# XCP reference

## XCP command reference overview

The XCP command reference provides examples of the available commands for XCP NFS and SMB. Each command has additional parameters that you can use alone or in combination, as required. XCP supports log file rotation and log filtering based on the severity level.

## NFS command reference

### help

The NFS `help` command displays a list of commands, command parameters, and a brief description of each. The `help` command is useful for beginners who are new to the XCP tool.

#### Syntax

```
xcp help
```

## Show example

```
[root@client1 linux]# ./xcp help
USAGE:
xcp [[help] [command] | -version]
optional arguments:
help Show XCP help message and exit
-version Show XCP version number and exit
To see help text, you can run:
xcp help Display this content
xcp help info Step by step usage of all commands
xcp help <command> Individual command help
command:
activate Activate an XCP license on the current host
license Show XCP license information
show Request information from host about NFS exports
scan Read all the files from export path
copy Recursively copy everything from source to target
resume Resume copy operation from the point it was halted
sync Synchronize increment changes on source to target after copy
isync Sync changes on target without index
verify Verify that the target is the same as the source
delete Delete data on the NFS exported volume
chown Change the ownership on the NFS exported volume
chmod Change the permissions on the NFS exported volume
logdump Collect all logs related to the XCP job and dump those into
      a zipped folder named <ID>.zip under the current dir
estimate Estimate the time taken for the copy command to complete
indexdelete Remove indexes from catalog
```

## help info

Use the `info` parameter with the `help` command to display documentation, examples, and tuning recommendations.

## Syntax

```
xcp help info
```

## Show example

```
[root@client1 linux]# ./xcp help info
COMMAND
info

USAGE
help info

DESCRIPTION
Step by step usage of the XCP command. Follow these steps after you
copy the binary and license

1. Download the XCP license and XCP binary to the Linux machine. Run
XCP activate: xcp activate

2. On a fresh system, the above command will fail when looking for a
license in
/opt/NetApp/xFiles/xcp.
Copy the XCP license to /opt/NetApp/xFiles/xcp and run the activate
command again: xcp activate

3. Check the validity of the license: xcp license

4. Configure the ini file located at /opt/NetApp/xFiles/xcp/xcp.ini
with catalog details: add catalog = catalog_nfs_server:/catalog_path

5. List all the exports and details from the NFS server: xcp show
server

6. Pick up one of the exports and run a scan of the export: xcp scan
server:/export1

7. Initiate baseline copy:
xcp copy -newid id1 server:/export1 server2:/e

8. If the copy is halted for some reason, you can use the "xcp resume"
command to resume the copy operation:
xcp resume -id id1
```

9. Start with incremental sync after the baseline is completed:  
xcp sync -id id1

10. After copy or after every sync, you can verify to check data integrity:

xcp verify server:/export1 server2:/export2

#### SUPPORTED COMMANDS

help: Display information about commands and options  
-exclude: Display examples of filters  
-fmt: Display examples of filters  
-match: Display examples of filters  
help info: Display documentation, examples, and tuning recommendations  
show: Request information from hosts about NFS and other RPC services  
-v: Show more detailed information about servers  
-loglevel <name>: Option to set log level; available levels are INFO, DEBUG (default: INFO)  
scan: Read all the directories in a file tree or a saved index  
-l, -q: File listing output formats  
-stats, -csv, -html: Tree statistics report formats  
-nonames: Do not look up user and group names for file listings or reports  
-newid <name>: Catalog name for a new index  
-id <name>: Catalog name of a previous copy or scan index  
-match <filter>: Only process files and directories that match the filter  
-fmt <string expression>: Formatted output  
-du: Summarize space usage of each directory, including subdirectories  
-md5: Checksum the files (also save the checksum files when indexing) (default: False)  
-duk: Summarize space usage of directory, include subdirectories, with output in kilobytes  
-acl4: Process NFSv4 access control lists (ACLs)  
-acl4.threads <n>: Per-process thread pool size (default: 100)  
-depth <n>: Limit the search depth  
-dircount <n[k]>: Request size for reading directories (default: 64k)  
-edupe: Include deduplication estimate in reports (see documentation for details)  
-bs <n[k]>: Read/write block size for scans that read data with -md5 or -edupe (default: 64k)  
-parallel <n>: Maximum concurrent batch processes (default: 7)  
-noId: Disable the creation of a default index (default: False)  
-exclude <filter>: Exclude the files and directories that match the

```
filter
  -preserve-atime: preserve atime of the file/dir (default: False)
  -nodes <name>: comma-separated list of worker nodes
  -s3.insecure: use http instead of https
  -s3.noverify: do not verify ssl certificates
  -s3.endpoint <S3 endpoint Url>: path such as https://10.10.10.101:1010
  -s3.profile <profile-name>: config/cred profile to be used
  -loglevel <name>: Option to set log level; available levels are INFO,
    DEBUG (default: INFO)
copy: Recursively copy everything from source to target
  -newid <name>: Catalog name for a new index
  -md5: Checksum the files (also save the checksum files when indexing)
    (default: False)
  -edupe: Include deduplication estimate in reports (see documentation
    for details)
  -nonames: Do not look up user and group names for file listings or
    reports
  -acl4: Process NFSv4 access control lists (ACLs)
  -acl4.threads <n>: Per-process thread pool size (default: 100)
  -acl4.alwaysset: call "setacl" for all ACL-capable files and
    directories
  -bs <n[k]>: read/write blocksize (default: 64k)
  -dircount <n[k]>: Request size for reading directories (default: 64k)
  -parallel <n>: Maximum concurrent batch processes (default: 7)
  -noId: Disable the creation of a default index (default: False)
  -match <filter>: Only process files and directories that match the
    filter
  -exclude <filter>: Exclude the files and directories that match the
    filter
  -copybatch <filename [args]>: custom batch processing module
  -chown: set destination uid and gid when copying as non-root      user
    (default: False)
  -preserve-atime: preserve atime of the file/dir (default: False)
  -nodes <name>: comma-separated list of worker nodes
  -s3.insecure: use http instead of https
  -s3.noverify: do not verify ssl certificates
  -s3.endpoint <S3 endpoint Url>: path such as https://10.10.10.101:1010
  -loglevel <name>: Option to set log level; available levels are INFO,
    DEBUG (default: INFO)
verify: Verify that the target is the same as the source
[no options]: Full verification of target structure, names, attributes,
and data
  -stats, -csv: Scan source and target trees in parallel and compare tree
    statistics
  -nodata: Do not check data
  -noattrs: Do not check attributes (default: False)
```

```
-noown: Do not check ownership (uid and gid) (default: False)
-nomods: Do not check file modification times
-mtimewindow <s>: Acceptable modification time difference for
verification
-newid <name>: Catalog name for a new index
-v, -l: Output formats to list any differences found
-acl4: Process NFSv4 access control lists (ACLs)
-acl4.threads <n>: Per-process thread pool size (default: 100)
-nonames: Do not look up user and group names for file listings or
reports
-match <filter>: Only process files and directories that match the
filter
-bs <n[k]>: read/write blocksize (default: 64k)
-parallel <n>: Maximum concurrent batch processes (default: 7)
-dircount <n[k]>: Request size for reading directories (default: 64k)
-noId: Disable the creation of a default index (default: False)
-exclude <filter>: Exclude the files and directories that match the
filter
-preserve-atime: preserve atime of the file/dir (default: False)
-s3.insecure: use http instead of https
-s3.noverify: do not verify ssl certificates
-s3.endpoint <S3 endpoint Url>: path such as https://10.10.10.101:1010
-s3.profile <profile-name>: config/cred profile to be used
-loglevel <name>: Option to set log level; available levels are INFO,
DEBUG (default: INFO)
```

```
sync: Find all source changes and apply them to the target
-id <name>: Catalog name of a previous copy index
-snap <name or path>: Access a Snapshot copy of the source tree
-nonames: Do not look up user and group names for file listings or
reports
-bs <n[k]>: read/write blocksize (default: 64k)
-dircount <n[k]>: Request size for reading directories (default: 64k)
-parallel <n>: Maximum concurrent batch processes (default: 7)
-acl4.threads <n>: Per-process thread pool size (default: 100)
-exclude <filter>: Exclude the files and directories that match the
filter
-preserve-atime: preserve atime of the file/dir (default: False)
-loglevel <name>: Option to set log level; available levels are INFO,
DEBUG (default: INFO)
```

```
sync dry-run: Find source changes but don't apply them to the target
-id <name>: Catalog name of a previous copy index
-snap <name or path>: Access a Snapshot copy of the source tree
-stats: Deep scan the modified directories and report on everything new
-nonames: Do not look up user and group names for file listings or
```

```
reports
-v, -l, -q: File listing output formats
-dircount <n[k]>: Request size for reading directories (default: 64k)
-parallel <n>: Maximum concurrent batch processes (default: 7)
-target: Check that the target files match the index
-loglevel <name>: Option to set log level; available levels are INFO,
DEBUG (default: INFO)

isync: Sync changes on target without index
-nodata: Do not check data
-noattrs: Do not check attributes
-nomods: Do not check file modification times
-mtimewindow <s>: Acceptable modification time difference for
verification
-acl4: Process NFSv4 access control lists (ACLs)
-acl4.threads <n>: Per-process thread pool size (default: 100)
-acl4.alwaysset: call "setacl" for all ACL-capable files and
directories
-match <filter>: Only process files and directories that match the
filter
-bs <n[k]>: read/write blocksize (default: 64k)
-parallel <n>: Maximum concurrent batch processes (default: 7)
-dircount <n[k]>: Request size for reading directories (default: 64k)
-exclude <filter>: Exclude the files and directories that match the
filter
-newid <name>: Catalog name for a new index
-loglevel <name>: Option to set log level; available levels are INFO,
DEBUG (default: INFO)
-preserve-atime: preserve atime of the file/dir (default: False)
-s3.insecure: use http instead of https
-s3.noverify: do not verify ssl certificates
-s3.endpoint <S3 endpoint Url>: path such as
https://10.10.10.101:1010
-s3.profile <profile-name>: config/cred profile to be used

isync estimate: Find the estimated time to complete the next isync
command
-nodata: Do not check data
-noattrs: Do not check attributes
-nomods: Do not check file modification times
-mtimewindow <s>: Acceptable modification time difference for
verification
-acl4: Process NFSv4 access control lists (ACLs)
-acl4.threads <n>: Per-process thread pool size (default: 100)
-acl4.alwaysset: call "setacl" for all ACL-capable files and
```

```
directories
  -match <filter>: Only process files and directories that match the
  filter
  -bs <n[k]>: read/write blocksize (default: 64k)
  -parallel <n>: Maximum concurrent batch processes (default: 7)
  -dircount <n[k]>: Request size for reading directories (default: 64k)
  -exclude <filter>: Exclude the files and directories that match the
  filter
  -loglevel <name>: Option to set log level; available levels are INFO,
  DEBUG (default: INFO)
  -preserve-atime: preserve atime of the file/dir (default: False)
  -s3.insecure: use http instead of https
  -s3.noverify: do not verify ssl certificates
  -s3.endpoint <S3 endpoint Url>: path such as
https://10.10.10.101:1010
  -s3.profile <profile-name>: config/cred profile to be used
  -id <name>: Catalog name of a previous copy index
```

```
resume: Restart an interrupted copy
  -id <name>: Catalog name of a previous copy index
  -bs <n[k]>: read/write
  -s3.insecure: use http instead of https
  -s3.noverify: do not verify ssl certificates
  -s3.endpoint <S3 endpoint Url>: path such as https://10.10.10.101:1010
  -s3.profile <profile-name>: config/cred profile to be used
  -loglevel <name>: Option to set log level; available levels are INFO,
  DEBUG (default: INFO)
```

```
delete: Delete everything recursively
  -match <filter>: Only process files and directories that match the
  filter
  -force: Delete without confirmation
  -removetopdir: remove directory including children
  -exclude <filter>: Exclude the files and directories that match the
  filter
  -parallel <n>: Maximum concurrent batch processes (default: 7)
  -preserve-atime: preserve atime of the file/dir (default: False)
  -s3.insecure: use http instead of https
  -s3.noverify: do not verify ssl certificates
  -s3.endpoint <S3 endpoint Url>: path such as https://10.10.10.101:1010
  -s3.profile <profile-name>: config/cred profile to be used
  -loglevel <name>: Option to set log level; available levels are INFO,
  DEBUG (default: INFO)
```

```
activate: Activate a license on the current host
-loglevel <name>: Option to set log level; available levels are INFO,
DEBUG (default: INFO)
```

```
license: Show xcp license info
```

```
license update: Retrieve the latest license from the XCP server
```

```
chown: changing ownership of a file object
exclude <filter>: Exclude the files and directories that match the
filter
-match <filter>: Only process files and directories that match the
filter
-group <group>: linux gid to be set at source
-user <user>: linux uid to be set at source
-user-from <userFrom>: user to be changed
-group-from <groupFrom>: group to be changed
-reference <reference>: referenced file or directory point
-v: reports output for every object processed
-preserve-atime: preserve atime of the file/dir (default: False)
-loglevel <name>: Option to set log level; available levels are INFO,
DEBUG (default: INFO)
```

```
chmod: changing permissions of a file object
-exclude <filter>: Exclude the files and directories that match the
filter
-match <filter>: Only process files and directories that match the
filter
-reference <reference>: referenced file or directory point
-v: reports output for every object processed
-mode <mode>: mode to be set
-preserve-atime: preserve atime of the file/dir (default: False)
-loglevel <name>: Option to set log level; available levels are INFO,
DEBUG (default: INFO)
```

```
logdump: Collect all logs related to the XCP job and dump those into a
zipped folder named <ID>.zip under current dir
-m <migration ID>: Filter logs by migration ID
-j <job ID>: Filter logs by job ID
```

```
estimate: Use a saved scan index to estimate copy time
```

```
-id <name>: Catalog name of a previous copy or scan index
-gbit <n>: Gigabits of bandwidth to estimate best-case time (default: 1)
-target <path>: Target to use for live test copy
-t <n[s|m|h]>: Duration of live test copy (default: 5m)
-bs <n[k]>: read/write blocksize (default: 64k)
-dircount <n[k]>: Request size for reading directories (default: 64k)
-parallel <n>: Maximum concurrent batch processes (default: 7)
preserve-atime:
    preserve atime of the file/dir (default: False)
-loglevel <name>: Option to set log level; available levels are INFO, DEBUG (default: INFO)

indexdelete: delete catalog indexes
    -match <filter>: Only process files and directories that match the filter
    -loglevel <name>: Option to set log level; available levels are INFO, DEBUG (default: INFO)
```

## OUTPUT

In the -l output, the size, space used, and modification time are all shown in human-readable format. Time is relative to the current time, so it is time zone independent. For example, "14d1h" means that the file was modified 14 days and one hour ago. Note: "current time" is the time XCP started. The timestamp is saved in the index metadata (catalog:/xFiles/indexes/\*.json) and is used for reports against the index.

