NetApp XCP documentation

XCP v1.9.4 Release Notes

The [XCP v1.9.4 Release Notes](#) describe new features, upgrade notes, fixed issues, known limitations, and known issues.

You are required to sign on to the NetApp Support Site to access the Release Notes.

Get started with XCP

Learn about XCP

NetApp XCP is a client-based software that allows for scalable and high-performance data migrations for any-to-NetApp and NetApp-to-NetApp data migrations and file analytics. XCP is designed to scale and achieve greater performance by utilizing all the available system resources to manage high-volume datasets and high-performance data migrations. XCP helps you get complete visibility into the file system with the option to generate customer reports. Thanks to the matching and formatting capabilities, you can customize the reports to match any reporting needs.

Use XCP for NFS or SMB systems as one of the following solutions:

- Migration solution
- File Analytics solution

XCP is command-line software available in a single package supporting NFS and SMB protocols. XCP is available as a Linux binary for NFS datasets and is available as a Windows executable for SMB datasets.

XCP File Analytics is host-based software that detects file shares, runs scans on the file system, and provides a dashboard for file analytics. XCP File Analytics works for both NetApp and third-party systems and runs on Linux or Windows hosts to provide analytics for NFS and SMB exported file systems. The binary for the file analytics GUI is included in the single package supporting NFS and SMB protocols.

The XCP binary is code signed. For more details, please refer to the README in `NETAPP_XCP_<version>.tgz`.

The XCP CLI is robust. For more information, download *XCP Reference* on the [XCP site](#).

XCP workflow

XCP NFS add-on features

The XCP NFS add-on features support the use of POSIX and HDFS connectors, enhance security, and support the use of scale-out architecture to speed up data migrations.

NFSv4 support

When you only enable NFSv4 on the source, destination, and catalog volumes in the data center, you can use the POSIX path instead of the export path to migrate your data. To use the POSIX path, you must first mount the source, destination, and catalog volumes on the host system running XCP and then use the POSIX file path to provide the source and destination to XCP. See [Configure the POSIX connector](#).

- NFSv4 support is limited to the POSIX path and the `copy` operation, the `sync` operation is not supported.
- The POSIX connector might be slower when compared to the XCP NFSv3 TCP socket client engine.

POSIX connectors

XCP supports the use of POSIX connectors to provide source, destination, and catalog paths for data migration. The POSIX connector (`file://`) gives XCP the capability to access any Linux-mounted file system, such as NFSv4, XFS, and Veritas. For non-root users, the system administrator can mount the file system to give any non-root user the capability to access the file system by using a POSIX connector with the `file://` prefix.

You can benefit from using POSIX connectors when you do not have enough permissions to mount the file or when the support available in the data centers is limited to NFSv4. In such cases, any root user can mount the source and destination and then access the path by using a POSIX connector. When you are using POSIX connectors, you can only run the `xcp copy` operation.

XCP security

The XCP security feature gives you the capability to perform a migration as a non-root user on a Linux host machine. In earlier XCP versions, as a root user on the Linux machine, you perform a migration with all the permissions for the source, destination, and catalog volumes, and the mount is completed by the XCP operations.

When you are performing data migrations, it is common to turn off security and let an administrator copy everything as fast as possible. For ongoing transitions in production environments where XCP has been in use for several years, it is not secure to run as an administrator (or root). Therefore, removing the requirement to run XCP as the root user gives you the capability to use XCP in secure environments. When a regular non-root user runs XCP operations, the non-root user has the same access rights and limits as the user.

In this secure environment, a root user can mount the source, destination, and catalog volume on the host machine and provide the necessary permissions for the destination and catalog volumes for a non-root user to write the data. This gives the non-root user the capability to perform a migration by using the XCP POSIX connector feature.

XCP scale-out

Until now, data migration using XCP was limited to a single host with higher RAM and CPU. To speed up the migration, memory and cores on the single host were increased, but it could still take a significant time to copy petabytes of data. XCP scaled-out architecture gives you the capability to use multiple hosts to perform a data migration. With this feature, you can use multiple Linux hosts to distribute your workload and decrease the migration time.

You can benefit from multinode scale-out in any environment where the performance of a single system is not sufficient. To overcome the performance limits of a single node, you can use a single `copy` (or `scan -md5`) command to run workers on multiple Linux systems or Hadoop cluster nodes. Currently, XCP scale-out is only supported for `copy` command operations.

Hadoop Distributed File System connectors

XCP supports migrating data from a Hadoop Distributed File System (HDFS) file system to a NetApp file system and vice versa. In a Hadoop environment with security enabled, a non-root user on a Hadoop cluster can perform the migration to a NetApp NFSv4 exported file system. The HDFS connector (`hdfs://`) gives XCP the capability to access any HDFS file system that is available with different vendors. A non-root user can use XCP to perform migrations by using HDFS or POSIX connectors.

You can include HDFS clusters in an XCP scale-out configuration because they use multiple high end Linux machines. This minimizes the requirement for additional XCP worker nodes. For the data migration, you have the choice to reuse the HDFS cluster nodes or to go with separate hosts.

HDFS connectors are qualified and supported for MapR and Cloudera clusters but can only perform a baseline `copy` operation.

Unsupported features

The following features are not supported on XCP NFS:

| Feature Name | Description |
|---|---|
| IPv6 | Does not support IP version 6 (IPv6) |
| NFSv4 access control lists (ACLs) (third-party) | Does not support third-party to NetApp NFSv4 ACLs |
| POSIX connector | <ul style="list-style-type: none">• The <code>sync</code> command does not support the POSIX connector• You should not use the <code>copy</code> command when the source is active |
| Linux | XCP is no longer supported on earlier distributions of Linux that were supported by XCP 1.6.3. |
| Active source support | XCP does not support combining baseline or incremental Snapshot copy operations with live source migrations. |
| NFS to S3 migration | XCP does not support NFS to S3 migration. |

The following features are not supported on XCP SMB:

| Feature Name | Description |
|--|---|
| Third-party to NetApp NTFS access control lists (ACLs) | XCP SMB does not support migration of third-party ACLs from non-NetApp to NetApp systems. |
| NFS symbolic link (symlink) | NFS symlink is not supported in XCP SMB |
| ACL option for scan | ACLs not supported for scan option |
| IPv6 | Does not support IP version 6 (IPv6) |
| XCP Filters | The XCP SMB exclude option currently excludes directories based on their pattern in the filter and traverses the filesystem of those directories. |
| Live source migration | XCP does not support modifying data on the source volume during migration. |
| Multiple instances of XCP on the same host | When running multiple instances of XCP on the same host you might get unpredictable results. |

The following common features are not available for XCP NFS and SMB:

- **Time to complete migration:** XCP upfront does not provide the time to complete the migration or the time to complete any command used for migration. If you are doing final cutover confirm that data churn on the source volume is low.
- **Running copy again on an uncleaned target:** XCP baseline copy will fail when there is partial data on the destination target. For a successful XCP baseline copy and XCP verify, the destination must be clean.
- **Live destination:** XCP does not support modifying data on the destination volume during a migration or during an incremental sync.
- **Non-root user for File Analytics:** XCP does not support installations and configurations performed by a non-root user or a sudo user.

The following features are not available for Hadoop Distributed File System (HDFS) connectors:

| Feature Name | Description |
|---|--|
| Support for the <code>sync</code> command | The HDFS connector does not support the <code>sync</code> command. |
| Symbolic link (symlink) and hard link support | The HDFS file system does not support symlinks, hard links, or special files. |
| Live source HDFS migration | XCP does not support modifying data on the HDFS file system at the source during migration |

The following features are not available for Simple Storage Service (S3) connectors:

- **Migration with S3 bucket as the source:** XCP does not support migration with an S3 bucket as the source.

Supported configurations

All the XCP supported configurations such as hosts, ONTAP versions, and supported browsers, are listed in the [Interoperability Matrix Tool \(IMT\)](#).

Ports used by XCP

The following ports are used by XCP.

| Service | Port |
|--|------------------------------|
| CIFS | 445 TCP/UDP |
| HTTP (httpd) | 80 |
| HTTPS | 443 |
| NFS | 111 TCP/UDP and 2049 TCP/UDP |
| Postgresql | 5432 |
| XCP (as a service for File Analytics) | 5030 |
| HDFS | 7222 |

Install XCP

Prepare for XCP installation

In preparation for installation, you download XCP, obtain a license, and prepare your system.

Install and configure workflow

This document provides an easy workflow for installing and setting up XCP on NFS and SMB systems.

Download XCP

Download XCP from the NetApp support site and obtain a license from the XCP site.

You can download XCP from the [NetApp Support site](#).

License XCP

NetApp offers a free one year XCP license. You can obtain the license file from the [XCP site](#). The licensing portal offers different licensing options. After one year, you can renew the license for another year using the same portal.

The XCP license is available as an offline or online license. If you want to send migration statistics use an online license. The online license requires an internet connection. The offline license does not require an internet connection.

To run XCP 1.9.3 and later, you must obtain a new XCP license from the [XCP site](#).

Licenses used with XCP 1.9.2 and earlier are not supported in XCP 1.9.3 and later. Similarly, licenses used with XCP 1.9.3 and later are not supported in XCP 1.9.2 and earlier.

Prepare your system

If you are using [XCP NFS on a Linux system](#), you must prepare catalog and storage.

If you are using [XCP SMB on a Microsoft Windows system](#), you must prepare storage.

Prepare Linux for XCP NFS

XCP NFS uses Linux client host systems to generate parallel I/O streams and fully use available network and storage performance.

You can configure your setup for a root and a non-root user and then, depending on your setup, you can select either user.

Configure catalog

XCP saves operation reports and metadata in an NFSv3-accessible catalog directory or on any POSIX path with the required permissions.

- Provisioning the catalog is a one-time pre-installation activity.
- Approximately 1 GB of space is indexed for every 10 million objects (directories plus files and hard links); each copy that can be resumed or synched and each offline-searchable scan requires an index.
- To support performance, at least ten disks or SSDs are required in the aggregate containing the export directory.

You must store XCP catalogs separately. They must not be located on either the source or the destination NFS export directory. XCP maintains the metadata, which are the reports in the catalog location specified during the initial setup. Before you run any operation using XCP, you must specify and update the location for storing the reports.

Configure storage

XCP NFS transitions and migrations have the following source and target storage requirements:

- Source and target servers must have the NFSv3 or NFS v4.0 protocol service enabled
 - For NFSv4 ACL migration, you must enable NFSv4 protocol service and NFSv4 ACL on the destination server
- Source and target volumes must be exported with `root` access to the XCP Linux client host
- For NFSv4 ACL migration, NFSv4 requires that you use the encoding language UTF-8 for volumes that require ACL migration.

- To prevent administrators accidentally modifying the source volume, you should configure the source volume for the NFSv3 and NFSv4 export directories as read-only.
- In ONTAP, you can use the diagnostic `-atime-update` option to preserve atime on source objects. This feature is only available in ONTAP and is helpful if you want to preserve atime in source objects while running XCP.
- In XCP, you can use the `-preserve-atime` option to preserve atime on source objects. This option is available to use with all commands that access source objects.

Root user

A root user on a Linux machine has the permissions to mount the source, destination, and catalog volumes.

Non-root user

A non-root user is required to have the following permissions on a mounted volume:

- Read permission access to the source volume
- Read/write permission access to the mounted destination volume
- Read/write permission access to the catalog volume

Prepare Windows for XCP SMB

XCP SMB uses Windows client host systems to generate parallel I/O streams and fully use available network and storage performance.

Configure storage

XCP SMB transitions and migrations have the following user login requirements:

- XCP host system: An XCP host user must have administrator privilege (the user must be part of the "BUILTIN\Administrators" group on the target SMB server).
- Add the migration or XCP host user to the audit and security log policy for Active Directory. To locate the 'Manage Auditing and Security Log' Policy on Windows 10, follow these steps:

Steps

1. Open the **Group Policy Editor** dialog box.
2. Go to **Computer Configuration > Windows Settings > Security Settings > Local Policies > User**

Rights Assignment.

3. Select **Mange auditing and security log**.
4. To add an XCP host user, select **Add User or Group**.

For more information, see: [Manage auditing and security log](#).

- Target storage system: XCP host user must have read and write access.
- Source storage system:
 - If the user is part of the “Backup Operators” group in the source storage system, the members of this group can read files while bypassing the security rules, regardless of any permissions that protect those files.
 - If the user is not part of “Backup Operators” group in source system, the user must have read access.

Write permission is required in the source storage system for supporting the XCP option – `preserve-atime`.

Configure a Windows client

- Add the destination storage box and the source storage box to the host file:
 1. Navigate to the following location: (C:\Windows\System32\drivers\etc\hosts)
 2. Insert the following host entries to the file in the following format:

```
<Source data vservers data interface ip> <Source cifs server name>  
<Destination data vservers data interface ip> <Destination cifs server name>
```

Example

```
# Copyright (c) 1993-2009 Microsoft Corp.
#
# This is a sample HOSTS file used by Microsoft TCP/IP for Windows.
#
# This file contains the mappings of IP addresses to host names. Each
# entry should be kept on an individual line. The IP address should
# be placed in the first column followed by the corresponding host name.
# The IP address and the host name should be separated by at least one
# space.
#
# Additionally, comments (such as these) may be inserted on individual
# lines or following the machine name denoted by a '#' symbol.
#
# For example:
#
#       XXX.XX.XX.XX      rhino.acme.com      # source server
#       XX.XX.XX          x.acme.com         # x client host

# localhost name resolution is handled within DNS itself.
#       127.0.0.1        localhost
#       ::1              localhost
xx.xxx.xxx.xxx          00906A52DFE247F
xx.xxx.xxx.xxx          42D1BBE1219CE63
```

Prepare File Analytics

Prepare for your data migration using File Analytics.

File Analytics has the following two parts:

- File Analytics server running on Linux
- XCP SMB service running on Windows

File Analytics installation has the following requirements:

- Supported OS and system requirements are the same as given for NFS and SMB installation. Because the database will reside on a Linux box, you must make sure you have a minimum of 10 GB free space.
- The Linux machine where you install the File Analytics server must be connected to the internet or the yum repository. The installation script talks to the yum repository to download the required packages, such as PostgreSQL, HTTP and SSL.
- The File Analytics GUI can only be hosted on a Linux machine along with XCP services for Linux running on same box.
- For running SMB services, complete the following steps:
 - Verify that your Windows box can ping the Linux machine where the File Analytics server is running.
 - If you are inside a firewall, verify that ports 5030 and 5432 are open. Port 5030 is used to make the REST call to Windows. Port 5432 port is used for the PostgreSQL connection.

The XCP File Analytics server always runs on a Linux machine. There is no separate installation available for SMB File Analytics. If you are a Windows user and want to run File Analytics for SMB share, then you must install File Analytics for Linux and connect the Windows box to a Linux database.

If you only use XCP File Analytics, you do not need to configure the XCP Catalog for NFS.

Install XCP NFS

If you want to upgrade XCP, delete the current installation and replace it with a new installation of the latest version.

This section details the system requirements and the procedures for the initial setup of XCP on a Linux client and the INI file configuration.

System Requirements

| Item | Requirement |
|---|---|
| System | 64-bit Intel or AMD server, minimum 8 cores and 64 GB RAM |
| Operating System & Software | See the IMT for supported operating systems |
| Special Requirements | Network connectivity and root level access to source and destination NFSv3 exports No other active applications |
| Storage | 20 MB of disk space for the XCP binary and at least 50 MB of disk space for the logs that are stored in the /opt/NetApp/xFiles/xcp/ directory |
| Supported Protocol Version | NFSv3 and NFSv4 (POSIX and ACL) |
| Supported browser (File Analytics only) | Refer to the IMT matrix for all supported browser versions for XCP File Analytics. |

The recommended configuration for live source migration is 8 cores and 64 GB RAM.

Install XCP NFS for a root user

You can use the following procedure to install XCP for a root user.

Steps

1. Log in to the Linux machine as the root user and download and install the license:

```
[root@scspr1980872003 ~]# ls -l
total 36188
-rw-r--r--  1 root root 37043983 Oct  5 09:36 NETAPP_XCP_<version>.tgz
-rw-----  1 root root      1994 Sep  4 2019 license
```

2. To extract the tool, untar XCP:

```
[root@scspr1980872003 ~]# tar -xvf NETAPP_XCP_<version>.tgz
[root@scspr1980872003 ~]# ls
NETAPP_XCP_<version>.tgz license xcp
[root@scspr1980872003 ~]# cd xcp/linux/
[root@scspr1980872003 linux]# ls
xcp
```

3. Verify that the `/opt/NetApp/xFiles/xcp` path is available on the system from a previous version of XCP.

If `/opt/NetApp/xFiles/xcp` is available, activate the license by using the `xcp activate` command and proceed with data migration.

If `/opt/NetApp/xFiles/xcp` is not available, when you run the `xcp activate` command is run for the first time, the system creates the XCP host configuration directory in `/opt/NetApp/xFiles/xcp`.

The `xcp activate` command fails because the license is not installed:

```
[root@scspr1980872003 linux]# ./xcp activate
(c) yyyy NetApp, Inc.
xcp: Host config file not found. Creating sample at
'/opt/NetApp/xFiles/xcp/xcp.ini'

xcp: ERROR: License file /opt/NetApp/xFiles/xcp/license not found.
Register for a license at https://xcp.netapp.com
```

4. Copy the license to `/opt/NetApp/xFiles/xcp/`:

```
[root@scspr1980872003 linux]# cp ~/license /opt/NetApp/xFiles/xcp/
```

5. Verify that the license file was copied to `/opt/NetApp/xFiles/xcp/`:

```
[root@scspr1980872003 ~]# ls -altr /opt/NetApp/xFiles/xcp/
total 44
drwxr-xr-x 3 root root    17 Oct  1 06:07 ..
-rw-r--r-- 1 root root   304 Oct  1 06:07 license
drwxr-xr-x 2 root root     6 Oct  1 10:16 xcpfalog
drwxr-xr-x 2 root root    21 Oct  1 10:16 xcplogs
-rw-r--r-- 1 root root   110 Oct  5 00:48 xcp.ini
drwxr-xr-x 4 root root    83 Oct  5 00:48 .
[root@scspr1978802001 ~]#
```

6. Activate XCP:

```
[root@scspr1980872003 linux]# ./xcp activate
XCP <version>; (c) yyyy NetApp, Inc.;
XCP activated
```

Install XCP for a non-root user

You can use the following procedure to install XCP for a non-root user.

Steps

1. Log in to the Linux machine as the non-root user and download and install the license:

```
[user1@scspr2474004001 ~]$ ls -l
total 36640
-rwxr-xr-x 1 user1 user1      352 Sep 20 01:56 license
-rw-r--r-- 1 user1 user1 37512339 Sep 20 01:56
NETAPP_XCP_Nightly_dev.tgz
[user1@scspr2474004001 ~]$
```

2. To extract the tool, untar XCP:

```
[user1@scspr2474004001 ~]$ tar -xvf NETAPP_XCP_Nightly_dev.tar
[user1@scspr2474004001 ~]$ cd xcp/linux/
[user1@scspr2474004001 linux]$ ls
xcp
[user1@scspr2474004001 linux]$
```

3. Verify that the `/home/user1/NetApp/xFiles/xcp` path is available on the system from a previous version of XCP.

If the `/home/user1/NetApp/xFiles/xcp` path is available, activate the license by using the `xcp activate` command and proceeding with data migration.

If `/home/user1/NetApp/xFiles/xcp` is not available, when you run the `xcp activate` command for the first time, the system creates the XCP host configuration directory in `/home/user1/NetApp/xFiles/xcp`.

The `xcp activate` command fails because the license is not installed:

```
[user1@scspr2474004001 linux]$ /home/user1/xcp/linux/xcp activate
(c) yyyy NetApp, Inc.
xcp: Host config file not found. Creating sample at
'/home/user1/NetApp/xFiles/xcp/xcp.ini'

xcp: ERROR: License file /home/user1/NetApp/xFiles/xcp/license not
found.
Register for a license at https://xcp.netapp.com
[user1@scspr2474004001 linux]$
```

4. Copy the license to /home/user1/NetApp/xFiles/xcp/:

```
[user1@scspr2474004001 linux]$ cp ~/license
/home/user1/NetApp/xFiles/xcp/
[user1@scspr2474004001 linux]$
```

5. Verify that the license file was copied to /home/user1/NetApp/xFiles/xcp/:

```
[user1@scspr2474004001 xcp]$ ls -ltr
total 8
drwxrwxr-x 2 user1 user1 21 Sep 20 02:04 xcplogs
-rw-rw-r-- 1 user1 user1 71 Sep 20 02:04 xcp.ini
-rwxr-xr-x 1 user1 user1 352 Sep 20 02:10 license
[user1@scspr2474004001 xcp]$
```

6. Activate XCP:

```
[user1@scspr2474004001 linux]$ ./xcp activate
(c) yyyy NetApp, Inc.

XCP activated

[user1@scspr2474004001 linux]$
```

Install XCP SMB

This section details the system requirements and the procedure for VC++ redistributable installation and the initial setup of XCP on a Windows client.

There is no option to upgrade; reinstall XCP to replace any existing version.

System Requirements

| Item | Requirement |
|---|---|
| System | 64-bit Intel or AMD server, minimum 4 cores and 32 GB RAM |
| Operating System & Software | Windows 2012 R2 or above. For supported Microsoft OS versions, see the Interoperability Matrix Tool . Visual C++ 2017 redistributable must be installed on the XCP host. |
| Special Requirements | The source storage system, XCP host, and the target ONTAP system must be part of same Active Directory domain |
| Storage | 20 MB of disk space for the XCP binary and at least 50 MB of disk space for the logs that are stored in the C:\NetApp\XCP directory |
| Supported Protocol Version | All SMB protocol versions |
| Supported browser (File Analytics only) | Refer to the IMT matrix for all supported browser versions for XCP File Analytics. |

XCP SMB Microsoft VC++ Redistributable installation

Follow these steps for the VC++ redistributable installation.

Steps

1. Click [VC++ 2017 redistributable](#) to download the executable to your default downloads folder.
2. To start the installation, double click the installer. Accept the terms and conditions and select **Install**.
3. When the installation is complete, restart the Windows client.

XCP SMB Initial Setup Procedure

Follow these steps to perform the initial setup of XCP SMB.

Steps

1. Download the license and the XCP SMB binary `NETAPP_XCP_<version>.tgz` on a Windows client.
2. Extract the `NETAPP_XCP_<version>.tgz` file.
3. Copy the `xcp.exe` file to your Windows C: drive, this binary is available inside `NETAPP_XCP_<version>\xcp\windows` after you extract the `tgz` file.
4. Verify that the `C:\NetApp\XCP` path is available on the system from a previous version of XCP.
If `C:\NetApp\XCP` is available, activate XCP by using the `xcp.exe activate` command and proceed with data migration.

If `C:\NetApp\XCP` is not available, the system creates the XCP host configuration directory and files it at `C:\NetApp\XCP` when you run the `xcp.exe activate` command for the first time. The `xcp.exe activate` command fails and creates an error message asking for a new license.

```
C:\>xcp.exe activate
(c) yyyy NetApp, Inc.

License file C:\NetApp\XCP\license not found.
Register for a license at https://xcp.netapp.com
```

5. Copy the license to the newly created folder C:\NetApp\XCP:

```
C:\>copy license c:\NetApp\XCP
1 file(s) copied.
```

6. Activate XCP:

```
C:\>xcp.exe activate
XCP SMB; (c) yyyy NetApp, Inc.;

XCP activated

C:\>
```

Install File Analytics for NFS

Install or upgrade File Analytics for NFS.

About this task

For system requirements for NFS, see [Install XCP NFS](#).

The `configure.sh` script installs XCP File Analytics on a Red Hat Enterprise Linux (RHEL) host machine. As part of the installation, the script installs Postgres Database, Apache HTTPD server, and other required packages on the host Linux machine. For information on specific supported RHEL versions, refer to the [IMT](#). You can change or update to a more recent version as needed and to adhere to security guidelines. To learn more about the `configure.sh` script, run `./configure.sh -h` on the command line.

Before you begin

- If any XCP operations are running, NetApp recommends that you complete the operations before you start the configuration.
- Your Linux machine must be connected to the Yum repository server or the internet.
- If a firewall is configured on the Linux machine, you must change the firewall settings to enable port 5030, which is used by the XCP service.

Steps

1. Install or upgrade File Analytics for NFS.

Install File Analytics

- a. Navigate to the `xcp` folder and run the `./configure.sh` script.

If installation is successful, the following message is displayed:

```
You can now access XCP file analytics using
(<username>:<password>)
https://<ip_address>/xcp
```

You can use this username and password to log in to the File Analytics GUI.

Upgrade File Analytics

- a. Navigate to the `xcp` folder and run `./configure.sh -f`.
- b. At the prompt, enter `y` to clean up and reconfigure the system.

After the script is approved, it cleans up the existing configuration and reconfigures the system.

If successful, the following message is displayed:

```
You can now access XCP file analytics using
(<username>:<password>)
https://<ip_address>/xcp
```

2. Launch File Analytics in a supported browser: **`https://<ip address of linux>/xcp`**.

Refer to [Install XCP NFS](#) for information on supported browsers.

Install File Analytics for SMB

Install or upgrade File Analytics for SMB.

About this task

For system requirements for SMB, see [Install XCP SMB](#).

Before you begin

- You must configure XCP File Analytics for NFS on a Linux machine to use the XCP SMB service.
- Make sure the XCP service is running on your Linux machine, before you begin configuring XCP File Analytics on a Windows machine.

Fresh install of File Analytics for SMB

To perform a fresh install of File Analytics for SMB, complete the following steps.

Steps

1. Copy the `xcp.exe` file to your Windows C: drive, this binary is available inside `/xcp/windows` after you untar the `tgz` file.
2. Download the XCP license file from the [XCP site](#).
3. Create the folder `C:\NetApp\XCP` and copy the XCP license to this location.
4. Activate the XCP license using the following command at the command prompt: `xcp.exe activate`
5. In the Windows CLI command prompt, run `xcp configure`.
6. When prompted, provide the IP address of the Linux machine where the XCP File Analytics server is configured.
7. Copy the `server.key` and `server.crt` files from `/opt/NetApp/xFiles/xcp/` (in the Linux box where XCP File Analytics is already configured) to `C:\NetApp\XCP`.

Optionally, if you have a CA certificate, place the certificate in `C:\NetApp\XCP` with the same name and extensions.

8. Go to your Windows machine and run `xcp listen`, now XCP File Analytics for SMB is configured. Keep the window open to continuously run the service.
9. Launch File Analytics on a supported browser: `https://<ip address of linux>/xcp`

Refer to [Install XCP SMB](#) for information on supported browsers.

10. Select **OK** when the dialog box displays.

A new tab opens. Enable pop-ups on the browser if they are blocked.

11. Accept the privacy policy for the URL. The following message displays: `SMB agent is ready to use. Please refresh the analytics page`
12. Display the SMB agent under the Agents card by returning to the original tab hosting the XCP File Analytics GUI and refreshing the page.

Upgrade of File Analytics for SMB

To upgrade the existing File Analytics for SMB, complete the following steps.

1. Before you run File Analytics, verify that the Linux server that File Analytics is running on is also upgraded and that the service is running.
2. In Windows, stop the existing XCP service by entering `CTRL-C` on the command line.
3. Replace `xcp.exe` with the latest binary.
4. Go to your Windows machine and run `xcp listen` to configure XCP File Analytics for SMB. Keep the window open to continuously run the service.
5. Launch File Analytics on a supported browser: `https://<ip address of linux>/xcp`

Refer to [Install XCP SMB](#) for information on supported browsers.

6. Select **OK** when the dialog box displays.

A new tab opens. Enable pop-ups on the browser if they are blocked.

7. Accept the privacy policy for the URL. The following message displays: SMB agent is ready to use. Please refresh the analytics page
8. Display the SMB agent under the Agents card by returning to the original tab hosting the XCP File Analytics GUI and refreshing the page.

Configure XCP

Configure the INI file

Steps to configure the INI file for XCP.

Configure the INI file for a root user

You can use the following procedure to configure the INI file for an XCP NFS root user.

Steps

1. Add the catalog location for the XCP server in the host configuration file by using the `vi` editor:

Catalog location should be exported before modifying the details in the `xcp.ini` XCP configuration file. Catalog location (NFSv3) should be mountable by the XCP Linux host but not necessarily be mounted.

```
[root@localhost ~]# vi /opt/NetApp/xFiles/xcp/xcp.ini
```

2. Verify that the XCP Linux client host configuration file entries for the catalog were modified:

```
[root@localhost ~]# cat /opt/NetApp/xFiles/xcp/xcp.ini
# Sample xcp config
[xcp]
catalog = 10.61.82.210:/vol/xcpvol/
```

Configure the INI file for a non-root user

As a non-root user, you do not have permission to mount the NFS file system. A root user is required to first mount the catalog volume and then, as a non-root user running XCP, if you have read/write permission to the catalog volume, you can access the mounted catalog volume by using a POSIX connector. After the volume is mounted, you can add catalog the path:

(t/10.237.170.53_catalog_vol - This is the path where catalog volume is mounted) as follows.

```
[user1@scspr2474004001 xcp]$ ls -ltr
total 8
drwxrwxr-x 2 user1 user1  21 Sep 20 02:04 xcplogs
-rw-rw-r-- 1 user1 user1  71 Sep 20 02:04 xcp.ini
-rwxr-xr-x 1 user1 user1 352 Sep 20 02:10 license
[user1@scspr2474004001 xcp]$ cat /home/user1/NetApp/xFiles/xcp/xcp.ini

Sample xcp config [xcp]
catalog = file:///t/10.237.170.53_catalog_vol
```

Performance tuning

For XCP NFS, after planning the migration by using the `show` and `scan` commands, you can migrate data.

When you are performing data migration as a non-root user, a root user can perform the following step.

For the optimal performance and reliability, NetApp recommends setting the following Linux kernel TCP performance parameters in `/etc/sysctl.conf` on the XCP Linux client host. Run `sysctl -p` or the `reboot` command to commit the changes:

```
net.core.rmem_default = 1342177
net.core.rmem_max = 16777216
net.core.rmem_max = 16777216
net.core.wmem_default = 1342177
net.core.wmem_max = 16777216
net.ipv4.tcp_rmem = 4096 1342177 16777216
net.ipv4.tcp_wmem = 4096 1342177 16777216
net.core.netdev_max_backlog = 300000
net.ipv4.tcp_fin_timeout = 10
```

For a non-root user, the setting must be performed by a root user.

Environment variable

Optional environment variable configuration for XCP NFS systems.

A non-root user can also use the following variables.

The environment variable `XCP_CONFIG_DIR` overrides the default location, `/opt/NetApp/xFiles/xcp`. If set, the value should be an OS filesystem path, possibly to a mounted NFS directory. When the `XCP_CONFIG_DIR` variable is set, a new directory with the same name as the host name is created inside the custom configuration directory path, new logs are stored at this location.

```
[root@localhost /]# export XCP_CONFIG_DIR='/tmp/xcp_config_dir_path'
```

The environment variable `XCP_LOG_DIR` overrides the default location that stores the XCP log in the configuration directory. If set, the value should be an OS filesystem path, possibly to a mounted NFS directory. When the `XCP_LOG_DIR` variable is set, a new directory with the same name as the host name is created inside the custom log directory path, new logs are stored at this location.

```
[root@localhost /]# export XCP_LOG_DIR='/tmp/xcp_log_dir_path'
```

The environment variable `XCP_CATALOG_PATH` overrides the setting in `xcp.ini`. If set, the value should be in the xcp path format, `server:export[:subdirectory]`.

```
[root@localhost /]# export XCP_CATALOG_PATH='10.61.82.210:/vol/xcpvol/'
```

For a non-root user, you must replace `XCP_CATALOG_PATH` from the exported path with the POSIX path.

