone: asia-east1-a</code>	

Volume provisioning options

You can control default volume provisioning in the `defaults` section of the configuration file.

Parameter	Description	Default
<code>exportRule</code>	The export rules for new volumes. Must be a comma-separated list of any combination of IPv4 addresses.	<code>"0.0.0.0/0"</code>
<code>snapshotDir</code>	Access to the <code>.snapshot</code> directory	<code>"true"</code> for NFSv4 <code>"false"</code> for NFSv3
<code>snapshotReserve</code>	Percentage of volume reserved for snapshots	<code>""</code> (accept default of 0)
<code>unixPermissions</code>	The unix permissions of new volumes (4 octal digits).	<code>""</code>

Example configurations

The following examples show basic configurations that leave most parameters to default. This is the easiest way to define a backend.

Minimal configuration

This is the absolute minimum backend configuration. With this configuration, Trident discovers all of your storage pools delegated to Google Cloud NetApp Volumes in the configured location, and places new volumes on one of those pools randomly. Because `nasType` is omitted, the `nfs` default applies and the backend will provision for NFS volumes.

This configuration is ideal when you are just getting started with Google Cloud NetApp Volumes and trying things out, but in practice you will most likely need to provide additional scoping for the volumes you provision.

```

Virtual pool configuration

This backend configuration defines multiple virtual pools in a single file. Virtual pools are defined in the storage section. They are useful when you have multiple storage pools supporting different service levels and you want to create storage classes in Kubernetes that represent those. Virtual pool labels are used to differentiate the pools. For instance, in the example below `performance` label and `serviceLevel` type is used to differentiate virtual pools.

You can also set some default values to be applicable to all virtual pools, and overwrite the default values for individual virtual pools. In the following example, `snapshotReserve` and `exportRule` serve as defaults for all virtual pools.

For more information, refer to [Virtual pools](#).

Cloud identity for GKE

```

apiVersion: trident.netapp.io/v1
kind: TridentBackendConfig
metadata:
  name: backend-tbc-gcp-gcnv
spec:
  version: 1
  storageDriverName: google-cloud-netapp-volumes
  projectNumber: '012345678901'
  network: gcnv-network
  location: us-west2
  serviceLevel: Premium
  storagePool: pool-premium1

```

Supported topologies configuration

Trident facilitates provisioning of volumes for workloads based on regions and availability zones. The `supportedTopologies` block in this backend configuration is used to provide a list of regions and zones per backend. The region and zone values specified here must match the region and zone values from the labels on each Kubernetes cluster node. These regions and zones represent the list of permissible values that can be provided in a storage class. For storage classes that contain a subset of the regions and zones provided in a backend, Trident creates volumes in the mentioned region and zone. For more information, refer to [Use CSI Topology](#).

```
---
version: 1
storageDriverName: google-cloud-netapp-volumes
subscriptionID: 9f87c765-4774-fake-ae98-a721add45451
tenantID: 68e4f836-edc1-fake-bff9-b2d865ee56cf
clientID: dd043f63-bf8e-fake-8076-8de91e5713aa
clientSecret: SECRET
location: asia-east1
serviceLevel: flex
supportedTopologies:
  - topology.kubernetes.io/region: asia-east1
    topology.kubernetes.io/zone: asia-east1-a
  - topology.kubernetes.io/region: asia-east1
    topology.kubernetes.io/zone: asia-east1-b
```

What's next?

After you create the backend configuration file, run the following command:

```
kubectl create -f <backend-file>
```

To verify that the backend is successfully created, run the following command:

```
kubectl get tridentbackendconfig
```

NAME	BACKEND NAME	BACKEND UUID
PHASE STATUS		
backend-tbc-gcnv	backend-tbc-gcnv	b2fd1ff9-b234-477e-88fd-713913294f65
Bound Success		

If the backend creation fails, something is wrong with the backend configuration. You can describe the backend using the `kubectl get tridentbackendconfig <backend-name>` command or view the logs to determine the cause by running the following command:

```
tridentctl logs
```

After you identify and correct the problem with the configuration file, you can delete the backend and run the create command again.

Storage class definitions

The following is a basic `StorageClass` definition that refers to the backend above.