The -stats option prints a human-readable report to the console. Other report format options are -html or -csv. The comma-separated values (CSV) format has exact values. CSV and HTML reports are automatically saved in the catalog, if there is one.

The histograms for modified, accessed, and changed only count regular files.

## FILTERS

A filter expression should evaluate to True or False in Python. Filters are used in XCP for the -match and -exclude options. See below for some examples of the filters. Use "xcp help <command>" to check which options are supported for commands.

Variables and file attributes currently available to use in a filter:  
modified, accessed, changed: Floats representing age in hours depth,  
size, used, uid, gid, type, nlinks, mode, fileid: Integers  
name, base,

```
ext: Strings (if name is "demo.sql" then base is =="demo" and ext is
==".sql") owner, group: Strings size units: k, m, g, t, p = K, M, G, T,
P = 1024, 1048576, 2**30, 2**40, 2**50 file types: f, d, b, c, l, s, q
= F, D, B, C, L, S, Q = 1, 2, 3, 4, 5, 6, 7
```

Functions available to use in a filter:

```
rxml(pattern): Regular expression match for each file name fnm(pattern):
Unix-style wildcard match for each file name load(path): List of lines
from a local (external) file rand(N): Match one out of every N files at
random path(pattern): Wildcard match for the full path
paths(<full_file_path>): Match or exclude all NFS export paths listed
in the file Note: unlike most shell wildcards, pattern "/a/*" will
match path /a/b/c
```

The rxml() function only runs Python re.compile (pattern) once.  
Similarly, load() only reads its file once.

Filter examples:

Match files modified less than half an hour ago "type == f and modified < .5"

Find anything with "core" in the name ("in" is a Python operator):  
"'core' in name"

Same match using regular expressions: "rxml('.\*core.\*')"

Same match using wildcards: "fnm('\*core\*')"

Match files that are not regular files, directories, or links: "type not in (f,d,l)"

Find jpg files over 500 megabytes (M is a variable): "fnm('\*.jpg') and size > 500\*M"

Find files with "/demo/smith" in the path (x is the file; str(x) is its full path): "'/demo/smith' in str(x)"

Exclude copying anything with "f" in its name: "fnm('\*f\*')"

Exclude multiple export paths specified in "/root/excludePaths.txt".  
"paths('/root/excludePaths.txt')"

The file "excludePaths.txt" may contain multiple export paths where each path is listed on a new line.

The export paths may contain wildcards.

For example, 10.10.1.10:/source\_vol/\*.txt in file excludePaths.txt will exclude all files having ".txt" extension

If there are incremental changes in previously included directories and you want to exclude anything that has "dir40" as a substring in its name, you can specify the new exclude filter with the sync. This overrides the exclude filter used previously with the copy command and applies the new exclude filter.

Note that if there are incremental changes on the source after the copy operation and there are files with "f" in their name, then these are copied on to the target when the sync operation is performed. If you want to avoid copying such files or directories, you can use the following command: xcp sync -exclude "'f' in name" -id <id>

#### PERFORMANCE

On Linux, please set the following in /etc/sysctl.conf and run "sysctl -p":

```
net.core.rmem_default = 1342177
net.core.rmem_max = 16777216
net.core.wmem_default = 1342177
net.core.wmem_max = 16777216
net.ipv4.tcp_rmem = 4096 1342177 16777216
net.ipv4.tcp_wmem = 4096 1342177 16777216
net.core.netdev_max_backlog = 300000
net.ipv4.tcp_fin_timeout = 10
```

Make sure that your system has multiple CPUs and at least a few gigabytes (GBs) of free memory.

Searching, checksumming or copying hundreds of thousands or millions of files should be many times faster with XCP than with standard tools such cp, find, du, rsync, or OS drag-and-drop.

For the case of a single file, reading or copying with XCP is usually faster with a faster host CPU. When processing many files, reading or copying is faster with more cores or CPUs.

The main performance throttle option is -parallel for the maximum number of concurrent processes as the number of concurrent directories being read and files being processed. For small numbers of files and/or when there is a network quality of service (QoS) limiter, you might also be able to increase performance by opening multiple channels. The usage section above shows how to use multiple host target addresses. The same syntax also opens more channels to a single target.

For example: "host1,host1:/vol/src" makes each XCP process open two channels to host1. In some WAN environments, this can improve performance. Within a datacenter, if there are only 1 GbE network interface cards (NICs) on the host with XCP it usually helps to use the multipath syntax to leverage more than one NIC.

To verify that you are running I/O over multiple paths, use OS tools to monitor network I/O. For example, on Linux, try "sar -n DEV 2 200".

#### ENVIRONMENT VARIABLES

XCP\_CONFIG\_DIR: Override the default location /opt/NetApp/xFiles/xcp. If set, the value should be an OS filesystem path, possibly a mounted NFS directory. When XCP\_CONFIG\_DIR is set, a new directory with name same as hostname is created inside the custom configuration directory path wherein new logs will be stored

XCP\_LOG\_DIR: Override the default, which stores the XCP log in the configuration directory. If set, the value should be an OS filesystem path, possibly a mounted NFS directory.

When XCP\_LOG\_DIR is set, a new directory with name same as hostname is created inside the custom log directory path wherein new logs will be stored

XCP\_CATALOG\_PATH: Override the setting in xp.ini. If set, the value should be in the XCP path format, server:export[:subdirectory].

#### SECURITY

All the files and directories in the catalog are world readable except for the index files, which have a ".index" suffix and are located in subdirectories under the top-level catalog "indexes" directory.

Because each index file is essentially an archive of metadata of an entire file tree, the catalog should be stored on a NetApp volume with export permissions matching the the actual sources and targets. Note that file data is not stored in the index, only metadata.

#### SUPPORT

<https://www.netapp.com/us/contact-us/support.aspx>

## show

The NFS show command queries the RPC services and NFS exports of one or more storage servers. The command also lists the available services and exports and shows the used and free capacity of each export, followed by the attributes of the root of each

**export.**

## Syntax

```
xcp show <ip_address_or_host_name>
```

The **show** command requires the host name or IP address of the NFSv3 exported system.

## Show example

```
[root@localhost linux]# ./xcp show <IP address or hostname of NFS server>

getting pmap dump from <IP address or hostname of NFS server> port
111... getting export list from <IP address or hostname of NFS server>...
sending 3 mounts and 12 nfs requests to <IP address or hostname of NFS server>...

== RPC Services ==
'<IP address or hostname of NFS server>': UDP rpc services: MNT v1/2/3,
NFS v3, NLM v4, PMAP v2/3/4, STATUS v1
'<IP address or hostname of NFS server>': TCP rpc services: MNT v1/2/3,
NFS v3/4, NLM v4, PMAP v2/3/4, STATUS v1

== NFS Exports == Mounts Errors Server
3    0 <IP address or hostname of NFS server>

Space      Files     Space      Files
Free       Free      Used       Used Export

93.9 MiB   19,886   1.10 MiB   104 <IP address or hostname of NFS
server>:/
9.44 GiB    2.49M    65.7 MiB   276 <IP address or hostname of NFS
server>:/catalog_vol
84.9 GiB    22.4M    593 MiB  115 <IP address or hostname of NFS
server>:/source_vol

== Attributes of NFS Exports ==
drwxr-xr-x --- root root 4KiB 4KiB 6d2h <IP address or hostname of
NFSServer>:/
drwxr-xr-x --- root root 4KiB 4KiB 6d2h <IP address or hostname of NFS
server>:/catalog_vol
drwxr-xr-x --- root root 4KiB 4KiB 1h30m <IP address or hostname of NFS
server>:/source_vol

Xcp command : xcp show <IP address or hostname of NFS server>
0 error
Speed    : 3.62 KiB in (17.9 KiB/s), 6.28 KiB out (31.1 KiB/s) Total
Time    : 0s.
STATUS   : PASSED
```

## **show -v**

Use the `-v` parameter with the `show` command to return details about NFS servers using the IP address or host name.

### **Syntax**

```
xcp show -v
```

## **license**

The `NFS license` command displays XCP license information.

Before running this command, verify that the license file is downloaded and copied to the `/opt/NetApp/xFiles/xcp/` directory on the XCP Linux client host.

### **Syntax**

```
xcp license
```

### **Show example**

```
[root@localhost /]# ./xcp license

Licensed to "XXX, NetApp Inc, XXX@netapp.com" until Sun Mar 31 00:00:00
2029 License type: SANDBOX
License status: ACTIVE
Customer name: N/A
Project number: N/A
Offline Host: Yes
Send statistics: No
Host activation date: N/A
License management URL: https://xcp.netapp.com
```

## **license update**

Use the `update` parameter with the `license` command to retrieve the latest license from the XCP server.

### **Syntax**

```
xcp license update
```

## Show example

```
[root@localhost /]# ./xcp license update  
  
XCP <version>; (c) yyyy NetApp, Inc.; Licensed to XXX [NetApp Inc]  
until Sun Mar 31 00:00:00 yyyy
```

## activate

The NFS activate command activates the XCP license.

Before running this command, verify that the license file is downloaded and copied to the opt/NetApp/xFiles/xcp/ directory on the XCP Linux client host.

## Syntax

```
xcp activate
```

## Show example

```
[root@localhost linux]# ./xcp activate  
  
XCP activated
```

## scan

The XCP NFS scan command recursively scans the entire source NFSv3 exported paths and returns file structure statistics.

NetApp recommends that you put the source NFS export mounts in read-only mode during the scan operation.

## Syntax

```
xcp scan <source_nfs_export_path>
```

## Show example

```
[root@localhost linux]# ./xcp scan <IP address of NFS server>:/  
  
source_vol  
source_vol  
source_vol/r1.txt  
source_vol/USER.1  
source_vol/USER.2  
source_vol/USER.1/FILE_1  
source_vol/USER.1/FILE_2  
source_vol/USER.1/FILE_3  
source_vol/USER.1/FILE_4  
source_vol/USER.1/FILE_5  
source_vol/USER.1/file1.txt  
source_vol/USER.1/file2.txt  
source_vol/USER.1/logfile.txt  
source_vol/USER.1/log1.txt  
source_vol/USER.2/FILE_1  
source_vol/USER.2/FILE_5  
source_vol/USER.2/FILE_2  
source_vol/USER.2/FILE_3  
source_vol/USER.2/FILE_4  
Xcp command : xcp scan <IP address of NFS server>:/source vol
```

The following table lists the `scan` parameters and their description.

Parameter	Description
<code>scan -l</code>	Lists files in the long listing output format.
<code>scan -q</code>	Shows the number of files scanned.
<code>scan -stats</code>	Lists files in the tree statistic report format.
<code>scan -csv</code>	Lists files in the tree statistic CSV report format.
<code>scan -html</code>	Lists files in the tree statistic HTML report format.
<code>scan -nonames</code>	Excludes user and group names from file listings and reports.
<code>scan -newid &lt;name&gt;</code>	Specifies the catalog name for a new index.
<code>scan -id &lt;catalog_name&gt;</code>	Specifies the catalog name of a previous copy or scan index.
<code>scan -match &lt;filter&gt;</code>	Only processes files and directories that match the filter.