Configure the POSIX connector

XCP NFS now supports the use of POSIX connectors to provide source and destination paths for data migration.

Supported features

The following features are supported for POSIX connectors:

- For POSIX file systems that support nanosecond `atime`, `mtime`, and `ctime`, the `scan` command gets the full values (seconds and nanoseconds) and the `copy` command sets them
- POSIX connectors are more secure than XCP with NFSv3 TCP sockets.

Path Syntax

The path syntax for a POSIX connector is `file://<mounted path on linux>`.

Set up a POSIX connector

To set up a POSIX connector, you must perform the following tasks:

- Mount a source and a destination volume
- Verify that the destination path has the necessary permission to write the data

A destination and a catalog are mounted in the following example:

```
root@scspr2395903001 ~]# findmnt -t nfs4
TARGET SOURCE FSTYPE OPTIONS
/t/10.237.170.39_src_vol 10.237.170.39:/source_vol nfs4
rw,relatime,vers=4.0,rsize=65536,wsiz=65536,namlen=255,hard,proto=t
cp,timeo=600,retrans=2,sec=sys,clien
/t/10.237.170.53_dest_vol 10.237.170.53:/dest_vol nfs4
rw,relatime,vers=4.0,rsize=65536,wsiz=65536,namlen=255,hard,proto=t
cp,timeo=600,retrans=2,sec=sys,clien
/t/10.237.170.53_catalog_vol 10.237.170.53:/xcp_catalog nfs4
rw,relatime,vers=4.0,rsize=65536,wsiz=65536,namlen=255,hard,proto=t
cp,timeo=600,retrans=2,sec=sys,clien
[root@scspr2395903001 ~]#
```

POSIX connectors access a source and destination volume by using the POSIX syntax `file://`. In the above example, the source path is `file:///t/10.237.170.39_src_vol` and the destination path is `file:///t/10.237.170.53_dest_vol`.

You can manage the sample configuration of an XCP catalog shared by non-root users by creating a Linux group for XCP users. For non-root users, the following permissions are required for Linux group users to perform migrations.

In the following sample output, `demo` is the non-root user and `/mnt/xcp-catalog` is the path where catalog volume is mounted:

```
sudo groupadd -g 7711 xcp_users
sudo usermod -G xcp_users -a demo
sudo chown -R :xcp_users /mnt/xcp-catalog
sudo chmod -R g+w /mnt/xcp-catalog
```

The XCP catalog does not store data but it does store scan and copy file names, directory names, and other metadata. Therefore, it is recommended that you configure the catalog file system permissions for allowed users to give them the capability to secure the stored metadata.

Ownership (UID and GID)

When you are set up as a regular user, by default, a `copy` command to a POSIX or NFS3 destination does not attempt to set the ownership (user ID (UID) and group ID (GID)). Setting the ownership is typically performed by an administrator. When user A copies files from user B, user A expects to own the destination. However, this is not the case when a root user copies the files. When a root user copies the files, the `-chown` option changes the behavior so that a non-root `copy` command with `-chown` attempts to set the UID and GID.

Increase the maximum number of open file descriptors

For optimal performance and reliability, you can increase the maximum number of open file descriptors for the XCP user on all nodes.

Steps

1. Open the file by using the following command:
`vi /etc/security/limits.conf`
2. Add the following line to the file:
`<username> - nofile 999999`

Example

```
root - nofile 999999
```

See [Red Hat solutions](#) for more information.

Configure the HDFS connector

For XCP NFS, the Hadoop Distributed File System (HDFS) connector (`hdfs://`) gives XCP the capability to access any HDFS file system that is available with different vendors.

Supported features

The `copy` command operation from HDFS to NFS is supported for HDFS connectors.

Path Syntax

The path syntax for a HDFS connector is `hdfs://[user@host:port]/full-path`.

If you do not specify a user, host, and port, XCP calls `hdfsConnect` with the host set to `default` and the port set to 0.

Set up a HDFS connector

To run the HDFS `copy` command, you must set the HDFS client on the Linux system, and based on the Hadoop vendor, follow the setup configuration available on the internet. For example, you can set the client for a MapR cluster by using <https://docs.datafabric.hpe.com/60/AdvancedInstallation/SettingUptheClient-redhat.html>.

After you complete the HDFS client setup, you must complete the configuration on the client. To use the HDFS paths with XCP commands, you must have the following environment variables:

- `NHDFS_LIBHDFS_PATH`
- `NHDFS_LIBJVM_PATH`

In the following examples, the settings work with MapR and `java-1.8.0-openjdk-devel` on CentOS:

```
export JAVA_HOME=$(dirname $(dirname $(readlink $(readlink $(which javac))))
export NHDFS_LIBJVM_PATH=`find $JAVA_HOME -name "libjvm.so"` export
NHDFS_LIBHDFS_PATH=/opt/mapr/lib/libMapRClient.so
```

```
[demo@mapr0 ~]$ hadoop fs -ls Found 3 items
drwxr-xr-x - demo mapr 0 2021-01-14 00:02 d1
drwxr-xr-x - demo mapr 0 2021-01-14 00:02 d2
drwxr-xr-x - demo mapr 0 2021-01-14 00:02 d3
```

Configure multinode scale-out

For XCP NFS, you can overcome the performance limits of a single node by using a single `copy` (or `scan -md5`) command to run workers on multiple Linux systems or cluster nodes.

Supported features

Multinode scale-out is helpful in any environment where the performance of a single system is not sufficient, for example, in the following scenarios:

- When it takes months for a single node to copy petabytes of data
- When high latency connections to cloud object stores slows down an individual node
- In large HDFS cluster farms where you run a very large number of I/O operations

Path syntax

The path syntax for multinode scale-out is `--nodes worker1,worker2,worker3`.

Set up multinode scale-out

Consider a setup with four Linux hosts with similar CPU and RAM configurations. You can use all four hosts for migration because XCP can coordinate the copy operations across all the host nodes. To make use of these nodes in a scale-out environment, you must identify one of the four nodes as the master node and other nodes as worker nodes. For example, for a Linux four-node setup, name the nodes as "master", "worker1", "worker2", and "worker3" and then set up the configuration on the master node:

1. Copy XCP in the home directory.
2. Install and activate the XCP license.
3. Modify the `xcp.ini` file and add the catalog path.
4. Set passwordless Secure Shell (SSH) from the master node to the worker nodes:
 - a. Generate the key on the master node:

```
ssh-keygen -b 2048 -t rsa -f /root/.ssh/id_rsa -q -N ''
```

- b. Copy the key to all the worker nodes:

```
ssh-copy-id -i /root/.ssh/id_rsa.pub root@worker1
```

The XCP master node uses SSH to run workers on other nodes. You must configure the worker nodes to enable passwordless SSH access for the user running XCP on the master node. For example, to enable a user demonstration on a master node to use node "worker1" as an XCP worker node, you must copy XCP binary from the master node to all the worker nodes in the home directory.

MaxStartups

When you start up multiple XCP workers simultaneously, to avoid errors, you should increase the `sshd` `MaxStartups` parameter on each worker node as shown in the following example:

```
echo "MaxStartups 100" | sudo tee -a /etc/ssh/sshd_config
sudo systemctl restart sshd
```

The "nodes.ini" file

When XCP runs a worker on a cluster node, the worker process inherits the environment variables from the main XCP process on the master node. To customize a particular node environment, you must set the variables in the `nodes.ini` file in the configuration directory only on the master node (worker nodes do not have a configuration directory or catalog). For example, for an ubuntu server mars that has its `libjvm.so` in a different location to the master node, such as wave (which is CentOS), it requires a configuration directory to allow a worker on mars to use the HDFS connector. This setup is shown in the following example:

```
[schay@wave ~]$ cat /opt/NetApp/xFiles/xcp/nodes.ini [mars]
NHDFS_LIBJVM_PATH=/usr/lib/jvm/java-8-openjdk-amd64/jre/lib/
amd64/server/libjvm.so
```

If you are using a multisession with POSIX and HDFS file paths, you must mount the file system and the source and destination exported file system on the master node and all worker nodes.

When XCP runs on a worker node, the worker node has no local configuration (no license, log files, or catalog). XCP binary only is required on the system in your home directory. For example, to run the `copy` command, the master node and all worker nodes need access to the source and destination. For `xcp copy --nodes linux1,linux2 hdfs:///user/demo/test file:///mnt/ontap`, the `linux1` and `linux2` hosts must have the HDFS client software configured and the NFS export mounted on `/mnt/ontap`, and, as mentioned previously, a copy of the XCP binary in the home directory.

Combine POSIX and HDFS connectors, multinode scale-out, and security features

You can use the POSIX and HDFS connectors, multinode scale-out, and security features in combination. For example, the following `copy` and `verify` commands combine POSIX and HDFS connectors with the security and scale-out features:

- `copy` command example:

```
./xcp copy hdfs:///user/demo/d1 file:///mnt/nfs-server0/d3
./xcp copy -match "'USER1 in name'" file:///mnt/nfs-server0/d3
hdfs:///user/demo/d1
./xcp copy -node worker1,worker2,worker3 hdfs:///user/demo/d1
file:///mnt/nfs-server0/d3
```

- `verify` command example:

```
./xcp verify hdfs:///user/demo/d2 file:///mnt/nfs-server0/d3
```

Configure the S3 connector

Beginning with XCP 1.9.2, the Simple Storage Service (S3) connector enhances the scope of XCP data migration by enabling data migration from Hadoop Distributed File System (HDFS) file systems to S3 object storage.

Supported migration use cases

The following migration use cases are supported for the S3 connectors:

- Migration from HDFS to NetApp StorageGRID
- Migration from HDFS to Amazon S3
- Migration from HDFS to NetApp ONTAP S3

Currently MapR is only qualified and supported for HDFS.

Supported features

Support for the `scan`, `copy`, `verify`, `resume` and `delete` commands is available for the S3 connectors.

Unsupported Features

Support for the `sync` command is not available for the S3 connectors.

Path Syntax

The path syntax for the S3 connector is `s3://<bucket in S3>`.

- You can provide a specific S3 profile for the XCP commands using the `-s3.profile` option.
- You can use the `s3.endpoint` option to modify the endpoint value to communicate with S3

Endpoint usage is mandatory for StorageGRID and ONTAP S3.

Set up an S3 connector

Steps

1. To run the XCP command with the S3 connector, create a bucket in S3 by following the online documentation for the respective platforms:

- [ONTAP S3 object storage management](#)
- [StorageGRID: Use a tenant account overview](#)

Before continuing, you must have the `access key`, `secret key`, `certificate authority (CA) certificate bundle`, and `endpoint url` information. XCP identifies and connects to the S3 bucket using these parameters before initiating an operation.

2. Install the Amazon Web Services (AWS) CLI packages and run the AWS CLI commands to configure the keys and Secure Sockets Layer (SSL) certificates for S3 accounts:
 - See [Installing or updating the latest version of the AWS CLI](#) to install the AWS packages.
 - See the [AWS CLI Command Reference](#) for more information.
3. Use the `aws configure` command to configure your credentials file. By default, the file's location is

/root/.aws/credentials. The credentials file should specify the access key and secret access key.

4. Use the `aws configure set` command to specify a CA certificate bundle, which is a file with the `.pem` extension that is used when verifying SSL certificates. By default, the file's location is `/root/.aws/config`.

Example:

```
[root@client1 ~]# aws configure
AWS Access Key ID [None]: <access_key>
AWS Secret Access Key [None]: <secret_key>
Default region name [None]:
Default output format [None]:
[root@client1 ~]# cat /root/.aws/credentials
[default]
aws_access_key_id = <access_key>
aws_secret_access_key = <secret_key>
[root@client1 ~]#
[root@client1 ~]# aws configure set default.ca_bundle
/u/xxxx/s3/ca/aws_cacert.pem
[root@client1 ~]# cat /root/.aws/config
[default]
ca_bundle = /u/xxxx/s3/ca/aws_cacert.pem
```

5. After the required setup configuration is completed, confirm that the AWS CLI commands can access the S3 buckets from the Linux client before running the XCP commands:

```
aws s3 ls --endpoint-url <endpoint_url> s3://bucket-name/
```

```
aws s3 ls --profile <profile> --endpoint-url <endpoint_url> s3://bucket-name
```

Example:

```
[root@client1 linux]# aws s3 ls --profile <profile> --endpoint
<endpoint_url> s3://<bucket-name>
PRE 1G/
PRE aws_files/
PRE copied_folders/
PRE d1/
PRE d2/
PRE giant_size_dirs/
PRE medium_size_dirs/
PRE small_size_dirs/

[root@client1 l
```

Plan data migration

You can plan your migration using the CLI or the File Analytics GUI.

Use the following commands to plan your migration:

- Show
- Scan

Use File Analytics to visualize the statistics for exports and shares.

Plan NFS data migration

Plan your NFS data migrations.

show

The `show` command queries the RPC services and NFS exports of one or more storage servers. The command lists the available services and exports with the used and free capacity of each export, followed by the root attributes of each export.

Example:

- `xcp show <NFS file server IP/FQDN>`
- `xcp show nfs_server01.netapp.com`

Run `xcp help show` for more details.

scan

The `scan` command recursively scans the entire source NFSv3 exported paths and prints the statistics of file structure at the end of the scan. NetApp recommends putting the source NFS export mounts in read-only mode during the scan operation.

If a file or directory name contains non-UTF-8 characters, these characters are converted to the UTF-8 format and displayed when you run the `xcp-scan` command. Depending on the translation from the source encoding to UTF-8, the characters might not display as expected.

Example:

- `xcp scan NFS [server:/export path | file://]`
- `xcp scan nfs_server01.netapp.com:/export1`
- `xcp scan file:///mnt/nfs-source`

Run `xcp help scan` for more details.

Optionally, use File Analytics to view the results graphically.

Plan SMB data migration

Plan your SMB data migrations.

Show

The `show` command shows all SMB shares available on the server with the permissions and space available.

Example:

- `xcp show \\<SMB file server IP/FQDN>`
- `xcp show smb_server01.netapp.com`

Run `xcp help show` for more details.

Scan

The `scan` command recursively scans the entire SMB share and lists all the files at the end of the scan.

During the scan operation, you can use the `-preserve-atime` flag with the `scan` command to preserve access time at the source .

Example:

- `xcp scan \\SMB server\share1`
- `xcp scan smb_server01.netapp.com:/share1`

Run `xcp help scan` for more details.

Optionally, use File Analytics to view the results graphically.

Plan HDFS data migration

Plan your HDFS data migrations.

Scan

The `scan` command recursively scans the entire source paths and prints the statistics for the file structure at the end of the scan.

- `xcp scan HDFS [hdfs://<hdfs mounted path>]`
- `xcp scan hdfs:///demo/user1`
- `xcp scan s3://my-bucket`
- `xcp scan -s3.profile <s3 profile name> -s3.endpoint <endpoint-url> s3://my-bucket`

Run `xcp help scan` for more details.

Plan using File Analytics

Plan your data migration

Plan your data migration using File Analytics.

XCP is a CLI, whereas File Analytics has a GUI.

Overview

XCP File Analytics uses the XCP scan API to collect data from NFS or SMB hosts. This data is then displayed on XCP File Analytics GUI. There are three main components involved in XCP File Analytics:

- XCP service
- File Analytics database
- File Analytics GUI to manage and view data

The deployment method for XCP File Analytics components depends on the solution required:

- Deploying XCP File Analytics solutions for NFS file systems:
 - You can deploy the File Analytics GUI, database, and XCP service in the same Linux host.
- Deploying XCP File Analytics solutions for SMB file systems:
You must deploy the File Analytics GUI and database in a Linux host and deploy the XCP service on a Windows host.

Access File Analytics

File Analytics provides a graphical view of scan results.

Log in to the File Analytics GUI

The XCP File Analytics GUI provides a dashboard with graphs for visualizing File Analytics. The XCP File Analytics GUI is enabled when you configure XCP on a Linux machine.

To check the supported browsers for accessing File Analytics, see the [NetApp IMT](#).

Steps

1. Use the link `https://<IP address of linux machine>/xcp` to access the File Analytics GUI. When prompted, accept the security certificate:
 - a. Select **Advanced** below the privacy statement.
 - b. Select the **Proceed to <IP address of linux machine>** link.
2. Log in to the File Analytics GUI.

There are two ways to log in to the File Analytics GUI:

Log in using user credentials

- a. Log in to the GUI using the user credentials obtained when you installed File Analytics.

- b. Optionally, change the password to your own password.

If you want to change the password obtained during installation to your own password, select the user icon and select **Change password**.

Your new password must be at least eight characters in length and contain at least one number, one upper case letter, one lower case letter, and one special character (! @ # \$ % ^ & * - _).

After changing the password, you are automatically logged out of the GUI and you must sign in again using the new password that you created.

Configure and enable SSO capability

You can use this login capability to set up XCP File Analytics on a particular machine and share the web UI URL enterprise-wide, allowing users to log in to the UI using their single sign-on (SSO) credentials.

SSO login is optional and can be configured and enabled permanently. To set up Security Assertion Markup Language (SAML) based SSO login, see [Configure SSO credentials](#).

3. After logging in, you can see the NFS agent; a green tick is present showing minimal system configuration of the Linux system and XCP version.
4. If you have configured an SMB agent, you can see the SMB agent added in the same agent card.

Configure SSO credentials

The SSO login functionality is implemented in XCP File Analytics using SAML and is supported with the Active

Directory Federation Services (ADFS) identity provider. SAML offloads the authentication task to the third-party identity provider (IdP) for your enterprise which can utilize any number of approaches for MFA (multifactor authentication).

Steps

1. Register the XCP File Analytics application with your enterprise identity provider.

File Analytics now runs as a service provider and therefore must be registered with your enterprise identity provider. Generally, there is a team in the enterprise that handles this SSO integration process. The first step is to find and reach out to the relevant team and share the File Analytics application metadata details with them.

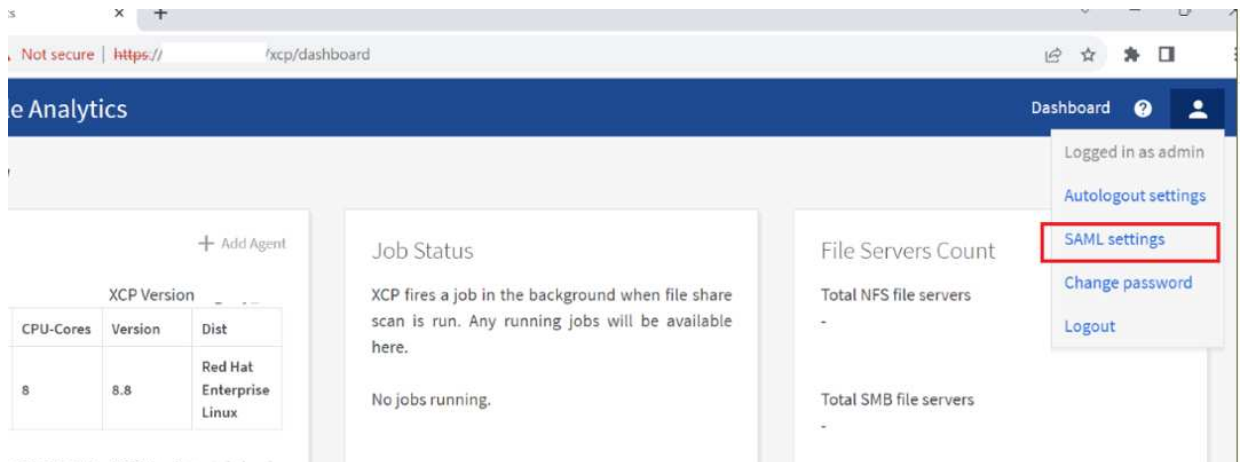

The following are the mandatory details that you must share to register with your identity provider:

- **Service provider entity ID:** `https://<IP address of linux machine>/xcp`
- **Service provider Assertion Consumer Service (ACS) URL:** `https://<IP address of linux machine>:5030/api/xcp/SAML/sp`

You can also verify these details by logging in to the File Analytics UI:

- a. Log in to the GUI using the steps described in [Log in to the File Analytics GUI](#).
- b. Select the **User** icon on the top right corner of the page, then select **SAML settings**.

Check **Service provider settings** in the drop down menu that appears.

After registration, you receive the IdP endpoint details for your enterprise. You are required to provide this IdP endpoint metadata to the File Analytics UI.

2. Provide the IdP details:
 - a. Go to **Dashboard**. Select the **User** icon at the top right corner of the page and select **SAML settings**.
 - b. Input the IdP details that you obtained after registration.

Example

- c. Select the **Enable SAML** checkbox to permanently enable SAML-based SSO.
- d. Select **Save**.
- e. Log out of File Analytics and log back in again.

You are redirected to your enterprise SSO page.

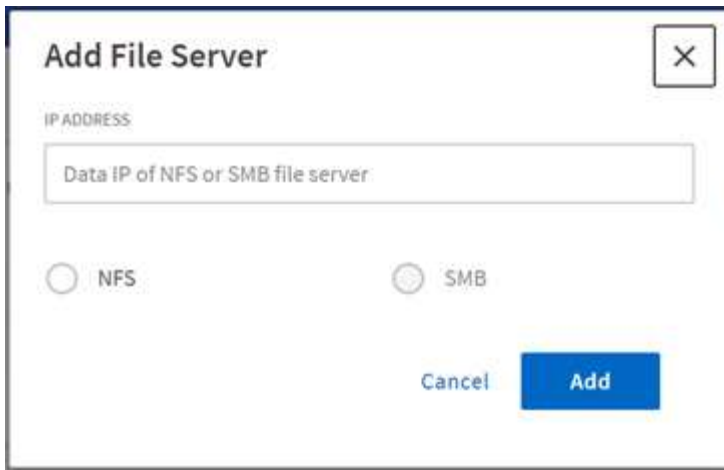

Add file servers

You can configure NFS and SMB exported file systems in the XCP File Analytics GUI.

This enables XCP File Analytics to scan and analyze data on the file system. Use the following steps to add NFS or SMB file servers.

Step

1. To add file servers, select **Add File Server**.

A dialog box titled "Add File Server" with a close button (X) in the top right corner. It contains a label "IP ADDRESS" above a text input field with the placeholder text "Data IP of NFS or SMB file server". Below the input field are two radio buttons: "NFS" (which is selected) and "SMB". At the bottom of the dialog are two buttons: "Cancel" and "Add".

Add the file server IP address, select the NFS or SMB option and click **Add**.

If an SMB agent is not visible in the GUI, you will not be able to add SMB server.

After adding the file server, XCP displays:

- Total file shares available
- File shares with analytics data
(The initial count is "0", this updates when you run a successful scan)
- Total space utilization – the sum of space utilized by all the exports
- The data for file shares and space utilization is real-time data direct from the NFS/SMB server. Collecting and processing the data takes several seconds.

Space available versus space used in File Analytics is calculated from each exported file system available over NFS. For example, if the volumes consist of qtrees and the exports are created over a qtree, the overall space is the cumulative space of the volume size and the qtree size.

Run a scan

When the NFS/SMB files system is added to the XCP File Analytics GUI, you can start a file system scan to analyze and represent the data.

Steps

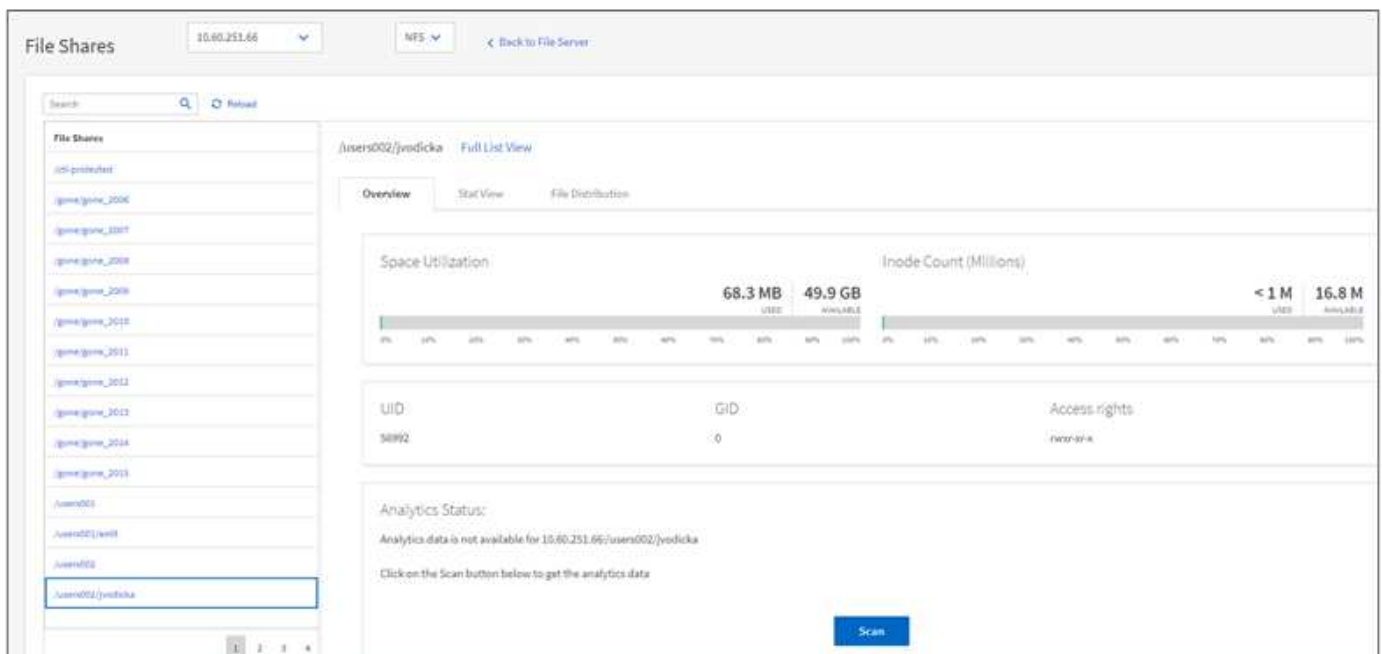

1. Select the arrow on the added file server card to view the file shares on the file server.

2. From the list of file shares, select the name of the file share to scan.
3. Select **Scan** to start the scan.

XCP displays a progress bar for the scan.

4. When the scan is complete the **stat view** and **file distribution** tabs are enabled to allow you to view graphs.

Learn about graphs

The File Analytics GUI dashboard displays multiple graphs for visualizing File Analytics.

Hot Cold Count Graph

XCP File Analytics categorizes files not accessed for 90 days as cold data. Files accessed in the last 90 days are hot data. Criteria to define hot and cold data is based on access time only.

The Hot Cold Count graph displays the number of inodes (in millions) that are hot or cold in XCP NFS. In XCP SMB, this graph denotes the number of files that are hot or cold. The colored bar represents the hot data and shows the percentage of files accessed within 90 days.

Hot Cold Size Graph

The Hot Cold Size graph displays the percentage of files that are hot and cold and the total size of the files in each category. The colored bar represents the hot data and the uncolored part represents the cold data. Criteria to define hot and cold data is based on access time only.

Entries in Directory Graph

The Entries in Directories graph displays the number of entries in directories. The Depth column contains different directory sizes and the Count column indicates the number of entries in each directory depth.

File Distribution by Size Graph

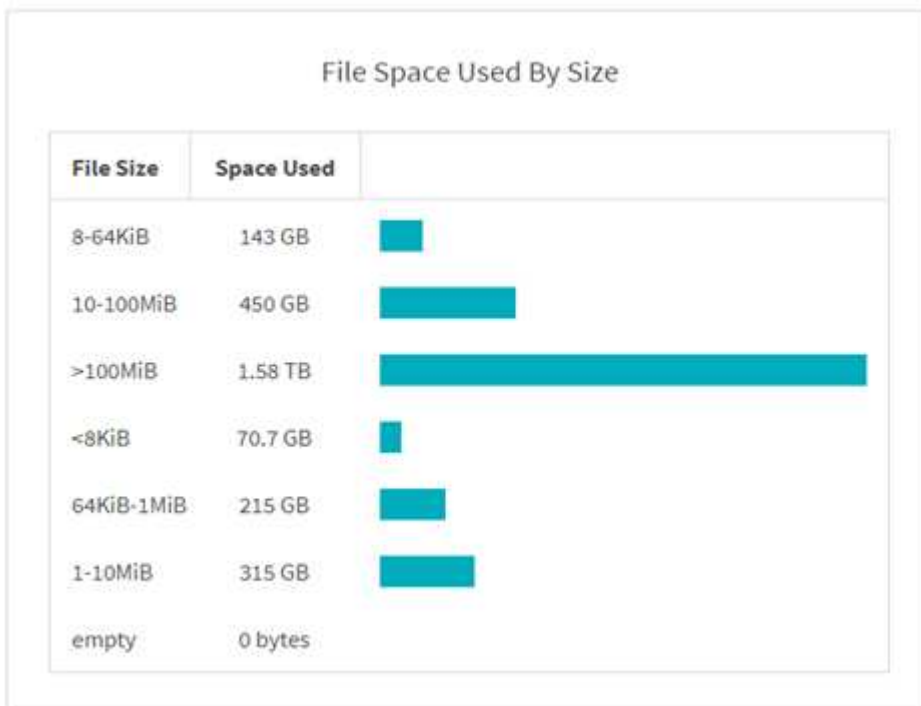

The File Distribution by Size graph displays the number of files that are under the given file sizes. The File Size column contains the categories of file size and the Count column indicates the distribution of the number of files.

Directory Depth Graph

The Directory Depth graph represents the distribution of the number of directories in various directory depth ranges. The Depth column contains various directory depths and the Count column contains the count of each directory depth in the file share.

File Space Used by Size Graph

The File Space Used by Size graph displays the number of files in different file-size ranges. The File Size column contains different file size ranges and the Space Used column indicates the space used by each file size range.

Space Occupied by Users Graph

Space Occupied By Users

| Username | Space Used | |
|----------|------------|---|
| 4568 | 47.8 GB |  |
| 14952 | 67.1 GB |  |
| 19592 | 48.2 GB |  |
| 48973 | 54.5 GB |  |
| 50900 | 47.3 GB |  |

12

The Space Occupied by Users graph displays the space used by users. The Username column contains the names of users (UID when usernames cannot be retrieved) and the Space Used column indicates the space used by each username.

Files Accessed/Modified/Created Graph

The Files Accessed/Modified/Created graph displays the count of files changed over time. The X-axis represents the period of time within which changes were made and the Y-axis represents the number of files changed.

To get the access time (atime) graph in SMB scans, check the box for preserving atime before running a scan.