```
apiVersion: storage.k8s.io/v1
kind: StorageClass
metadata:
  name: gcnv-nfs-sc
provisioner: csi.trident.netapp.io
parameters:
  backendType: "google-cloud-netapp-volumes"
```

Example definitions using the `parameter.selector` field:

Using `parameter.selector` you can specify for each `StorageClass` the [virtual pool](#) that is used to host a volume. The volume will have the aspects defined in the chosen pool.

```

apiVersion: storage.k8s.io/v1
kind: StorageClass
metadata:
  name: extreme-sc
provisioner: csi.trident.netapp.io
parameters:
  selector: performance=extreme
  backendType: google-cloud-netapp-volumes

---
apiVersion: storage.k8s.io/v1
kind: StorageClass
metadata:
  name: premium-sc
provisioner: csi.trident.netapp.io
parameters:
  selector: performance=premium
  backendType: google-cloud-netapp-volumes

---
apiVersion: storage.k8s.io/v1
kind: StorageClass
metadata:
  name: standard-sc
provisioner: csi.trident.netapp.io
parameters:
  selector: performance=standard
  backendType: google-cloud-netapp-volumes

```

For more details on storage classes, refer to [Create a storage class](#).

Example definitions for SMB volumes

Using `nasType`, `node-stage-secret-name`, and `node-stage-secret-namespace`, you can specify an SMB volume and provide the required Active Directory credentials. Any Active Directory user/password with any/no permissions can be used for the node stage secret.

Basic configuration on default namespace

```
apiVersion: storage.k8s.io/v1
kind: StorageClass
metadata:
  name: gcnv-sc-smb
provisioner: csi.trident.netapp.io
parameters:
  backendType: "google-cloud-netapp-volumes"
  trident.netapp.io/nasType: "smb"
  csi.storage.k8s.io/node-stage-secret-name: "smbcreds"
  csi.storage.k8s.io/node-stage-secret-namespace: "default"
```

Using different secrets per namespace

```
apiVersion: storage.k8s.io/v1
kind: StorageClass
metadata:
  name: gcnv-sc-smb
provisioner: csi.trident.netapp.io
parameters:
  backendType: "google-cloud-netapp-volumes"
  trident.netapp.io/nasType: "smb"
  csi.storage.k8s.io/node-stage-secret-name: "smbcreds"
  csi.storage.k8s.io/node-stage-secret-namespace: ${pvc.namespace}
```

Using different secrets per volume

```
apiVersion: storage.k8s.io/v1
kind: StorageClass
metadata:
  name: gcnv-sc-smb
provisioner: csi.trident.netapp.io
parameters:
  backendType: "google-cloud-netapp-volumes"
  trident.netapp.io/nasType: "smb"
  csi.storage.k8s.io/node-stage-secret-name: ${pvc.name}
  csi.storage.k8s.io/node-stage-secret-namespace: ${pvc.namespace}
```

nasType: smb filters for pools which support SMB volumes. nasType: nfs or nasType: null filters for NFS pools.

PVC definition example

```
kind: PersistentVolumeClaim
apiVersion: v1
metadata:
  name: gcnv-nfs-pvc
spec:
  accessModes:
    - ReadWriteMany
  resources:
    requests:
      storage: 100Gi
  storageClassName: gcnv-nfs-sc
```

To verify if the PVC is bound, run the following command:

```
kubectl get pvc gcnv-nfs-pvc
```

NAME	STATUS	VOLUME	CAPACITY
ACCESS MODES	STORAGECLASS	AGE	
gcnv-nfs-pvc	Bound	pvc-b00f2414-e229-40e6-9b16-ee03eb79a213	100Gi
RWX	gcnv-nfs-sc	1m