Parameter	Description
<code>scan -fmt &lt;string_expression&gt;</code>	Only processes files and directories that match the format.
<code>scan -du</code>	Summarizes the space usage of each directory, including subdirectories.
<code>scan -md5 &lt;string_expression&gt;</code>	Generates checksums on the files and saves the checksums when indexing (default: false).
<code>scan -depth &lt;n&gt;</code>	Limits the search depth.
<code>scan -dircount &lt;n[k]&gt;</code>	Specifies the request size when reading directories.
<code>scan -edupe</code>	Includes the dedupe estimate in reports.
<code>scan -bs &lt;n[k]&gt;</code>	Specifies the read/write block size for scans that read data using <code>-md5</code> or <code>-edupe</code> (default: 64k).
<code>scan -parallel &lt;n&gt;</code>	Specifies the maximum number of concurrent batch processes (default: 7).
<code>scan -nold</code>	Disables the creation of a default index (default: false).
<code>scan -subdir-names</code>	Retrieves the names of the top-level subdirectories in a directory.
<code>scan -preserve-atime</code>	Restores all files to the last accessed date on the source.
<code>scan -s3.insecure</code>	Provides the option to use HTTP instead of HTTPS for S3 bucket communication.
<code>scan -s3.endpoint &lt;s3_endpoint_url&gt;</code>	Overrides the default Amazon Web Services (AWS) endpoint URL with the specified URL for S3 bucket communication.
<code>scan -s3.profile &lt;profile_name&gt;</code>	Specifies a profile from the AWS credential file for S3 bucket communication.
<code>scan -s3.noverify</code>	Overrides the default verification of SSL certification for S3 bucket communication.

## scan -

Use the `-l` parameter with the `scan` command to list files in the long listing output format.

### Syntax

```
xcp scan -l <ip_address_or_hostname>:/source_vol
```

## Show example

```
root@localhost linux]# ./xcp scan -l <IP address or hostname of  
NFSserver>:/source_vol  
  
drwxr-xr-x --- root root 4KiB 4KiB 6s source_vol  
drwxr-xr-x --- root root 4KiB 4KiB 42s source_vol/USER.1  
drwxr-xr-x --- root root 4KiB 4KiB 42s source_vol/USER.2  
rw-r--r--- --- root root 1KiB 4KiB 42s source_vol/USER.1(FILE_1  
rw-r--r--- --- root root 1KiB 4KiB 42s source_vol/USER.1(FILE_2  
rw-r--r--- --- root root 1KiB 4KiB 42s source_vol/USER.1(FILE_3  
rw-r--r--- --- root root 1KiB 4KiB 42s source_vol/USER.1(FILE_4  
rw-r--r--- --- root root 1KiB 4KiB 42s source_vol/USER.1(FILE_5  
rw-r--r--- --- root root 1KiB 4KiB 42s source_vol/USER.2(FILE_1  
rw-r--r--- --- root root 1KiB 4KiB 42s source_vol/USER.2(FILE_5  
rw-r--r--- --- root root 1KiB 4KiB 42s source_vol/USER.2(FILE_2  
rw-r--r--- --- root root 1KiB 4KiB 42s source_vol/USER.2(FILE_3  
rw-r--r--- --- root root 1KiB 4KiB 42s source_vol/USER.2(FILE_4  
Xcp command : xcp scan -l <IP address or hostname of NFS  
server>:/source_vol  
13 scanned, 0 matched, 0 error  
Speed : 3.73 KiB in (4.89 KiB/s), 756 out (989/s)  
Total Time : 0s.  
STATUS : PASSED
```

## scan -q

Use the `-q` parameter with the `scan` command to show the number of files scanned.

### Syntax

```
xcp scan -q <ip_address_or_hostname>:/source_vol
```

## Show example

```
[root@localhost linux]# ./xcp scan -q <IP address or hostname of NFSserver>:/source_vol

Xcp command : xcp scan -q <IP address or hostname of NFS server>:/source_vol
13 scanned, 0 matched, 0 error
Speed : 3.73 KiB in (3.96 KiB/s), 756 out(801/s)
Total Time : 0s.
STATUS : PASSED
```

## scan -stats, scan -csv, and scan -html

Use the `-stats`, `-csv`, and `-html` parameters with the `scan` command to list files in the tree statistic report format.

XCP reports (.csv, .html) are saved in the catalog location specified in the `xcp.ini` file. The files are stored in the `<catalog_path>/catalog/indexes/1/reports` folder. You can view sample reports in the appendix.

## Syntax

```
xcp scan -stats <ip_address>:/source_vol
```

## Show example

```
root@client1 linux]# ./xcp scan -stats <ip_address>:/fg1

## scan -nonames

Use the `-nonames` parameter with the `scan` command to exclude user and group names from file listings or reports.

When used with the `scan` command, the `-nonames` parameter only applies to file listings returned using the `-l` option.

## Syntax

```
xcp scan -nonames <ip_address_or_hostname>:/source_vol
```

## Show example

```
[root@localhost linux]# ./xcp scan -nonames <IP address or hostname of  
NFS server>:/source_vol  
  
source_vol  
source_vol/USER.1  
source_vol/USER.2

Speed : 3.73 KiB in (4.66 KiB/s), 756 out(944/s)  
Total Time : 0s.  
STATUS : PASSED
```

## scan -newid <name>

Use the `-newid <name>` parameter with the `scan` command to specify the catalog name for a new index when running a scan.

### Syntax

```
xcp scan -newid <name> <ip_address_or_hostname>:/source_vol
```

## Show example

```
[root@localhost linux]# ./xcp scan -newid ID001 <IP address or hostname  
of NFS server>:/source_vol  
  
Xcp command : xcp scan -newid ID001 <IP address or hostname of NFS  
server>:/source_vol  
13 scanned, 0 matched, 0 error  
Speed : 13.8 KiB in (17.7 KiB/s), 53.1 KiB out (68.0 KiB/s)  
Total Time : 0s.  
STATUS : PASSED
```

## scan -id <catalog\_name>

Use the `-id` parameter with the `scan` command to specify the catalog name of previous copy or scan index.

## Syntax

```
xcp scan -id <catalog_name>
```

## Show example

```
[root@localhost linux]# ./xcp scan -id 3  
  
xcp: Index: {source: 10.10.1.10:/vol/ex_s01/etc/keymgr, target: None}

```

## scan -match <filter>

Use the `-match <filter>` parameter with the `scan` command to specify that only the files and directories that match a filter are processed.

## Syntax

```
xcp scan -match <filter> <ip_address_or_hostname>:/source_vol
```

## Show example

```
root@localhost linux]# ./xcp scan -match bin <IP address or hostname of  
NFS server>:/source_vol  
  
source_vol  
source_vol/USER.1/FILE_1  
source_vol/USER.1/FILE_2

source_vol/USER.2/FILE_2  
source_vol/USER.2/FILE_3  
source_vol/USER.2/FILE_4  
Filtered: 0 did not match  
Xcp command : xcp scan -match bin <IP address or hostname of  
NFSserver>:/source_vol  
18 scanned, 18 matched, 0 error  
Speed : 4.59 KiB in (6.94 KiB/s), 756 out (1.12KiB/s)  
Total Time : 0s.  
STATUS : PASSED
```

## scan -fmt <string\_expression>

Use the `-fmt` parameter with the `scan` command to specify that only files and directories that match the specified format are returned.

## Syntax

```
xcp scan -fmt <string_expression> <ip_address_or_hostname>:/source_vol
```

## Show example

```
[root@localhost linux]# ./xcp scan -fmt "'{}, {}, {}, {}, {}'.format(name, x, ctime, atime, mtime)"
<IP address or hostname of NFS server>:/source_vol

## scan -du

Use the `-du` parameter with the `scan` command to summarize the space usage of each directory, including subdirectories.

### Syntax

```
xcp scan -du <ip_address_or_hostname>:/source_vol
```

## Show example

```
[root@localhost linux]# ./xcp scan -du <IP address or hostname of  
NFSserver>:/source_vol  
  
24KiB source_vol/USER.1  
24KiB source_vol/USER.2

STATUS : PASSED
```

## scan -md5 <string\_expression>

Use the `-md5` parameter with the `scan` command to generate checksums for the file listings and save the checksums when indexing. The default value is set to false.

The checksums are not used for file verification; they are only used for file listings during scan operations.

## Syntax

```
xcp scan -md5 <ip_address_or_hostname>:/source_vol
```

## Show example

```
root@localhost linux]# ./xcp scan -md5 <IP address or hostname of  
NFSserver>:/source_vol

```

## scan -depth <n>

Use the `-depth <n>` parameter with the `scan` command to limit the search depth of a scan. The `-depth <n>` parameter specifies the depth into the subdirectories that XCP can scan files. For example, if the number 2 is specified, XCP will only scan the first two subdirectory levels.

## Syntax

```
xcp scan -depth <n> <ip_address_or_hostname>:/source_vol
```

## Show example

```
[root@localhost linux]# ./xcp scan -depth 2 <IP address or hostname of  
NFS server>:/source_vol  
  
source_vol  
source_vol/r1.txt  
source_vol/USER.1  
source_vol/USER.2  
source_vol/USER.1(FILE_1  
source_vol/USER.1(FILE_2  
source_vol/USER.1(FILE_3  
source_vol/USER.1(FILE_4  
source_vol/USER.1(FILE_5  
source_vol/USER.1/file1.txt  
source_vol/USER.1/file2.txt  
source_vol/USER.1/logfile.txt  
source_vol/USER.1/log1.txt  
source_vol/USER.2(FILE_1  
source_vol/USER.2(FILE_5  
source_vol/USER.2(FILE_2  
source_vol/USER.2(FILE_3  
source_vol/USER.2(FILE_4  
Xcp command : xcp scan -depth 2 <IP address or hostname of  
NFSserver>:/source_vol  
18 scanned, 0 matched, 0 error  
Speed : 4.59 KiB in (6.94 KiB/s), 756 out (1.12KiB/s)  
Total Time : 0s.  
STATUS : PASSED
```

## scan -dircount <n[k]>

Use the `-dircount <n[k]>` parameter with the `scan` command to specify the request size when reading directories in a scan. The default value is 64k.

### Syntax

```
xcp scan -dircount <n[k]> <ip_address_or_hostname>:/source_vol
```

## Show example

```
[root@localhost linux]# ./xcp scan -dircount 64k <IP address or  
hostname of NFS server>:/source_vol  
  
source_vol  
source_vol/USER.1(FILE_1  
source_vol/USER.1(FILE_2  
source_vol/USER.1(FILE_3  
source_vol/USER.1(FILE_4  
source_vol/USER.1(FILE_5  
source_vol/USER.1/file1.txt  
source_vol/USER.1/file2.txt  
source_vol/USER.1/logfile.txt  
source_vol/USER.1/log1.txt  
source_vol/r1.txt  
source_vol/USER.1  
source_vol/USER.2  
source_vol/USER.2(FILE_1  
source_vol/USER.2(FILE_5
```

## scan -edupe

Use the `-edupe` parameter with the `scan` command to include the deduplication estimate in reports.

Simple Storage Service (S3) does not support sparse files. Therefore, specifying an S3 bucket as the target destination for `scan -edupe` returns the value "None" for sparse data.

## Syntax

```
xcp scan -edupe <ip_address_or_hostname>:/source_vol
```

## Show example

```
root@localhost linux]# ./xcp scan -edupe <IP address or hostname of
NFSserver>:/source_vol

### **scan -bs <n[k]>**

Use the `-bs <n[k]>` parameter with the `scan` command to specify the read/write block size. This applies to scans that read data using the `-md5` or `-edupe` parameters. The default block size is 64k.

#### **Syntax**

```
xcp scan -bs <n[k]> <ip_address_or_hostname>:/source_vol
```

## Show example

```
[root@localhost linux]# ./xcp scan -bs 32 <IP address or hostname of  
NFS server>:/source_vol  
  
source_vol

Total Time : 0s.  
STATUS : PASSED
```

## scan -parallel <n>

Use the `-parallel` parameter with the `scan` command to specify the maximum number of concurrent batch processes. The default value is 7.

### Syntax

```
xcp scan -parallel <n> <ip_address_or_hostname>:/source_vol
```

## Show example

```
[root@localhost linux]# ./xcp scan -parallel 5 <IP address or hostname  
of NFS server>:/source_vol  
  
source_vol  
source_vol/USER.1(FILE_1  
source_vol/USER.1(FILE_2  
source_vol/USER.1(FILE_3

Total Time : 0s.  
STATUS : PASSED
```

## scan -nold

Use the `-noId` parameter with the `scan` command to disable the creation of a default index. The default value is false.

## Syntax

```
xcp scan -noId <ip_address_or_hostname>:/source_vol
```

## Show example

```
[root@localhost linux]# ./xcp scan -noId <IP address or hostname of NFS server>:/source_vol

source_vol
source_vol/USER.1(FILE_1
source_vol/USER.1(FILE_2
source_vol/USER.1(FILE_3
source_vol/USER.1(FILE_4
source_vol/USER.1(FILE_5

Total Time : 0s.
STATUS : PASSED
```

## scan -subdir-names

Use the `-subdir-names` parameter with the `scan` command to retrieve the names of the top-level subdirectories in a directory.

### Syntax

```
xcp scan -subdir-names <ip_address_or_hostname>:/source_vol
```

## Show example

```
[root@localhost linux]# ./xcp scan -subdir-names <IP address or  
hostname of NFS server>:/source_vol  
  
source_vol  
Xcp command : xcp scan -subdir-names <IP address or hostname of NFS  
server>:/source_vol  
7 scanned, 0 matched, 0 error  
Speed : 1.30 KiB in (1.21 KiB/s), 444 out(414/s)  
Total Time : 1s.  
STATUS : PASSED
```

## scan -preserve-atime

Use the `-preserve-atime` parameter with the `scan` command to restore all files to the last accessed date on the source.

When an NFS share is scanned, the access time is modified on the files if the storage system is configured to modify access time on read. XCP does not directly change the access time. XCP reads the files one by one and this triggers an update to the access time. The `-preserve-atime` option resets the access time to the original value set before the XCP read operation.

## Syntax

```
xcp scan -preserve-atime <ip_address_or_hostname>:/source_vol
```

## Show example

```
[root@client 1 linux]# ./xcp scan -preserve-atime  
101.10.10.10:/source_vol  
  
xcp: Job ID: Job_2022-06-30_14.14.15.334173_scan

## scan -s3.insecure

Use the `-s3.insecure` parameter with the `scan` command to use HTTP instead of HTTPS for S3 bucket communication.