File Size Accessed/Modified/Created Graph

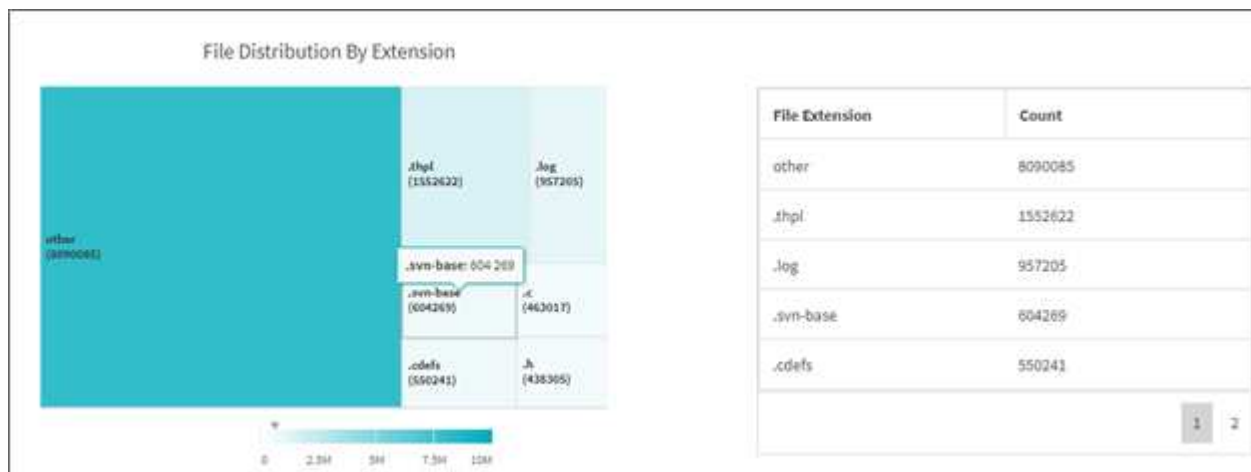

The File Size Accessed/Modified/Created graph displays the size of files changed over time. The X-axis represents the period of time within which changes were made and the Y- axis represents the size of files changed.

To get the access time (atime) graph in SMB scans, check the box for preserving atime before running a scan.

File Distribution by Extension Graph

The File Distribution by Extension graph represents the count of the different file extensions in a file share. The size of the divisions representing the extensions is based on the number of files with each extension.

Additionally, for SMB shares, you can get the number of alternate data streams files for each file extension by checking the box for alternate data streams before running a scan.

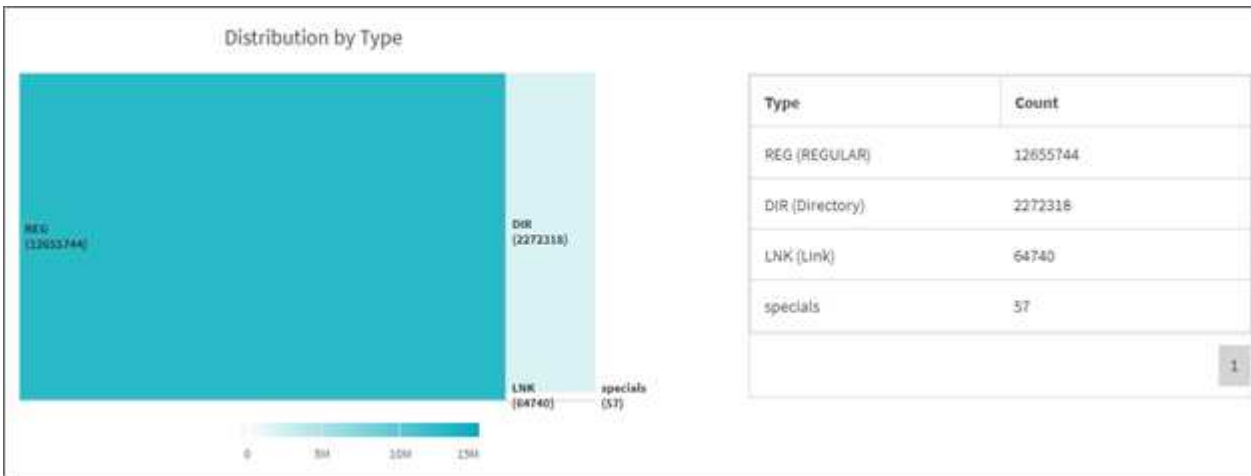

File Size Distribution by Extension Graph

The File Size Distribution by Extension graph represents the cumulative size of the different file extensions in a file share. The size of the divisions representing the extensions is based on the size of files with each extension.

File Distribution by Type Graph

The Distribution by Type graph represents the count of the following types of files:

- REG: Regular files
- LNK: Files with links
- Specials: Files with device files and character files.
- DIR: Files with directories

- Junction: Available in SMB only

Additionally, for SMB shares, you can get the number of alternate data streams files for different types by checking the box for alternate data streams before running a scan.

Filters

XCP provides filter options that can be used in XCP operations.

XCP uses filters for `-match` and `-exclude` options for NFS and SMB.

For NFS, run `xcp help info` and refer to the FILTERS section to see how to use `-match` and `-exclude` filters.

For SMB, run `xcp help -match` and `xcp help -exclude` to get more details on match and exclude filters.

If you want to use filters in XCP commands, run `xcp help <command>` to see if they are supported options.

Logging for NFS and SMB (optional)

Logging for XCP NFS and SMB.

XCP supports configuring multiple optional features by using the `xcpLogConfig.json` JSON configuration file. To enable only specific features, manually create the `xcpLogConfig.json` configuration file. You can use the `xcpLogConfig.json` configuration file to enable:

- event log messages
- syslog client for XCP
- custom XCP logging

Event log messages and the syslog client are disabled in the default configuration. Configuration is common for both NFS and SMB.

| Config JSON file location | NFS | SMB |
|--|---|--------------------------|
| Config file default location | /opt/NetApp/xFiles/xcp/ | C:\NetApp\XCP\ConfigFile |
| Custom location requires the XCP_CONFIG_DIR environment variable | Use the location you have set against the XCP_CONFIG_DIR variable | N/A |

The JSON configuration file options are case sensitive. These options are the same for XCP NFS and XCP SMB.

| Sub options name | JSON data type | Default | Description |
|------------------|----------------|----------|---|
| logConfig | | | Option to customize XCP logging. |
| "level" | String | INFO | Log message severity filter level. XCP log messages support five severity levels in order of decreasing severity: CRITICAL, ERROR, WARNING, INFO, DEBUG (NetApp strongly recommends using INFO or DEBUG) |
| "maxBytes" | Integer | 52428800 | Size of each rotating log file. Max supported rotation files are 10. |
| "name" | String | xcp.log | Option to set custom log file name. |
| eventlog | | | Option to configure event log message. |
| "isEnabled" | Boolean | true | This boolean option is used to enable event messaging. Setting it to <code>false</code> will not generate any event messages and no event logs will be published to event log file. |
| "level" | String | INFO | Event message severity filter level. Event messaging support five severity levels in order of decreasing severity: CRITICAL, ERROR, WARNING, INFO, DEBUG |
| syslog | | | Option to configure syslog messaging. |
| "isEnabled" | Boolean | false | This boolean option is used to enable syslog client in XCP. |
| "level" | String | INFO | Message severity filter level. XCP event log messages support five severity levels in order of decreasing severity: CRITICAL, ERROR, WARNING, INFO, DEBUG |
| "serverIp" | String | None | Remote syslog server IP addresses or hostname. |
| "port" | Integer | 514 | Remote syslog receiver port. Syslog receivers accepting syslog datagrams on a different port can be configured with port option UDP port 514 but you can also configure to the desired port. |

| Sub options name | JSON data type | Default | Description |
|------------------|----------------|---------|--|
| "sanitize" | Boolean | false | <p>A common option for XCP support; setting its value to true hides sensitive information (IP and username) in the messages going to support (logging, events, syslog, and so on).</p> <p>For example, with the <code>sanitize</code> option as false:</p> <pre>* 2020-07-17 03:10:23,779 - INFO - 12806 xcp xcp Paths: ['10.234.104.251:/cat_vol'] * 2020-07-17 03:10:23,778 - INFO - 12806 xcp xcp User Name: root</pre> <p>With the <code>sanitize</code> option as true:</p> <pre>* 2020-07-17 03:13:51,596 - INFO - 12859 xcp xcp Paths: ['IP: XX.XX.XX.XX:/cat_vol'] * 2020-07-17 03:13:51,595 - INFO - 12859 xcp xcp User Name: * * *</pre> |

Create the JSON configuration file

If you want to enable event log messages, the syslog client, or customer logging, complete the following steps.

Steps

1. Open any text editor, such as notepad or vi.
2. Create a new file with the following JSON template.

```
{
  "logConfig": {
    "level": "INFO",
    "maxBytes": 52428800,
    "name": "xcp.log"
  },
  "eventlog": {
    "isEnabled": false,
    "level": "INFO"
  },
  "syslog": {
    "isEnabled": false,
    "level": "INFO",
    "serverIp": "10.234.219.87",
    "port": 514
  },
  "sanitize": false
}
```

3. For any features that you want to enable, change the `isEnabled` value to `true`.
4. Name the file `xcpLogConfig.json` and save it to the default location: `/opt/NetApp/xFiles/xcp/`

If the `XCP_CONFIG_DIR` environment variable is set, save the `xcpLogConfig.json` file in the same location that is set against the `XCP_CONFIG_DIR` variable.

| Default configuration | Example json configuration file |
|---|---|
| <pre>{ "logConfig": { "level": "INFO", "maxBytes": 52428800, "name": "xcp.log" }, "sanitize": false }</pre> | <pre>{ "logConfig": { "level": "INFO", "maxBytes": 52428800, "name": "xcp.log" }, "eventlog": { "isEnabled": false, "level": "INFO" }, "syslog": { "isEnabled": false, "level": "INFO", "serverIp": "10.234.219.87", "port": 514 }, "sanitize": false }</pre> |

Migrate data

Migrate NFS data

After planning the migration with the `show` and `scan` commands, you can migrate the NFS data.

Copy

The `copy` command scans and copies the entire source directory structure to a destination NFSv3 export. The `copy` command requires having source and destination paths as variables. The scanned and copied files, throughput/speed, and elapsed time details are displayed at the end of the copy operation.

Example:

```
xcp copy <source_nfs_export_path> <destination_nfs_export_path>
```

POSIX path example:

```
xcp copy -newid <id> file:///mnt/source file:///mnt/dest
```

Run `xcp help copy` for more details.

Resume

The `resume` command restarts a previously interrupted copy operation by specifying the catalog index name or number. The catalog index name or number of the previous copy operation is stored on the `<catalog path>:/catalog/indexes` directory.

Example:

```
xcp resume -id <catalog_name>
```

Run `xcp help resume` for more details.

Sync

The `sync` command scans for changes and modifications performed on a source NFS directory using a catalog index tag name or the number of a previous copy operation. Source incremental changes are copied and applied to the target directory. The old catalog index numbers are replaced with a new one after the sync operation.

Example:

```
xcp sync -id <catalog_name>
```

Run `xcp help sync` for more details.

Verify

The `verify` command uses a full byte-by-byte data comparison between source and target directories after the copy operation without using a catalog index number. The command checks for modification times and other file or directory attributes, including permissions. The command also reads the files on both sides and compares the data.

Example:

```
xcp verify <source_ip_address>:/source_vol  
<destination_ip_address>:/dest_vol
```

POSIX path example:

```
xcp verify file:///mnt/source file:///mnt/dest
```

Run `xcp help verify` for more details.

iSync

The `isync` command compares the source and destination and synchronizes the differences on the target without using the catalog index.

Example

```
xcp isync <source_ip_address>:/src <destination_ip_address>:/dest
```

You can use `isync` with the `estimate` option to estimate the time it takes for the `isync` command to synchronize the incremental changes. The `-id` parameter specifies the catalog name of a previous copy operation.

If you change more than 25% of the data set size used, the `isync estimate` command might not show the expected results.

Example

```
xcp isync estimate -id <name>
```

Run `xcp help isync` for more details.

Migrate SMB data

After planning the migration with the `show` and `scan` commands, you can migrate the SMB data.

Copy

The `copy` command scans and copies the entire source directory structure to a destination SMB share. The `copy` command requires having source and destination paths as variables. The scanned and copied files, throughput/speed, and elapsed time details are printed to the console once every five seconds.

During the copy operation, you can use the `-preserve-atime` flag with the `copy` command to preserve access time at the source.

Example:

```
C:\xcp>xcp copy \\<IP address or hostname of SMB server>\source_share  
\\<IP address of SMB destination server>\dest_share
```

Run `xcp help copy` for more details.

Sync

The `sync` command scans for changes and modifications in the source and target shares in parallel, and applies the appropriate actions (remove, modify, rename, and so on) to the target to make sure that the target is identical to the source.

The `sync` command compares data content, time stamps, file attributes, ownership, and security information.

During the sync operation, you can use the `-preserve-atime` flag with the `sync` command to preserve access time at the source.

Example:

```
C:\xcp>xcp sync \\<IP address or hostname of SMB server>\source_share  
\\<IP address of SMB destination server>\dest_share
```

Run `xcp help sync` for more details.

Verify

The `verify` command reads both source and target shares and compares them, providing information about what is different. You can use the command on any source and destination, regardless of the tool used to perform the copy or sync.

During the verify operation, you can use the `-preserve-atime` flag with the `verify` command to preserve access time at the source.

Example:

```
C:\xcp>xcp verify \\<IP address or hostname of SMB server>\source_share  
\\<IP address of SMB destination server>\dest_share
```

Run `xcp help verify` for more details.

NTFS alternate data streams migration for SMB

Beginning with XCP 1.9.3, XCP SMB supports migration of NTFS alternate data streams by using the `-ads` option with the XCP SMB commands.

Supported use cases

You can use the XCP SMB `copy` and `sync` commands to migrate data that includes alternate data streams, and the XCP SMB `scan` command to scan the SMB share for alternate data streams.

Supported XCP SMB commands

The following XCP SMB commands support the `-ads` option:

- `scan`
- `copy`
- `verify`
- `sync`

Command examples

The following example commands show how to use the `-ads` option:

- `xcp scan -ads \\<SMB share>`
- `xcp copy -ads \\<source SMB share> \\<destination SB share>`
- `xcp sync -ads \\<source SMB share> \\<destination SB share>`
- `xcp verify -ads \\<source SMB share> \\<destination SB share>`

Migrate HDFS data

After planning the migration with the `scan` command, you can migrate the HDFS data.

Copy

The `copy` command scans and copies the entire source Hadoop Distributed File System (HDFS) data to an NFS or Simple Storage Service (S3) bucket. The `copy` command requires having source and destination paths as variables. The scanned and copied files, throughput, speed, and elapsed time details are displayed at the end of the copy operation.

NFS path example:

```
xcp copy -newid <id> hdfs:///demo/user dst_server:/dst_export
```

POSIX path example:

```
xcp copy -newid <id> hdfs:///demo/user file:///mnt/dest
```

S3 path example:

```
xcp copy -newid <id> hdfs:///demo/user s3://my-bucket  
xcp copy -newid <id> -s3.profile <s3 profile name> -s3.endpoint <endpoint-url> hdfs:///demo/user s3://my-bucket
```

Run `xcp help copy` for more details.

Resume

The `resume` command restarts a previously interrupted copy operation by specifying the catalog index name or number. The catalog index name or number of the previous copy operation is stored in the `<catalog path>:/catalog/indexes` directory.

Example:

```
xcp resume [options] -id <id used for copy>  
xcp resume [options] -s3.profile <s3 profile name> -s3.endpoint <endpoint-url> -id <id used for copy>
```

By default, the XCP `resume` command uses the S3 endpoint and S3 profile from the copy index that was used during the `copy` command. However, if new `-s3.endpoint` and `-s3.profile` values are provided with the `resume` command, the new values for the options are used and the values used with the `copy` command are overridden.

Run `xcp help resume` for more details.

Verify

The `verify` command uses a full byte-by-byte data comparison between source and target directories after the copy operation without using a catalog index number. The command reads the files on both sides and compares the data.

Example:

```
xcp verify hdfs:///demo/user dst_server:/dst_export
```

POSIX path example:

```
xcp verify hdfs:///user/demo1/data file:///user/demo1/dest
```

S3 path example:

```
xcp verify hdfs:///user/demo1/data s3://my-bucket  
xcp verify -s3.profile <s3 profile name> -s3.endpoint <endpoint-url>  
hdfs:///demo/user s3://my-bucket
```

Run `xcp help verify` for more details.

Run multiple XCP jobs on the same XCP host

Beginning with XCP 1.9.2, you can run multiple XCP jobs or commands on a single XCP host, provided that the host has sufficient resources for each job. When you run a command that supports multiple jobs, XCP uses minimal host memory to complete the job, which creates the capacity to run additional jobs on the same host configuration.

Minimum system requirements

For each XCP job, you should allow up to 64GB of host memory and eight cores for medium to large migrations.

Running multiple XCP jobs on the same host is not supported for SMB data migration.

Logging

By default, each XCP job is logged in a separate log file that is unique to the job ID. This logging mechanism works well when running multiple jobs on the same individual host. NetApp does not recommend changing the `xcpLogConfig.Json` file to use a single `xcp.log` file to log multiple XCP jobs running in parallel on the same host.

Supported commands

Running multiple XCP jobs on the same host is supported with the following XCP commands:

- `scan`
- `copy`
- `resume`
- `verify`

- `isync`
- `chmod`
- `chown`
- `delete`

Unsupported commands

Running multiple XCP jobs on the same host is not supported with the `sync` command.

Additional NFS features

XCP includes some additional NFS features.

Chown and Chmod

You can use the XCP `chown` and `chmod` commands to recursively change all of the files and directories for a given NFS share or POSIX path. This increases the performance of millions of files.

Before changing the ownership of the files, you must configure the new owner. Otherwise, the command will fail. The XCP `chown` and `chmod` commands work similar to the Linux `chown` and `chmod` commands.

Chmod

The `chmod` command scans and changes the file permission of all files in the chosen directory structure. The `chmod` command requires a mode or reference and an NFS share or POSIX path as variables. XCP `chmod` recursively changes the permissions for a given path. You can use the `chmod` command to display the total files scanned and the permissions that have been changed in the output.

Example:

```
xcp chmod -mode 777 NFS [server:/export path | file://<NFS mounted path>]
xcp chmod -mode 707 nfs_server01.netapp.com:/export1
xcp chmod -reference nfs_server01.netapp.com:/export/dir1/file.txt
nfs_server02.netapp.com: export1
xcp chmod -match "fnm('file.txt')" -mode 111 file:///mnt/nfs_mount_point/
xcp chmod -exclude "fnm('file.txt')" -mode 111 file:///demo/user1/
```

Run the `xcp help chmod` command for more information.

Chown

You can use the XCP `chown` command to recursively change all of the files and directories for a given NFS share or POSIX path. This increases the performance of millions of files.

The `chown` command scans and changes the ownership of all files in the chosen directory structure. The `chown` command requires an NFS share or POSIX path as variables. XCP `chown` recursively changes the

ownership for a given path.

Example

```
xcp chown -user user1 NFS [server:/export path | file:///<NFS mounted path>
xcp chown -user user1 nfs_server01.netapp.com:/export1
xcp chown -user user1 -group group1 nfs_server01.netapp.com:/export1/dir1/
xcp chown -reference nfs_server01.netapp.com:/export/dir1/file.txt
nfs_server02.netapp.com:/export1
xcp chown -match "fnm('file.txt')" -user user1
file:///mnt/nfs_mount_point/
xcp chown -exclude "fnm('file.txt')" -user user1 -group group1
xcp chown -user-from user1 -user user2 file:///mnt/nfs_mount_point/
xcp chown -group-from group1 -group group2
nfs_server01.netapp.com:/export1/
```

Run the `xcp help chown` command for more information.

XCP Estimation

The XCP estimation feature estimates the time to complete a baseline `copy` operation from the source to the destination. It calculates the estimated time to complete a baseline `copy` operation by using all the currently available system resources such as CPU, RAM, network, or other parameters. When you use the `-target` option, XCP runs a sample copy operation to find the estimation time.

Example

```
server : NFS server IP
export : NFS exported path for the above IP

xcp static estimation
xcp estimate -id <scan id>

xcp live estimation with default time
xcp estimate -id <scan id> -target server:/export

xcp live estimation with -t option
xcp estimate -id <scan id> -t <time for which estimation should run>
-target server:/export
```

indexdelete

You can use the `indexdelete` command to delete catalog indexes.

Example

```
xcp indexdelete
```

Run `xcp help indexdelete` for more details.

Troubleshoot

Troubleshoot XCP NFS errors

Review the solutions to troubleshoot your issue.

XCP issues and solutions

| XCP issue | Solution |
|---|--|
| <code>xcp: ERROR: compare batches: Incompatible index file. Please use the index file generated with the current version of XCP only. Alternatively, you can download an older XCP binary from xcp.netapp.com.</code> | You are trying to perform operations on an index that was generated using an XCP version older than XCP 1.9. This is not supported. It is recommended to complete any in-progress migrations and then switch to this version of XCP. Alternatively, you can re-run the <code>scan</code> , <code>copy</code> or <code>verify</code> commands to generate a new index with XCP 1.9. |
| <code>xcp: ERROR: must run as root</code> | Execute XCP commands as root user |
| <code>xcp: ERROR: License file /opt/NetApp/xFiles/xcp/license not found.</code> | Download the license from the XCP site , copy it to <code>/opt/NetApp/xFiles/xcp/</code> , and activate it by running the <code>xcp activate</code> command. |
| <code>xcp: ERROR: This license has expired</code> | Renew or obtain the new XCP license from the XCP site . |
| <code>xcp: ERROR: License unreadable</code> | License file might be corrupted. Obtain the new XCP license from the XCP site . |
| <code>xcp: ERROR: XCP not activated, run 'activate' first</code> | Run the <code>xcp activate</code> command |
| This copy is not licensed | Obtain the appropriate XCP license file. Copy the XCP license to the <code>/opt/NetApp/xFiles/xcp/</code> directory on the XCP server. Run the <code>xcp activate</code> command to activate the license. |
| <code>xcp: ERROR: Failed to activate license: Server unreachable</code> | You are trying to activate the online license and your host system is not connected to the internet. Make sure your system is connected to the internet. |
| <code>xcp: ERROR: Failed to activate license: Server xcp.netapp.com unreachable</code> <code>xcp: HINT: Configure DNS on this host or return to the license page to request a private license</code> Expected error: Failed to activate license: Server <code>xcp.netapp.com</code> unreachable | Make sure <code>xcp.netapp.com</code> is reachable from your host or request for the offline license |

| XCP issue | Solution |
|---|---|
| xcp: ERROR: Catalog inaccessible: Cannot mount nfs_server:/export[:subdirectory] | Open the editor on the XCP Linux client host and update the configuration file with the proper catalog location. The XCP configuration file is located at /opt/NetApp/xFiles/xcp/xcp.ini. Sample entries of configuration file: [root@scspr1949387001 ~]# cat /opt/NetApp/xFiles/xcp/xcp.ini [xcp] catalog = 10.235.128.153:/catalog |
| nfs3 error 2: no such file or directory | Operation did not find the source file(s) on the target NFS export. Run the xcp sync command to copy the incremental updates from source to destination |
| xcp: ERROR: Empty or invalid index | Previous copy operation was interrupted before the index file was created. Rerun the same command with the new index and when the command is executing, verify that the keyword “indexed” is displayed in the stats. |
| xcp: ERROR: compare batches: child process failed (exit code -9): recv <type 'exceptions.EOFError'> | Follow the instructions in the following KB article: Cannot allocate memory when synching NFS data |
| xcp: ERROR: For xcp to process ACLs, please mount <path> using the OS nfs4 client | Mount the source and target on the XCP host using NFSv4, for example, mount -o vers=4.0 10.10.10.10:/source_vol /mnt/source |
| The XCP verify command fails during a migration. The STATUS shows as FAILED. (Live) | The XCP verify command was run when the source was live. Run the XCP verify command after the final cutover. |
| The XCP verify command fails after a cutover. (Live) | The XCP cutover sync operation might not have copied all the data. Rerun the XCP sync command followed by the verify command after the final cutover. If the problem persists, contact technical support. |
| The XCP sync command fails (this applies to all sync failures during migrations). (Live) | XCP is not able to read the data, this might be due to an XCP issue. Check the XCP STATUS message after the command operation completes. Rerun the sync command. If the sync operation fails again, contact technical support. |
| The XCP copy, resume, and sync commands fail due to insufficient memory. XCP crashes and the XCP status shows as FAILED. (Live) | There is low available memory on the host or there has been a huge incremental change. Follow the instructions in the following KB article: Cannot allocate memory when synching NFS data |
| mnt3 error 13: permission denied | As a non-root user, you do not have the correct permissions to access the file system. Check if you can access the file system and perform read write operations. |

| XCP issue | Solution |
|--|--|
| xcp: batch 1: ERROR: [Errno 13] Permission denied: | As a non-root user, you do not have the correct permissions to access the file system. Check if you can access the file system and perform read write operations. |
| mxcp: ERROR: OSMounter 'file:///t/10.234.115.215_src_vol/DIR': [Errno 2] No such file or directory | The path /t/10.234.115.215_src_vol/ DIR is not mounted on the Linux file system. Check if the path exists. |
| ERROR: run sync {-id: 'xcp_index_1624263869.3734858'}: sync not yet available for hdfs/ posix/s3fs sources and targets -workaround is copy with a match filter for recent mods | The sync command is not supported in XCP for the POSIX and HDFS connectors. |
| The xcp verify command fails with different mod time | You can identify the file and manually copy the file to the destination. |
| Non dir object copy/sync can not be resumed; try copy again. For more details please refer XCP user guide. | Because you cannot resume a single file, it is recommended to run the xcp copy command again for the file. Any change in the file leads to a complete copy of the file. As a result, performance is not affected. |
| Non dir object can not be synced; try copy again. For more details please refer XCP user guide. | Because you cannot sync a single file, it is recommended to run the xcp copy command again for the file. Any change in the file leads to a complete copy of the file. As a result, performance is not affected. |

|---|--|
| <p>The SnapLock volume does not retain the WORM files after an <code>xcp copy</code> operation.</p> | <p>XCP copies the WORM files to the volume successfully but the files are not retained by the SnapLock volume.</p> <ol style="list-style-type: none"> 1. Perform the <code>xcp copy</code> operation from the source to the destination volume: <pre>xcp copy src_server:/src_export dst_server:/dst_export</pre> 2. Use the <code>xcp chmod</code> command to change the file permissions on the destination volume to readonly: <pre>xcp chmod -mode a-w dst_server:/dst_export</pre> <p>When the above steps are complete, the SnapLock volume starts retaining the copied files.</p> <div data-bbox="850 772 1412 982">  <p>The retention time of a SnapLock volume is governed by the volume's default retention policy. Check the volume retention settings before starting migration: Set the retention time</p> </div> |

Logdump

If you encounter an issue with an XCP command or job, the `logdump` command enables you to dump log files related to the issue into a `.zip` file that can be sent to NetApp for debugging. The `logdump` command filters logs based on the migration ID or job ID and dumps those logs into a `.zip` file in the current directory. The `.zip` file has the same name as the migration or job ID that is used with the command.

Example

```
xcp logdump -j <job id>
xcp logdump -m <migration id>
```

After migration, if you use the `XCP_CONFIG_DIR` or `XCP_LOG_DIR` environment variables to override the default config location or log location, the `logdump` command fails when used with an old migration or job ID. To avoid this, use the same logpath until migration completes.

Troubleshoot XCP SMB errors

Review the solutions to troubleshoot your issue.

| Issue | Solution |
|--|--|
| XCP commands do not show the expected results when a junction path is used in the source or destination. | Use an SMB share path instead of a junction path when running XCP commands. |
| <p>A traceback error might occur if the source, destination, or both is a junction with no directories and an online license is used in migration. If this occurs, the XCP command status is <code>PASSED</code> but the following error is returned at the end of the console output:</p> <pre>Error in atexit._run_exitfuncs: Traceback (most recent call last): File "xcp\stats.py", line 214, in call_home File "xcp\histograms.py", line 387, in calculate_averages ZeroDivisionError: division by zero</pre> | Use an offline license instead of an online license. |
| xcp: ERROR: This license has expired | Renew or obtain the new XCP license from the XCP site . |
| This copy is not licensed | Obtain the appropriate XCP license file. Copy the XCP license to the <code>c:\netapp\xcp</code> folder on the XCP host. Run the <code>xcp activate</code> command to activate the license |
| xcp: ERROR: XCP not activated, run 'activate' first | Download the XCP license from the XCP site . Copy the file on the XCP Linux client host at <code>c:\netapp\xcp</code> on the XCP host. Run the <code>xcp activate</code> command to activate the license. |
| xcp: ERROR: License file C:\NetApp\XCP\license not found | Register for the XCP license on the XCP site . Download and copy the license file to <code>C:\NetApp\XCP\</code> on the XCP Windows client host. |
| xcp scan Error: The network name cannot be found | Rerun the command with correct share name |
| <p>xcp copy Error: ERROR failed to obtain fallback security principal</p> <p>Error message logged in xcp.log file:</p> <pre>pywintypes.error: (1722, 'LookupAccountName', 'The RPC server is unavailable.')</pre> | <p>Add the destination box in the hosts file (<code>C:\Windows\System32\drivers\etc\hosts</code>). | <p>xcp copy with ACL migration</p> <p>Error message logged in xcp.log file: pywintypes.error: (1314, 'GetNamedSecurityInfo', 'A required privilege is not held by the client.')</p> | <p>An issue related to security descriptors because the migration user account only has the required privileges for XCP to retrieve owner, group, and DACL. It cannot retrieve SACL.</p> <p>Add your migration user account to the "Manage Audit and Security Log" policy in your Active Directory.</p> <p>Reference: Manage auditing and security log</p> |

Troubleshoot XCP File Analytics errors

Review the solutions to troubleshoot your issue.

| Issue | Solution |
|---------------------------|--|
| PostgreSQL service failed | <p>Run configure again and select the installation option. If the previous installation was successful, you can select the repair option. If you are still getting the error, try manual steps as follows:</p> <ol style="list-style-type: none"> Restart the PostgreSQL service: <pre>sudo systemctl restart postgresql.service</pre> Check the service status: <pre>sudo systemctl status postgresql.service grep Active</pre> |

| Issue | Solution |
|--|--|
| HTTPD service failed | <p>Run configure again and select the installation option. If the previous installation was successful, you can select the repair option. If you are still getting the error, try manual steps as follows:</p> <ol style="list-style-type: none"> 1. Restart the HTTPD services: <pre>sudo systemctl restart httpd</pre> 2. Check the HTTPD service status: <pre>sudo systemctl status httpd grep Active</pre> |
| Not able to open login page after successful install | <p>Verify that your system can ping the Linux machine where XCP File Analytics is installed and HTTPD is running. If the services are not running, run <code>configure</code> and choose the repair option.</p> <p>Verify that you are using a supported browser version. See the IMT.</p> |
| User login failed | <ul style="list-style-type: none"> • Verify that you are using a supported browser version. See the IMT. • Verify that the user is “admin” and the password is correct. • Verify that the XCP service is running by issuing <code>xcp service status</code>. • Verify that port 5030 is open on Linux. Open the application at <code>https:// <linux ip> :5030/api/xcp</code>, and confirm that the <code>messagereads msg: Missing Authorization Header</code>. • Check whether the <code>xcp.ini</code> file is present in the <code>/opt/NetApp/xFiles/xcp/</code> location. To reset the <code>xcp.ini</code> file, run the configuration script and select the Repair option. Next, select the menu option to rebuild xcp.ini file. • Manually run the <code>xcp --listen</code> command on the CLI and try logging in. If you do not receive a request on the server, re-check the installation and the ports used for communication with the server. After you verify that the installation is correct, run the <code>service xcp start</code> command to restart the service. |
| XCP GUI is not showing updated pages | Clear the cache and try again |
| XCP service is not starting | To run the <code>xcp</code> service, use the <code>sudo systemctl start xcp</code> command. Alternatively, run the configuration script and select the Repair option to start the services that are stopped. |

| Issue | Solution |
|--|---|
| Failed to scan file share | <p>File share/volume might not be readable. Check manually whether the file share is accessible/readable by running the <code>xcp show</code> command.</p> <p>Also, check if the <code>xcp.ini</code> file is deleted. If it is deleted, rebuild the <code>xcp.ini</code> file by using the <code>configure.sh</code> script repair option.</p> |
| Could not load file servers | <p>Try a page refresh. If the problem persists, manually run the <code>xcp show</code> command on the prompt and check whether you can scan the file server. If successful, raise a ticket with NetApp customer support. If unsuccessful, check if the file server is active by performing a manual check.</p> <p>Check whether the <code>xcp.ini</code> file and license files are in the correct location. To reset the <code>xcp.ini</code> file, run the configuration script and select the Repair option. Next, select the menu option to rebuild xcp.ini file.</p> <p>Check the <code>xcpfalogs</code> logs to see if the license needs renewal.</p> |
| XCP File Analytics page is not displayed after system reboot | <p>XCP services might be down. Run the configuration script and select the option to Repair. This will restart all the services that are stopped.</p> |
| The total space for an exported file system on a given file server might show more space compared to the allocated physical storage. | <p>This can happen when there are qtree level exports inside the volume.</p> <p>For example, if the volume size that is exported as <code>/vol1</code> is 10 GB and there is a qtree inside the volume <code>/vol1/qtrees1</code>, then the <code>xcp show</code> command will show the <code>vol1</code> size as 10 GB and the <code>qtrees1</code> size as 10 GB. XCP File Analytics sums the space of both exports and gives the total space, in this case, 20 GB. It does not understand that <code>qtrees1</code> is a logical space.</p> |

XCP reference

XCP command reference overview

The XCP command reference provides examples of the available commands for XCP NFS and SMB. Each command has additional parameters that you can use alone or in combination, as required. XCP supports log file rotation and log filtering based on the severity level.