### Syntax

```
xcp scan -s3.insecure s3://<bucket_name>
```

## Show example

```
[root@client1 linux]# ./xcp scan -s3.insecure s3://bucket1

## scan -s3.endpoint <s3\_endpoint\_url>

Use the `-s3.endpoint <s3_endpoint_url>` parameter with the `scan` command to override the default AWS endpoint URL with a specified URL for S3 bucket communication.

### Syntax

```
xcp scan -s3.endpoint https://<endpoint_url>: s3://<bucket_name>
```

## Show example

```
[root@client1 linux]# ./xcp scan -s3.endpoint https://<endpoint_url>:

STATUS : PASSED
```

## scan -s3.profile <name>

Use the `s3.profile` parameter with the `scan` command to specify a profile from the AWS credential file for S3 bucket communication.

### Syntax

```
xcp scan -s3.profile <name> -s3.endpoint https://<endpoint_url>:  
s3://<bucket_name>
```

## Show example

```
[root@client1 linux]# ./xcp scan -s3.profile sg -s3.endpoint

## scan -s3.noverify

Use the `-s3.noverify` parameter with the `scan` command to override the default verification of SSL certification for S3 bucket communication.

### Syntax

```
xcp scan -s3.noverify s3://<bucket_name>
```

## Show example

```
root@client1 linux]# ./xcp scan -s3.noverify s3:// bucket1

Job ID: Job_2023-06-13_11.00.59.742237_scan

STATUS : PASSED
```

## copy

The XCP NFS copy command scans and copies the entire source directory structure to a destination NFSv3 export.

The `copy` command requires having source and destination paths as variables. The scanned and copied files, throughput, speed, and elapsed time details are displayed at the end of the copy operation.

- The runtime log file is located in `/opt/NetApp/xFiles/xcp/xcp.log`. This path is configurable. Additional logging is located in the catalog after each command is run.
- If the source is a 7-Mode system, you can use a Snapshot copy as a source. For example:  
`<ip_address>:/vol/ex_s01/.snapshot/<snapshot_name>`

## Syntax

```
xcp copy <source_nfs_export_path> <destination_nfs_export_path>
```

## Show example

```
root@localhost linux]# ./xcp copy <IP address of NFS server>:/source_vol < IP address of destination NFS server>:/dest_vol

xcp: WARNING: No index name has been specified, creating one with name: autoname_copy_2020-03-03_23.46.33.153705
Xcp command : xcp copy <IP address of NFS server>:/source_vol <IP address of destination NFS server>:/dest_vol
18 scanned, 0 matched, 17 copied, 0 error
Speed : 38.9 KiB in (51.2 KiB/s), 81.2 KiB out (107KiB/s)
Total Time : 0s.
STATUS : PASSED
```

The following table lists the `copy` parameters and their description.

Parameter	Description
<code>copy -nonames</code>	Excludes user and group names from file listings and reports.
<code>copy -match &lt;filter&gt;</code>	Only processes files and directories that match the filter.
<code>copy -md5 &lt;string_expression&gt;</code>	Generates checksums on the files and saves the checksums when indexing (default: false).
<code>copy -dircount &lt;n[k]&gt;</code>	Specifies the request size when reading directories.
<code>copy -edupe</code>	Includes the dedupe estimate in reports.
<code>copy -bs &lt;n[k]&gt;</code>	Specifies the read/write block size (default: 64k).
<code>copy -parallel &lt;n&gt;</code>	Specifies the maximum number of concurrent batch processes (default: 7).
<code>copy -preserve-atime</code>	Restores all files to the last accessed date on the source.
<code>copy -s3.insecure</code>	Provides the option to use HTTP instead of HTTPS for S3 bucket communication.
<code>copy -s3.endpoint &lt;s3_endpoint_url&gt;</code>	Overrides the default Amazon Web Services (AWS) endpoint URL with the specified URL for S3 bucket communication.
<code>copy -s3.profile &lt;profile_name&gt;</code>	Specifies a profile from the AWS credential file for S3 bucket communication.

Parameter	Description
<code>copy -s3.noverify</code>	Overrides the default verification of SSL certification for S3 bucket communication.

## copy -nonames

Use the `-nonames` parameter with the `copy` command to exclude user and group names from file listings or reports.

### Syntax

```
xcp copy -nonames <source_ip_address_or_hostname>:/source_vol
<destination_ip_address_or_hostname>:/dest_vol
```

### Show example

```
[root@localhost linux]# ./xcp copy -nonames <IP address or hostname of
NFS server>:/source_vol <IP
address of destination NFS server>:/dest_vol

xcp: WARNING: No index name has been specified, creating one with name:

## copy -match <filter>

Use the `-match <filter>` parameter with the `copy` command to specify that only the files and directories that match a filter are processed.

### Syntax

```
xcp copy -match <filter> <source_ip_address_or_hostname>:/source_vol
<destination_ip_address_or_hostname>:/dest_vol
```

## Show example

```
[root@localhost linux]# ./xcp copy -match bin <IP address or hostname  
of NFS server>:/source_vol <IP  
address of destination NFS server>:/dest_vol  
  
xcp: WARNING: No index name has been specified, creating one with name:

```

## copy -md5 <string\_expression>

Use the `-md5` parameter with the `copy` command to generate checksums for the file listings and save the checksums when indexing. The default value is set to false.

## Syntax

```
xcp copy -md5 <source_ip_address_or_hostname>:/source_vol  
<destination_ip_address_or_hostname>:/dest_vol
```

## Show example

```
[root@localhost linux]# ./xcp copy -md5 <IP address or hostname of NFS server>:/source_vol <IP address of destination NFS server>:/dest_vol

## copy -dircount <n[k]>

Use the `-dircount <n[k]>` parameter with the `copy` command to specify the request size when reading directories. The default value is 64k.

## Syntax

```
xcp copy -dircount <n[k]> <source_ip_address_or_hostname>:/source_vol <destination_ip_address_or_hostname>:/dest_vol
```

## Show example

```
[root@localhost linux]# ./xcp copy -dircount 32k <IP address or  
hostname of NFS server>:/source_vol  
<IP address of destination NFS server>:/dest_vol

```

## copy -edupe

Use the `-edupe` parameter with the `copy` command to include the deduplication estimate in reports.

Simple Storage Service (S3) does not support sparse files. Therefore, specifying an S3 bucket as the target destination for `copy -edupe` returns the value "None" for sparse data.

## Syntax

```
xcp copy -edupe <source_ip_address_or_hostname>:/source_vol  
<destination_ip_address_or_hostname>:/dest_vol
```

## Show example

```
[root@localhost linux]# ./xcp copy -edupe <IP address or hostname of
NFS server>:/source_vol <IP
address of destination NFS server>:/dest_vol

## copy -preserve-atime

Use the `-preserve-atime` parameter with the `copy` command to restore all files to the last accessed date on the source.

The `-preserve-atime` option resets the access time to the original value set before the XCP read operation.

## Syntax

```
xcp copy -preserve-atime <source_ip_address_or_hostname>:/source_vol  
<destination_ip_address_or_hostname>:/dest_vol
```

## Show example

```
[root@client1 linux]# ./xcp copy -preserve-atime

## sync

View the descriptions, parameters, and examples for the XCP sync command, including when the sync command is used with the dry run option.

### sync

The XCP NFS sync command scans for changes and modifications to a source NFS directory by using a catalog index tag name or the number of a previous copy operation. Incremental changes to the source are copied and applied to the target directory. The old catalog index numbers are replaced with new ones after the sync operation.

During the sync operation, modified files and directories are copied to the destination NFSv3 export again.

### Syntax

```
xcp sync -id <catalog_name>
```

The -id <catalog\_name> parameter is required with the sync command.

## Show example

```
[root@localhost linux]# ./xcp sync -id autoname_copy_2020-03-04_01.10.22.338436

xcp: Index: {source: <IP address or hostname of NFS server>:/source_vol, target: <IP address of destination NFS server>:/dest_vol}
Xcp command : xcp sync -id autoname_copy_2020-03-04_01.10.22.338436
0 scanned, 0 copied, 0 modification, 0 new item, 0 delete item, 0 error
Speed : 26.4 KiB in (27.6 KiB/s), 22.7 KiB out (23.7 KiB/s)
Total Time : 0s.
STATUS : PASSED
```

The following table lists the `sync` parameters and their description.

Parameter	Description
<code>sync -id &lt;catalog_name&gt;</code>	Specifies the catalog name of a previous copy index. This is a required parameter for the <code>sync</code> command.
<code>sync -nonames</code>	Excludes user and group names from file listings and reports.
<code>sync -bs &lt;n[k]&gt;</code>	Specifies the read/write block size (default: 64k).
<code>sync -dircount &lt;n[k]&gt;</code>	Specifies the request size when reading directories.
<code>sync -parallel &lt;n&gt;</code>	Specifies the maximum number of concurrent batch processes (default: 7).
<code>sync -preserve-atime</code>	Restores all files to the last accessed date on the source.

### **sync -nonames**

Use the `-nonames` parameter with the `sync` command to exclude user and group names from file listings or reports.

### **Syntax**

```
xcp sync -id <catalog_name> -nonames
```

## Show example

```
[root@localhost linux]# ./xcp sync -id ID001 -nonames

xcp: Index: {source: <IP address or hostname of NFS
server>:/source_vol, target: <IP address of
destination NFS server>:/dest_vol}
Xcp command : xcp sync -id ID001 -nonames
0 scanned, 0 copied, 0 modification, 0 new item, 0 delete item, 0 error
Speed : 26.4 KiB in (22.2 KiB/s), 22.3 KiB out (18.8 KiB/s)
Total Time : 1s.
STATUS : PASSED
```

## sync -bs <n[k]>

Use the the `-bs <n[k]>` parameter with the `sync` command to specify the read/write block size. The default block size is 64k.

## Syntax

```
xcp sync -id <catalog_name> -bs <n[k]>
```

## Show example

```
[root@localhost linux]# ./xcp sync -id ID001 -bs 32k

xcp: Index: {source: <IP address or hostname of NFS
server>:/source_vol, target: <IP address of
destination NFS server>:/dest_vol}
Xcp command : xcp sync -id ID001 -bs 32k
0 scanned, 0 copied, 0 modification, 0 new item, 0 delete item, 0 error
Speed : 25.3 KiB in (20.4 KiB/s), 21.0 KiB out (16.9 KiB/s)
Total Time : 1s.
STATUS : PASSED
```

## sync -dircount <n[k]>

Use the the `-dircount <n[k]>` parameter with the `sync` command to specify the request size when reading directories. The default value is 64k.

## Syntax

```
xcp sync -id <catalog_name> -dircount <n[k]>
```

## Show example

```
[root@localhost linux]# ./xcp sync -id ID001 -dircount 32k

xcp: Index: {source: <IP address or hostname of NFS
server>:/source_vol, target: <IP address of
destination NFS server>:/dest_vol}
Xcp command : xcp sync -id ID001 -dircount 32k
0 scanned, 0 copied, 0 modification, 0 new item, 0 delete item, 0 error
Speed : 25.3 KiB in (27.8 KiB/s), 21.0 KiB out (23.0 KiB/s)
Total Time : 0s.
STATUS : PASSED
```

## sync -parallel

Use the the `-parallel` parameter with the `sync` command to specify the maximum number of concurrent batch processes. The default value is 7.

## Syntax

```
xcp sync -id <catalog_name> -parallel <n>
```

## Show example

```
[root@localhost linux]# ./xcp sync -id ID001 -parallel 4

xcp: Index: {source: <IP address or hostname of NFS
server>:/source_vol, target: <IP address of
destination NFS server>:/dest_vol}
Xcp command : xcp sync -id ID001 -parallel 4
0 scanned, 0 copied, 0 modification, 0 new item, 0 delete item, 0 error
Speed : 25.3 KiB in (20.6 KiB/s), 21.0 KiB out (17.1 KiB/s)
Total Time : 1s.
STATUS : PASSED
```

## -preserve-atime

Use the the `-preserve-atime` parameter with the `sync` command to restore all files to the last accessed date on the source.

The `-preserve-atime` option resets the access time to the original value set before the XCP read operation.

## Syntax

```
xcp sync -preserve-atime -id <catalog_name>
```

## Show example

```
[root@client-1 linux]# ./xcp sync -preserve-atime -id XCP_copy_2022-06-30_14.22.53.742272

xcp: Job ID: Job_XCP_copy_2022-06-30_14.22.53.742272_2022-06-30_14.27.28.660165_sync

## sync dry-run

The `sync` command with the `dry-run` option looks for changes or modifications made to the source NFS directory using the previous catalog index number of a copy operation. This command also detects files and directories that are new, moved, deleted, or renamed since the previous copy operation. The command reports the source changes but does not apply them to the target.

### Syntax

```
xcp sync dry-run -id <catalog_name>
```

The `-id <catalog_name>` parameter is required with the `sync dry-run` command option.

### Show example

```
[root@localhost linux]# ./xcp sync dry-run -id ID001

xcp: Index: {source: <IP address or hostname of NFS
server>:/source_vol, target: <IP address of
destination NFS server>:/dest_vol}
Xcp command : xcp sync dry-run -id ID001
0 matched, 0 error
Speed : 15.2 KiB in (46.5 KiB/s), 5.48 KiB out (16.7 KiB/s)
Total Time : 0s.
STATUS : PASSED
```

The following table lists the `sync dry-run` parameters and their description.

Parameter	Description
<code>sync dry-run -id &lt;catalog_name&gt;</code>	Specifies the catalog name of a previous copy index. This is a required parameter for the <code>sync</code> command.
<code>sync dry-run -stats</code>	Performs a deep scan of the modified directories and reports everything that is new.
<code>sync dry-run -</code>	Prints details about files and directories that changed.
<code>sync dry-run -nonames</code>	Excludes user and group names from file listings and reports.
<code>sync dry-run -dircount &lt;n[k]&gt;</code>	Specifies the request size when reading directories.
<code>sync dry-run -parallel &lt;n&gt;</code>	Specifies the maximum number of concurrent batch processes (default: 7).

`sync dry-run -id <catalog_name>`

Use the `-id <catalog_name>` parameter with `sync dry-run` to specify the catalog name of a previous

copy index.

The `-id <catalog_name>` parameter is required with the `sync dry-run` command option.

## Syntax

```
xcp sync dry-run -id <catalog_name>
```

## Show example

```
[root@localhost linux]# ./xcp sync dry-run -id ID001

xcp: Index: {source: <IP address or hostname of NFS
server>:/source_vol, target: <IP address of
destination NFS server>:/dest_vol}
Xcp command : xcp sync dry-run -id ID001
0 matched, 0 error
Speed : 15.2 KiB in (21.7 KiB/s), 5.48 KiB out (7.81 KiB/s)
Total Time : 0s.
STATUS : PASSED
```

## sync dry-run -stats

Use the `-stats` parameter with `sync dry-run` to perform a deep scan of the modified directories and report everything that is new.

## Syntax

```
xcp sync dry-run -id <catalog_name> -stats
```

## Show example

```
[root@localhost linux]# ./xcp sync dry-run -id ID001 -stats

xcp: Index: {source: <IP address or hostname of NFS
server>:/source_vol, target: <IP address of
destination NFS server>:/dest_vol}
4,895 reviewed, 43,163 checked at source, 12.8 MiB in (2.54 MiB/s),
5.49 MiB out (1.09 MiB/s),
5s
4,895 reviewed, 101,396 checked at source, 19.2 MiB in (1.29 MiB/s),
12.8 MiB out (1.47 MiB/s),
10s
Xcp command : xcp sync dry-run -id ID001 -stats
0 matched, 0 error
Speed : 22.9 MiB in (1.74 MiB/s), 17.0 MiB out (1.29 MiB/s)
Total Time : 13s.
STATUS : PASSED
```

## sync dry-run -l

Use the the -l parameter with sync dry-run to print details about files and directories that changed.

## Syntax

```
xcp sync dry-run -id <catalog_name> -l
```

## Show example

```
[root@localhost linux]# ./xcp sync dry-run -id ID001 -l

xcp: Index: {source: <IP address or hostname of NFS
server>:/source_vol, target: <IP address of
destination NFS server>:/dest_vol}
Xcp command : xcp sync dry-run -id ID001 -l
0 matched, 0 error
Speed : 15.2 KiB in (13.6 KiB/s), 5.48 KiB out (4.88 KiB/s)
Total Time : 1s.
STATUS : PASSED
```

## sync dry-run -nonames

Use the the -nonames parameter with sync dry-run to exclude user and group names from file listings or

reports.

## Syntax

```
xcp sync dry-run -id <catalog_name> -nonames
```

### Show example

```
[root@localhost linux]# ./xcp sync dry-run -id ID001 -nonames

xcp: Index: {source: <IP address or hostname of NFS
server>:/source_vol, target: <IP address of
destination NFS server>:/dest_vol}
Xcp command : xcp sync dry-run -id ID001 -nonames
0 matched, 0 error
Speed : 15.2 KiB in (15.8 KiB/s), 5.48 KiB out (5.70 KiB/s)
Total Time : 0s.
STATUS : PASSED
```

## sync dry-run -dircount <n[k]>

Use the the `-dircount <n[k]>` parameter with `sync dry-run` to specify the request size when reading directories. The default value is 64k.

## Syntax

```
xcp sync dry-run -id <catalog_name> -dircount <n[k]>
```

### Show example

```
[root@localhost linux]# ./xcp sync dry-run -id ID001 -dircount 32k

xcp: Index: {source: <IP address or hostname of NFS
server>:/source_vol, target: <IP address of
destination NFS server>:/dest_vol}
Xcp command : xcp sync dry-run -id ID001 -dircount 32k
0 matched, 0 error
Speed : 15.2 KiB in (32.5 KiB/s), 5.48 KiB out (11.7 KiB/s)
Total Time : 0s.
STATUS : PASSED
```

## **sync dry-run -parallel**

Use the the **-parallel** parameter with **sync dry-run** to specify the maximum number of concurrent batch processes. The default value is 7.

### **Syntax**

```
xcp sync dry-run -id <catalog_name> -parallel <n>
```

### **Show example**

```
[root@localhost linux]# ./xcp sync dry-run -id ID001 -parallel 4

xcp: Index: {source: <IP address or hostname of NFS
server>:/source_vol, target: <IP address of
destination NFS server>:/dest_vol}
Xcp command : xcp sync dry-run -id ID001 -parallel 4
0 matched, 0 error
Speed : 15.2 KiB in (25.4 KiB/s), 5.48 KiB out (9.13 KiB/s)
Total Time : 0s.
STATUS : PASSED
```

## **resume**

The XCP NFS **resume** command restarts an interrupted copy operation by specifying the catalog index name or number. The catalog index name or number of the previous copy operation is located in the **<catalog\_path>:/catalog/indexes** directory.

### **Syntax**

```
xcp resume -id <catalog_name>
```

The **-id <catalog\_name>** parameter is required with the **resume** command.

## Show example

```
[root@localhost linux]# ./xcp resume -id ID001

xcp: Index: {source: <IP address or hostname of NFS
server>:/source_vol, target: <IP address of
destination NFS server>:/dest_vol}
xcp: resume 'ID001': Reviewing the incomplete index...

The following table lists the `resume` parameters and their description.

Parameter	Description
<code>resume -id &lt;catalog_name&gt;</code>	Specifies the catalog name of a previous copy index. This is a required parameter for the <code>resume</code> command.
<code>resume -bs &lt;n[k]&gt;</code>	Specifies the read/write block size (default: 64k).
<code>resume -dircount &lt;n[k]&gt;</code>	Specifies the request size when reading directories.
<code>resume -parallel &lt;n&gt;</code>	Specifies the maximum number of concurrent batch processes (default: 7).

Parameter	Description
<code>resume -preserve-atime</code>	Restores all files to the last accessed date on the source.
<code>resume -s3.insecure</code>	Provides the option to use HTTP instead of HTTPS for S3 bucket communication.
<code>resume -s3.endpoint &lt;s3_endpoint_url&gt;</code>	Overrides the default Amazon Web Services (AWS) endpoint URL with the specified URL for S3 bucket communication.
<code>resume -s3.profile &lt;profile_name&gt;</code>	Specifies a profile from the AWS credential file for S3 bucket communication.
<code>resume -s3.noverify</code>	Overrides the default verification of SSL certification for S3 bucket communication.

### **resume -bs <n[k]>**

Use the `-bs <n[k]>` parameter with the `resume` command to specify the read/write block size. The default block size is 64k.

#### **Syntax**

```
xcp resume -id <catalog_name> -bs <n[k]>
```

## Show example

```
[root@localhost linux]# ./xcp resume -id ID001 -bs 32k

## resume -preserve-atime

Use the `-preserve-atime` parameter with the `resume` command to restore all files to the last accessed date on the source.

The `-preserve-atime` parameter resets the access time to the original value set before the XCP read operation.

## Syntax

```
xcp resume -id <catalog_name> -preserve-atime
```

## Show example

```
root@client1 linux]# ./xcp resume -preserve-atime -id XCP_copy_2022-06-30_14.22.53.742272

## resume -s3.insecure

Use the `-s3.insecure` parameter with the `resume` command to use HTTP instead of HTTPS for S3 bucket communication.

If the `-s3.insecure` parameter is used with the `copy` command, it is ignored on `resume`. You must specify `-s3.insecure` again to use the option on `resume`.

## Syntax

```
xcp resume -s3.insecure -id <catalog_name>
```

## Show example

```
root@client1 linux]# ./xcp resume -s3.insecure -id XCP_copy_2023-06-08_10.31.47.381883

### **resume -s3.endpoint <s3\_endpoint\_url>**

Use the `-s3.endpoint <s3_endpoint_url>` parameter with the `resume` command to override the default AWS endpoint URL with the specified URL for S3 bucket communication.

 By default, resume uses the S3 profile and S3 endpoint specified during the copy operation. However, if you specify a new S3 endpoint and S3 profile on resume, it overrides the default used with the `copy` command.

### **Syntax**

```
xcp resume -s3.profile <profile_name> -s3.endpoint https://<endpoint_url>:
-id <catalog_name>
```

## Show example

```
[root@client1 linux]# ./xcp resume -id XCP_copy_2023-06-13_11.48.59.454327

Job ID: Job_XCP_copy_2023-06-13_11.48.59.454327_2023-06-13_11.49.34.887164_resume

### resume s3.profile <profile\_name>

Use the `-s3.profile <profile_name>` parameter with the `resume` command to specify a profile from the AWS credential file for S3 bucket communication.

 By default, `resume` uses the S3 profile and S3 endpoint specified during the `copy` operation. However, if you specify a new S3 endpoint and S3 profile on `resume`, it overrides the default used with the `copy` command.

### Syntax

```
xcp resume -s3.profile <name> -s3.endpoint -id <catalog_name>
```

## Show example

```
[root@client1 linux]# ./xcp resume -s3.profile sg -s3.endpoint

## verify

The `verify` command uses full byte-by-byte data comparison between source and target directories after a copy operation without using a catalog index number. The command checks for modification times and other file or directory attributes, including permissions. The command also reads the files on both sides and compares the data.

### Syntax

```
xcp verify <source NFS export path> <destination NFS exportpath>
```

## Show example

```
[root@localhost linux]# ./xcp verify <IP address of NFS
server>:/source_vol <IP address of destination NFS server>:/dest_vol

The following table lists the verify parameters and their description.

Parameter	Description
<code>verify -stats</code>	Scans the source and target trees in parallel and compares tree statistics.
<code>verify -csv</code>	Scans the source and target trees in parallel and compares tree statistics.
<code>verify -nodata</code>	Does not check data.
<code>verify -noattrs</code>	Does not check attributes.
<code>verify -nomods</code>	Does not check file modification times.
<code>verify -mtimewindow &lt;s&gt;</code>	Specifies the acceptable modification time difference for verification.
<code>verify -v</code>	Retrieves output formats to list any differences found.
<code>verify -l</code>	Retrieves output formats to list any differences found.
<code>verify -nonames</code>	Excludes user and group names from file listings or reports.
<code>verify -match &lt;filter&gt;</code>	Only processes files and directories that match the format.
<code>verify -bs &lt;n[k]&gt;</code>	Specifies the read/write block size (default: 64k).
<code>verify -parallel &lt;n&gt;</code>	Specifies the maximum number of concurrent batch processes (default: 7).
<code>verify -dircount &lt;n[k]&gt;</code>	Specifies the request size when reading directories.
<code>verify -nold</code>	Disables the creation of a default index (default: False).
<code>verify -preserve-atime</code>	Restores all files to the last accessed date on the source.
<code>verify -s3.insecure</code>	Provides the option to use HTTP instead of HTTPS for S3 bucket communication.
<code>verify -s3.endpoint &lt;s3_endpoint_url&gt;</code>	Overrides the default Amazon Web Services (AWS) endpoint URL with the specified URL for S3 bucket communication.
<code>verify -s3.profile &lt;profile_name&gt;</code>	Specifies a profile from the AWS credential file for S3 bucket communication.
<code>verify -s3.noverify</code>	Overrides the default verification of SSL certification for S3 bucket communication.

## **verify -stats and verify -csv**

Use the **-stats** and **-csv** parameters with the **verify** command to scan the source and target trees in parallel and compare tree statistics.