NFS command reference

help

The NFS `help` command displays a list of commands, command parameters, and a brief description of each. The `help` command is useful for beginners who are new to the XCP tool.

Syntax

```
xcp help
```

Show example

```
[root@client1 linux]# ./xcp help
USAGE:
xcp [[help] [command]] -version]
optional arguments:
help Show XCP help message and exit
-version Show XCP version number and exit
To see help text, you can run:
xcp help Display this content
xcp help info Step by step usage of all commands
xcp help <command> Individual command help
command:
activate Activate an XCP license on the current host
license Show XCP license information
show Request information from host about NFS exports
scan Read all the files from export path
copy Recursively copy everything from source to target
resume Resume copy operation from the point it was halted
sync Synchronize increment changes on source to target after copy
isync Sync changes on target without index
verify Verify that the target is the same as the source
delete Delete data on the NFS exported volume
chown Change the ownership on the NFS exported volume
chmod Change the permissions on the NFS exported volume
logdump Collect all logs related to the XCP job and dump those into
        a zipped folder named <ID>.zip under the current dir
estimate Estimate the time taken for the copy command to complete
indexdelete Remove indexes from catalog
```

help info

Use the `info` parameter with the `help` command to display documentation, examples, and tuning recommendations.

Syntax

```
xcp help info
```

Show example

```
[root@client1 linux]# ./xcp help info
```

COMMAND

info

USAGE

help info

DESCRIPTION

Step by step usage of the XCP command. Follow these steps after you copy the binary and license

1. Download the XCP license and XCP binary to the Linux machine. Run XCP activate: xcp activate

2. On a fresh system, the above command will fail when looking for a license in

/opt/NetApp/xFiles/xcp.

Copy the XCP license to /opt/NetApp/xFiles/xcp and run the activate command again: xcp activate

3. Check the validity of the license: xcp license

4. Configure the ini file located at /opt/NetApp/xFiles/xcp/xcp.ini with catalog details: add catalog = catalog_nfs_server:/catalog_path

5. List all the exports and details from the NFS server: xcp show server

6. Pick up one of the exports and run a scan of the export: xcp scan server:/export1

7. Initiate baseline copy:

xcp copy -newid id1 server:/export1 server2:/e

8. If the copy is halted for some reason, you can use the "xcp resume" command to resume the copy operation:

xcp resume -id id1

9. Start with incremental sync after the baseline is completed:

```
xcp sync -id id1
```

10. After copy or after every sync, you can verify to check data integrity:

```
xcp verify server:/export1 server2:/export2
```

SUPPORTED COMMANDS

help: Display information about commands and options

-exclude: Display examples of filters

-fmt: Display examples of filters

-match: Display examples of filters

help info: Display documentation, examples, and tuning recommendations

show: Request information from hosts about NFS and other RPC services

-v: Show more detailed information about servers

-loglevel <name>: Option to set log level; available levels are INFO, DEBUG (default: INFO)

scan: Read all the directories in a file tree or a saved index

-l, -q: File listing output formats

-stats, -csv, -html: Tree statistics report formats

-nonames: Do not look up user and group names for file listings or reports

-newid <name>: Catalog name for a new index

-id <name>: Catalog name of a previous copy or scan index

-match <filter>: Only process files and directories that match the filter

-fmt <string expression>: Formatted output

-du: Summarize space usage of each directory, including subdirectories

-md5: Checksum the files (also save the checksum files when indexing) (default: False)

-duk: Summarize space usage of directory, include subdirectories, with output in kilobytes

-acl4: Process NFSv4 access control lists (ACLs)

-acl4.threads <n>: Per-process thread pool size (default: 100)

-depth <n>: Limit the search depth

-dircount <n[k]>: Request size for reading directories (default: 64k)

-edupe: Include deduplication estimate in reports (see documentation for details)

-bs <n[k]>: Read/write block size for scans that read data with -md5 or -edupe (default: 64k)

-parallel <n>: Maximum concurrent batch processes (default: 7)

-noId: Disable the creation of a default index (default: False)

-exclude <filter>: Exclude the files and directories that match the

filter

- preserve-ctime: preserve ctime of the file/dir (default: False)
- nodes <name>: comma-separated list of worker nodes
- s3.insecure: use http instead of https
- s3.noverify: do not verify ssl certificates
- s3.endpoint <S3 endpoint Url>: path such as https://10.10.10.101:1010
- s3.profile <profile-name>: config/cred profile to be used
- loglevel <name>: Option to set log level; available levels are INFO, DEBUG (default: INFO)

copy: Recursively copy everything from source to target

- newid <name>: Catalog name for a new index
- md5: Checksum the files (also save the checksum files when indexing) (default: False)
- edupe: Include deduplication estimate in reports (see documentation for details)
- nonames: Do not look up user and group names for file listings or reports
- acl4: Process NFSv4 access control lists (ACLs)
- acl4.threads <n>: Per-process thread pool size (default: 100)
- acl4.alwaysset: call "setacl" for all ACL-capable files and directories
- bs <n[k]>: read/write blocksize (default: 64k)
- dircount <n[k]>: Request size for reading directories (default: 64k)
- parallel <n>: Maximum concurrent batch processes (default: 7)
- noId: Disable the creation of a default index (default: False)
- match <filter>: Only process files and directories that match the filter

-exclude <filter>: Exclude the files and directories that match the filter

- copybatch <filename [args]>: custom batch processing module
- chown: set destination uid and gid when copying as non-root user (default: False)

- preserve-ctime: preserve ctime of the file/dir (default: False)
- nodes <name>: comma-separated list of worker nodes
- s3.insecure: use http instead of https
- s3.noverify: do not verify ssl certificates
- s3.endpoint <S3 endpoint Url>: path such as https://10.10.10.101:1010
- loglevel <name>: Option to set log level; available levels are INFO, DEBUG (default: INFO)

verify: Verify that the target is the same as the source

[no options]: Full verification of target structure, names, attributes, and data

- stats, -csv: Scan source and target trees in parallel and compare tree statistics

- nodata: Do not check data

- noattrs: Do not check attributes (default: False)

- noown: Do not check ownership (uid and gid) (default: False)
- nomods: Do not check file modification times
- mtimewindow <s>: Acceptable modification time difference for verification
- newid <name>: Catalog name for a new index
- v, -l: Output formats to list any differences found
- acl4: Process NFSv4 access control lists (ACLs)
- acl4.threads <n>: Per-process thread pool size (default: 100)
- nonames: Do not look up user and group names for file listings or reports
- match <filter>: Only process files and directories that match the filter
- bs <n[k]>: read/write blocksize (default: 64k)
- parallel <n>: Maximum concurrent batch processes (default: 7)
- dircount <n[k]>: Request size for reading directories (default: 64k)
- noId: Disable the creation of a default index (default: False)
- exclude <filter>: Exclude the files and directories that match the filter
- preserve-ctime: preserve ctime of the file/dir (default: False)
- s3.insecure: use http instead of https
- s3.noverify: do not verify ssl certificates
- s3.endpoint <S3 endpoint Url>: path such as https://10.10.10.101:1010
- s3.profile <profile-name>: config/cred profile to be used
- loglevel <name>: Option to set log level; available levels are INFO, DEBUG (default: INFO)

sync: Find all source changes and apply them to the target

- id <name>: Catalog name of a previous copy index
- snap <name or path>: Access a Snapshot copy of the source tree
- nonames: Do not look up user and group names for file listings or reports
- bs <n[k]>: read/write blocksize (default: 64k)
- dircount <n[k]>: Request size for reading directories (default: 64k)
- parallel <n>: Maximum concurrent batch processes (default: 7)
- acl4.threads <n>: Per-process thread pool size (default: 100)
- exclude <filter>: Exclude the files and directories that match the filter
- preserve-ctime: preserve ctime of the file/dir (default: False)
- loglevel <name>: Option to set log level; available levels are INFO, DEBUG (default: INFO)

sync dry-run: Find source changes but don't apply them to the target

- id <name>: Catalog name of a previous copy index
- snap <name or path>: Access a Snapshot copy of the source tree
- stats: Deep scan the modified directories and report on everything new
- nonames: Do not look up user and group names for file listings or

reports

- v, -l, -q: File listing output formats
- dircount <n[k]>: Request size for reading directories (default: 64k)
- parallel <n>: Maximum concurrent batch processes (default: 7)
- target: Check that the target files match the index
- loglevel <name>: Option to set log level; available levels are INFO, DEBUG (default: INFO)

isync: Sync changes on target without index

- nodata: Do not check data
- noattrs: Do not check attributes
- nomods: Do not check file modification times
- mtimewindow <s>: Acceptable modification time difference for

verification

- acl4: Process NFSv4 access control lists (ACLs)
- acl4.threads <n>: Per-process thread pool size (default: 100)
- acl4.alwaysset: call "setacl" for all ACL-capable files and

directories

- match <filter>: Only process files and directories that match the filter

- bs <n[k]>: read/write blocksize (default: 64k)
- parallel <n>: Maximum concurrent batch processes (default: 7)
- dircount <n[k]>: Request size for reading directories (default: 64k)
- exclude <filter>: Exclude the files and directories that match the

filter

- newid <name>: Catalog name for a new index
- loglevel <name>: Option to set log level; available levels are INFO, DEBUG (default: INFO)

- preserve-ctime: preserve ctime of the file/dir (default: False)
- s3.insecure: use http instead of https
- s3.noverify: do not verify ssl certificates
- s3.endpoint <S3 endpoint Url>: path such as
https://10.10.10.101:1010

- s3.profile <profile-name>: config/cred profile to be used

isync estimate: Find the estimated time to complete the next isync command

- nodata: Do not check data
- noattrs: Do not check attributes
- nomods: Do not check file modification times
- mtimewindow <s>: Acceptable modification time difference for

verification

- acl4: Process NFSv4 access control lists (ACLs)
- acl4.threads <n>: Per-process thread pool size (default: 100)
- acl4.alwaysset: call "setacl" for all ACL-capable files and

directories

- match <filter>: Only process files and directories that match the filter
- bs <n[k]>: read/write blocksize (default: 64k)
- parallel <n>: Maximum concurrent batch processes (default: 7)
- dircount <n[k]>: Request size for reading directories (default: 64k)
- exclude <filter>: Exclude the files and directories that match the filter
- loglevel <name>: Option to set log level; available levels are INFO, DEBUG (default: INFO)
- preserve-ctime: preserve ctime of the file/dir (default: False)
- s3.insecure: use http instead of https
- s3.noverify: do not verify ssl certificates
- s3.endpoint <S3 endpoint Url>: path such as https://10.10.10.101:1010
- s3.profile <profile-name>: config/cred profile to be used
- id <name>: Catalog name of a previous copy index

resume: Restart an interrupted copy

- id <name>: Catalog name of a previous copy index
- bs <n[k]>: read/write
- s3.insecure: use http instead of https
- s3.noverify: do not verify ssl certificates
- s3.endpoint <S3 endpoint Url>: path such as https://10.10.10.101:1010
- s3.profile <profile-name>: config/cred profile to be used
- loglevel <name>: Option to set log level; available levels are INFO, DEBUG (default: INFO)

delete: Delete everything recursively

- match <filter>: Only process files and directories that match the filter
- force: Delete without confirmation
- removetopdir: remove directory including children
- exclude <filter>: Exclude the files and directories that match the filter
- parallel <n>: Maximum concurrent batch processes (default: 7)
- preserve-ctime: preserve ctime of the file/dir (default: False)
- s3.insecure: use http instead of https
- s3.noverify: do not verify ssl certificates
- s3.endpoint <S3 endpoint Url>: path such as https://10.10.10.101:1010
- s3.profile <profile-name>: config/cred profile to be used
- loglevel <name>: Option to set log level; available levels are INFO, DEBUG (default: INFO)

activate: Activate a license on the current host
-loglevel <name>: Option to set log level; available levels are INFO, DEBUG (default: INFO)

license: Show xcp license info

license update: Retrieve the latest license from the XCP server

chown: changing ownership of a file object
exclude <filter>: Exclude the files and directories that match the filter
-match <filter>: Only process files and directories that match the filter
-group <group>: linux gid to be set at source
-user <user>: linux uid to be set at source
-user-from <userFrom>: user to be changed
-group-from <groupFrom>: group to be changed
-reference <reference>: referenced file or directory point
-v: reports output for every object processed
-preserve-ctime: preserve ctime of the file/dir (default: False)
-loglevel <name>: Option to set log level; available levels are INFO, DEBUG (default: INFO)

chmod: changing permissions of a file object
-exclude <filter>: Exclude the files and directories that match the filter
-match <filter>: Only process files and directories that match the filter
-reference <reference>: referenced file or directory point
-v: reports output for every object processed
-mode <mode>: mode to be set
-preserve-ctime: preserve ctime of the file/dir (default: False)
-loglevel <name>: Option to set log level; available levels are INFO, DEBUG (default: INFO)

logdump: Collect all logs related to the XCP job and dump those into a zipped folder named <ID>.zip under current dir
-m <migration ID>: Filter logs by migration ID
-j <job ID>: Filter logs by job ID

estimate: Use a saved scan index to estimate copy time

`-id <name>`: Catalog name of a previous copy or scan index
`-gbit <n>`: Gigabits of bandwidth to estimate best-case time (default: 1)
`-target <path>`: Target to use for live test copy
`-t <n[s|m|h]>`: Duration of live test copy (default: 5m)
`-bs <n[k]>`: read/write blocksize (default: 64k)
`-dircount <n[k]>`: Request size for reading directories (default: 64k)
`-parallel <n>`: Maximum concurrent batch processes (default: 7)
`preserve-ctime`:
 preserve ctime of the file/dir (default: False)
`-loglevel <name>`: Option to set log level; available levels are INFO, DEBUG (default: INFO)

`indexdelete`: delete catalog indexes
 `-match <filter>`: Only process files and directories that match the filter
 `-loglevel <name>`: Option to set log level; available levels are INFO, DEBUG (default: INFO)

OUTPUT

In the `-l` output, the size, space used, and modification time are all shown in human-readable format. Time is relative to the current time, so it is time zone independent. For example, "14dlh" means that the file was modified 14 days and one hour ago. Note: "current time" is the time XCP started. The timestamp is saved in the index metadata (catalog:/xFiles/indexes/*.json) and is used for reports against the index.

The `-stats` option prints a human-readable report to the console. Other report format options are `-html` or `-csv`. The comma-separated values (CSV) format has exact values. CSV and HTML reports are automatically saved in the catalog, if there is one.

The histograms for modified, accessed, and changed only count regular files.

FILTERS

A filter expression should evaluate to True or False in Python. Filters are used in XCP for the `-match` and `-exclude` options. See below for some examples of the filters. Use `"xcp help <command>"` to check which options are supported for commands.

Variables and file attributes currently available to use in a filter: modified, accessed, changed: Floats representing age in hours depth, size, used, uid, gid, type, nlinks, mode, fileid: Integers name, base,

ext: Strings (if name is "demo.sql" then base is == "demo" and ext is == ".sql") owner, group: Strings size units: k, m, g, t, p = K, M, G, T, P = 1024, 1048576, 2**30, 2**40, 2**50 file types: f, d, b, c, l, s, q = F, D, B, C, L, S, Q = 1, 2, 3, 4, 5, 6, 7

Functions available to use in a filter:

rxm(pattern): Regular expression match for each file name fnm(pattern): Unix-style wildcard match for each file name load(path): List of lines from a local (external) file rand(N): Match one out of every N files at random path(pattern): Wildcard match for the full path paths(<full_file_path>): Match or exclude all NFS export paths listed in the file Note: unlike most shell wildcards, pattern "/a/*" will match path /a/b/c

The rxm() function only runs Python re.compile (pattern) once. Similarly, load() only reads its file once.

Filter examples:

Match files modified less than half an hour ago "type == f and modified < .5"

Find anything with "core" in the name ("in" is a Python operator):
"'core' in name"

Same match using regular expressions: "rxm('.*core.*')"

Same match using wildcards: "fnm('*core*')"

Match files that are not regular files, directories, or links: "type not in (f,d,l)"

Find jpg files over 500 megabytes (M is a variable): "fnm('*.jpg') and size > 500*M"

Find files with "/demo/smith" in the path (x is the file; str(x) is its full path): "'/demo/smith' in str(x)"

Exclude copying anything with "f" in its name: "fnm('*f*')"

Exclude multiple export paths specified in "/root/excludePaths.txt".
"paths('/root/excludePaths.txt')"

The file "excludePaths.txt" may contain multiple export paths where each path is listed on a new line.

The export paths may contain wildcards.

For example, 10.10.1.10:/source_vol/*.txt in file excludePaths.txt will exclude all files having ".txt" extension

If there are incremental changes in previously included directories and you want to exclude anything that has "dir40" as a substring in its name, you can specify the new exclude filter with the sync. This overrides the exclude filter used previously with the copy command and applies the new exclude filter.

Note that if there are incremental changes on the source after the copy operation and there are files with "f" in their name, then these are copied on to the target when the sync operation is performed. If you want to avoid copying such files or directories, you can use the following command: xcp sync -exclude "'f' in name" -id <id>

PERFORMANCE

On Linux, please set the following in /etc/sysctl.conf and run "sysctl -p":

```
net.core.rmem_default = 1342177
net.core.rmem_max = 16777216
net.core.wmem_default = 1342177
net.core.wmem_max = 16777216
net.ipv4.tcp_rmem = 4096 1342177 16777216
net.ipv4.tcp_wmem = 4096 1342177 16777216
net.core.netdev_max_backlog = 300000
net.ipv4.tcp_fin_timeout = 10
```

Make sure that your system has multiple CPUs and at least a few gigabytes (GBs) of free memory.

Searching, checksumming or copying hundreds of thousands or millions of files should be many times faster with XCP than with standard tools such cp, find, du, rsync, or OS drag-and-drop.

For the case of a single file, reading or copying with XCP is usually faster with a faster host CPU. When processing many files, reading or copying is faster with more cores or CPUs.

The main performance throttle option is -parallel for the maximum number of concurrent processes as the number of concurrent directories being read and files being processed. For small numbers of files and/or when there is a network quality of service (QoS) limiter, you might also be able to increase performance by opening multiple channels. The usage section above shows how to use multiple host target addresses. The same syntax also opens more channels to a single target.

For example: "host1,host1:/vol/src" makes each XCP process open two channels to host1. In some WAN environments, this can improve performance. Within a datacenter, if there are only 1 GbE network interface cards (NICs) on the host with XCP it usually helps to use the multipath syntax to leverage more than one NIC.

To verify that you are running I/O over multiple paths, use OS tools to monitor network I/O. For example, on Linux, try "sar -n DEV 2 200".

ENVIRONMENT VARIABLES

XCP_CONFIG_DIR: Override the default location /opt/NetApp/xFiles/xcp. If set, the value should be an OS filesystem path, possibly a mounted NFS directory. When XCP_CONFIG_DIR is set, a new directory with name same as hostname is created inside the custom configuration directory path wherein new logs will be stored.

XCP_LOG_DIR: Override the default, which stores the XCP log in the configuration directory. If set, the value should be an OS filesystem path, possibly a mounted NFS directory.

When XCP_LOG_DIR is set, a new directory with name same as hostname is created inside the custom log directory path wherein new logs will be stored.

XCP_CATALOG_PATH: Override the setting in xcp.ini. If set, the value should be in the XCP path format, server:export[:subdirectory].

SECURITY

All the files and directories in the catalog are world readable except for the index files, which have a ".index" suffix and are located in subdirectories under the top-level catalog "indexes" directory.

Because each index file is essentially an archive of metadata of an entire file tree, the catalog should be stored on a NetApp volume with export permissions matching the the actual sources and targets. Note that file data is not stored in the index, only metadata.

SUPPORT

<https://www.netapp.com/us/contact-us/support.aspx>

show

The NFS **show** command queries the RPC services and NFS exports of one or more storage servers. The command also lists the available services and exports and shows the used and free capacity of each export, followed by the attributes of the root of each

export.

Syntax

```
xcp show <ip_address_or_host_name>
```

The `show` command requires the host name or IP address of the NFSv3 exported system.

Show example

```
[root@localhost linux]# ./xcp show <IP address or hostname of NFS
server>

getting pmap dump from <IP address or hostname of NFS server> port
111... getting export list from <IP address or hostname of NFS
server>...
sending 3 mounts and 12 nfs requests to <IP address or hostname of NFS
server>...

STATUS  : PASSED
```

show -v

Use the `-v` parameter with the `show` command to return details about NFS servers using the IP address or host name.

Syntax

```
xcp show -v
```

license

The NFS `license` command displays XCP license information.

Before running this command, verify that the license file is downloaded and copied to the `/opt/NetApp/xFiles/xcp/` directory on the XCP Linux client host.

Syntax

```
xcp license
```

Show example

```
[root@localhost /]# ./xcp license
```

```
Licensed to "XXX, NetApp Inc, XXX@netapp.com" until Sun Mar 31 00:00:00
2029 License type: SANDBOX
License status: ACTIVE
Customer name: N/A
Project number: N/A
Offline Host: Yes
Send statistics: No
Host activation date: N/A
License management URL: https://xcp.netapp.com
```

license update

Use the `update` parameter with the `license` command to retrieve the latest license from the XCP server.

Syntax

```
xcp license update
```

Show example

```
[root@localhost /]# ./xcp license update

XCP <version>; (c) yyyy NetApp, Inc.; Licensed to XXX [NetApp Inc]
until Sun Mar 31 00:00:00 yyyy
```

activate

The NFS `activate` command activates the XCP license.

Before running this command, verify that the license file is downloaded and copied to the `opt/NetApp/xFiles/xcp/` directory on the XCP Linux client host.

Syntax

```
xcp activate
```

Show example

```
[root@localhost linux]# ./xcp activate

XCP activated
```

scan

The XCP NFS `scan` command recursively scans the entire source NFSv3 exported paths and returns file structure statistics.

NetApp recommends that you put the source NFS export mounts in read-only mode during the scan operation.

Syntax

```
xcp scan <source_nfs_export_path>
```

Show example

```
[root@localhost linux]# ./xcp scan <IP address of NFS server>:/

source_vol
source_vol
source_vol/r1.txt
source_vol/USER.1
source_vol/USER.2
source_vol/USER.1/FILE_1
source_vol/USER.1/FILE_2
source_vol/USER.1/FILE_3
source_vol/USER.1/FILE_4
source_vol/USER.1/FILE_5
source_vol/USER.1/file1.txt
source_vol/USER.1/file2.txt
source_vol/USER.1/logfile.txt
source_vol/USER.1/log1.txt
source_vol/USER.2/FILE_1
source_vol/USER.2/FILE_5
source_vol/USER.2/FILE_2
source_vol/USER.2/FILE_3
source_vol/USER.2/FILE_4
Xcp command : xcp scan <IP address of NFS server>:/source_vol
```

The following table lists the `scan` parameters and their description.

| Parameter | Description |
|--|---|
| <code>scan -l</code> | Lists files in the long listing output format. |
| <code>scan -q</code> | Shows the number of files scanned. |
| <code>scan -stats</code> | Lists files in the tree statistic report format. |
| <code>scan -csv</code> | Lists files in the tree statistic CSV report format. |
| <code>scan -html</code> | Lists files in the tree statistic HTML report format. |
| <code>scan -nonames</code> | Excludes user and group names from file listings and reports. |
| <code>scan -newid <name></code> | Specifies the catalog name for a new index. |
| <code>scan -id <catalog_name></code> | Specifies the catalog name of a previous copy or scan index. |
| <code>scan -match <filter></code> | Only processes files and directories that match the filter. |

| Parameter | Description |
|--|---|
| <code>scan -fmt <string_expression></code> | Only processes files and directories that match the format. |
| <code>scan -du</code> | Summarizes the space usage of each directory, including subdirectories. |
| <code>scan -md5 <string_expression></code> | Generates checksums on the files and saves the checksums when indexing (default: false). |
| <code>scan -depth <n></code> | Limits the search depth. |
| <code>scan -dircount <n[k]></code> | Specifies the request size when reading directories. |
| <code>scan -edupe</code> | Includes the dedupe estimate in reports. |
| <code>scan -bs <n[k]></code> | Specifies the read/write block size for scans that read data using <code>-md5</code> or <code>-edupe</code> (default: 64k). |
| <code>scan -parallel <n></code> | Specifies the maximum number of concurrent batch processes (default: 7). |
| <code>scan -nold</code> | Disables the creation of a default index (default: false). |
| <code>scan -subdir-names</code> | Retrieves the names of the top-level subdirectories in a directory. |
| <code>scan -preserve-atime</code> | Restores all files to the last accessed date on the source. |
| <code>scan -s3.insecure</code> | Provides the option to use HTTP instead of HTTPS for S3 bucket communication. |
| <code>scan -s3.endpoint <s3_endpoint_url></code> | Overrides the default Amazon Web Services (AWS) endpoint URL with the specified URL for S3 bucket communication. |
| <code>scan -s3.profile <profile_name></code> | Specifies a profile from the AWS credential file for S3 bucket communication. |
| <code>scan -s3.noverify</code> | Overrides the default verification of SSL certification for S3 bucket communication. |

scan -l

Use the `-l` parameter with the `scan` command to list files in the long listing output format.

Syntax

```
xcp scan -l <ip_address_or_hostname>:/source_vol
```

Show example

```
root@localhost linux]# ./xcp scan -l <IP address or hostname of
NFSserver>:/source_vol

drwxr-xr-x --- root root 4KiB 4KiB 6s source_vol
drwxr-xr-x --- root root 4KiB 4KiB 42s source_vol/USER.1
drwxr-xr-x --- root root 4KiB 4KiB 42s source_vol/USER.2
rw-r--r-- --- root root 1KiB 4KiB 42s source_vol/USER.1/FILE_1
rw-r--r-- --- root root 1KiB 4KiB 42s source_vol/USER.1/FILE_2
rw-r--r-- --- root root 1KiB 4KiB 42s source_vol/USER.1/FILE_3
rw-r--r-- --- root root 1KiB 4KiB 42s source_vol/USER.1/FILE_4
rw-r--r-- --- root root 1KiB 4KiB 42s source_vol/USER.1/FILE_5
rw-r--r-- --- root root 1KiB 4KiB 42s source_vol/USER.2/FILE_1
rw-r--r-- --- root root 1KiB 4KiB 42s source_vol/USER.2/FILE_5
rw-r--r-- --- root root 1KiB 4KiB 42s source_vol/USER.2/FILE_2
rw-r--r-- --- root root 1KiB 4KiB 42s source_vol/USER.2/FILE_3
rw-r--r-- --- root root 1KiB 4KiB 42s source_vol/USER.2/FILE_4
Xcp command : xcp scan -l <IP address or hostname of NFS
server>:/source_vol
13 scanned, 0 matched, 0 error
Speed : 3.73 KiB in (4.89 KiB/s), 756 out (989/s)
Total Time : 0s.
STATUS : PASSED
```

scan -q

Use the `-q` parameter with the `scan` command to show the number of files scanned.

Syntax

```
xcp scan -q <ip_address_or_hostname>:/source_vol
```

Show example

```
[root@localhost linux]# ./xcp scan -q <IP address or hostname of  
NFSserver>:/source_vol
```

```
Xcp command : xcp scan -q <IP address or hostname of NFS  
server>:/source_vol  
13 scanned, 0 matched, 0 error  
Speed : 3.73 KiB in (3.96 KiB/s), 756 out(801/s)  
Total Time : 0s.  
STATUS : PASSED
```

scan -stats, scan -csv, and scan -html

Use the `-stats`, `-csv`, and `-html` parameters with the `scan` command to list files in the tree statistic report format.

XCP reports (.csv, .html) are saved in the catalog location specified in the `xcp.ini` file. The files are stored in the `<catalog path>/catalog/indexes/1/reports` folder. You can view sample reports in the appendix.

Syntax

```
xcp scan -stats <ip_address>:/source_vol
```

Show example

```
root@client1 linux]# ./xcp scan -stats <ip_address>:/fgl

scan -nonames

Use the `-nonames` parameter with the `scan` command to exclude user and group names from file listings or reports.

When used with the `scan` command, the `-nonames` parameter only applies to file listings returned using the `-l` option.

Syntax

```
xcp scan -nonames <ip_address_or_hostname>:/source_vol
```

Show example

```
[root@localhost linux]# ./xcp scan -nonames <IP address or hostname of
NFS server>:/source_vol

scan -newid <name>

Use the `-newid <name>` parameter with the `scan` command to specify the catalog name for a new index when running a scan.

Syntax

```
xcp scan -newid <name> <ip_address_or_hostname>:/source_vol
```

Show example

```
[root@localhost linux]# ./xcp scan -newid ID001 <IP address or hostname of NFS server>:/source_vol

Xcp command : xcp scan -newid ID001 <IP address or hostname of NFS server>:/source_vol

```

scan -match <filter>

Use the `-match <filter>` parameter with the `scan` command to specify that only the files and directories that match a filter are processed.

Syntax

```
xcp scan -match <filter> <ip_address_or_hostname>:/source_vol
```

Show example

```
root@localhost linux]# ./xcp scan -match bin <IP address or hostname of
NFS server>:/source_vol

source_vol

scan -fmt <string_expression>

Use the `-fmt` parameter with the `scan` command to specify that only files and directories that match the specified format are returned.

Syntax

```
xcp scan -fmt <string_expression> <ip_address_or_hostname>:/source_vol
```

Show example

```
[root@localhost linux]# ./xcp scan -fmt "'{}', {}, {}, {},  
{}}'.format(name, x, ctime, atime, mtime)"

scan -du

Use the `-du` parameter with the `scan` command to summarize the space usage of each directory, including subdirectories.

Syntax

```
xcp scan -du <ip_address_or_hostname>:/source_vol
```

Show example

```
[root@localhost linux]# ./xcp scan -du <IP address or hostname of
NFSserver>:/source_vol

STATUS : PASSED
```

scan -md5 <string_expression>

Use the `-md5` parameter with the `scan` command to generate checksums for the file listings and save the checksums when indexing. The default value is set to false.

The checksums are not used for file verification; they are only used for file listings during scan operations.

Syntax

```
xcp scan -md5 <ip_address_or_hostname>:/source_vol
```

Show example

```
root@localhost linux]# ./xcp scan -md5 <IP address or hostname of
NFSserver>:/source_vol

Total Time : 0s.
STATUS : PASSED
```

scan -depth <n>

Use the `-depth <n>` parameter with the `scan` command to limit the search depth of a scan. The `-depth <n>` parameter specifies the depth into the subdirectories that XCP can scan files. For example, if the number 2 is specified, XCP will only scan the first two subdirectory levels.

Syntax

```
xcp scan -depth <n> <ip_address_or_hostname>:/source_vol
```

Show example

```
[root@localhost linux]# ./xcp scan -depth 2 <IP address or hostname of
NFS server>:/source_vol

source_vol
source_vol/r1.txt
source_vol/USER.1
source_vol/USER.2
source_vol/USER.1/FILE_1
source_vol/USER.1/FILE_2
source_vol/USER.1/FILE_3
source_vol/USER.1/FILE_4
source_vol/USER.1/FILE_5
source_vol/USER.1/file1.txt
source_vol/USER.1/file2.txt
source_vol/USER.1/logfile.txt
source_vol/USER.1/log1.txt
source_vol/USER.2/FILE_1
source_vol/USER.2/FILE_5
source_vol/USER.2/FILE_2
source_vol/USER.2/FILE_3
source_vol/USER.2/FILE_4
Xcp command : xcp scan -depth 2 <IP address or hostname of
NFSserver>:/source_vol
18 scanned, 0 matched, 0 error
Speed : 4.59 KiB in (6.94 KiB/s), 756 out (1.12KiB/s)
Total Time : 0s.
STATUS : PASSED
```

scan -dircount <n[k]>

Use the `-dircount <n[k]>` parameter with the `scan` command to specify the request size when reading directories in a scan. The default value is 64k.

Syntax

```
xcp scan -dircount <n[k]> <ip_address_or_hostname>:/source_vol
```

Show example

```
[root@localhost linux]# ./xcp scan -dircount 64k <IP address or  
hostname of NFS server>:/source_vol
```

```
source_vol  
source_vol/USER.1/FILE_1  
source_vol/USER.1/FILE_2  
source_vol/USER.1/FILE_3  
source_vol/USER.1/FILE_4  
source_vol/USER.1/FILE_5  
source_vol/USER.1/file1.txt  
source_vol/USER.1/file2.txt  
source_vol/USER.1/logfile.txt  
source_vol/USER.1/log1.txt  
source_vol/r1.txt  
source_vol/USER.1  
source_vol/USER.2  
source_vol/USER.2/FILE_1  
source_vol/USER.2/FILE_5
```

scan -edupe

Use the `-edupe` parameter with the `scan` command to include the deduplication estimate in reports.

Simple Storage Service (S3) does not support sparse files. Therefore, specifying an S3 bucket as the target destination for `scan -edupe` returns the value "None" for sparse data.

Syntax

```
xcp scan -edupe <ip_address_or_hostname>:/source_vol
```

Show example

```
root@localhost linux]# ./xcp scan -edupe <IP address or hostname of
NFSserver>:/source_vol

scan -bs <n[k]>

Use the `-bs <n[k]>` parameter with the `scan` command to specify the read/write block size. This applies to scans that read data using the `-md5` or `-edupe` parameters. The default block size is 64k.

Syntax

```
xcp scan -bs <n[k]> <ip_address_or_hostname>:/source_vol
```

Show example

```
[root@localhost linux]# ./xcp scan -bs 32 <IP address or hostname of

STATUS : PASSED
```

scan -nold

Use the `-noId` parameter with the `scan` command to disable the creation of a default index. The default value is false.

Syntax

```
xcp scan -noId <ip_address_or_hostname>:/source_vol
```

Show example

```
[root@localhost linux]# ./xcp scan -noId <IP address or hostname of NFS
server>:/source_vol

Xcp command : xcp scan -subdir-names <IP address or hostname of NFS  
server>:/source_vol  
7 scanned, 0 matched, 0 error  
Speed : 1.30 KiB in (1.21 KiB/s), 444 out(414/s)  
Total Time : 1s.  
STATUS : PASSED
```

scan -preserve-ctime

Use the `-preserve-ctime` parameter with the `scan` command to restore all files to the last accessed date on the source.

When an NFS share is scanned, the access time is modified on the files if the storage system is configured to modify access time on read. XCP does not directly change the access time. XCP reads the files one by one and this triggers an update to the access time. The `-preserve-ctime` option resets the access time to the original value set before the XCP read operation.

Syntax

```
xcp scan -preserve-ctime <ip_address_or_hostname>:/source_vol
```

Show example

```
[root@client 1 linux]# ./xcp scan -preserve-ctime  
101.10.10.10:/source_vol
```

```

copy

The XCP NFS `copy` command scans and copies the entire source directory structure to a destination NFSv3 export.

The `copy` command requires having source and destination paths as variables. The scanned and copied files, throughput, speed, and elapsed time details are displayed at the end of the copy operation.

- The runtime log file is located in `/opt/NetApp/xFiles/xcp/xcp.log`. This path is configurable. Additional logging is located in the catalog after each command is run.
- If the source is a 7-Mode system, you can use a Snapshot copy as a source. For example:
`<ip_address>:/vol/ex_s01/.snapshot/<snapshot_name>`

Syntax

```
xcp copy <source_nfs_export_path> <destination_nfs_export_path>
```

Show example

```
root@localhost linux]# ./xcp copy <IP address of NFS
server>:/source_vol < IP address of
destination NFS server>:/dest_vol

xcp: WARNING: No index name has been specified, creating one with name:

STATUS : PASSED
```

The following table lists the `copy` parameters and their description.

| Parameter | Description |
|--|--|
| <code>copy -nonames</code> | Excludes user and group names from file listings and reports. |
| <code>copy -match <filter></code> | Only processes files and directories that match the filter. |
| <code>copy -md5 <string_expression></code> | Generates checksums on the files and saves the checksums when indexing (default: false). |
| <code>copy -dircount <n[k]></code> | Specifies the request size when reading directories. |
| <code>copy -edupe</code> | Includes the dedupe estimate in reports. |
| <code>copy -bs <n[k]></code> | Specifies the read/write block size (default: 64k). |
| <code>copy -parallel <n></code> | Specifies the maximum number of concurrent batch processes (default: 7). |
| <code>copy -preserve-atime</code> | Restores all files to the last accessed date on the source. |
| <code>copy -s3.insecure</code> | Provides the option to use HTTP instead of HTTPS for S3 bucket communication. |
| <code>copy -s3.endpoint <s3_endpoint_url></code> | Overrides the default Amazon Web Services (AWS) endpoint URL with the specified URL for S3 bucket communication. |
| <code>copy -s3.profile <profile_name></code> | Specifies a profile from the AWS credential file for S3 bucket communication. |

| Parameter | Description |
|--------------------------------|--|
| <code>copy -s3.noverify</code> | Overrides the default verification of SSL certification for S3 bucket communication. |

copy -nonames

Use the `-nonames` parameter with the `copy` command to exclude user and group names from file listings or reports.

Syntax

```
xcp copy -nonames <source_ip_address_or_hostname>:/source_vol
<destination_ip_address_or_hostname>:/dest_vol
```

Show example

```
[root@localhost linux]# ./xcp copy -nonames <IP address or hostname of
NFS server>:/source_vol <IP
address of destination NFS server>:/dest_vol

xcp: WARNING: No index name has been specified, creating one with name:

Total Time : 0s.
STATUS : PASSED
```

copy -match <filter>

Use the `-match <filter>` parameter with the `copy` command to specify that only the files and directories that match a filter are processed.

Syntax

```
xcp copy -match <filter> <source_ip_address_or_hostname>:/source_vol
<destination_ip_address_or_hostname>:/dest_vol
```

Show example

```
[root@localhost linux]# ./xcp copy -match bin <IP address or hostname
of NFS server>:/source_vol <IP
address of destination NFS server>:/dest_vol

xcp: WARNING: No index name has been specified, creating one with name:

STATUS : PASSED
```

copy -md5 <string_expression>

Use the `-md5` parameter with the `copy` command to generate checksums for the file listings and save the checksums when indexing. The default value is set to false.

Syntax

```
xcp copy -md5 <source_ip_address_or_hostname>:/source_vol
<destination_ip_address_or_hostname>:/dest_vol
```

Show example

```
[root@localhost linux]# ./xcp copy -md5 <IP address or hostname of NFS
server>:/source_vol <IP
address of destination NFS server>:/dest_vol

Total Time : 0s.
STATUS : PASSED
```

copy -dircount <n[k]>

Use the `-dircount <n[k]>` parameter with the `copy` command to specify the request size when reading directories. The default value is 64k.

Syntax

```
xcp copy -dircount <n[k]> <source_ip_address_or_hostname>:/source_vol
<destination_ip_address_or_hostname>:/dest_vol
```

Show example

```
[root@localhost linux]# ./xcp copy -dircount 32k <IP address or
hostname of NFS server>:/source_vol
<IP address of destination NFS server>:/dest_vol

Speed : 39.1 KiB in (56.7 KiB/s), 81.6 KiB out (119 KiB/s)
Total Time : 0s.
STATUS : PASSED
```

copy -edupe

Use the `-edupe` parameter with the `copy` command to include the deduplication estimate in reports.

Simple Storage Service (S3) does not support sparse files. Therefore, specifying an S3 bucket as the target destination for `copy -edupe` returns the value "None" for sparse data.

Syntax

```
xcp copy -edupe <source_ip_address_or_hostname>:/source_vol
<destination_ip_address_or_hostname>:/dest_vol
```

Show example

```
[root@localhost linux]# ./xcp copy -edupe <IP address or hostname of
NFS server>:/source_vol <IP
address of destination NFS server>:/dest_vol

```

copy -preserve-ctime

Use the `-preserve-ctime` parameter with the `copy` command to restore all files to the last accessed date on the source.

The `-preserve-ctime` option resets the access time to the original value set before the XCP read operation.

Syntax

```
xcp copy -preserve-ctime <source_ip_address_or_hostname>:/source_vol
<destination_ip_address_or_hostname>:/dest_vol
```

Show example

```
[root@client1 linux]# ./xcp copy -preserve-ctime

sync

View the descriptions, parameters, and examples for the XCP `sync` command, including when the `sync` command is used with the `dry run` option.

sync

The XCP NFS `sync` command scans for changes and modifications to a source NFS directory by using a catalog index tag name or the number of a previous copy operation. Incremental changes to the source are copied and applied to the target directory. The old catalog index numbers are replaced with new ones after the `sync` operation.

During the `sync` operation, modified files and directories are copied to the destination NFSv3 export again.

Syntax

```
xcp sync -id <catalog_name>
```

The `-id <catalog_name>` parameter is required with the `sync` command.

Show example

```
[root@localhost linux]# ./xcp sync -id autoname_copy_2020-03-04_01.10.22.338436

xcp: Index: {source: <IP address or hostname of NFS
server>:/source_vol, target: <IP address of
destination NFS server>:/dest_vol}
Xcp command : xcp sync -id autoname_copy_2020-03-04_01.10.22.338436
0 scanned, 0 copied, 0 modification, 0 new item, 0 delete item, 0 error
Speed : 26.4 KiB in (27.6 KiB/s), 22.7 KiB out (23.7 KiB/s)
Total Time : 0s.
STATUS : PASSED
```

The following table lists the `sync` parameters and their description.

| Parameter | Description |
|--|--|
| <code>sync -id <catalog_name></code> | Specifies the catalog name of a previous copy index. This is a required parameter for the <code>sync</code> command. |
| <code>sync -nonames</code> | Excludes user and group names from file listings and reports. |
| <code>sync -bs <n[k]></code> | Specifies the read/write block size (default: 64k). |
| <code>sync -dircount <n[k]></code> | Specifies the request size when reading directories. |
| <code>sync -parallel <n></code> | Specifies the maximum number of concurrent batch processes (default: 7). |
| <code>sync -preserve-atime</code> | Restores all files to the last accessed date on the source. |

`sync -nonames`

Use the the `-nonames` parameter with the `sync` command to exclude user and group names from file listings or reports.

Syntax

```
xcp sync -id <catalog_name> -nonames
```

Show example

```
[root@localhost linux]# ./xcp sync -id ID001 -nonames

xcp: Index: {source: <IP address or hostname of NFS
server>:/source_vol, target: <IP address of
destination NFS server>:/dest_vol}
Xcp command : xcp sync -id ID001 -nonames
0 scanned, 0 copied, 0 modification, 0 new item, 0 delete item, 0 error
Speed : 26.4 KiB in (22.2 KiB/s), 22.3 KiB out (18.8 KiB/s)
Total Time : 1s.
STATUS : PASSED
```

sync -bs <n[k]>

Use the the `-bs <n[k]>` parameter with the `sync` command to specify the read/write block size. The default block size is 64k.

Syntax

```
xcp sync -id <catalog_name> -bs <n[k]>
```

Show example

```
[root@localhost linux]# ./xcp sync -id ID001 -bs 32k

xcp: Index: {source: <IP address or hostname of NFS
server>:/source_vol, target: <IP address of
destination NFS server>:/dest_vol}
Xcp command : xcp sync -id ID001 -bs 32k
0 scanned, 0 copied, 0 modification, 0 new item, 0 delete item, 0 error
Speed : 25.3 KiB in (20.4 KiB/s), 21.0 KiB out (16.9 KiB/s)
Total Time : 1s.
STATUS : PASSED
```

sync -dircount <n[k]>

Use the the `-dircount <n[k]>` parameter with the `sync` command to specify the request size when reading directories. The default value is 64k.

Syntax

```
xcp sync -id <catalog_name> -dircount <n[k]>
```

Show example

```
[root@localhost linux]# ./xcp sync -id ID001 -dircount 32k

xcp: Index: {source: <IP address or hostname of NFS
server>:/source_vol, target: <IP address of
destination NFS server>:/dest_vol}
Xcp command : xcp sync -id ID001 -dircount 32k
0 scanned, 0 copied, 0 modification, 0 new item, 0 delete item, 0 error
Speed : 25.3 KiB in (27.8 KiB/s), 21.0 KiB out (23.0 KiB/s)
Total Time : 0s.
STATUS : PASSED
```

sync -parallel

Use the the `-parallel` parameter with the `sync` command to specify the maximum number of concurrent batch processes. The default value is 7.

Syntax

```
xcp sync -id <catalog_name> -parallel <n>
```

Show example

```
[root@localhost linux]# ./xcp sync -id ID001 -parallel 4

xcp: Index: {source: <IP address or hostname of NFS
server>:/source_vol, target: <IP address of
destination NFS server>:/dest_vol}
Xcp command : xcp sync -id ID001 -parallel 4
0 scanned, 0 copied, 0 modification, 0 new item, 0 delete item, 0 error
Speed : 25.3 KiB in (20.6 KiB/s), 21.0 KiB out (17.1 KiB/s)
Total Time : 1s.
STATUS : PASSED
```

-preserve-ctime

Use the the `-preserve-ctime` parameter with the `sync` command to restore all files to the last accessed date on the source.

The `-preserve-ctime` option resets the access time to the original value set before the XCP read operation.

Syntax

```
xcp sync -preserve-ctime -id <catalog_name>
```

Show example

```
[root@client-1 linux]# ./xcp sync -preserve-ctime -id XCP_copy_2022-06-30_14.22.53.742272

xcp: Job ID: Job_XCP_copy_2022-06-30_14.22.53.742272_2022-06-30_14.27.28.660165_sync

sync dry-run

The `sync` command with the `dry-run` option looks for changes or modifications made to the source NFS directory using the previous catalog index number of a copy operation. This command also detects files and directories that are new, moved, deleted, or renamed since the previous copy operation. The command reports the source changes but does not apply them to the target.

Syntax

```
xcp sync dry-run -id <catalog_name>
```

The `-id <catalog_name>` parameter is required with the `sync dry-run` command option.

Show example

```
[root@localhost linux]# ./xcp sync dry-run -id ID001

xcp: Index: {source: <IP address or hostname of NFS
server>:/source_vol, target: <IP address of
destination NFS server>:/dest_vol}
Xcp command : xcp sync dry-run -id ID001
0 matched, 0 error
Speed : 15.2 KiB in (46.5 KiB/s), 5.48 KiB out (16.7 KiB/s)
Total Time : 0s.
STATUS : PASSED
```

The following table lists the `sync dry-run` parameters and their description.

| Parameter | Description |
|--|--|
| <code>sync dry-run -id <catalog_name></code> | Specifies the catalog name of a previous copy index. This is a required parameter for the <code>sync</code> command. |
| <code>sync dry-run -stats</code> | Performs a deep scan of the modified directories and reports everything that is new. |
| <code>sync dry-run -l</code> | Prints details about files and directories that changed. |
| <code>sync dry-run -nonames</code> | Excludes user and group names from file listings and reports. |
| <code>sync dry-run -dircount <n[k]></code> | Specifies the request size when reading directories. |
| <code>sync dry-run -parallel <n></code> | Specifies the maximum number of concurrent batch processes (default: 7). |

`sync dry-run -id <catalog_name>`

Use the `-id <catalog_name>` parameter with `sync dry-run` to specify the catalog name of a previous

copy index.

The `-id <catalog_name>` parameter is required with the `sync dry-run` command option.

Syntax

```
xcp sync dry-run -id <catalog_name>
```

Show example

```
[root@localhost linux]# ./xcp sync dry-run -id ID001

xcp: Index: {source: <IP address or hostname of NFS
server>:/source_vol, target: <IP address of
destination NFS server>:/dest_vol}
Xcp command : xcp sync dry-run -id ID001
0 matched, 0 error
Speed : 15.2 KiB in (21.7 KiB/s), 5.48 KiB out (7.81 KiB/s)
Total Time : 0s.
STATUS : PASSED
```

sync dry-run -stats

Use the the `-stats` parameter with `sync dry-run` to perform a deep scan of the modified directories and report everything that is new.

Syntax

```
xcp sync dry-run -id <catalog_name> -stats
```

Show example

```
[root@localhost linux]# ./xcp sync dry-run -id ID001 -stats

xcp: Index: {source: <IP address or hostname of NFS
server>:/source_vol, target: <IP address of
destination NFS server>:/dest_vol}

```

sync dry-run -l

Use the the `-l` parameter with `sync dry-run` to print details about files and directories that changed.

Syntax

```
xcp sync dry-run -id <catalog_name> -l
```

Show example

```
[root@localhost linux]# ./xcp sync dry-run -id ID001 -l

xcp: Index: {source: <IP address or hostname of NFS
server>:/source_vol, target: <IP address of
destination NFS server>:/dest_vol}
Xcp command : xcp sync dry-run -id ID001 -l
0 matched, 0 error
Speed : 15.2 KiB in (13.6 KiB/s), 5.48 KiB out (4.88 KiB/s)
Total Time : 1s.
STATUS : PASSED
```

sync dry-run -nonames

Use the the `-nonames` parameter with `sync dry-run` to exclude user and group names from file listings or

reports.

Syntax

```
xcp sync dry-run -id <catalog_name> -nonames
```

Show example

```
[root@localhost linux]# ./xcp sync dry-run -id ID001 -nonames

xcp: Index: {source: <IP address or hostname of NFS
server>:/source_vol, target: <IP address of
destination NFS server>:/dest_vol}
Xcp command : xcp sync dry-run -id ID001 -nonames
0 matched, 0 error
Speed : 15.2 KiB in (15.8 KiB/s), 5.48 KiB out (5.70 KiB/s)
Total Time : 0s.
STATUS : PASSED
```

sync dry-run -dircount <n[k]>

Use the the `-dircount <n[k]>` parameter with `sync dry-run` to specify the request size when reading directories. The default value is 64k.

Syntax

```
xcp sync dry-run -id <catalog_name> -dircount <n[k]>
```

Show example

```
[root@localhost linux]# ./xcp sync dry-run -id ID001 -dircount 32k

xcp: Index: {source: <IP address or hostname of NFS
server>:/source_vol, target: <IP address of
destination NFS server>:/dest_vol}
Xcp command : xcp sync dry-run -id ID001 -dircount 32k
0 matched, 0 error
Speed : 15.2 KiB in (32.5 KiB/s), 5.48 KiB out (11.7 KiB/s)
Total Time : 0s.

sync dry-run -parallel

Use the the `-parallel` parameter with `sync dry-run` to specify the maximum number of concurrent batch processes. The default value is 7.

Syntax

```
xcp sync dry-run -id <catalog_name> -parallel <n>
```

Show example

```
[root@localhost linux]# ./xcp sync dry-run -id ID001 -parallel 4

xcp: Index: {source: <IP address or hostname of NFS
server>:/source_vol, target: <IP address of
destination NFS server>:/dest_vol}
Xcp command : xcp sync dry-run -id ID001 -parallel 4
0 matched, 0 error
Speed : 15.2 KiB in (25.4 KiB/s), 5.48 KiB out (9.13 KiB/s)
Total Time : 0s.
STATUS : PASSED
```

resume

The XCP NFS `resume` command restarts an interrupted copy operation by specifying the catalog index name or number. The catalog index name or number of the previous copy operation is located in the `<catalog path>:/catalog/indexes` directory.

Syntax

```
xcp resume -id <catalog_name>
```

The `-id <catalog_name>` parameter is required with the `resume` command.

Show example

```
[root@localhost linux]# ./xcp resume -id ID001

The following table lists the `resume` parameters and their description.

| Parameter | Description |
|--|---|
| <code>resume -id <catalog_name></code> | Specifies the catalog name of a previous copy index. This is a required parameter for the resume command. |
| <code>resume -bs <n[k]></code> | Specifies the read/write block size (default: 64k). |
| <code>resume -dircount <n[k]></code> | Specifies the request size when reading directories. |
| <code>resume -parallel <n></code> | Specifies the maximum number of concurrent batch processes (default: 7). |

| Parameter | Description |
|--|--|
| <code>resume -preserve-atime</code> | Restores all files to the last accessed date on the source. |
| <code>resume -s3.insecure</code> | Provides the option to use HTTP instead of HTTPS for S3 bucket communication. |
| <code>resume -s3.endpoint <s3_endpoint_url></code> | Overrides the default Amazon Web Services (AWS) endpoint URL with the specified URL for S3 bucket communication. |
| <code>resume -s3.profile <profile_name></code> | Specifies a profile from the AWS credential file for S3 bucket communication. |
| <code>resume -s3.noverify</code> | Overrides the default verification of SSL certification for S3 bucket communication. |

resume -bs <n[k]>

Use the `-bs <n[k]>` parameter with the `resume` command to specify the read/write block size. The default block size is 64k.

Syntax

```
xcp resume -id <catalog_name> -bs <n[k]>
```

Show example

```
[root@localhost linux]# ./xcp resume -id ID001 -bs 32k

resume -preserve-atime

Use the `-preserve-atime` parameter with the `resume` command to restore all files to the last accessed date on the source.

The `-preserve-atime` parameter resets the access time to the original value set before the XCP read operation.

Syntax

```
xcp resume -id <catalog_name> -preserve-ptime
```

Show example

```
root@client1 linux]# ./xcp resume -preserve-ptime -id XCP_copy_2022-06-30_14.22.53.742272

xcp: Job ID: Job_XCP_copy_2022-06-30_14.22.53.742272_2022-06-30_14.37.07.746208_resume

resume -s3.insecure

Use the `-s3.insecure` parameter with the `resume` command to use HTTP instead of HTTPS for S3 bucket communication.

If the `-s3.insecure` parameter is used with the `copy` command, it is ignored on `resume`. You must specify `-s3.insecure` again to use the option on `resume`.

Syntax

```
xcp resume -s3.insecure -id <catalog_name>
```

Show example

```
root@client1 linux]# ./xcp resume -s3.insecure -id XCP_copy_2023-06-08_10.31.47.381883

resume -s3.endpoint <s3_endpoint_url>

Use the `-s3.endpoint <s3_endpoint_url>` parameter with the `resume` command to override the default AWS endpoint URL with the specified URL for S3 bucket communication.

By default, `resume` uses the S3 profile and S3 endpoint specified during the copy operation. However, if you specify a new S3 endpoint and S3 profile on `resume`, it overrides the default used with the `copy` command.

Syntax

```
xcp resume -s3.profile <profile_name> -s3.endpoint https://<endpoint_url>:
-id <catalog_name>
```

Show example

```

verify

The `verify` command uses full byte-by-byte data comparison between source and target directories after a copy operation without using a catalog index number. The command checks for modification times and other file or directory attributes, including permissions. The command also reads the files on both sides and compares the data.

Syntax

```
xcp verify <source NFS export path> <destination NFS exportpath>
```

Show example

```
[root@localhost linux]# ./xcp verify <IP address of NFS
server>:/source_vol <IP address of destination NFS server>:/dest_vol

The following table lists the `verify` parameters and their description.

| Parameter | Description |
|--|--|
| <code>verify -stats</code> | Scans the source and target trees in parallel and compares tree statistics. |
| <code>verify -csv</code> | Scans the source and target trees in parallel and compares tree statistics. |
| <code>verify -nodata</code> | Does not check data. |
| <code>verify -noattrs</code> | Does not check attributes. |
| <code>verify -nomods</code> | Does not check file modification times. |
| <code>verify -mtimewindow <s></code> | Specifies the acceptable modification time difference for verification. |
| <code>verify -v</code> | Retrieves output formats to list any differences found. |
| <code>verify -l</code> | Retrieves output formats to list any differences found. |
| <code>verify -nonames</code> | Excludes user and group names from file listings or reports. |
| <code>verify -match <filter></code> | Only processes files and directories that match the format. |
| <code>verify -bs <n[k]></code> | Specifies the read/write block size (default: 64k). |
| <code>verify -parallel <n></code> | Specifies the maximum number of concurrent batch processes (default: 7). |
| <code>verify -dircount <n[k]></code> | Specifies the request size when reading directories. |
| <code>verify -nold</code> | Disables the creation of a default index (default: False). |
| <code>verify -preserve-atime</code> | Restores all files to the last accessed date on the source. |
| <code>verify -s3.insecure</code> | Provides the option to use HTTP instead of HTTPS for S3 bucket communication. |
| <code>verify -s3.endpoint <s3_endpoint_url></code> | Overrides the default Amazon Web Services (AWS) endpoint URL with the specified URL for S3 bucket communication. |
| <code>verify -s3.profile <profile_name></code> | Specifies a profile from the AWS credential file for S3 bucket communication. |
| <code>verify -s3.noverify</code> | Overrides the default verification of SSL certification for S3 bucket communication. |

verify -stats and verify -csv

Use the `-stats` and `-csv` parameters with the `verify` command to scan the source and target trees in parallel and compare tree statistics.

Syntax

```
cp verify -stats <source_ip_address>:/source_vol  
<destination_ip_address>:/dest_vol
```

Show example

```
[root@localhost linux]# ./xcp verify -stats
<source_ip_address>:/source_vol <destination_ip_address>:/dest_vol

```

verify -dircount <n[k]>

Use the `-dircount <n[k]>` parameter with the `verify` command to specify the request size when reading directories. The default value is 64k.

Syntax

```

xcp verify -dircount <n[k]> <source_ip_address>:/source_vol
<destination_ip_address>:/dest_vol

```

Show example

```
[root@localhost linux]# ./xcp verify -dircount 32k <IP address of NFS
server>:/source_vol <IP address of destination NFS server>:/dest_vol

verify -preserve-ctime

Use the `-preserve-ctime` parameter with the `verify` command to restore all files to the last accessed date on the source. The `-preserve-ctime` parameter resets the access time to the original value set before the XCP read operation.

Syntax

```
xcp verify -preserve-ctime <source_ip_address>:/source_vol  
<destination_ip_address>:/dest_vol
```

Show example

```
[root@client1 linux]# ./xcp verify -preserve-ctime  
<IP_address>:/source_vol <destination_IP_address>:/dest_vol

chmod

The XCP NFS `chmod` command scans and changes the file permission of all the files for the given directory structure. The 'chmod' command requires mode or reference, NFS share, or the POSIX path as a variable. The XCP `chmod` command recursively changes the permissions for a given path. The command output displays the total files scanned and the permissions changed in the output.

Syntax

```
xcp chmod -mode <value> <source NFS export path>
```

Show example

```

[root@user-1 linux]# ./xcp chmod -mode <IP address>:/source_vol

Xcp command : xcp chmod -mode <IP address>://source_vol
Stats : 6 scanned, 4 changed mode
Speed : 1.96 KiB in (2.13 KiB/s), 812 out (882/s)
Total Time : 0s.
STATUS : PASSED
[root@user-1 linux] #

```

The following table lists the `chmod` parameters and their description.

| Parameter | Description |
|---|---|
| <code>chmod -exclude <filter></code> | Excludes the files and directories that match the filter. |
| <code>chmod -match <filter></code> | Only processes the files and directories that match the filter. |
| <code>chmod -reference <reference></code> | Specifies the referenced file or directory point. |
| <code>chmod -v</code> | Reports the output for every object processed. |

chmod -exclude <filter>

Use the `-exclude <filter>` parameter with the `chmod` command to exclude the files and directories that match the filter.

Syntax

```
xcp chmod -exclude <filter> -mode <value> <source NFS export path>
```

Show example

```
[root@user-1 linux]# ./xcp chmod -exclude "fnm('3.img')" -mode 770
101.11.10.10:/s_v1/D3/

Excluded: 1 excluded, 0 did not match exclude criteria
Xcp command : xcp chmod -exclude fnm('3.img') -mode 770
101.11.10.10:/s_v1/D3/
Stats : 5 scanned, 1 excluded, 5 changed mode
Speed : 2.10 KiB in (7.55 KiB/s), 976 out (3.43 KiB/s)
Total Time : 0s.
STATUS : PASSED
[root@user-1 linux]#
```

chmod -match <filter>

Use the `-match <filter>` parameter with the `chmod` command to only process the files and directories that match the filter.

Syntax

```
xcp chmod -match <filter> -mode <value> <source NFS export path>
```

Show example

```
[root@user-1 linux]# ./xcp chmod -match "fnm('2.img')" -mode 777
101.11.10.10:/s_v1/D2/

Filtered: 1 matched, 5 did not match
Xcp command : xcp chmod -match fnm('2.img') -mode
101.11.10.10:/s_v1/D2/
Stats : 6 scanned, 1 matched, 2 changed mode
Speed : 1.67 KiB in (1.99 KiB/s), 484 out (578/s)
Total Time : 0s.
STATUS : PASSED
[root@user-1 linux]
```

chmod -reference <reference>

Use the `-reference <reference>` parameter with the `chmod` command to specify the referenced file or directory point.

Syntax

```
xcp chmod -reference <reference> <source NFS export path>
```

Show example

```

```

chown

The XCP NFS `chown` command scans and changes the ownership of all the files for the given directory structure. The `chown` command requires an NFS share or the POSIX path as a variable. XCP `chown` recursively changes the ownership for a given path. The `chown` command displays the changed user ID (UID) for a file.

Syntax

```
xcp chown -user/-group <user-name/group-name> <source NFS export path>
```

Show example

```
[root@user-1 linux]# ./xcp chown -user user2 -v
101.101.10.110:/s_v1/smaple_set/D1

Sat Apr 2 23:06:05 2022

```

The following table lists the `chown` parameters and their description.

| Parameter | Description |
|---|---|
| <code>chown -exclude <filter></code> | Excludes the files and directories that match the filter. |
| <code>chown -match <filter></code> | Only processes the files and directories that match the filter. |
| <code>chown -group <group></code> | Sets the Linux group ID (GID) at the source. |
| <code>chown -user <user></code> | Sets the Linux UID at the source. |
| <code>chown -user-from <user_from></code> | Changes the UID. |
| <code>chown -group-from <group_from></code> | Changes the GID. |
| <code>chown -reference <reference></code> | Specifies the referenced file or directory point. |
| <code>chown -v</code> | Reports the output for every object processed. |

chown -exclude <filter>

Use the `-exclude <filter>` parameter with the `chown` command to exclude the files and directories that match the filter.

Syntax

```
xcp chown -exclude <filter> -user <user_name> <source NFS export path>
```

Show example

```
[root@user-1 linux]# ./xcp chown -exclude "fnm('1.img')" -user user2  
101.101.10.210:/s_v1/smaple_set/D1
```

```

Total Time : 0s.
STATUS : PASSED
[root@user-1 linux]#
```

chown -user-from <user_from>

Use the `-user-from <user_from>` parameter with the `chown` command to change the UID.

Syntax

```
xcp chown -user-from user1 -user <user_name> <source NFS export path>
```

Show example

```
[root@user-1 linux]# ./xcp chown -user-from user1 -user user2
101.101.10.210:/s_v1/smaple_set/D1

Xcp command : xcp chown -user-from user1 -user user2
102.108.10.210:/s_v1/smaple_set/D1
Stats : 6 scanned, 6 changed ownership
Speed : 2.25 KiB in (2.44 KiB/s), 1.11 KiB out (1.21 KiB/s)
Total Time : 0s.
STATUS : PASSED
[root@user-1 linux]#
```

chown -group-from <group_from>

Use the `-group-from <group_from>` parameter with the `chown` command to change the GID.

Syntax

```
xcp chown -group-from <group_name> -group <group_name> <source NFS export
path>
```

Show example

```
[root@user-1 linux]# ./xcp chown -group-from group1 -group group2
101.101.10.210:/s_v1/smaple_set/D1

logdump

The NFS `logdump` command filters logs based on the migration ID or job ID and dumps those logs into a `.zip` file in the current directory. The `.zip` file has the same name as the migration or job ID that is used with the command.