### **Syntax**

```
cp verify -stats <source_ip_address>:/source_vol  
<destination_ip_address>:/dest_vol
```

## Show example

```
[root@localhost linux]# ./xcp verify -stats
<source_ip_address>:/source_vol <destination_ip_address>:/dest_vol

## verify -nodata

Use the `-nodata` parameter with the `verify` command to specify not to check data.

### Syntax

```
xcp verify -nodata <source_ip_address>:/source_vol  
<destination_ip_address>:/dest_vol
```

### Show example

```
[root@localhost linux]# ./xcp verify -nodata <IP address of source NFS  
server>:/source_vol <IP address of destination NFS server>:/dest_vol

## verify -noattrs

Use the `-noattrs` parameter with the `verify` command to specify not to check attributes.

## Syntax

```
xcp verify -noattrs <source_ip_address>/source_vol  
<destination_ip_address>/dest_vol
```

## Show example

```
[root@localhost linux]# ./xcp verify -noattrs <IP address of source NFS server>:/source_vol <IP address of destination NFS server>:/dest_vol

## **verify -mtimewindow <s>**

Use the `-mtimewindow <s>` parameter with the `verify` command to specify the acceptable modification time difference for verification.

### **Syntax**

```
xcp verify -mtimewindow <s> <source_ip_address>:/source_vol
<destination_ip_address>:/dest_vol
```

## Show example

```
[root@localhost linux]# ./xcp verify -mtimewindow 2 <IP address of NFS server>:/source_vol <IP address of destination NFS server>:/dest_vol

## verify -nonames

Use the `-nonames` parameter with the `verify` command to exclude user and group names from file listings or reports

### Syntax

```
xcp verify -nonames <source_ip_address>/:source_vol
<destination_ip_address>/:dest_vol
```

**Show example**

```

[root@localhost linux]# ./xcp verify -nonames <IP address of NFS
server>:/source_vol <IP address of destination NFS server>:/dest_vol

## verify -noid

Use the `-noId` parameter with the `verify` command to disable the creation of a default index. The default value is false.

### Syntax

```
xcp verify -noId <source_ip_address>:/source_vol
<destination_ip_address>:/dest_vol
```

### Show example

```
[root@localhost linux]# ./xcp verify -noId <IP address of source NFS
server>:/source_vol <IP address of destination NFS server>:/dest_vol

Job ID: Job_2024-04-22_07.19.41.825308_verify

## **verify -preserve-atime**

Use the `-preserve-atime` parameter with the `verify` command to restore all files to the last accessed date on the source. The `-preserve-atime` parameter resets the access time to the original value set before the XCP read operation.

### **Syntax**

```
xcp verify -preserve-atime <source_ip_address>:/source_vol  
<destination_ip_address>:/dest_vol
```

### **Show example**

```
[root@client1 linux]# ./xcp verify -preserve-atime  
<IP_address>:/source_vol <destination_IP_address>:/dest_vol

## **verify -s3.insecure**

Use the `-s3.insecure` parameter with the `verify` command to use HTTP instead of HTTPS for S3 bucket communication.

### **Syntax**

```
xcp verify -s3.insecure hdfs:///user/test s3://<bucket_name>
```

## Show example

```
[root@client1 linux]# ./xcp verify -s3.insecure hdfs://<HDFS source>
s3://<s3-bucket>

## verify -s3.endpoint <s3\_endpoint\_url>

Use the `-s3.endpoint <s3_endpoint_url>` parameter with the `verify` command to override the default AWS endpoint URL with a specified URL for S3 bucket communication.

### Syntax

```
xcp verify -s3.endpoint https://<endpoint_url>: s3://<bucket_name>
```

## Show example

```
[root@client1 linux]# ./xcp verify -s3.endpoint https://<endpoint_url>
hdfs://<HDFS source> s3://<s3-bucket>

## verify -s3.profile <name>

Use the `s3.profile` parameter with the `verify` command to specify a profile from the AWS credential file for S3 bucket communication.

### Syntax

```
xcp verify -s3.profile <name> -s3.endpoint https://<endpoint_url>:
s3://<bucket_name>
```

## Show example

```
[root@client1 linux]# ./xcp verify -s3.profile sg -s3.endpoint
https://<endpoint_url> hdfs://<HDFS source> s3://<s3-bucket>

## chmod

The XCP NFS chmod command scans and changes the file permission of all the files for the given directory structure. The 'chmod' command requires mode or reference, NFS share, or the POSIX path as a variable. The XCP chmod command recursively changes the permissions for a given path. The command output displays the total files scanned and the permissions changed in the output.

### Syntax

```
xcp chmod -mode <value> <source NFS export path>
```

### Show example

```
[root@user-1 linux]# ./xcp chmod -mode <IP address>:/source_vol

Xcp command : xcp chmod -mode <IP address>://source_vol
Stats : 6 scanned, 4 changed mode
Speed : 1.96 KiB in (2.13 KiB/s), 812 out (882/s)
Total Time : 0s.
STATUS : PASSED
[root@user-1 linux] #
```

The following table lists the `chmod` parameters and their description.

Parameter	Description
<code>chmod -exclude &lt;filter&gt;</code>	Excludes the files and directories that match the filter.
<code>chmod -match &lt;filter&gt;</code>	Only processes the files and directories that match the filter.
<code>chmod -reference &lt;reference&gt;</code>	Specifies the referenced file or directory point.
<code>chmod -v</code>	Reports the output for every object processed.

### **chmod -exclude <filter>**

Use the `-exclude <filter>` parameter with the `chmod` command to exclude the files and directories that match the filter.

#### **Syntax**

```
xcp chmod -exclude <filter> -mode <value> <source NFS export path>
```

#### **Show example**

```
[root@user-1 linux]# ./xcp chmod -exclude "fnm('3.img')" -mode 770  
101.11.10.10:/s_v1/D3/  
  
Excluded: 1 excluded, 0 did not match exclude criteria  
Xcp command : xcp chmod -exclude fnm('3.img') -mode 770  
101.11.10.10:/s_v1/D3/  
Stats : 5 scanned, 1 excluded, 5 changed mode  
Speed : 2.10 KiB in (7.55 KiB/s), 976 out (3.43 KiB/s)  
Total Time : 0s.  
STATUS : PASSED  
[root@user-1 linux]#
```

### **chmod -match <filter>**

Use the `-match <filter>` parameter with the `chmod` command to only process the files and directories that match the filter.

#### **Syntax**

```
xcp chmod -match <filter> -mode <value> <source NFS export path>
```

## Show example

```
[root@user-1 linux]# ./xcp chmod -match "fnm('2.img')" -mode 777  
101.11.10.10:/s_v1/D2/  
  
Filtered: 1 matched, 5 did not match  
Xcp command : xcp chmod -match fnm('2.img') -mode  
101.11.10.10:/s_v1/D2/  
Stats : 6 scanned, 1 matched, 2 changed mode  
Speed : 1.67 KiB in (1.99 KiB/s), 484 out (578/s)  
Total Time : 0s.  
STATUS : PASSED  
[root@user-1 linux]
```

## chmod -reference <reference>

Use the `-reference <reference>` parameter with the `chmod` command to specify the referenced file or directory point.

## Syntax

```
xcp chmod -reference <reference> <source NFS export path>
```

## Show example

```
[root@user-1 linux]# ./xcp chmod -reference 101.11.10.10:/s_v1/D1/1.txt  
102.21.10.10:/s_v1/D2/  
  
Xcp command : xcp chmod -reference 101.11.10.10:/s_v1/D1/1.txt  
102.21.10.10:/s_v1/D2/  
Stats : 6 scanned, 6 changed mode  
Speed : 3.11 KiB in (3.15 KiB/s), 1.98 KiB out (2.00 KiB/s)  
Total Time : 0s.  
STATUS : PASSED  
[root@user-1 linux]#
```

## chmod -v

Use the `-v` parameter with the `chmod` command to report the output for every object processed.

## Syntax

```
chmod -mode <value> -v <source NFS export path>
```

## Show example

```
[root@user-1 linux]# ./xcp chmod -mode 111 -v file:///mnt/s_v1/D1/  
mode of 'file:///mnt/s_v1/D1' changed from 0777 to 0111  
mode of 'file:///mnt/s_v1/D1/1.txt' changed from 0777 to 0111  
mode of 'file:///mnt/s_v1/D1/softlink_1.img' changed from 0777 to 0111  
mode of 'file:///mnt/s_v1/D1/softlink_to_hardlink_1.img' changed from  
0777 to 0111 mode  
of 'file:///mnt/s_v1/D1/1.img' changed from 0777 to 0111  
mode of 'file:///mnt/s_v1/D1/hardlink_1.img' changed from 0777 to 0111  
mode of  
'file:///mnt/s_v1/D1/1.img1' changed from 0777 to 0111  
Xcp command : xcp chmod -mode 111 -v file:///mnt/s_v1/D1/ Stats : 7  
scanned, 7  
changed mode  
Speed : 0 in (0/s), 0 out (0/s)  
Total Time : 0s.  
STATUS : PASSED  
[root@user-1 linux]#
```

## chown

The XCP NFS chown command scans and changes the ownership of all the files for the given directory structure. The chown command requires an NFS share or the POSIX path as a variable. XCP chown recursively changes the ownership for a given path. The chown command displays the changed user ID (UID) for a file.

### Syntax

```
xcp chown -user/-group <user-name/group-name> <source NFS export path>
```

## Show example

```
[root@user-1 linux]# ./xcp chown -user user2 -v  
101.101.10.110:/s_v1/smaple_set/D1  
  
Sat Apr 2 23:06:05 2022  
changed ownership of 101.101.10.110:/s_v1/smaple_set/D1 from 1001:0 to  
1004:0  
changed ownership of 101.101.10.110:/s_v1/smaple_set/D1/1.txt from  
1001:0 to 1004:0  
changed ownership of 101.101.10.110:/s_v1/smaple_set/D1/softlink_1.img

Stats : 6 scanned, 6 changed ownership  
Speed : 2.25 KiB in (1.82 KiB/s), 1.11 KiB out (923/s)  
Total Time : 1s.  
STATUS : PASSED  
[root@user-1 linux]#
```

The following table lists the `chown` parameters and their description.

Parameter	Description
<code>chown -exclude &lt;filter&gt;</code>	Excludes the files and directories that match the filter.
<code>chown -match &lt;filter&gt;</code>	Only processes the files and directories that match the filter.
<code>chown -group &lt;group&gt;</code>	Sets the Linux group ID (GID) at the source.
<code>chown -user &lt;user&gt;</code>	Sets the Linux UID at the source.
<code>chown -user-from &lt;user_from&gt;</code>	Changes the UID.
<code>chown -group-from &lt;group_from&gt;</code>	Changes the GID.
<code>chown -reference &lt;reference&gt;</code>	Specifies the referenced file or directory point.
<code>chown -v</code>	Reports the output for every object processed.

## **chown -exclude <filter>**

Use the `-exclude <filter>` parameter with the `chown` command to exclude the files and directories that match the filter.

### **Syntax**

```
xcp chown -exclude <filter> -user <user_name> <source NFS export path>
```

### **Show example**

```
[root@user-1 linux]# ./xcp chown -exclude "fnm('1.img')" -user user2  
101.101.10.210:/s_v1/smapple_set/D1  
  
Excluded: 1 excluded, 0 did not match exclude criteria  
Xcp command : xcp chown -exclude fnm('1.img') -user  
user2101.101.10.210:/s_v1/smapple_set/D1  
Stats : 5 scanned, 1 excluded, 5 changed ownership  
Speed : 2.10 KiB in (1.75 KiB/s), 976 out (812/s)  
Total Time : 1s.  
STATUS : PASSED  
[root@user-1 linux]#
```

## **chown -match <filter>**

Use the `-match <filter>` parameter with the `chown` command to only process the files and directories that match the filter.

### **Syntax**

```
xcp chown -match <filter> -user <user_name> <source NFS export path>
```

## Show example

```
[root@user-1 linux]# ./xcp chown -exclude "fnm('1.img')" -user user2  
101.101.10.210:/s_v1/smaple_set/D1  
  
Excluded: 1 excluded, 0 did not match exclude criteria  
Xcp command : xcp chown -exclude fnm('1.img') -user  
user2101.101.10.210:/s_v1/smaple_set/D1  
Stats : 5 scanned, 1 excluded, 5 changed ownership  
Speed : 2.10 KiB in (1.75 KiB/s), 976 out (812/s)  
Total Time : 1s.  
STATUS : PASSED  
[root@user-1 linux]#
```

## chown -group <group>

Use the `-group <group>` parameter with the `chown` command to set the Linux GID at the source.

### Syntax

```
xcp chown -match <filter> -user <user_name> <source NFS export path>
```

## Show example

```
[root@user-1 linux]# ./xcp chown -group group1  
101.101.10.210:/s_v1/smaple_set/D1  
  
Xcp command : xcp chown -group group1  
101.101.10.210:/s_v1/smaple_set/D1

```

## chown -user <user>

Use the `-user <user>` parameter with the `chown` command to set the Linux UID at the source.

### Syntax

```
xcp chown -user -user <user_name> <source NFS export path>
```

## Show example

```
[root@user-1 linux]# ./xcp chown -user user1  
102.101.10.210:/s_v1/smaple_set/D1  
  
Xcp command : xcp chown -user user1 102.101.10.210:/s_v1/smaple_set/D1  
Stats : 6 scanned, 6 changed ownership

Total Time : 0s.  
STATUS : PASSED  
[root@user-1 linux]#
```

## chown -user-from <user\_from>

Use the `-user-from <user_from>` parameter with the `chown` command to change the UID.