Syntax

```
xcp logdump -m <migration ID>  
xcp logdump -j <job ID>
```

Show example

```
[root@client1 xcp_nfs]# xcp logdump -j Job_2022-06-14_21.49.28.060943_scan

The following table lists the `delete` parameters and their description.

| Parameter | Description |
|--|--|
| <code>delete -match <filter></code> | Only processes the files and directories that match the filter. |
| <code>delete -force</code> | Deletes without confirmation. |
| <code>delete -removetopdir</code> | Removes the directory, including child directories. |
| <code>delete -exclude <filter></code> | Excludes the files and directories that match the filter. |
| <code>delete -parallel <n></code> | Specifies the maximum concurrent batch processes (default: 7). |
| <code>delete -preserve-atime</code> | Preserves access time of the file or directory (default: false). |
| <code>delete -loglevel <name></code> | Sets the log level; available levels are INFO, DEBUG (default: INFO). |
| <code>delete -s3.insecure</code> | Provides the option to use HTTP instead of HTTPS for S3 bucket communication. |
| <code>delete -s3.endpoint <s3_endpoint_url></code> | Overrides the default Amazon Web Services (AWS) endpoint URL with the specified URL for S3 bucket communication. |
| <code>delete -s3.profile <profile_name></code> | Specifies a profile from the AWS credential file for S3 bucket communication. |
| <code>delete -s3.noverify</code> | Overrides the default verification of SSL certification for S3 bucket communication. |

`delete -match <filter>`

Use the `-match <filter>` parameter with the `delete` command to only process the files and directories that match the filter.

Syntax

```
xcp delete -match <filter> <NFS export path>
```

Show example

```
[root@client1 linux]# ./xcp delete -match "fnm('XCP_copy_2023-04-25_05.51.28.315997')" 10.101.10.101:/xcp_catalog

Job ID: Job_2023-04-25_06.10.29.637371_delete

estimate

The XCP NFS `estimate` command is used to estimate the time to complete a baseline copy from the source to destination. It calculates the estimated time to complete a baseline copy by using all of the current available system resources, such as CPU, RAM, Network, and other parameters. You can use the `-target` option to start a sample copy operation and get the estimation time.

Syntax

```
xcp estimate -id <name>
```

Show example

```
[root@client-01 linux]# ./xcp estimate -t 100 -id estimate01 -target
10.101.10.10:/temp8

xcp: WARNING: your license will expire in less than 10 days! You can

```

The following table lists the `estimate` parameters and their description.

| Parameter | Description |
|--|--|
| <code>estimate -id <name></code> | Specifies the catalog name of a previous copy or scan index. |
| <code>estimate -gbit <n></code> | Uses gigabits of bandwidth to estimate best-case time (default: 1). |
| <code>estimate -target <path></code> | Specifies the target to use for live test copy. |
| <code>estimate -t <n/s/m/h></code> | Specifies the duration of live test copy (default: 5m). |
| <code>estimate -bs <n[k]></code> | Specifies the read/write block size (default: 64k). |
| <code>estimate -dircount <n[k]></code> | Specifies the request size for reading directories (default: 64k). |
| <code>estimate -preserve-atime</code> | Preserves access time of the file or directory (default: False). |
| <code>estimate -loglevel <name></code> | Sets the log level; available levels are INFO, DEBUG (default: INFO) |

estimate -id <name>

Use the `-id <name>` parameter with the `estimate` command to exclude the files and directories that match the filter.

Syntax

```
xcp estimate -id <name>
```

Show example

```
[root@client1 linux]# ./xcp estimate -id csdata01

isync

View the descriptions, parameters, and examples for the XCP `isync` command, including when the `isync` command is used with the `estimate` option.

isync

The XCP NFS `isync` command compares the source and destination and synchronizes the differences on the target without using the catalog index.

Syntax

```
xcp isync <source_ip_address>:/src <destination_ip_address>:/dest
```

Show example

```
[root@client1 linux]# ./xcp isync <source_ip_address>:/src
<destination_ip_address>:/dest

```

The following table lists the `isync` parameters and their description.

| Parameter | Description |
|---|---|
| <code>isync -nodata</code> | Does not check data. |
| <code>isync -noattrs</code> | Does not check attributes. |
| <code>isync -nomods</code> | Does not check file modification times. |
| <code>isync -mtimewindow <s></code> | Specifies the acceptable modification time difference for verification. |

| Parameter | Description |
|---|--|
| <code>isync -match <filter></code> | Only processes the files and directories that match the filter. |
| <code>isync -bs <n[k]></code> | Specifies the read/write block size (default: 64k). |
| <code>isync -parallel <n></code> | Specifies the maximum number of concurrent batch processes (default: 7). |
| <code>isync -dircount <n[k]></code> | Specifies the request size when reading directories (default 64k). |
| <code>isync -exclude <filter></code> | Excludes the files and directories that match the filter. |
| <code>isync -newid <name></code> | Specifies the catalog name for a new index catalog. |
| <code>isync -loglevel <name></code> | Sets the log level; available levels are INFO, DEBUG (default: INFO). |
| <code>isync -preserve-atime</code> | Restores all files to the last accessed date on the source. |
| <code>isync -s3.insecure</code> | Provides the option to use HTTP instead of HTTPS for S3 bucket communication. |
| <code>isync -s3.endpoint <s3_endpoint_url></code> | Overrides the default Amazon Web Services (AWS) endpoint URL with the specified URL for S3 bucket communication. |
| <code>isync -s3.profile <profile_name></code> | Specifies a profile from the AWS credential file for S3 bucket communication. |
| <code>isync -s3.noverify</code> | Overrides the default verification of SSL certification for S3 bucket communication. |

isync -nodata

Use the the `-nodata` parameter with the `isync` command to specify not to check data.

Syntax

```
xcp isync -nodata <source_ip_address>:/source_vol
<destination_ip_address>:/dest_vol
```

Show example

```
root@client1 linux]# ./xcp isync -nodata
<source_ip_address>:/source_vol<destination_ip_address>:/dest_vol

isync -s3.profile <name>

Use the `s3.profile` parameter with the `isync` command to specify a profile from the AWS credential file for S3 bucket communication.

Syntax

```
xcp isync -s3.profile <name> -s3.endpoint <S3-endpoint_url>  
<source_ip_address>:/src/USER4 s3://isyncestimate
```

Show example

```
[root@client1 linux]# /xcp/linux/xcp isync -s3.profile s3_profile
-s3.endpoint <S3-endpoint_url> <source_ip_address>:/src/USER4
s3://isynceestimate

isync estimate

The `isync` command can be used with the `estimate` option to estimate the time it takes for the `isync` command to synchronize incremental changes. The `-id` parameter specifies the catalog name of a previous copy operation.

Syntax

```
xcp isync estimate -id <name>
```

The `-id` parameter is required with the `isync estimate` command option.

Show example

```
[root@client1 linux]# ./xcp isync estimate -id <name>

Job ID: Job_2023-11-20_04.08.18.967541_isync_estimate

The following table lists the `isync estimate` parameters and their description.

| Parameter | Description |
|---|--|
| <code>isync estimate -nodata</code> | Does not check data. |
| <code>isync estimate -noattrs</code> | Does not check attributes. |
| <code>isync estimate -nomods</code> | Does not check file modification times. |
| <code>isync estimate -mtimewindow <s></code> | Specifies the acceptable modification time difference for verification. |
| <code>isync estimate -match <filter></code> | Only processes the files and directories that match the filter. |
| <code>isync estimate -bs <n[k]></code> | Specifies the read/write block size (default: 64k). |
| <code>isync estimate -parallel <n></code> | Specifies the maximum number of concurrent batch processes (default: 7). |
| <code>isync estimate -dircount <n[k]></code> | Specifies the request size when reading directories (default 64k). |
| <code>isync estimate -exclude <filter></code> | Excludes the files and directories that match the filter. |
| <code>isync estimate -id <name></code> | Specifies the catalog name for a previous copy operation. |

| Parameter | Description |
|--|--|
| <code>isync estimate -loglevel <name></code> | Sets the log level; available levels are INFO, DEBUG (default: INFO). |
| <code>isync estimate -preserve-atime</code> | Restores all files to the last accessed date on the source. |
| <code>isync estimate -s3.insecure</code> | Provides the option to use HTTP instead of HTTPS for S3 bucket communication. |
| <code>isync estimate -s3.endpoint <s3_endpoint_url></code> | Overrides the default Amazon Web Services (AWS) endpoint URL with the specified URL for S3 bucket communication. |
| <code>isync -s3.profile <profile_name></code> | Specifies a profile from the AWS credential file for S3 bucket communication. |
| <code>isync estimate -s3.noverify</code> | Overrides the default verification of SSL certification for S3 bucket communication. |

isync estimate -nodata

Use the the `-nodata` parameter with `isync estimate` to specify not to check data.

Syntax

```
xcp isync estimate -nodata -id <name>
```

Show example

```
[root@client1 linux]# ./xcp isync estimate -nodata -id <name>

Job ID: Job_2023-11-23_23.19.45.648691_isync_estimate

isync estimate -s3.noverify

Use the `-s3.noverify` parameter with `isync estimate` to override the default verification of SSL certification for S3 bucket communication.

Syntax

```
xcp isync estimate -s3.noverify -id <name>
```

Show example

```
[root@client1 linux]# ./xcp isync estimate -s3.noverify -id S3_index

Job ID: Job_2023-11-16_02.23.36.515890_isync_estimate

SMB command reference

help

The SMB `help` command displays a list of commands, command parameters, and a brief description of each. This command is very useful for beginners who are new to XCP.

Syntax

```
xcp --help
```

Show example

```
C:\Users\Administrator\Desktop\xcp>xcp --help
usage: xcp [-h] [-version]

{scan,show,listen,configure,copy,sync,verify,license,activate,help}
    ...
optional arguments:
  -h, --help            show this help message and exit
  -version              show program's version number and exit

XCP commands:
  {scan,show,listen,configure,copy,sync,verify,license,activate,help}
  scan                  Read all the files in a file tree
  show                  Request information from host about SMB shares
  listen                Run xcp service
  configure              Configure xcp.ini file
  copy                  Recursively copy everything from source to target
  sync                  Sync target with source
  verify                Verify that the target is the same as the source
  license                Show xcp license info
  activate              Activate a license on the current host
  help                  Show help for commands
```

help <command>

Use <command> with `help` to display examples and option details for the specified <command>.

Syntax

```
xcp help <command>
```

The following example output shows the details, usage, arguments, and optional arguments for the `sync`

command.

Show example

```

C:\Users\Administrator\Desktop\xcp>xcp help sync
usage: xcp sync [-h] [-v] [-parallel <n>] [-match <filter>] [-preserve-
atime]
[-noatime] [-noctime] [-nomtime] [-noattrs]
[-noownership] [-atimewindow <float>] [-ctimewindow <float>]
[-mtimewindow <float>] [-acl] [-fallback-user FALLBACK_USER]
[-fallback-group FALLBACK_GROUP] [-l]
source target
Note: ONTAP does not let a SMB client modify COMPRESSED or ENCRYPTED
attributes.
XCP sync will ignore these file attributes.
positional arguments:
source
target
optional arguments:
-h, --help            show this help message and exit
-v                    increase debug verbosity
-parallel <n>         number of concurrent processes (default: <cpu-
count>)
-match <filter>       only process files and directories that match the
filter
                        see `xcp help -match` for details)
-preserve-atime       restore last accessed date on source
-noatime              do not check file access time
-noctime              do not check file creation time
-nomtime              do not check file modification time
-noattrs              do not check attributes
-noownership          do not check ownership
-atimewindow <float>  acceptable access time difference in seconds
-ctimewindow <float>  acceptable creation time difference in seconds
-mtimewindow <float>  acceptable modification time difference in
seconds
-acl                  copy security information
-fallback-user FALLBACK_USER
                        a user on the target machine to receive the
permissions of local
(non-domain)source machine users (eg. domain\administrator)
-fallback-group      FALLBACK_GROUP
                        a group on the target machine to receive the
permissions of local
(non-domain) source machine groups (eg. domain\administrators)
-l                    increase output
-root                sync acl for root directory
C:\Users\Administrator\Desktop\xcp>

```

show

The SMB `show` command queries the RPC services and NFS exports of one or more storage servers. The command also lists the available services and exports with the used and free capacity of each export, followed by the attributes of the root of each export.

Syntax

The `show` command requires the host name or IP address of the NFSv3 exported system:

```
xcp show \\<IP address or hostname of SMB server>
```

Show example

```
C:\Users\Administrator\Desktop\xcp>xcp show \\<IP address or hostname
of SMB server>

xcp show \\<IP address or hostname of SMB server>
0 errors
Total Time : 0s
STATUS : PASSED
```

The following table lists the show parameters and their description.

| Parameter | Description |
|-----------------|---|
| show -v | Prints verbose details about SMB servers using the IP address or host name. |
| show -h, --help | Displays detailed information about how to use the command. |

license

The SMB `license` command displays XCP license information.

Syntax

```
xcp license
```

Show example

```
C:\Users\Administrator\Desktop\xcp>xcp license
xcp license
XCP <version>; (c) yyyy NetApp, Inc.; Licensed to XXX [NetApp Inc]
until Mon Dec 31 00:00:00 yyyy
License type: SANDBOX
License status: ACTIVE
Customer name: N/A
Project number: N/A
Offline Host: Yes
Send statistics: No
Host activation date: N/A
License management URL: https://xcp.netapp.com
```

activate

The SMB `activate` command activates the XCP license. Before running this command, verify that the license file is downloaded and copied on the C:\NetApp\XCP directory on the XCP host or client machine. The license can be activated on any number of hosts.

Syntax

```
xcp activate
```

Show example

```
C:\Users\Administrator\Desktop\xcp>xcp activate
XCP activated
```

scan

The SMB `scan` command recursively scans the entire SMB share and lists all the files by the end of the `scan` command.

Syntax

```
xcp scan \\<SMB share path>
```

Show example

```
C:\Users\Administrator\Desktop\xcp>xcp scan \\<IP address or hostname
of SMB server>\volxcp
c:\netapp\xcp\xcp scan \\<IP address of SMB destination
server>\source_share
volxcp\3333.txt
volxcp\SMB.txt
volxcp\SMB1.txt
volxcp\com.txt
volxcp\commands.txt
volxcp\console.txt
volxcp\linux.txt
volxcp\net use.txt
volxcp\newcom.txt
volxcp\notepad.txt
c:\netapp\xcp\xcp scan \\<IP address of SMB destination
server>\source_share
60,345 scanned, 0 matched, 0 errors
Total Time : 8s
STATUS : PASSED
C:\Users\Administrator\Desktop\xcp>Parameters
```

The following table lists the `scan` parameters and their description.

| Parameter | Description |
|------------------------------|---|
| <code>scan -h, --help</code> | Displays detailed information about how to use the <code>scan</code> command. |

| Parameter | Description |
|---|---|
| <code>scan -v</code> | Increases debug verbosity. |
| <code>scan -parallel <n></code> | Specifies the number of concurrent processes (default: <code><cpu-count></code>). |
| <code>scan -match <filter></code> | Only processes files and directories that match the filter. |
| <code>scan -exclude <filter></code> | Only excludes files and directories in the filter. |
| <code>scan -preserve-atime</code> | Restores the last accessed date on source. |
| <code>scan -depth <n></code> | Limits the search depth to n levels. |
| <code>scan -stats</code> | Lists files in the tree statistic report format. |
| <code>scan -html</code> | Lists files in the tree statistic HTML report format. |
| <code>scan -csv</code> | Lists files in the tree statistic CSV report format. |
| <code>scan -l</code> | Lists files in the long listing output format. |
| <code>scan -ownership</code> | Retrieves ownership information of files and directories on the source system. |
| <code>scan -du</code> | Summarizes space usage of each directory including subdirectories. |
| <code>scan -fmt <expression></code> | Formats file listing according to the Python expression (see <code>xcp help -fmt</code> for details). |
| <code>scan -ads</code> | Recursively scans the entire SMB share and lists all files and any associated alternate data streams. |

scan -h, --help

Use the `-h` and `--help` parameters with the `scan` command to display detailed information about how to use the `scan` command.

Syntax

```
xcp scan --help
```

Show example

```
C:\netapp\xcp>xcp scan --help

usage: xcp scan [-h] [-v] [-parallel <n>] [-match <filter>] [-exclude
<filter>] [-preserve-atime] [-depth
<n>] [-loglevel <name>] [-stats] [-l] [-ownership] [-du]
                [-fmt <expression>] [-html] [-csv] [-edupe] [-bs <n>]
[-ads]
                source
positional arguments:
  source
optional arguments:
  -h, --help            show this help message and exit
  -v                    increase debug verbosity
  -parallel <n>         number of concurrent processes (default: <cpu-
count>)
  -match <filter>       only process files and directories that match
the filter (see `xcp help -match` for details)
  -exclude <filter>     Exclude files and directories that match the
filter (see `xcp help -exclude` for details)
  -preserve-atime       restore last accessed date on source
  -depth <n>           limit the search depth
  -loglevel <name>     option to set log level filter (default:INFO)
  -stats               print tree statistics report
  -l                   detailed file listing output
  -ownership           retrieve ownership information
  -du                  summarize space usage of each directory
including subdirectories
  -fmt <expression>    format file listing according to the python
expression (see `xcp help -fmt` for details)
  -html                Save HTML statistics report
  -csv                 Save CSV statistics report
  -edupe               Include dedupe and sparse data estimate in
reports (see documentation for details)
  -bs <n>              read/write block size for scans which read data
with -edupe (default: 64k)
  -ads                 scan NTFS alternate data stream
```

scan -v

Use the `-v` parameter with the `scan` command to provide detailed logging information to troubleshoot or debug when an error or warning is reported.

Syntax

```
xcp scan -v \\<IP address or hostname of SMB server>\source_share
```

Show example

```
c:\netapp\xcp>xcp scan -v \\<IP address or hostname of SMB
server>\source_share
xcp scan -v \\<IP address or hostname of SMB server>\source_share

STATUS : PASSED
```

scan -parallel <n>

Use the `-parallel <n>` parameter with the `scan` command to set a higher or lower number of XCP concurrent processes.

The maximum value for `n` is 61.

Syntax

```
xcp scan -parallel <n> \\<IP address or hostname of SMB  
server>\source_share
```

Show example

```
c:\netapp\xcp>xcp scan -parallel 8 \\<IP address or hostname of SMB
server>\cifs_share
xcp scan -parallel 8 \\<IP address or hostname of SMB
server>\cifs_share

cifs_share
xcp scan -parallel 8 \\<IP address or hostname of SMB
server>\cifs_share
317 scanned, 0 matched, 0 errors
Total Time : 0s
STATUS : PASSED
```

scan -match <filter>

Use the `-match <filter>` parameter with the `scan` command to only process files and directories that match the filter.

Syntax

```
xcp scan -match <filter> \\<IP address or hostname of SMB
server>\source_share
```

In the following example, `scan -match` scans all files that have changed between one month and one year and prints a line to the console for each file found. The ISO format of its last modification time, a human-readable size of the file, its type, and its relative path are returned for each file.

Show example

```
c:\netapp\xcp>xcp scan -match "1*month < modified < 1*year" -fmt
"'{:>15} {:>7}{}
{}'.format(iso(mtime), humanize_size(size), type, relpath)" \\<IP
address or hostname of SMB server>\source_share
xcp scan -match "1*month < modified < 1*year" -fmt "'{:>15} {:>7} {}
{}'.format(iso(mtime), humanize_size(size), type, relpath)" \\<IP
address or hostname of SMB server>\source_share

xcp scan -match 1*month < modified < 1*year -fmt '{:>15} {:>7} {}
{}'.format(iso(mtime), humanize_size(size), type, relpath) \\<IP
address or hostname of SMB server>\source_share
317 scanned, 0 matched, 0 errors
Total Time : 0s
STATUS : PASSED
```

In the following example, `scan -match` lists the files that have not been modified for more than 3 months and have a size bigger than 4MB.

Show example

```
c:\netapp\xcp>xcp scan -match "modified > 3*month and size > 4194304"
-fmt "'{},{},{},{}'".format(iso(mtime), humanize_size(size), relpath) "\\<IP address or
hostname of SMB
server>\source_share
xcp scan -match "modified > 3*month and size > 4194304" -fmt "'{},{},{},{}'".format(iso(mtime), humanize_size(size), relpath) "\\<IP address or
hostname of SMB server>\source_share

xcp scan -match modified > 3*month and size > 4194304 -fmt '{},{},{},{}'".format(iso(mtime), humanize_size(size), relpath) "\\<IP address or
hostname of SMB server>\source_share
317 scanned, 0 matched, 0 errors
Total Time : 0s
STATUS : PASSED
```

The first of the following two examples only matches the directories and the formatting adds a comma between the variables "mtime", "relative path", and "depth".

The second example redirects the same output to "name.csv".

Show example

```
c:\netapp\xcp>xcp scan -match "type is directory" -fmt
"','.join(map(str, [iso(mtime), relpath, depth]))" "\\<IP address or
hostname of SMB server>\source_share
xcp scan -match "type is directory" -fmt "','.join(map(str,
[iso(mtime), relpath, depth]))" "\\<IP address or hostname of SMB
server>\source_share

2013-03-07_15:41:40.376072,source_share\agnostic,1
2020-03-05_04:15:07.769268,source_share,0

xcp scan -match type is directory -fmt "','.join(map(str, [iso(mtime),
relpath, depth]))" "\\<IP address or hostname of SMB server>\source_share
317 scanned, 2 matched, 0 errors
Total Time : 0s
STATUS : PASSED
```

Show example

```
c:\netapp\xcp>xcp scan -match "type is directory" -fmt
"','.join(map(str, [iso(mtime), relpath, depth]))" "\\<IP address or
hostname of SMB server>\source_share > name.csv
xcp scan -match "type is directory" -fmt "','.join(map(str,
[iso(mtime), relpath, depth]))" "\\<IP address or hostname of SMB
server>\source_share > name.csv
```

The following example prints the full path and the raw `mtime` value of all the files that are not directories. The `mtime` value is padded with 70 characters to facilitate a readable console report.

Show example

```
c:\netapp\xcp>xcp scan -match "type is not directory" -fmt
"'{}{:>70}'.format(abspath, mtime)" "\\<IP address or hostname of SMB
server>\source_share
xcp scan -match "type is not directory" -fmt "'{}
{:>70}'.format(abspath, mtime)" "\\<IP address or hostname of SMB
server>\source_share

xcp scan -match type is not directory -fmt '{} {:>70}'.format(abspath,
mtime) \\<IP address or hostname of SMB server>\source_share
317 scanned, 315 matched, 0 errors
Total Time : 0s
STATUS : PASSED

```

scan -exclude <filter>

Use the `-exclude <filter>` with the `scan` command to exclude directories and files based on the pattern in the filter.

Syntax

```

xcp scan -exclude <filter> \\<IP address or hostname of SMB
server>\source_share

```

In the following example, `scan -exclude` excludes any file that has changed between one month and one year, and prints a line to the console for each file that is not excluded. The details printed for each file are the ISO format of its last modification time, a human-readable size of the file, its type, and its relative path.

Show example

```
c:\netapp\xcp>xcp scan -exclude "1*month < modified < 1*year" -fmt
"'{:>15} {:>7}{}
{}'.'.format(iso(mtime), humanize_size(size), type, relpath)" \\<IP
address or hostname ofSMB server>\localtest\arch\win32\agnostic
xcp scan -exclude "1*month < modified < 1*year" -fmt "'{:>15} {:>7}
{}{}'.'.format(iso(mtime), humanize_size(size), type, relpath)" \\<IP
address or hostname of SMB server>\localtest\arch\win32\agnostic

xcp scan -exclude 1*month < modified < 1*year -fmt '{:>15} {:>7} {}
{}'.'.format(iso(mtime), humanize_size(size), type, relpath) \\<IP
address or hostname of SMB server>\localtest\arch\win32\agnostic
140,856 scanned, 1 excluded, 0 errors
Total Time : 46s
STATUS : PASSED
```

In the following example, `scan -exclude` lists the not excluded files that have not been modified for more

than three months and have a size greater than 5.5 KB. The details that are printed for each file are the ISO format of its last modification time, a human-readable size of the file, its type, and its relative path.

Show example

```
c:\netapp\xcp>xcp scan -exclude "modified > 3*month and size > 5650"
-fmt "'{ }, { }, {'}.format(iso(mtime), humanize_size(size), relpath)"
\\<IP address or hostname of SMB
server>\localtest\arch\win32\agnostic\snapmirror
xcp scan -exclude "modified > 3*month and size > 5650" -fmt "'{ }, { },
{'}.format(iso(mtime), humanize_size(size) relpath)" \\<IP address or
hostname of SMB server>\localtest\arch\win32\agnostic\snapmirror

xcp scan -exclude type is directory -fmt "','.join(map(str, [iso(mtime),
relpath, depth])) \\<IP address or hostname of SMB
server>\localtest\arch\win32\agnostic\snapmirror
18 scanned, 1 excluded, 0 errors
Total Time : 0s
STATUS : PASSED
```

This following example prints the complete file path and the raw `mtimevalue` of all files that are not directories. The `mtimevalue` is padded with 70 characters to facilitate a readable console report.

Show example

```
c:\netapp\xcp>xcp scan -exclude "type is not directory" -fmt "'{}  
{:>70}'.format(abspath, mtime)" \\<IP address or hostname of  
SMBserver>\source_share  
  
xcp scan -exclude type is not directory -fmt '{}  
{:>70}'.format(abspath, mtime) \\<IP address or hostname of SMB  
server>\source_share  
18 scanned, 17 excluded, 0errors  
Total Time : 0s  
STATUS : PASSED
```

scan -preserve-ctime

Use the `-preserve-ctime` parameter with the `scan` command to restore the last accessed date of all the files on the source and reset the `ctime` to the original value before XCP read the file.

When you scan an SMB share, the access time is modified on the files (if the storage system is configured to modify `ctime` on read) because XCP is reading the files one by one. XCP never changes the `ctime`, it just reads the file, which triggers an update on `ctime`.

Syntax

```
xcp scan -preserve-ctime \\<IP address or hostname of SMB  
server>\source_share
```

Show example

```
c:\netapp\xcp>xcp scan -preserve-ctime \\<IP address or hostname of SMB
server>\source_share
xcp scan -preserve-ctime \\<IP address or hostname of SMB
server>\source_share

Total Time : 1s
STATUS : PASSED
```

scan -depth <n>

Use the `-depth <n>` parameter with the `scan` command to limit the search depth of directories inside an SMB share.

The `-depth` option specifies how deep XCP can scan the files into the subdirectories.

Syntax

```
xcp scan -depth <2> \\<IP address or hostname of SMB server>\source_share
```

Show example

```
c:\netapp\xcp>xcp scan -depth 2 \\<IP address or hostname of SMB
server>\source_share
xcp scan -depth 2 \\<IP address or hostname of SMB server>\source_share

scan -stats

Use the `-stats` parameter with the `scan` command to list files in a tree statistics report format.

Syntax

```
xcp scan -stats \\<IP address or hostname of SMB server>\source_share
```

Show example

```
C:\netapp\xcp>xcp scan -stats \\<IP address or hostname of SMB
server>\cifs_share

scan -html

Use the `-html` parameter with the `scan` command to list files in a HTML statistics report.

XCP reports (.csv, .html) are saved in the same location as the XCP binary. The file name is in the format `<xcp_process_id>_<time_stamp>.html`. When XCP cannot map security identifiers (SIDs) to owner names, it uses the last few digits after the final “-” in the SID to represent the owner. For example, when XCP is unable to map the SID S-1-5-21-1896871423-3211229150-3383017265-4854184 to its owner, it represents the owner by using 4854184.

Syntax

```
xcp scan -stats -html -preserve-ctime -ownership \\<IP address or hostname
of SMB server>\source_share
```

Show example

```
Z:\scripts\xcp\windows>xcp scan -stats -html -preserve-atime -ownership
\\<IP address or hostname of SMB server>\source_share

scan -l

Use the -l parameter with the scan command to list files in the long listing output format.

Syntax

```
xcp scan -l \\<IP address or hostname of SMB server>\source_share
```

Show example

```
c:\netapp\xcp>xcp scan -l \\<IP address or hostname of SMB
server>\source_share xcp scan -l \\<IP address or hostname of SMB
server>\source_share

scan -ownership

Use the `-ownership` parameter with the `scan` command to retrieve ownership information for files.

You can only use `-ownership` with the `-l`, `-match`, `-fmt`, or `-stats` parameters.

Syntax

```
xcp scan -l -ownership \\<IP address or hostname of SMB  
server>\source_share
```

Show example

```
c:\netapp\xcp>xcp scan -l -ownership \\<IP address or hostname of SMB
server>\source_share xcp scan -l -ownership \\<IP address or hostname
of SMB server>\source_share

scan -du

Use the `-du` parameter with the `scan` command to summarize the space usage of each directory, including subdirectories.

Syntax

```
xcp scan -du \\<IP address or hostname of SMB server>\source_share
```

Show example

```
c:\netapp\xcp>xcp scan -du \\<IP address or hostname of SMB  
server>\source_share xcp scan -du \\<IP address or hostname of SMB  
server>\source_share

Total Time : 0s  
STATUS : PASSED
```

scan -fmt <expression>

Use the `-fmt <expression>` parameter with the `scan` command to format a file listing according to a defined expression.

Syntax

```
xcp scan -fmt "'", '.join(map(str, [relpath, name, size, depth]))"  
\\<IP address or hostname of SMB server>\source_share
```

Show example

```
c:\netapp\xcp>xcp scan -fmt "'", '.join(map(str, [reldpath, name, size,
depth]))' "\\<IP address or hostname of SMB server>\source_share
xcp scan -fmt "'", '.join(map(str, [reldpath, name, size, depth]))'
\\"<IP address or hostname of SMB server>\source_share

scan -ads

Use the `-ads` flag parameter with the `scan` command with to recursively scan the entire SMB share and list all files and any associated alternate data streams.

Syntax

```
xcp scan -ads \\<source_ip_address>\source_share\src
```

Show example

```
C:\netapp\xcp>xcp scan -ads \\<source_ip_address>\source_share\src

copy

The `copy` command scans and copies the entire source directory structure to a destination SMB share. The `copy` command requires source and destination paths as variables. The scanned and copied files, throughput/speed, and elapsed time details are printed to the console once every five seconds.

- The run-time log file is stored under "C:\NetApp\XCP".
- This `copy` command copies data without an access control list (ACL).

Syntax

```
xcp copy \\<IP address or hostname of SMB server>\source_share \\<IP address of SMB destination server>\dest_share
```

Show example

```
c:\netapp\xcp>xcp copy \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share

xcp copy \\<IP address or hostname of SMB server>\source_share \\<IP
address of SMB destination server>\dest_share
317 scanned, 0 matched, 316 copied, 0 errors
Total Time : 2s
STATUS : PASSED
```

The following table lists the `copy` parameters and their description.

| Parameter | Description |
|--|---|
| <code>copy -h, --help</code> | Displays detailed information about the <code>copy</code> command. |
| <code>copy -v</code> | Increase debug verbosity. |
| <code>copy -parallel <n></code> | Specifies the number of concurrent processes (default: <code><cpu-count></code>). |
| <code>copy -match <filter></code> | Only processes files and directories that match the filter (see <code>xcp help - match</code> for details). |
| <code>copy -exclude <filter></code> | Only excludes files and directories in the filter |
| <code>copy -preserve-atime</code> | Restores last accessed date on source. |
| <code>copy -acl</code> | Copies security information. |
| <code>copy -fallback-user <fallback_user></code> | Specifies the Active Directory user or local (non-domain) user on the target machine that receives the permissions of local (non-domain) source machine users. For example, <code>domain\administrator</code> . |
| <code>copy -fallback-group <fallback_group></code> | Specifies the Active Directory group or local (non-domain) group on the target machine that receives the permissions of local (non-domain) source machine groups. For example, <code>domain\administrators</code> . |

| Parameter | Description |
|---------------------------------------|--|
| <code>copy -root</code> | Copies the ACLs for a root directory. |
| <code>copy -aclverify {yes,no}</code> | Provides an option to skip or include ACL verification during the copy -acl operation. |
| <code>copy -noownership</code> | Does not copy ownership. |
| <code>copy -bs <n></code> | Read/Write blocksize (default:1M) |
| <code>copy -ads</code> | Copies NTFS alternate data streams from the source SMB share to the destination SMB share. |

copy -h, --help

Use the `-h` and `--help` parameters with the `copy` command to display detailed information about the `copy` command

Syntax

```
xcp copy -help
```

Show example

```
C:\netapp\xcp>xcp copy -help
```

```
usage: xcp copy [-h] [-v] [-parallel <n>] [-match <filter>] [-exclude  
<filter>] [-preserve- atime] [-acl] [-fallback-user FALLBACK_USER]  
[-fallback-group FALLBACK_GROUP] [-loglevel <name>] [-root] [-  
noownership] [- aclverify {yes,no}] [-bs <n>] [-ads]  
        source target
```

positional arguments:

source
target

optional arguments:

| | |
|--------------------------------|--|
| -h, --help | show this help message and exit |
| -v | increase debug verbosity |
| -parallel <n> | number of concurrent processes (default: <cpu-count>) |
| -match <filter> | only process files and directories that match the filter (see `xcp help -match` for details) |
| -exclude <filter> | Exclude files and directories that match the filter (see `xcp help - exclude` for details) |
| -preserve-atime | restore last accessed date on source |
| -acl | copy security information |
| -fallback-user FALLBACK_USER | the name of the user on the target machine to receive the permissions of local (non-domain) source machine users (eg. domain\administrator) |
| -fallback-group FALLBACK_GROUP | the name of the group on the target machine to receive the permissions of local (non-domain) source machine groups (eg. domain\administrators) |
| -loglevel <name> | option to set log level filter (default:INFO) |
| -root | copy acl for root directory |
| -noownership | do not copy ownership |
| -aclverify {yes,no} | choose whether you need to skip acl verification |
| -bs <n> | read/write block size for copy (default: 1M) |
| -ads | copy NTFS alternate data streams. |

copy -v

Use the -v parameter with the copy command to provide detailed debug information.

Syntax

```
xcp copy -v \\<IP address or hostname of SMB server>\source_share \\<IP address of SMB destination server>\dest_share
```

Show example

```
c:\netapp\xcp>xcp copy -v \\<IP address of SMB destination server>\src
\\<IP address of SMB destination server>\dest\d1

failed to set attributes for "d1": (5, 'CreateDirectory', 'Access is
denied.')
failed to copy "f1.txt": (5, 'CreateFile', 'Access is denied.')
failed to set attributes for "": (5, 'SetFileAttributesW', 'Access is
denied.') error setting timestamps on "": errno (code: 5) Access is
denied.
H:\p 4\xcp_latest\xcp_cifs\xcp\ main .py copy -v \\<IP address of SMB
destination server>\src \\<IP address of SMB destination
server>\dest\d1
3 scanned, 0 matched, 0 skipped, 1 copied, 0 (0/s), 3 errors
Total Time : 3s
STATUS : FAILED
```

copy -parallel <n>

Use the `-parallel <n>` parameter with the `copy` command to set a higher or lower number of XCP concurrent processes. The default value for `-parallel` is equal to the CPU count.

The maximum value for `n` is 61.

Syntax

```
xcp copy -parallel <n> \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination server>\dest_share
```

Show example

```
c:\netapp\xcp>xcp copy -parallel 7  \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share

xcp copy -parallel 7 \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share
317 scanned, 0 matched, 316 copied, 0errors
Total Time : 2s
STATUS : PASSED
```

copy -match <filter>

Use the -match <filter> parameter with the copy command to copy only the data that matches the argument passed.

Syntax

```
xcp copy -match <filter>  \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination server>\dest_share
```

Show example

```
c:\netapp\xcp>xcp copy -match "'gx' in name"  \\<IP address or hostname
of SMB server>\source_share \\<IP address of SMB destination
server>\dest_share

xcp copy -match 'gx' in name  \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share
317 scanned, 5 matched, 4 copied, 0 errors
Total Time : 1s
STATUS : PASSED
```

copy -exclude <filter>

Use the -exclude <filter> parameter with the copy command to only copy excluded data.

Syntax

```
xcp copy -exclude <filter> \\<IP address or hostname of SMB  
server>\source_share \\<IP address of SMB destination server>\dest_share
```

In the following example, the files and directories that have the string "resync" in their name have been excluded for copy.

Show example

```
c:\netapp\xcp>xcp copy -exclude "'resync' in name" \\<IP address or  
hostname of SMB server>\source_share \\<IP address or hostname of SMB  
server>\dest_share  
  
xcp copy -exclude 'resync' in name \\<IP address or hostname of SMB  
server>\source_share \\<IP address or hostname of SMB  
server>\dest_share  
18 scanned, 2 excluded, 0 skipped, 15 copied, 122KiB (50.5KiB/s), 0  
errors  
Total Time : 2s  
STATUS : PASSED
```

copy -preserve-ctime

Use the `-preserve-ctime` parameter with the `copy` command to reset the "ctime" to the original value before XCP read the file.

Syntax

```
xcp copy -preserve-ctime \\<IP address or hostname of SMB  
server>\source_share \\<IP address of SMB destination server>\dest_share
```

Show example

```
c:\netapp\xcp>xcp copy -preserve-ctime \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share

xcp copy -preserve-ctime \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share
317 scanned, 0 matched, 316 copied, 0 errors
Total Time : 2s
STATUS : PASSED
```

copy -acl -fallback-user <fallback_user> -fallback-group <fallback_group>

Use the `-acl` parameter with the `copy` command to activate the transfer of the security descriptors (ACLs).

Use the `-acl` parameter with the `-fallback-user` and `-fallback-group` options to specify a user and a group on the target machine or from Active Directory to receive the permissions of local (non-domain) source machine users or groups. This does not refer to unmatched users from an Active Directory.

Syntax

```
xcp copy -acl -fallback-user <fallback_user> -fallback-group
<fallback_group> \\<IP address or hostname of SMB server>\source_share
\\<IP address of SMB destination server>\dest_share
```

copy -aclverify {yes,no}

Use the `-aclverify {yes,no}` parameter with the `copy` command to provide an option to skip or include ACL verification during an ACL copy operation.

You must use the `-aclverify {yes,no}` parameter with the `copy -acl` command. By default, the ACL copy operation verifies the ACLs. If you set the `-aclverify` option to `no`, you can skip ACL verification and the `fallback-user` and `fallback-group` options are not required. If you set `-aclverify` to `yes`, it requires the `fallback-user` and `fallback-group` options, as shown in the following example.

Syntax

```
xcp copy -acl -aclverify yes -fallback-user <fallback_user> -fallback
-group <fallback_group> \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination server>\dest_share
```

Show example

```
C:\NetApp\xcp>xcp copy -acl -aclverify yes -fallback-user "DOMAIN\User"
-fallback-group "DOMAIN\Group"
\\<source_IP_address>\source_share
\\<destination_IP_address>\dest_share

acls copied xcp copy -acl -aclverify yes -fallback-user "DOMAIN\User"
-fallback-group "DOMAIN\Group" \\<source_IP_address>\source_share
\\<destination_IP_address>\dest_share
12 scanned, 0 matched, 0 skipped, 11 copied, 10KiB (634/s), 0 errors,
11 acls copied
Total Time : 16s
STATUS : PASSED

C:\NetApp\xcp>xcp copy -acl -aclverify no
\\<source_IP_address>\source_share
\\<destination_IP_address>\dest_share

xcp copy -acl -aclverify no \\<source_IP_address>\source_share
\\<destination_IP_address>\dest_share
12 scanned, 0 matched, 0 skipped, 11 copied, 10KiB (5.61KiB/s), 0
errors, 11 acls copied
Total Time : 1s
STATUS : PASSED
```

copy -root

Use the `-root` parameter with the `copy` command to copy the ACLs for the root directory.

Syntax

```
xcp copy -acl -root -fallback-user "DOMAIN\User" -fallback-group
"DOMAIN\Group" \\<IP address or hostname of SMB server>\source_share \\<IP
address of SMB destination server>\dest_share
```

Show example

```
C:\NetApp\XCP>xcp copy -acl -root -fallback-user "DOMAIN\User"
-fallback-group "DOMAIN\Group" \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share

xcp copy -acl -root -fallback-user "DOMAIN\User" -fallback-group
"DOMAIN\Group" \\<IP address or hostname of SMB server>\source_share
\\<IP address of SMB destination server>\dest_share
6 scanned, 0 matched, 0 skipped, 5 copied, 200 (108/s), 0 errors, 6
acls copied
Total Time : 1s
STATUS : PASSED
```

copy -noownership

Use the `-noownership` parameter with the `copy` command to specify not to copy the ownership from the source to the destination. You must use `-noownership` with the `-acl` option and it requires `fallback-user` and `fallback-group` as mandatory parameters.

Syntax

```
xcp.exe copy -acl -noownership -fallback-user <fallback_user> -fallback
-group <fallback_group> \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination server>\dest_share
```

Show example

```
C:\Netapp\xcp>xcp.exe copy -acl -noownership -fallback-user
"DOMAIN\User" -fallback-group "DOMAIN\Group"
\\<source_IP_address>\source_share
\\<destination_IP_address>\dest_share

Total Time : 17s
STATUS : PASSED
```

copy -bs <n>

Use the -bs <n> parameter with the copy command to provide a read/write block size. The default value is 1M.

Syntax

```
xcp.exe copy -bs <n> \\<IP address or hostname of SMB server>\source_share
\\<IP address of SMB destination server>\dest_share
```

Show example

```
c:\Netapp\xcp>xcp.exe copy -bs 32k \\<source_IP_address>\source_share
\\<destination_IP_address>\dest_share

xcp.exe copy -bs 32k \\<source_IP_address>\source_share
\\<destination_IP_address>\dest_share
568 scanned, 0 matched, 0 skipped, 567 copied, 17.7MiB (6.75MiB/s), 0
errors
Total Time : 2s
STATUS : PASSED
```

copy -ads

Use the `-ads` parameter with the `copy` command to copy NTFS alternate data streams from the source SMB share to destination SMB share.

Syntax

```
xcp copy -ads \\<IP address or hostname of SMB server>\source_share \\<IP address of SMB destination server>\dest_share
```

Show example

```
c:\netapp\xcp>xcp copy -ads \\<source_IP_address>\source_share\src
\\<dest_IP_address>\dest_share

STATUS : PASSED
```

sync

The `sync` command scans for changes and modifications in the source and target shares in parallel and applies the appropriate actions to the target to make sure that the target is identical to the source. The `sync` command compares data content, time stamps, file attributes, ownership, and security information.

Syntax

```
xcp sync \\<source SMB share> \\<IP address of SMB destination server>
```

Show example

```
c:\netapp\xcp>xcp sync \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share
xcp sync \\<IP address or hostname of SMB server>\source_share \\<IP
address of SMB destination server>\dest_share
xcp sync \\<IP address or hostname of SMB server>\source_share \\<IP
address of SMB destination server>\dest_share
634 scanned, 0 copied, 634 compared, 0 removed, 0 errors
Total Time : 3s
STATUS : PASSED
```

The following table lists the `sync` parameters and their description.

| Parameter | Description |
|---|--|
| <code>sync -h, --help</code> | Show this help message and exit. |
| <code>sync -v</code> | Increase debug verbosity. |
| <code>sync -parallel <n></code> | Number of concurrent processes (default: <cpu-count>). |
| <code>sync -match <filter></code> | Only process files and directories that match the filter (see <code>xcp help - match</code> for details). |
| <code>sync -exclude <filter></code> | Only exclude files and directories in the filter. |
| <code>sync -preserve-atime</code> | Restore last accessed date on source. |
| <code>sync -noatime</code> | Do not check file access time. |
| <code>sync -noctime</code> | Do not check file creation time. |
| <code>sync -nomtime</code> | Do not check file modification time. (This option is deprecated. Sync will continue to run without this option.) |
| <code>sync -noattrs</code> | Do not check attributes. |

| Parameter | Description |
|--|--|
| <code>sync -noownership</code> | Do not check ownership. |
| <code>sync -atimewindow <float></code> | Acceptable access time difference, in seconds. |
| <code>sync -ctimewindow <float></code> | Acceptable creation time difference, in seconds. |
| <code>sync -mtimewindow <float></code> | Acceptable modification time difference, in seconds, |
| <code>sync -acl</code> | Copy security information. |
| <code>sync -fallback-user <fallback_user></code> | Active Directory user or local(non-domain) user on the target machine to receive the permissions of local (non-domain) source machine users (example: domain\administrator). |
| <code>sync -fallback-group <fallback_group></code> | Active Directory group or local(non-domain) group on the target machine to receive the permissions of local(non-domain) source machine groups (example: domain\administrators). |
| <code>sync -l</code> | Increases output detail. |
| <code>sync -root</code> | Sync ACLs for the root directory. |
| <code>sync -onlyacl</code> | Copy only the security information. |
| <code>sync -aclverify{yes,no}</code> | Provide an option to include or skip ACL verification during the ACL sync operation. |
| <code>sync -bs <n></code> | Read/Write blocksize (default:1M). |
| <code>sync -ads</code> | Use the <code>sync</code> command with the <code>-ads</code> flag to scan for changes and modifications of alternate data streams in the source and target SMB share. If there are changes, it applies the change to the target to make sure that the target is identical to the source. |

sync -h, --help

Use the `-h` and `--help` parameters with the `sync` command to display detailed information about the `sync` command

Syntax

```
xcp sync --help
```

Show example

```
C:\Netapp\xcp>xcp sync --help
usage: xcp sync [-h] [-v] [-parallel <n>] [-match <filter>] [-exclude
<filter>] [-preserve-atime] [-noatime] [-noctime] [-nomtime] [-noattrs]
[-atimewindow <float>]
[-ctimewindow <float>] [-mtimewindow <float>] [-acl] [-fallback-user
FALLBACK_USER] [-fallback-group FALLBACK_GROUP] [-loglevel <name>] [-l]
[-root]
[-noownership] [-onlyacl] [-aclverify {yes,no}] [-bs <n>] [-ads] source
target
```

Note: ONTAP does not let a SMB client modify COMPRESSED or ENCRYPTED attributes. XCP sync will ignore these file attributes.

positional arguments:

source
target

optional arguments:

| | |
|--------------------------------|---|
| -h, --help | show this help message and exit |
| -v | increase debug verbosity |
| -parallel <n> | number of concurrent processes (default: <cpu-count>) |
| -match <filter> | only process files and directories that match the filter (see `xcp help -match` for details) |
| -exclude <filter> | Exclude files and directories that match the filter (see `xcp help -exclude` for details) |
| -preserve-atime | restore last accessed date on source |
| -noatime | do not check file access time |
| -noctime | do not check file creation time |
| -nomtime | do not check file modification time |
| -noattrs | do not check attributes |
| -atimewindow <float> | acceptable access time difference in seconds |
| -ctimewindow <float> | acceptable creation time difference in seconds |
| -mtimewindow <float> | acceptable modification time difference in seconds |
| -acl | copy security information |
| -fallback-user FALLBACK_USER | the name of the user on the target machine to receive the permissions of local (non-domain) source machine users (eg. domain\administrator) |
| -fallback-group FALLBACK_GROUP | the name of the group on the target machine to receive the permissions of local (non-domain) source machine groups |

```
(eg. domain\administrators)
-loglevel <name>      option to set log levelfilter
-l                    increase output detail
-root                 sync acl for root directory
-noownership           do not sync ownership
-onlyacl              sync only acls
-aclverify {yes,no}   choose whether you need to skip acl
verification
-bs <n>               read/write block size for sync (default: 1M)
-ads                  sync ntfs alternate data stream
```

sync -v

Use the `-v` parameter with the `sync` command to provide detailed debug information.

Syntax

```
xcp sync -v \\<IP address or hostname of SMB
server>\vol_SMB_source_xxxxxx\warning \\<IP address of SMB destination
server>\vol_SMB_target_xxxxxx
```

Show example

```
C:\XCP>xcp sync -v \\
```

```

```

sync -parallel <n>

Use the `-parallel <n>` parameter with the `sync` command to set a higher or lower number of XCP concurrent processes. The `sync -parallel <n>` command syncs with the number of concurrent processes (default: `<cpu-count>`).

The maximum value for n is 61.

Syntax

```
xcp sync -parallel <n>> \\<IP address or hostname of SMB
server>\volxcp\\<IP address of SMB destination server>\xcpl_test1
```

Show example

```
C:\xcp>xcp sync -parallel 5 \\<IP address or hostname of SMB
server>\volxcp\\<IP address of SMB destination server>\xcpl_test1
658 scanned, 244 compared, 0 errors, 0 skipped, 0 copied, 0 removed, 5s
658 scanned, 606 compared, 0 errors, 0 skipped, 0 copied, 0 removed,
10s
658 scanned, 658 compared, 0 errors, 0 skipped, 0 copied, 0 removed,
10s
Sending statistics...
```

sync -match <filter>

Use the `-match <filter>` parameter with the `sync` command to scan the source and target tree and compare only the files or directories that match the filter argument. If there are any differences, the command applies the required actions on the target to keep them in sync.

Syntax

```
xcp sync -match <filter> \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination server>\dest_share
```

Show example

```
c:\netapp\xcp>xcp sync -match "'gx' in name" \\<IP address or hostname
of SMB server>\source_share \\<IP address of SMB destination
server>\dest_share
xcp sync -match "'gx' in name" \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share

xcp sync -match 'gx' in name \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share
634 scanned, 0 copied, 10 compared, 0 removed, 0 errors
Total Time : 2s
STATUS : PASSED
```

sync -exclude <filter>

Use the `-exclude <filter>` parameter with the `sync` command to only exclude files and directories in the filter.

Syntax

```
xcp sync -exclude <filter> \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination server>\dest_share
```

Show example

```
C:\netapp\xcp>xcp sync -exclude "path('*Exceptions*')" \\<IP address or
hostname of SMB server>\source_share \\<IP address of SMB destination
server>\dest_share

xcp sync -exclude path('*Exceptions*') \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share
451 scanned, 427 excluded, 0 copied, 24 compared, 0 skipped, 0 removed,
0 errors
Total Time : 2s
STATUS : PASSED
```

sync -preserve-ctime

Use the `-preserve-ctime` parameter with the `sync` command to reset "ctime" to the original value before XCP read the file.

Syntax

```
xcp sync -preserve-ctime \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination server>\dest_share
```

Show example

```
c:\netapp\xcp>xcp sync -preserve-ctime \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share
xcp sync -preserve-ctime \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share

xcp sync -preserve-ctime \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share
634 scanned, 0 copied, 634 compared, 0 removed, 0 errors
Total Time : 4s
STATUS : PASSED
```

sync -noctime

Use the `-noctime` parameter with the `sync` command to sync all the differences in the source to the target, excluding files that only have differences in access time.

Syntax

```
xcp sync -noctime \\<IP address or hostname of SMB server>\source_share
\\<IP address of SMB destination server>\dest_share
```

Show example

```
c:\netapp\xcp>xcp sync -noctime \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share
xcp sync -noctime \\<IP address or hostname of SMB server>\source_share
\\<IP address of SMB destination server>\dest_share

xcp sync -noctime \\<IP address or hostname of SMB server>\source_share
\\<IP address of SMB destination server>\dest_share
634 scanned, 0 copied, 634 compared, 0 removed, 0 errors
Total Time : 3s
STATUS : PASSED
```

sync -noctime

Use the `-noctime` parameter with the `sync` command to sync all the differences in the source to the target,

excluding files that only have differences in creation time.

Syntax

```
xcp sync -noctime \\<IP address or hostname of SMB server>\source_share  
\\<IP address of SMB destination server>\dest_share
```

Show example

```
c:\netapp\xcp>xcp sync -noctime \\<IP address or hostname of SMB  
server>\source_share \\<IP address of SMB destination  
server>\dest_share  
xcp sync -noctime \\<IP address or hostname of SMB server>\source_share  
\\<IP address of SMB destination server>\dest_share  
  
xcp sync -noctime \\<IP address or hostname of SMB server>\source_share  
\\<IP address of SMB destination server>\dest_share  
634 scanned, 0 copied, 634 compared, 0 removed, 0 errors  
Total Time : 3s  
STATUS : PASSED
```

sync -nomtime

Use the `-nomtime` parameter with the `sync` command to sync all the differences in the source to the target, excluding files that only have differences in modification time. (This option is deprecated. The `sync` command will continue to run without this option.)

Syntax

```
xcp sync -nomtime \\<IP address or hostname of SMB server>\source_share  
\\<IP address of SMB destination server>\dest_share
```

Show example

```
c:\netapp\xcp>xcp sync -nomtime \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share
xcp sync -nomtime \\<IP address or hostname of SMB server>\source_share
\\<IP address of SMB destination server>\dest_share

xcp sync -nomtime \\<IP address or hostname of SMB server>\source_share
\\<IP address of SMB destination server>\dest_share
634 scanned, 0 copied, 634 compared, 0 removed, 0 errors
Total Time : 3s
STATUS : PASSED
```

sync -noattrs

Use the `-noattrs` parameter with the `sync` command to sync all the differences in the source to the target, excluding files that only have differences in file attributes. XCP copies a file only when it has different content (the ACLs are transferred).

Syntax

```
xcp sync -noattrs \\<IP address or hostname of SMB server>\source_share
\\<IP address of SMB destination server>\dest_share
```

Show example

```
c:\netapp\xcp>xcp sync -noattrs \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share
xcp sync -noattrs \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share

xcp sync -noattrs \\<IP address or hostname of SMB server>\source_share
\\<IP address of SMB destination server>\dest_share
634 scanned, 0 copied, 634 compared, 0 removed, 0 errors
Total Time : 3s
STATUS : PASSED
```

sync -noownership

Use the `-noownership` parameter with the `sync` command to sync all the differences of the source to the

target, excluding files that only have differences in ownership.

Syntax

```
xcp sync -noownership \\<IP address or hostname of SMB
server>\vol_SMB_source_XXXXXX \\<IP address of SMB destination
server>\vol_SMB_target_XXXXXX
```

Show example

```
>xcp sync -acl -noownership -fallback-user "DOMAIN\User" -fallback
-group "DOMAIN\Group" \\<source_IP_address>\source_share \\<IP address
of SMB destination server>\dest_share
```

Truncated Output

Total Time : 10m29s
STATUS : PASSED
```

sync -atimewindow <float>

Use the `-atimewindow <float>` parameter with the `sync` command to specify the acceptable difference, in seconds, for the atime of a file from the source to the destination. XCP does not report files as being different if the difference in atime is less than <value>.

Syntax

```
xcp sync -atimewindow <float> \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination server>\dest_share
```

In the following example, XCP accepts a difference in atime of up to 10 minutes between the source and the destination files, and it does not update the atime on the target.

Show example

```
c:\netapp\xcp>xcp sync -atimewindow 600 \\<IP address or hostname of
SMB server>\source_share \\<IP address of SMB destination
server>\source_share
xcp sync -atimewindow 600 \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\source_share

xcp sync -atimewindow 600 \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\source_share
634 scanned, 0 copied, 634 compared, 0 removed, 0 errors
Total Time : 3s
STATUS : PASSED
```

sync -ctimewindow <float>

Use the `-ctimewindow <float>` parameter with the `sync` command to specify the acceptable difference, in seconds, for the ctime of a file from the source to the destination. XCP does not report files as being different when the difference in ctime is less than <value>.

Syntax

```
xcp sync -ctimewindow <float> \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination server>\dest_share
```

In the following example, XCP accepts a difference in atime for up to 10 minutes between the source and the destination files, and it does not update the ctime on the target.

Show example

```
c:\netapp\xcp>xcp sync -ctimewindow 600 \\<IP address or hostname of
SMB server>\source_share \\<IP address of SMB destination
server>\dest_share
xcp sync -ctimewindow 600 \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share

xcp sync -ctimewindow 600 \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share
634 scanned, 0 copied, 634 compared, 0 removed, 0 errors
Total Time : 3s
STATUS : PASSED
```

sync -mtimewindow <float>

Use the `-mtimewindow <float>` parameter with the `sync` command to specify the acceptable difference, in seconds, for the mtime of a file from the source to the destination. XCP does not report files as being different when the difference in mtime is less than <value>.

Syntax

```
xcp sync -mtimewindow <float> \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination server>\dest_share
```

Show example

```
c:\netapp\xcp>xcp sync -mtimewindow 600 \\<IP address or hostname of
SMB server>\source_share \\<IP address of SMB destination
server>\dest_share
xcp sync -mtimewindow 600 \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share

xcp sync -mtimewindow 600 \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share
634 scanned, 0 copied, 634 compared, 0 removed, 0 errors Total Time :
3s
STATUS : PASSED
```

sync -acl -fallback-user <fallback_user> -fallback-group <fallback_group>

Use the `-acl`, `-fallback-user` and `-fallback-group` parameters with the `sync` command to compare the data and the security information from the source with the target and apply the required actions on the target. The `-fallback-user` and `-fallback-group` options are a user or group on the target machine or in the Active Directory that receive the permissions of the local (non-domain) source users or groups.

You cannot use the `-acl` option without the `-fallback-user` and `-fallback-group` options.

Syntax

```
xcp sync -acl -fallback-user <fallback_user> -fallback-group  
<fallback_group> \\<IP address or hostname of SMB  
server>\performance_SMB_home_dirs \\<IP address of SMB destination  
server>\performance_SMB_home_dirs
```

Show example

```
C:\xcp>xcp sync -acl -fallback-user "DOMAIN\User" -fallback-group
"DOMAIN\Group" \\<IP address or hostname of SMB server>\source_share
\\<IP address of SMB destination server>\dest_share

Total Time : 1m51
STATUS : PASSED

```

sync -l

Use the `-l` parameter with the `sync` command to provide detailed logging information in the standard output for all actions performed by XCP on the target.

Syntax

```

xcp sync -l \\<IP address or hostname of SMB server>\source_share \\<IP
address of SMB destination server>\dest_share

```

Show example

```

c:\netapp\xcp>xcp sync -l \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share
xcp sync -l \\<IP address or hostname of SMB server>\source_share \\<IP
address of SMB destination server>\dest_share

address of SMB destination server>\dest_share
634 scanned, 0 copied, 634 compared, 0 removed, 0 errors
Total Time : 3s
STATUS : PASSED

```

sync -root

Use the `-root` parameter with the `sync` command to sync the ACLs for the root directory.

Syntax

```
xcp sync -acl -root -fallback-user "DOMAIN\User" -fallback-group  
"DOMAIN\Group" \\<IP address or hostname of SMB server>\source_share \\<IP  
address of SMB destination server>\dest_share
```

Show example

```
C:\NetApp\XCP>xcp sync -acl -root -fallback-user "DOMAIN\User"  
-fallback-group "DOMAIN\Group" \\<IP address or hostname of SMB  
server>\source_share \\<IP address of SMB destination  
server>\dest_share  
  
xcp sync -acl -root -fallback-user "DOMAIN\User" -fallback-group  
"DOMAIN\Group" \\<IP address or hostname of SMB server>\source_share

12 scanned, 0 copied, 12 compared, 0 skipped, 0 removed, 0 errors, 1  
acls copied  
Total Time : 2s  
STATUS : PASSED
```

sync -onlyacl-fallback-user <fallback_user> -fallback-group <fallback_group>

Use the `-onlyacl`, `-fallback-user`, and `-fallback-group` parameters with the `sync` command to compare the security information between the source with the target and apply the required actions on the target. The `-fallback-user` and `-fallback-group` are a user or group on the target machine or in the Active Directory that receive the permissions of the local (non-domain) source users or groups.

You cannot use the `-onlyacl` parameter without the `-fallback-user` and `-fallback-group` options.

Syntax

```
xcp sync -onlyacl -fallback-user <fallback_user> -fallback-group  
<fallback_group> \\<IP address or hostname of SMB server>\source_share  
\\<IP address of SMB destination server>\dest_share
```

Show example

```
C:\Users\ctladmin\Desktop>xcp sync -onlyacl -fallback-user
"DOMAIN\User" -fallback-group "DOMAIN\Group"
\\<source_IP_address>\source_share \\<IP address of SMB destination
server>\dest_share

```

sync -aclverify{yes,no}

Use the `-aclverify{yes,no}` parameter with the `sync` command to provide an option to include or skip ACL verification during the ACL sync operation. This option can only be used with the `sync -acl` and `sync -onlyacl` commands. ACL sync performs ACL verification by default. If you set the `-aclverify` option to `no`, you can skip ACL verification and the `fallback-user` and `fallback-group` options are not required. If you set `-aclverify` to `yes`, it requires the `fallback-user` and `fallback-group` options, as shown in the following example.