### Syntax

```
xcp chown -user-from user1 -user <user_name> <source NFS export path>
```

## Show example

```
[root@user-1 linux]# ./xcp chown -user-from user1 -user user2  
101.101.10.210:/s_v1/smaple_set/D1  
  
Xcp command : xcp chown -user-from user1 -user user2  
102.108.10.210:/s_v1/smaple_set/D1  
Stats : 6 scanned, 6 changed ownership

Total Time : 0s.  
STATUS : PASSED  
[root@user-1 linux]#
```

## chown -group-from <group\_from>

Use the `-group-from <group_from>` parameter with the `chown` command to change the GID.

### Syntax

```
xcp chown -group-from <group_name> -group <group_name> <source NFS export  
path>
```

## Show example

```
[root@user-1 linux]# ./xcp chown -group-from group1 -group group2  
101.101.10.210:/s_v1/smaple_set/D1  
  
Xcp command : xcp chown -group-from group1 -group group2  
101.101.10.210:/s_v1/smaple_set/D1  
Stats : 6 scanned, 6 changed ownership

```

## chown -reference <reference>

Use the `-reference <reference>` parameter with the `chown` command to specify the referenced file or directory point.

### Syntax

```
xcp chown -reference <reference> <source NFS export path>
```

## Show example

```
[root@user-1 linux]# ./xcp chown -reference  
101.101.10.210:/s_v1/smaple_set/D2/2.img  
101.101.10.210:/s_v1/smaple_set/D1  
  
Xcp command : xcp chown -reference  
101.101.10.210:/s_v1/smaple_set/D2/2.img  
101.101.10.210:/s_v1/smaple_set/D1

## logdump

The NFS logdump command filters logs based on the migration ID or job ID and dumps those logs into a .zip file in the current directory. The .zip file has the same name as the migration or job ID that is used with the command.

## Syntax

```
xcp logdump -m <migration ID>
xcp logdump -j <job ID>
```

## Show example

```
[root@client1 xcp_nfs]# xcp logdump -j Job_2022-06-14_21.49.28.060943_scan

The following table lists the `delete` parameters and their description.

Parameter	Description
<code>delete -match &lt;filter&gt;</code>	Only processes the files and directories that match the filter.
<code>delete -force</code>	Deletes without confirmation.
<code>delete -removetopdir</code>	Removes the directory, including child directories.
<code>delete -exclude &lt;filter&gt;</code>	Excludes the files and directories that match the filter.
<code>delete -parallel &lt;n&gt;</code>	Specifies the maximum concurrent batch processes (default: 7).
<code>delete -preserve-atime</code>	Preserves access time of the file or directory (default: false).
<code>delete -loglevel &lt;name&gt;</code>	Sets the log level; available levels are INFO, DEBUG (default: INFO).
<code>delete -s3.insecure</code>	Provides the option to use HTTP instead of HTTPS for S3 bucket communication.
<code>delete -s3.endpoint &lt;s3_endpoint_url&gt;</code>	Overrides the default Amazon Web Services (AWS) endpoint URL with the specified URL for S3 bucket communication.
<code>delete -s3.profile &lt;profile_name&gt;</code>	Specifies a profile from the AWS credential file for S3 bucket communication.
<code>delete -s3.noverify</code>	Overrides the default verification of SSL certification for S3 bucket communication.

### **delete -match <filter>**

Use the `-match <filter>` parameter with the `delete` command to only process the files and directories that match the filter.

#### **Syntax**

```
xcp delete -match <filter> < NFS export path>
```

## Show example

```
[root@client1 linux]# ./xcp delete -match "fnm('XCP_copy_2023-04-25_05.51.28.315997')" 10.101.10.101:/xcp_catalog

## delete -s3.insecure

Use the `-s3.insecure` parameter with the `delete` command to use HTTP instead of HTTPS for S3 bucket communication.

### Syntax

```
xcp delete -s3.insecure s3://bucket1
```

## Show example

```
[root@client1 linux]# ./xcp delete -s3.insecure s3:// bucket1

Job ID: Job_2023-06-08_08.51.40.849991_delete
WARNING: You have selected s3://bucket1 for removing data. Data in this
path //bucket1 will be
deleted.
Are you sure you want to delete (yes/no): yes

### **delete -s3.endpoint <s3\_endpoint\_url>**

Use the `-s3.endpoint <s3_endpoint_url>` parameter with the `delete` command to override the default AWS endpoint URL with a specified URL for S3 bucket communication.

#### Syntax

```
xcp delete -s3.endpoint https://<endpoint_url>: s3://bucket
```

## Show example

```
[root@client1 linux]# ./xcp delete -s3.endpoint https://<endpoint_url>:  
s3://xcp-testing  
  
Job ID: Job_2023-06-13_11.39.33.042545_delete

```

## delete -s3.profile <name>

Use the `s3.profile` parameter with the `delete` command to specify a profile from the AWS credential file for S3 bucket communication.

### Syntax

```
xcp delete -s3.profile sg -s3.endpoint https://<endpoint_url>:  
s3://bucket
```

## Show example

```
[root@client1 linux]# ./xcp delete -s3.profile sg -s3.endpoint
https://<endpoint_url>: s3://bucket

## delete -s3.noverify

Use the `-s3.noverify` parameter with the `delete` command to override the default verification of SSL certification for S3 bucket communication.

### Syntax

```
xcp delete -s3.noverify s3://bucket
```

## Show example

```
[root@client-1 linux]# ./xcp delete -s3.noverify s3://bucket1

Job ID: Job_2023-06-13_10.56.19.319076_delete

## estimate

The XCP NFS estimate command is used to estimate the time to complete a baseline copy from the source to destination. It calculates the estimated time to complete a baseline copy by using all of the current available system resources, such as CPU, RAM, Network, and other parameters. You can use the -target option to start a sample copy operation and get the estimation time.

### Syntax

```
xcp estimate -id <name>
```

## Show example

```
[root@client-01 linux]# ./xcp estimate -t 100 -id estimate01 -target  
10.101.10.10:/temp8  
  
xcp: WARNING: your license will expire in less than 10 days! You can

[root@client-01linux]#
```

The following table lists the estimate parameters and their description.

Parameter	Description
estimate -id <name>	Specifies the catalog name of a previous copy or scan index.
estimate -gbit <n>	Uses gigabits of bandwidth to estimate best-case time (default: 1).
estimate -target <path>	Specifies the target to use for live test copy.
estimate -t <n/s/m/h>	Specifies the duration of live test copy (default: 5m).
estimate -bs <n[k]>	Specifies the read/write block size (default: 64k).
estimate -dircount <n[k]>	Specifies the request size for reading directories (default: 64k).
estimate -preserve-atime	Preserves access time of the file or directory (default: False).
estimate -loglevel <name>	Sets the log level; available levels are INFO, DEBUG (default: INFO)

## **estimate -id <name>**

Use the `-id <name>` parameter with the `estimate` command to exclude the files and directories that match the filter.

### **Syntax**

```
xcp estimate -id <name>
```

### **Show example**

```
[root@client1 linux]# ./xcp estimate -id csdata01

xcp: WARNING: your license will expire in less than 11 days! You can

The following table lists the `indexdelete` parameters and their description.

Parameter	Description
<code>indexdelete -match &lt;filter&gt;</code>	Only processes the files and directories that match the filter.
<code>indexdelete -loglevel &lt;name&gt;</code>	Sets the log level; available levels are INFO, DEBUG (default: INFO).

### **indexdelete -match <filter>**

Use the `-match <filter>` parameter with the `indexdelete` command to only process the files and directories that match the filter.

### **Syntax**

```
xcp indexdelete -match <filter>
```

## Show example

```
[root@client1 linux]# ./xcp indexdelete -match "fnm('S3_index12')"

## isync

View the descriptions, parameters, and examples for the XCP `isync` command, including when the `isync` command is used with the `estimate` option.

### isync

The XCP NFS `isync` command compares the source and destination and synchronizes the differences on the target without using the catalog index.

#### Syntax

```
xcp isync <source_ip_address>/src <destination_ip_address>/dest
```

## Show example

```
[root@client1 linux]# ./xcp isync <source_ip_address>/src
<destination_ip_address>/dest

[root@client1 linux]
```

The following table lists the `isync` parameters and their description.

Parameter	Description
<code>isync -nodata</code>	Does not check data.
<code>isync -noattrs</code>	Does not check attributes.
<code>isync -nomods</code>	Does not check file modification times.
<code>isync -mtimewindow &lt;s&gt;</code>	Specifies the acceptable modification time difference for verification.

Parameter	Description
<code>isync -match &lt;filter&gt;</code>	Only processes the files and directories that match the filter.
<code>isync -bs &lt;n[k]&gt;</code>	Specifies the read/write block size (default: 64k).
<code>isync -parallel &lt;n&gt;</code>	Specifies the maximum number of concurrent batch processes (default: 7).
<code>isync -dircount &lt;n[k]&gt;</code>	Specifies the request size when reading directories (default 64k).
<code>isync -exclude &lt;filter&gt;</code>	Excludes the files and directories that match the filter.
<code>isync -newid &lt;name&gt;</code>	Specifies the catalog name for a new index catalog.
<code>isync -loglevel &lt;name&gt;</code>	Sets the log level; available levels are INFO, DEBUG (default: INFO).
<code>isync -preserve-atime</code>	Restores all files to the last accessed date on the source.
<code>isync -s3.insecure</code>	Provides the option to use HTTP instead of HTTPS for S3 bucket communication.
<code>isync -s3.endpoint &lt;s3_endpoint_url&gt;</code>	Overrides the default Amazon Web Services (AWS) endpoint URL with the specified URL for S3 bucket communication.
<code>isync -s3.profile &lt;profile_name&gt;</code>	Specifies a profile from the AWS credential file for S3 bucket communication.
<code>isync -s3.noverify</code>	Overrides the default verification of SSL certification for S3 bucket communication.

#### **isync -nodata**

Use the the `-nodata` parameter with the `isync` command to specify not to check data.

#### **Syntax**

```
xcp isync -nodata <source_ip_address>/:source_vol
<destination_ip_address>/:dest_vol
```

## Show example

```
root@client1 linux]# ./xcp isync -nodata
<source_ip_address>:/source_vol<destination_ip_address>:/dest_vol

## isync -bs <n[k]>

Use the the `-bs <n[k]>` parameter with the `isync` command to specify the read/write block size. The default block size is 64k.

## Syntax

```
xcp isync -loglevel DEBUG -bs <n[k]> <source_ip_address>:/source_vol
<destination_ip_address>:/dest_vol
```

## Show example

```
root@client1 linux]# ./xcp isync -loglevel DEBUG -bs 32k
<source_ip_address>:/source_vol <destination_ip_address>:/dest_vol

## isync estimate

The `isync` command can be used with the `estimate` option to estimate the time it takes for the `isync` command to synchronize incremental changes. The `-id` parameter specifies the catalog name of a previous copy operation.

### Syntax

```
xcp isync estimate -id <name>
```

The `-id` parameter is required with the `isync estimate` command option.

## Show example

```
[root@client1 linux]# ./xcp isync estimate -id <name>

```

The following table lists the `isync estimate` parameters and their description.

Parameter	Description
<code>isync estimate -nodata</code>	Does not check data.
<code>isync estimate -noattrs</code>	Does not check attributes.
<code>isync estimate -nomods</code>	Does not check file modification times.
<code>isync estimate -mtimewindow &lt;s&gt;</code>	Specifies the acceptable modification time difference for verification.
<code>isync estimate -match &lt;filter&gt;</code>	Only processes the files and directories that match the filter.
<code>isync estimate -bs &lt;n[k]&gt;</code>	Specifies the read/write block size (default: 64k).
<code>isync estimate -parallel &lt;n&gt;</code>	Specifies the maximum number of concurrent batch processes (default: 7).
<code>isync estimate -dircount &lt;n[k]&gt;</code>	Specifies the request size when reading directories (default 64k).
<code>isync estimate -exclude &lt;filter&gt;</code>	Excludes the files and directories that match the filter.
<code>isync estimate -id &lt;name&gt;</code>	Specifies the catalog name for a previous copy operation.

Parameter	Description
<code>isync estimate -loglevel &lt;name&gt;</code>	Sets the log level; available levels are INFO, DEBUG (default: INFO).
<code>isync estimate -preserve-atime</code>	Restores all files to the last accessed date on the source.
<code>isync estimate -s3.insecure</code>	Provides the option to use HTTP instead of HTTPS for S3 bucket communication.
<code>isync estimate -s3.endpoint &lt;s3_endpoint_url&gt;</code>	Overrides the default Amazon Web Services (AWS) endpoint URL with the specified URL for S3 bucket communication.
<code>isync -s3.profile &lt;profile_name&gt;</code>	Specifies a profile from the AWS credential file for S3 bucket communication.
<code>isync estimate -s3.noverify</code>	Overrides the default verification of SSL certification for S3 bucket communication.

### **isync estimate -nodata**

Use the the `-nodata` parameter with `isync estimate` to specify not to check data.