Syntax

```
xcp sync -acl -aclverify yes -fallback-user <fallback_user> -fallback  
-group <fallback_group> \\<IP address or hostname of SMB  
server>\source_share \\<IP address of SMB destination server>\dest_share
```

Show example

```
C:\NetApp\xcp>xcp sync -acl -aclverify yes -fallback-user "DOMAIN\User"
-fallback-group "DOMAIN\Group" \\<source_IP_address>\source_share \\<IP
address of SMB destination server>\dest_share

sync -bs <n>

Use the `-bs <n>` parameter with the `sync` command to provide a read/write block size. The default size is 1M.

Syntax

```
xcp.exe sync -bs <n> \\<IP address or hostname of SMB server>\source_share  
\\<IP address of SMB destination server>\dest_share
```

Show example

```
C:\Netapp\xcp>xcp.exe sync -bs 64k \\<source_IP_address>\source_share  
\\<IP address of SMB destination server>\dest_share  
1,136 scanned, 0 copied, 1,135 compared, 0 skipped, 95 removed, 0

of SMB destination server>\dest_share 1,136 scanned, 283 copied, 1,136  
compared, 0 skipped, 283 removed, 0 errors  
Total Time : 10s  
STATUS : PASSED
```

sync -ads

Use `-ads` parameter with the `sync` command to scan for changes and modifications to alternate data streams in the source and target SMB share. If there are changes, it applies the change to the target to make sure that the target is identical to the source.

Syntax

```
xcp sync -ads \\<IP address or hostname of SMB server>\source_share \\<IP  
address of SMB destination server>\dest_share
```

Show example

```
C:\netapp\xcp>xcp sync -ads \\<source_IP_address>\source_share\src

verify

The `verify` command reads and compares the source and target shares and provides information about what is different. You can use the `verify` command on any source and destination, regardless of the tool used to perform the copy or sync operation.

Syntax

```
xcp verify \\<IP address or hostname of SMB server>\source_share \\<IP
address of SMB destination server>\dest_share
```

Show example

```
c:\netapp\xcp>xcp verify \\<IP address of SMB source
server>\source_share \\<IP address of SMB destination
server>\dest_share
xcp verify \\<IP address of SMB source server>\source_share \\ <IP
address of SMB destination server>\dest_share

xcp verify \\<IP address of SMB source server>\source_share \\<IP
address of SMB destination server>\dest_share
374 scanned, 373 compared, 373 same, 0 different, 0 missing, 0 errors
xcp verify \\<IP address of SMB source server>\source_share \\<IP
address of SMB destination server>\dest_share
Total Time : 3s
STATUS : PASSED
```

The following table lists the `verify` parameters and their description.

| Parameter | Description |
|---|---|
| <code>verify -h, --help</code> | Show this help message and exit. |
| <code>verify -v</code> | Increase debug verbosity. |
| <code>verify -parallel <n></code> | Number of concurrent processes (default: <cpu-count>). |
| <code>verify -match <filter></code> | Only process files and directories that match the filter (see <code>xcp help - match</code> for details). |
| <code>verify -exclude <filter></code> | Only exclude files and directories in the filter. |

| Parameter | Description |
|--|---|
| <code>verify -preserve-ctime</code> | Restore last accessed date on source. |
| <code>verify -nodata</code> | Do not check data. |
| <code>verify -atime</code> | Verify file access time. |
| <code>verify -noctime</code> | Do not check file creation time. |
| <code>verify -nomtime</code> | Do not check file modification time. |
| <code>verify -noattrs</code> | Do not check attributes. |
| <code>verify -noownership</code> | Do not check ownership. |
| <code>verify -ads</code> | Scan for changes and modifications of alternate data streams in the source and target SMB share. If there are changes, it applies the change to the target to make sure that the target is identical to the source. |
| <code>verify -noacls</code> | Do not check ACLs. |
| <code>verify -atimewindow <float></code> | Acceptable access time difference, in seconds. |
| <code>verify -ctimewindow <float></code> | Acceptable creation time difference, in seconds. |
| <code>verify -mtimewindow <float></code> | Acceptable modification time difference, in seconds, |
| <code>verify -stats</code> | Scan source and target trees in parallel and compare tree statistics. |
| <code>verify -l</code> | Increases output detail. |
| <code>verify -ll</code> | Increases output detail (git diff format). |
| <code>verify -fallback-user <fallback_user></code> | Active Directory user or local(non-domain) user on the target machine to receive the permissions of local (non-domain) source machine users (example: domain\administrator). |
| <code>verify -fallback-group <fallback_group></code> | Active Directory group or local(non-domain) group on the target machine to receive the permissions of local(non-domain) source machine groups (example: domain\administrators). |
| <code>verify -root</code> | Sync ACLs for the root directory. |
| <code>verify -onlyacl</code> | Copy only the security information. |

verify -h, --help

Use the `-h` and `--help` parameters with the `verify` command to display detailed information about the `verify` command

Syntax

```
xcp verify -help
```

Show example

```
C:\Netapp\xcp>xcp verify -help
usage: xcp verify [-h] [-v] [-parallel <n>] [-match <filter>] [-exclude
<filter>][-preserve-ctime]
[-loglevel <name>] [-fallback-user FALLBACK_USER]
[-fallback-group FALLBACK_GROUP] [-noacls] [-nodata] [-stats] [-l] [-
root] [-noownership] [-onlyacl] [-noctime] [-nomtime] [-noattrs] [-
ctime]
[-atimewindow <float>] [-ctimewindow <float>] [-mtimewindow <float>] [-
ads] source target
```

Note: ONTAP does not let a SMB client modify COMPRESSED or ENCRYPTED attributes. XCP sync will ignore these file attributes.

positional arguments:

source
target

optional arguments:

| | |
|--------------------------------|---|
| -h, --help | show this help message and exit |
| -v | increase debug verbosity |
| -parallel <n> | number of concurrent processes (default: <cpu-count>) |
| -match <filter> | only process files and directories that match the filter (see `xcp help -match` for details) |
| -exclude <filter> | Exclude files and directories that match the filter (see `xcp help -exclude` for details) |
| -preserve-ctime | restore last accessed date on source |
| --help-diag | Show all options including diag.The diag options should be used only on recommendation by NetApp support. |
| -loglevel <name> | option to set log level filter (default:INFO) |
| -fallback-user FALLBACK_USER | a user on the target machine to translate the permissions of local (non-domain) source machine users (eg. domain\administrator) |
| -fallback-group FALLBACK_GROUP | a group on the target machine to translate the permissions of local (non- domain) source machine groups (eg. domain\administrators) |
| -nodata | do not check data |
| -stats | scan source and target trees in parallel and compare tree statistics |
| -l | detailed file listing output |
| -root | verify acl for root directory |
| -noacls | do not check acls |

| | |
|----------------------|--|
| -noownership | do not check ownership |
| -onlyacl | verify only acls |
| -noctime | do not check file creation time |
| -nomtime | do not check file modification time |
| -noattrs | do not check attributes |
| -atime | verify access time as well |
| -atimewindow <float> | acceptable access time difference in seconds |
| -ctimewindow <float> | acceptable creation time difference in seconds |
| -mtimewindow <float> | acceptable modification time difference in seconds |
| -ads | verify ntfs alternate data stream |

verify -v

Use the -v parameter with the verify command to provide detailed debug information.

Syntax

```
xcp verify -v \\<IP address of SMB source server>\source_share address of
SMB destination server>\dest_share
```

Show example

```
c:\netapp\xcp> xcp verify -v \\<IP address of SMB source
server>\source_share address of SMB destination server>\dest_share
xcp verify -v \\<IP address of SMB source server>\source_share \\<IP
address of SMB destination server>\dest_share

xcp verify -v \\< IP address of SMB source server>\source_share \\<IP
address of SMB destination server>\dest_share
374 scanned, 373 compared, 373 same, 0 different, 0 missing, 0 errors
Total Time : 3s
STATUS : PASSED
```

verify -parallel <n>

Use the -parallel <n> parameter with the verify command to set a higher or lower number of XCP concurrent processes. The verify -parallel <n> command verifies the number of concurrent processes (default: <cpu-count>).

The maximum value for n is 61.

Syntax

```
xcp verify -v -parallel <n> \\<IP address of SMB source  
server>\source_share \\<IP address of SMB destination server>\dest_share
```

Show example

```
c:\netapp\xcp>xcp verify -v -parallel 8 \\<IP address of SMB source  
server>\source_share \\<IP address of SMB destination  
server>\dest_share  
xcp verify -v -parallel 8 \\<IP address of SMB source  
server>\source_share \\<IP address of SMB destination  
server>\dest_share  
  
xcp verify -v -parallel 8 \\<IP address of SMB source  
server>\source_share \\<IP address of SMB destination  
server>\dest_share  
374 scanned, 373 compared, 373 same, 0 different, 0 missing, 0 errors  
Total Time : 4s  
STATUS : PASSED
```

verify -match <filter>

Use the `-match <filter>` parameter with the `verify` command to scan the source and target tree and compare only the files or directories that match the filter argument. If there are any differences, the command applies the required actions on the target to keep them in sync.

Syntax

```
xcp verify -v -match <filter> \\<IP address of SMB source  
server>\source_share \\<IP address of SMB destination server>\dest_share
```

Show example

```
c:\netapp\xcp>xcp verify -v -match "'Microsoft' in name" \\<IP address  
of SMB source server>\source_share \\<IP address of SMB destination  
server>\dest_share  
xcp verify -v -match "'Microsoft' in name" \\<IP address of SMB source  
server>\source_share \\<IP address of SMB destination  
server>\dest_share  
  
xcp verify -v -match 'Microsoft' in name \\<IP address of SMB source  
server> \source_share \\<IP address of SMB destination  
server>\dest_share  
374 scanned, 0 compared, 0 same, 0 different, 0 missing, 0 errors  
Total Time : 1s  
STATUS : PASSED
```

verify -exclude <filter>

Use the -exclude <filter> parameter with the verify command to only exclude files and directories in the filter.

Syntax

```
xcp verify -exclude <filter> \\<IP address of SMB source  
server>\source_share \\<IP address of SMB destination server>\dest_share
```

Show example

```
C:\netapp\xcp>xcp verify -exclude "path('*Exceptions*')" \\<IP address
of SMB sourceserver>\source_share \\<IP address of SMB destination
server>\dest_share

Total Time : 1m11s
STATUS : PASSED
```

verify -preserve-atime

Use the `-preserve-atime` parameter with the `verify` command to reset atime to the original value before XCP read the file.

Syntax

```
xcp verify -preserve-atime \\<IP address of SMB source
server>\source_share \\<IP address of SMB destination server>\dest_share
```

Show example

```
c:\netapp\xcp>xcp verify -preserve-ctime \\<IP address of SMB source
server>\source_share \\<IP address of SMB destination
server>\dest_share
xcp verify -preserve-ctime \\<IP address of SMB source
server>\source_share \\<IP address of SMB destination
server>\dest_share

xcp verify -preserve-ctime \\<IP address of SMB source
server>\source_share \\<IP address of SMB destination
server>\dest_share
374 scanned, 373 compared, 373 same, 0 different, 0 missing, 0 errors
Total Time : 8s
STATUS : PASSED
```

verify -nodata

Use the `-nodata` parameter with the `verify` command to not compare data.

Syntax

```
xcp verify -nodata \\<IP address of SMB source server>\source_share \\<IP
address of SMB destination server>\dest_share
```

Show example

```
c:\netapp\xcp>xcp verify -nodata \\<IP address of SMB source
server>\source_share \\<IP address of SMB destination
server>\dest_share
xcp verify -nodata \\<IP address of SMB source server>\source_share
\\<IP address of SMB destination server>\dest_share

xcp verify -nodata \\<IP address of SMB source server> \source_share
\\<IP address of SMB destination server>\dest_share : PASSED
374 scanned, 373 compared, 373 same, 0 different, 0 missing, 0 errors
Total Time : 3s
STATUS : PASSED
```

verify -atime

Use the `-atime` parameter with the `verify` command to compare file access time stamps from the source to destination.

Syntax

```
xcp verify -ll -atime \\<IP address of SMB source server>\source_share  
\\<IP address of SMB destination server>\dest_share
```

Show example

```
c:\Netapp\xcp> xcp verify -ll -atime \\<IP address of SMB source  
server>\source_share \\<IP address of SMB destination  
server>\dest_share

verify -noctime

Use the `-noctime` parameter with the `verify` command to not compare file creation time stamps from the source to destination.

Syntax

```
xcp verify -noctime \\<IP address of SMB source server>\source_share \\<IP  
address of SMB destination server>\dest_share
```

Show example

```
c:\netapp\xcp>xcp verify -noctime \\<IP address of SMB source
server>\source_share \\<IP address of SMB destination
server>\dest_share
xcp verify -noctime \\<IP address of SMB source server>\source_share

```

verify -nomtime

Use the `-nomtime` parameter with the `verify` command to not compare file modification time stamps from the source to destination.

Syntax

```
xcp verify -nomtime \\<IP address of SMB source server>\source_share \\<IP
address of SMB destination server>\dest_share
```

Show example

```
c:\netapp\xcp>xcp verify -nomtime \\<IP address of SMB source
server>\source_share \\<IP address of SMB destination
server>\dest_share
xcp verify -nomtime \\<IP address of SMB source server>\source_share
\\<IP address of SMB destination server>\dest_share

xcp verify -nomtime \\<IP address of SMB source server>\source_share

374 scanned, 373 compared, 373 same, 0 different, 0 missing, 0 errors
Total Time : 3s
STATUS : PASSED
```

verify -noattrs

Use the `-noattrs` parameter with the `verify` command to not check attributes.

Syntax

```
xcp verify -noattrs \\<IP address of SMB source server>\source_share \\<IP address of SMB destination server>\dest_share
```

Show example

```
c:\netapp\xcp>xcp verify -noattrs \\<IP address of SMB source server>\source_share \\<IP address of SMB destination server>\dest_share
xcp verify -noattrs \\<IP address of SMB source server>\source_share \\<IP address of SMB destination server>\dest_share

xcp verify -noattrs \\<IP address of SMB source server>\source_share \\<IP address of SMB destination server>\dest_share : PASSED
374 scanned, 373 compared, 373 same, 0 different, 0 missing, 0 errors
Total Time : 3s
STATUS : PASSED
```

verify -noownership

Use the -noownership parameter with the verify command to not check ownership.

Syntax

```
xcp verify -noownership \\<IP address of SMB source server>\source_share \\<IP address of SMB destination server>\dest_share
```

Show example

```
c:\netapp\xcp>xcp verify -noownership \\<IP address of SMB source
server>\source_share \\<IP address of SMB destination
server>\dest_share
xcp verify -noownership \\<IP address of SMB source
server>\source_share \\<IP address of SMB destination
server>\dest_share

xcp verify -noownership \\<IP address of SMB source
server>\source_share \\<IP address of SMB destination
server>\dest_share : PASSED
374 scanned, 373 compared, 373 same, 0 different, 0 missing, 0 errors
Total Time : 3s
STATUS : PASSED
```

verify -ads

Using -ads parameter with the verify command to read if there are any alternate data streams on the source and destination and display any differences.

Syntax

```
xcp verify -ads \\<IP address or hostname of SMB server>\source_share
\\<IP address of SMB destination server>\dest_share
```

Show example

```
c:\netapp\xcp>xcp verify -ads \\<source_IP_address>\source_share\src  
\\<dest_IP_address>\dest_share
```

STATUS : PASSED
```

verify -noacls

Use the `-noacls` parameter with the `verify` command to not check ACLs.

Syntax

```
xcp verify -noacls -noownership \\<IP address or hostname of SMB  
server>\source_share \\<IP address of SMB destination server>\dest_share
```

Show example

```
c:\netapp\xcp>xcp verify -noacls -noownership \\<IP address or hostname  
of SMB server>\source_share \\<IP address of SMB destination  
server>\dest_share  
xcp verify -noacls -noownership \\<IP address or hostname of SMB  
server>\source_share \\<IP address of SMB destination  
server>\dest_share  
  
xcp verify -noacls -noownership \\<IP address or hostname of SMB  
server>\source_share \\<IP address of SMB destination  
server>\dest_share  
318 scanned, 317 compared, 317 same, 0 different, 0 missing, 0 errors  
Total Time : 1s  
STATUS : PASSED
```

verify -noacls -noownership

Use the `-noownership` parameter with `verify -noacls` to not check ACLs or ownership from the source to the destination.

Syntax

```
xcp verify -noacls -noownership <source> <target>
```

verify -atimewindow <float>

Use the `-atimewindow <float>` parameter with the `verify` command to specify the acceptable difference, in seconds, for the `atime` of a file from the source to the destination. XCP does not report files as being different if the difference in `atime` is less than `<value>`. The `verify - atimewindow` command can only be used with the `-atime` flag.

Syntax

```
xcp verify -atimewindow <float> \\<IP address of SMB source
server>\source_share \\<IP address of SMB destination server>\dest_share
```

Show example

```
c:\Netapp\xcp> xcp verify -atimewindow 600 -atime \\<IP address of SMB
source server>\source_share \\<IP address of SMB destination
server>\dest_share
```

```
xcp verify -atimewindow 600 -atime \\<IP address of SMB source
server>\source_share \\<IP address of SMB destination
server>\dest_share
```

```
14 scanned, 13 compared, 13 same, 0 different, 0 missing, 0 errors
```

verify -ctimewindow <float>

Use the `-ctimewindow <float>` parameter with the `verify` command to specify the acceptable difference, in seconds, for the `ctime` of a file from the source to the destination. XCP does not report files as being different when the difference in `ctime` is less than `<value>`.

Syntax

```
xcp verify -ctimewindow <float> \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination server>\dest_share
```

Show example

```
c:\netapp\xcp>xcp verify -ctimewindow 600 \\<IP address of SMB
sourceserver>\source_share \\<IP address of SMB destination
server>\dest_share
xcp verify -ctimewindow 600 \\<IP address of SMB source
server>\source_share \\<IP address of SMB destination
server>\dest_share

xcp verify -ctimewindow 600 \\<IP address of SMB source
server>\source_share \\<IP address of SMB destination
server>\dest_share
374 scanned, 373 compared, 373 same, 0 different, 0 missing, 0 errors
Total Time : 3s
STATUS : PASSED
```

verify -mtimewindow <float>

Use the `-mtimewindow <float>` parameter with the `verify` command to specify the acceptable difference, in seconds, for the `mtime` of a file from the source to the destination. XCP does not report files as being different when the difference in `mtime` is less than `<value>`.

Syntax

```
xcp verify -mtimewindow <float> \\<IP address of SMB
sourceserver>\source_share \\<IP address of SMB destination
server>\dest_share
```

Show example

```
c:\netapp\xcp>xcp verify -mtimewindow 600 \\<IP address of SMB
sourceserver>\source_share \\<IP address of SMB destination
server>\dest_share
xcp verify -mtimewindow 600 \\<IP address of SMB source
server>\source_share \\<IP address of SMB destination
server>\dest_share

xcp verify -mtimewindow 600 \\<IP address of SMB source
server>\source_share \\<IP address of SMB destination
server>\dest_share
374 scanned, 373 compared, 373 same, 0 different, 0 missing, 0 errors
Total Time : 3s
STATUS : PASSED
```

verify -stats

Use the `-stats` parameter with the `verify` command to scan the source and the destination and print a tree statistics report showing similarities or differences between the two shares.

Syntax

```
xcp verify -stats \\<IP address or hostname of SMB server>\source_share  
\\<IP address of SMB destination server>\dest_share
```

Show example

```

c:\netapp\xcp>xcp verify -stats \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share
xcp verify -stats \\<IP address or hostname of SMB server>\source_share
\\<IP address of SMB destination server>\dest_share

```

verify -l

Use the `-l` parameter with the `verify` command to list the differences between files and directories on the source and destination.

Syntax

```
xcp verify -l \\<IP address of SMB source server>\source_share \\<IP  
address of SMB destination server>\dest_share
```

In the following example, during copy, the ownership information was not transferred, and you can see the differences in the command output.

Show example

```
c:\netapp\xcp>xcp verify -l \\<IP address of SMB source  
server>\source_share \\<IP address of SMB destination  
server>\dest_share  
xcp verify -l \\<IP address of SMB source server>\source_share \\<IP

374 scanned, 373 compared, 373 same, 0 different, 0 missing, 0 errors  
Total Time : 3s  
STATUS : PASSED
```

verify -ll

Use the `-ll` parameter with the `verify` command to list the detailed differences of the files or directories from the source and the target. The format is like git diff. The red value is the old one from the source, and the green value is the new one from the target.

Syntax

```
xcp verify -ll \\<IP address of SMB source server>\source_share \\<IP  
address of SMB destination server>\dest_share
```

Show example

```
c:\netapp\xcp>xcp verify -ll \\<IP address of SMB source
server>\source_share \\<IP address of SMB destination
server>\dest_share
xcp verify -ll \\<IP address of SMB source server>\source_share \\<IP
address of SMB destination server>\dest_share

xcp verify -ll \\<IP address of SMB source server>\source_share \\<IP
address of SMB destination server>\dest_share
374 scanned, 373 compared, 373 same, 0 different, 0 missing, 0 errors
Total Time : 3s
STATUS : PASSED
```

verify-fallback-user <fallback_user> -fallback-group <fallback_group>

Use the `-fallback-user` and `-fallback-group` parameters with the `verify` command to list the ACL and ownership differences between files and directories on the source and destination.

If you use `fallback-user` and `fallback-group` with a copy or sync operation, NetApp recommends that you also use the `fallback-user` and `fallback-group` parameters with the `verify` operation.

Syntax

```
xcp verify -fallback-user <fallback_user> -fallback-group <fallback_group>
\\<IP address of SMB source server>\source_share \\<IP address of SMB
destination server>\dest_share
```

verify -noownership-fallback-user <fallback_user> -fallback-group <fallback_group>

Use the `-noownership`, `-fallback-user`, and `-fallback-group` parameters with the `verify` command to list the ACL differences and skip verification of ownership between files and directories on the source and destination.

Syntax

```
xcp verify -noownership -fallback-user <fallback_user> -fallback-group
<fallback_group> \\<IP address of SMB source server>\source_share \\<IP
address of SMB destination server>\dest_share
```

verify -noacls-fallback-user <fallback_user> -fallback-group <fallback_group>

Use the `-noacls`, `-fallback-user`, and `-fallback-group` parameters with the `verify` command to skip verification of ACLs and verify ownership between files and directories on the source and destination.

Syntax

```
xcp verify -noacls -fallback-user <fallback_user> -fallback-group  
<fallback_group> \\<IP address of SMB source server>\source_share \\<IP  
address of SMB destination server>\dest_share
```

verify -root

Use the `-root` parameter with the `verify` command to sync the ACLs for the root directory.

Syntax

```
xcp verify -root -fallback-user <fallback_user> -fallback- group  
<fallback_group> \\<IP address of SMB source server>\source_share \\<IP  
address of SMB destination server>\dest_share
```

Show example

```
C:\NetApp\XCP>xcp verify -root -fallback-user "DOMAIN\User" -fallback  
-group "DOMAIN\Group" \\<IP address of SMB source server>\source_share  
\\<IP address of SMB destination server>\dest_share
```

```
xcp verify -l -root -fallback-user "DOMAIN\User" -fallback-group  
"DOMAIN\Group" \\<IP address of SMB source server>\source_share \\<IP  
address of SMB destination server>\dest_share  
7 scanned, 6 compared, 6 same, 0 different, 0 missing, 0 errors  
Total Time : 1s  
STATUS : PASSED
```

verify -onlyacl -fallback-user <fallback_user> -fallback- group <fallback_group>

Use the `-onlyacl`, `-fallback-user` and `-fallback-group` parameters with the `verify` command to compare only the security information between the source and destination.

Syntax

```
xcp verify -onlyacl -preserve-ctime -fallback-user <fallback_user>  
-fallback- group <fallback_group> \\<IP address of SMB source  
server>\source_share \\<IP address of SMB destination server>\dest_share
```

Show example

```
C:\Users\ctladmin\Desktop>xcp verify -onlyacl -preserve-atime -fallback

```

configure

The `configure` command configures the SMB system and connects to the system where the PostgreSQL database is running.

Syntax

```
xcp.exe configure
```

Show example

```
C:\NetApp\XCP>xcp.exe configure

Please choose the menu you want to start:
1. Configure xcp.ini file
0. Quit
```

listen

The `listen` command reads the XCP binary and starts the XCP services.

Syntax

```
xcp.exe listen
```

Show example

```
c:\NetApp\XCP>xcp.exe listen
* Serving Flask app "xcp_rest_smb_app" (lazy loading)
* Environment: production
  WARNING: This is a development server. Do not use it in a production
deployment. Use a production WSGI server instead.
* Debug mode: off
```

XCP use cases

Use cases for XCP NFS and SMB

[CIFS data migration with ACLs from a source storage box to ONTAP](#)

XCP logging

Set the logConfig option

Learn about the logConfig option in the `xcpLogConfig.json` JSON configuration file for XCP NFS and SMB.

The following example shows the JSON configuration file set with the “logConfig” option:

Example

```
{
  "level": "INFO",
  "maxBytes": "52428800",
  "name": "xcp.log"
}
```

- With this configuration you can filter messages according to their severity by selecting a valid level value from CRITICAL, ERROR, WARNING, INFO, and Debug.
- The `maxBytes` setting enables you to change the file size of the rotating log files. The default is 50MB. Setting the value to 0 stops rotation and a single file is created for all logs.
- The `name` option configures the name of the log file.
- If any key value pair is missing, the system uses the default value. If you make a mistake specifying the name of an existing key, it is treated as a new key, and the new key does not affect how the systems works or system functionality.

Set the eventlog option

XCP supports event messaging, which you can enable using the `eventlog` option in the `xcpLogConfig.json` JSON config file.

For NFS, all event messages are written to the `xcp_event.log` file located in either the default location `/opt/NetApp/xFiles/xcp/` or a custom location configured using the following environment variable:

`XCP_CONFIG_DIR`

When both locations are set, `XCP_LOG_DIR` is used.

For SMB, all event messages are written to the file `xcp_event.log` located in the default location `C:\NetApp\XCP\`.

JSON configuration for event messaging for NFS and SMB

In the following examples, the JSON configuration files enable event messaging for NFS and SMB.

Example JSON configuration file with the eventlog option enabled

```
{
  "eventlog": {
    "isEnabled": true,
    "level": "INFO"
  },
  "sanitize": false
}
```

Example JSON configuration file with eventlog and other options enabled

```
{
  "logConfig": {
    "level": "INFO",
    "maxBytes": 52428800,
    "name": "xcp.log"
  },
  "eventlog": {
    "isEnabled": true,
    "level": "INFO"
  },
  "syslog": {
    "isEnabled": true,
    "level": "info",
    "serverIp": "10.101.101.10",
    "port": 514
  },
  "sanitize": false
}
```

The following table shows the eventlog sub options and their description:

| Sub option | JSON data type | Default value | Description |
|------------|----------------|---------------|--|
| isEnabled | Boolean | False | This boolean option is used to enable event messaging. If set to false, it does not generate any event messages and no event logs are published to the event log file. |
| level | String | INFO | Event message severity filter level. Event messaging support five severity levels in order of decreasing severity: CRITICAL, ERROR, WARNING, INFO, and DEBUG |

Template for an NFS event log message

The following table shows a template and an example for an NFS event log message:

| Template | Example |
|--|--|
| <code><Time stamp> - <Severity level> {"Event ID": <ID>, "Event Category":<category of xcp event log>, "Event Type": <type of event log>, "ExecutionId": < unique ID for each xcp command execution >, "Event Source": <host name>, "Description": <XCP event log message>}</code> | <pre>2020-07-14 07:07:07,286 - ERROR {"Event ID": 51, "Event Category": "Application failure", "Event Type": "No space left on destination error", " ExecutionId ": 408252316712, "Event Source": "NETAPP-01", "Description": "Target volume is left with no free space while executing : copy {}. Please increase the size of target volume 10.101.101.101:/cat_vol"}</pre> |

Eventlog message options

The following options are available for an eventlog message:

- **Event ID:** The unique identifier for each event log message.
- **Event Category:** Explains the category of event type and event log message.
- **Event Type:** This is a short string that describes the event message. Multiple event types can belong to one category.
- **Description:** The description field contains the event log message generated by XCP.
- **ExecutionId:** A unique identifier for each XCP command executed.

Enable the syslog client

XCP supports a syslog client to send XCP event log messages to a remote syslog receiver for NFS and SMB. It supports the UDP protocol using the default port 514.

Configure the syslog client for NFS and SMB

Enabling the syslog client requires configuring the `syslog` option in the `xcpLogConfig.json` configuration file for NFS and SMB.

The following example configuration for the syslog client for NFS and SMB:

```
{
  "syslog":{
    "isEnabled":true,
    "level":"INFO",
    "serverIp":"10.101.101.d",
    "port":514
  },
  "sanitize":false
}
```

Syslog options

The following table shows the syslog sub options and their description:

| Sub option | JSON data type | Default value | Description |
|------------|----------------|---------------|--|
| isEnabled | Boolean | False | This Boolean option enables the syslog client in XCP. Setting it to false will ignore the syslog configuration. |
| level | String | INFO | Event message severity filter level. Event messaging support five severity levels in order of decreasing severity: CRITICAL, ERROR, WARNING, INFO, and DEBUG |
| serverIp | String | None | This option lists the remote syslog server IP addresses or hostnames. |
| port | Integer | 514 | This option is the remote syslog receiver port. You can configure syslog receivers to accept syslog datagrams on a different port with this option. The default UDP port is 514. |

The `sanitize` option should not be specified within “syslog” configuration. This option has a global scope and is common to logging, event log, and syslog within JSON config. Setting this value to “true” will hide sensitive information in syslog messages posted to the syslog server.

Syslog message format

Every syslog messages sent to the remote syslog server over UDP is formatted as per the RFC 5424 format for NFS and SMB.

The following table shows the severity level as per RFC 5424 supported for syslog messages for XCP:

| Severity values | Severity level |
|-----------------|---------------------------------------|
| 3 | Error: error conditions |
| 4 | Warning: warning conditions |
| 6 | Informational: informational messages |
| 7 | Debug: debug-level messages |

In the syslog header for NFS and SMB, version has a value of 1 and the facility value for all messages for XCP is set to 1 (user-level messages):

`<PRI> = syslog facility * 8 + severity value`

XCP application syslog message format with a syslog header for NFS:

The following table shows a template and example of the syslog message format with a syslog header for NFS:

| Template | Example |
|---|---|
| <pre><PRI><version> <Time stamp> <hostname> xcp_nfs - - - <XCP message></pre> | <pre><14>1 2020-07-08T06:30:34.341Z netapp xcp_nfs - - - INFO {"Event ID": 14, "Event Category": "XCP job status", "Event Type": "XCP scan completion", "Event Source": "netapp", "Description": "XCP scan is completed by scanning 8 items"}</pre> |

XCP application message without syslog header for NFS

The following table shows a template and example of the syslog message format without a syslog header for NFS:

| Template | Example |
|---|---|
| <pre><message severity level i.e CRITICAL, ERROR, WARNING, INFO, DEBUG> <XCP event log message></pre> | <pre>INFO {"Event ID": 14, "Event Category": "XCP job status", "Event Type": "XCP scan completion", "Event Source": "netapp", "Description": "XCP scan is completed by scanning 8 items"}</pre> |

XCP application syslog message format with syslog header for SMB

The following table shows a template and example of the syslog message format with a syslog header for SMB:

| Template | Example |
|---|---|
| <pre><PRI><version> <Time stamp> <hostname> xcp_smb - - - <XCP message></pre> | <pre><14>1 2020-07-10T10:37:18.452Z bansala01 xcp_smb - - - INFO {"Event ID": 14, "Event Category": "XCP job status", "Event Type": "XCP scan completion", "Event Source": "NETAPP- 01", "Description": "XCP scan is completed by scanning 17 items"}</pre> |

XCP application message without syslog header for SMB

The following table shows a template and example of the syslog message format without a syslog header for SMB:

| Template | Example |
|---|---|
| <pre><message severity level i.e CRITICAL, ERROR, WARNING, INFO, DEBUG> <XCP event log message></pre> | <pre>NFO {"Event ID": 14, "Event Category": "XCP job status", "Event Type": "XCP scan completion", "Event Source": "NETAPP-01", "Description": "XCP scan is completed by scanning 17items"}</pre> |