#### **Syntax**

```
xcp isync estimate -nodata -id <name>
```

#### **Show example**

```
[root@client1 linux]# ./xcp isync estimate -nodata -id <name>

Job ID: Job_2023-11-23_23.19.45.648691_isync_estimate
Index: isync_est {source: <source_ip_address>:/fg1, target:
<destination_ip_address>:/fv}
Xcp command : xcp isync estimate -nodata -id <name>
Estimated Time : 0.6s
Job ID : Job_2023-11-23_23.19.45.648691_isync_estimate
Log Path : /opt/NetApp/xFiles/xcp/xcplogs/Job_2023-11-
23_23.19.45.648691_isync_estimate.log
STATUS : PASSED
```

### **isync estimate -noattrs**

Use the the `-noattrs` parameter with `isync estimate` to specify not to check attributes.

## Syntax

```
xcp isync estimate -noattrs -id <name>
```

## Show example

```
[root@client1 linux]# ./xcp isync estimate -noattrs -id <name>

Job ID: Job_2023-11-23_23.20.25.042500_isync_estimate
Index: isync_est {source: <source_ip_address>:/fg1, target:
<target_ip_address>:/fv}
Xcp command : xcp isync estimate -noattrs -id <name>
Estimated Time : 2.4s
Job ID : Job_2023-11-23_23.20.25.042500_isync_estimate
Log Path : /opt/NetApp/xFiles/xcp/xcplogs/Job_2023-11-

STATUS : PASSED
```

## isync estimate -nomods

Use the the `-nomods` parameter with `isync estimate` to specify not to check file modification times.

## Syntax

```
xcp isync estimate -nomods -id <name>
```

## Show example

```
[root@client1 linux]# ./xcp isync -nomodes
<source_ip_address>:/source_vol <destination_ip_address>:/dest_vol

## isync estimate -mtimewindow <s>

Use the the `-mtimewindow <s>` parameter with `isync estimate` to specify the acceptable modification time difference for verification.

## Syntax

```
xcp isync estimate -mtimewindow <s> -id <name>
```

## Show example

```
[root@client1 linux]# ./xcp isync estimate -mtimewindow 10 -id <name>

STATUS : PASSED
```

## isync estimate -match <filter>

Use the `-match <filter>` parameter with `isync estimate` to only process the files and directories that match the filter.

## Syntax

```
xcp isync estimate -match <filter> -id <name>
```

## Show example

```
[root@client1 linux]# ./xcp isync estimate -match <filter> -id <name>

Job ID: Job_2023-11-16_02.13.34.904794_isync_estimate

```

## isync estimate -bs <n[k]>

Use the `-bs <n[k]>` parameter with `isync estimate` to specify the read/write block size. The default

block size is 64k.

## Syntax

```
xcp isync estimate -bs <n[k]> -id <name>
```

### Show example

```
[root@client1 linux]# ./xcp isync estimate -bs 128k -id <name>

Job ID: Job_2023-11-16_02.14.21.263618_isync_estimate
Index: <name> {source: <source_ip_address>:/source_vol, target:
<destination_ip_address>:/dest_vol}
Xcp command : xcp isync estimate -bs 128k -id <name>
Estimated Time : 6m48s
Job ID : Job_2023-11-16_02.14.21.263618_isync_estimate

STATUS : PASSED
```

## isync estimate -parallel

Use the the `-parallel <n>` parameter with `isync estimate` to specify the maximum number of concurrent batch processes. The default value is 7.

## Syntax

```
xcp isync estimate -parallel <n> -id <name>
```

### Show example

```
[root@client1 linux]# ./xcp isync estimate -parallel 10 -id <name>

Job ID: Job_2023-11-16_02.15.25.109554_isync_estimate
Index: <name> {source: <source_ip_address>:/source_vol, target:
<destination_ip_address>:/dest_vol}
Xcp command : xcp isync estimate -parallel 10 -id <name>
Estimated Time : 8m3s
Job ID : Job_2023-11-16_02.15.25.109554_isync_estimate
Log Path : /opt/NetApp/xFiles/xcp/xcplogs/Job_2023-11-
16_02.15.25.109554_isync_estimate.log
STATUS : PASSED
```

```
isync estimate -dircount <n[k]>
```

Use the the `-dircount <n[k]>` parameter with `isync estimate` to specify the request size when reading directories. The default value is 64k.

## Syntax

```
xcp isync estimate -dircount <n[k]> -id <name>
```

## Show example

```
[root@client1 linux]# ./xcp isync estimate -dircount 128k -id <name>

Job ID: Job_2023-11-16_02.15.56.200697_isync_estimate
Index: <name> {source: <source_ip_address>:/source_vol, target:
<destination_ip_address>:/dest_vol}
Xcp command : xcp isync estimate -dircount 128k -id <name>
Estimated Time : 8m6s
Job ID : Job_2023-11-16_02.15.56.200697_isync_estimate

16_02.15.56.200697_isync_estimate.log
STATUS : PASSED
```

```
isync estimate -exclude <filter>
```

Use the the `-exclude <filter>` parameter with `isync estimate` to exclude the files and directories that match the filter.

## Syntax

```
xcp isync estimate -exclude <filter> -id <name>
```

## Show example

```
[root@client1 linux]# ./xcp isync estimate -exclude "fnm('DIR1*')" -id <name>

Job ID: Job_2023-11-16_02.16.30.449378_isync_estimate
Index: <name> {source: <source_ip_address>:/source_vol, target: <destination_ip_address>:/dest_vol}
Excluded: 60 excluded, 0 did not match exclude criteria
Xcp command : xcp isync estimate -exclude fnm('DIR1*') -id <name>
Estimated Time : 3m29s
Job ID : Job_2023-11-16_02.16.30.449378_isync_estimate

### isync estimate -loglevel <name>

Use the the `-loglevel <name>` parameter with `isync estimate` to set the log level; available levels are INFO and DEBUG. The default value is INFO.

### Syntax

```
xcp isync estimate -loglevel <name> -id <name>
```

## Show example

```
[root@client1 linux]# ./xcp isync estimate -loglevel DEBUG -id <name>

Job ID: Job_2023-11-16_02.16.58.212518_isync_estimate
Index: <name> {source: <source_ip_address>:/source_vol, target:
<destination_ip_address>:/dest_vol}

STATUS : PASSED
```

## isync estimate -preserve-atime

Use the `-preserve-atime` parameter with `isync estimate` to restore all files to the last accessed date on the source.

## Syntax

```
xcp isync estimate -preserve-atime -id <name>
```

## Show example

```
[root@client1 linux]# ./xcp isync estimate -preserve-atime -id <name>

Job ID: Job_2023-11-16_02.17.32.085754_isync_estimate
Index: <name> {source: <source_ip_address>:/source_vol, target:

16_02.17.32.085754_isync_estimate.log
STATUS : PASSED
```

## isync estimate -s3.insecure

Use the `-s3.insecure` parameter with `isync estimate` to use HTTP instead of HTTPS for S3 bucket communication.

## Syntax

```
xcp isync estimate -s3.insecure -id <name>
```

## Show example

```
[root@client1 linux]# ./xcp isync estimate -s3.insecure -id S3_index  
  
Job ID: Job_2023-11-16_02.22.36.481539_isync_estimate  
Index: S3_index {source: <source_ip_address>:/source_vol/USER5, target:

16_02.22.36.481539_isync_estimate.log  
STATUS : PASSED
```

## isync estimate -s3.endpoint <s3\_endpoint\_url>

Use the `-s3.endpoint <s3_endpoint_url>` parameter with `isync estimate` to override the default AWS endpoint URL with a specified URL for S3 bucket communication.

## Syntax

```
xcp isync estimate -s3.endpoint <S3_endpoint_url> -id <name>
```

## Show example

```
[root@client1 linux]# ./xcp isync estimate -s3.endpoint
<S3_endpoint_url> -id S3_index1

Job ID: Job_2023-11-16_02.35.49.911194_isync_estimate
Index: S3_index1 {source: <source_ip_address>:/source_vol/USER5,
target: s3://isyncestimate/}
2,002 scanned, 432 KiB in (85.6 KiB/s), 5.54 KiB out (1.10 KiB/s), 5s
2,002 scanned, 432 KiB in (0/s), 5.54 KiB out (0/s), 10s
Xcp command : xcp isync estimate -s3.endpoint <S3_endpoint_url> -id
S3_index1
Estimated Time : 13.3s
Job ID : Job_2023-11-16_02.35.49.911194_isync_estimate

STATUS : PASSED
```

### **isync estimate -s3.profile <name>**

Use the `s3.profile` parameter with `isync estimate` to specify a profile from the AWS credential file for S3 bucket communication.

### **Syntax**

```
xcp isync estimate -s3.profile s3_profile -id <name>
```

## Show example

```
[root@client1 linux]# ./xcp isync estimate -s3.profile s3_profile -id S3_index

Job ID: Job_2023-11-16_02.25.57.045692_isync_estimate
Index: S3_index {source: <source_ip_address>:/source_vol/USER5, target: s3://

## isync estimate -s3.noverify

Use the `-s3.noverify` parameter with `isync estimate` to override the default verification of SSL certification for S3 bucket communication.

## Syntax

```
xcp isync estimate -s3.noverify -id <name>
```

## Show example

```
[root@client1 linux]# ./xcp isync estimate -s3.noverify -id S3_index

Job ID: Job_2023-11-16_02.23.36.515890_isync_estimate

# SMB command reference

## help

The SMB `help` command displays a list of commands, command parameters, and a brief description of each. This command is very useful for beginners who are new to XCP.

### Syntax

```
xcp --help
```

### Show example

```
C:\Users\Administrator\Desktop\xcp>xcp --help
usage: xcp [-h] [-version]

{scan,show,listen,configure,copy,sync,verify,license,activate,help}
      ...
optional arguments:
-h, --help            show this help message and exit
--version           show program's version number and exit

XCP commands:
{scan,show,listen,configure,copy,sync,verify,license,activate,help}
  scan          Read all the files in a file tree
  show          Request information from host about SMB shares
  listen         Run xcp service
  configure       Configure xcp.ini file
  copy           Recursively copy everything from source to target
  sync           Sync target with source
  verify          Verify that the target is the same as the source
  license         Show xcp license info
  activate        Activate a license on the current host
  help            Show help for commands
```

## help <command>

Use `<command>` with `help` to display examples and option details for the specified `<command>`.

### Syntax

```
xcp help <command>
```

The following example output shows the details, usage, arguments, and optional arguments for the `sync`

command.

Show example

```
C:\Users\Administrator\Desktop\xcp>xcp help sync
usage: xcp sync [-h] [-v] [-parallel <n>] [-match <filter>] [-preserve-
atime]
[-noatime] [-noctime] [-nomtime] [-noattrs]
[-noownership] [-atimewindow <float>] [-ctimewindow <float>]
[-mtimewindow <float>] [-acl] [-fallback-user FALBACK_USER]
[-fallback-group FALBACK_GROUP] [-l]
source target
Note: ONTAP does not let a SMB client modify COMPRESSED or ENCRYPTED
attributes.
XCP sync will ignore these file attributes.
positional arguments:
source
target
optional arguments:
-h, --help            show this help message and exit
-v                  increase debug verbosity
-parallel <n>        number of concurrent processes (default: <cpu-
count>)
-match <filter>      only process files and directories that match the
filter
                                         see `xcp help -match` for details)
-preserve-atime     restore last accessed date on source
-noatime             do not check file access time
-noctime              do not check file creation time
-nomtime              do not check file modification time
-noattrs              do not check attributes
-noownership         do not check ownership
-atimewindow <float> acceptable access time difference in seconds
-ctimewindow <float> acceptable creation time difference in seconds
-mtimewindow <float> acceptable modification time difference in
seconds
-acl                 copy security information
-fallback-user FALBACK_USER
                                         a user on the target machine to receive the
permissions of local
(nondomain)source machine users (eg. domain\administrator)
-fallback-group      FALBACK_GROUP
                                         a group on the target machine to receive the
permissions of local
(non-domain) source machine groups (eg. domain\administrators)
-l                   increase output
-root                sync acl for root directory
C:\Users\Administrator\Desktop\xcp>
```

## **show**

The SMB `show` command queries the RPC services and NFS exports of one or more storage servers. The command also lists the available services and exports with the used and free capacity of each export, followed by the attributes of the root of each export.

### **Syntax**

The `show` command requires the host name or IP address of the NFSv3 exported system:

```
xcp show \\<IP address or hostname of SMB server>
```

## Show example

```
C:\Users\Administrator\Desktop\xcp>xcp show \\<IP address or hostname  
of SMB server>  
Shares Errors Server  
7 0 <IP address or hostname of SMB server>

```

The following table lists the show parameters and their description.

Parameter	Description
show -v	Prints verbose details about SMB servers using the IP address or host name.
show -h, --help	Displays detailed information about how to use the command.

## license

The SMB license command displays XCP license information.

### Syntax

```
xcp license
```

### Show example

```
C:\Users\Administrator\Desktop\xcp>xcp license
xcp license
XCP <version>; (c) yyyy NetApp, Inc.; Licensed to XXX [NetApp Inc]
until Mon Dec 31 00:00:00 yyyy
License type: SANDBOX
License status: ACTIVE
Customer name: N/A
Project number: N/A
Offline Host: Yes
Send statistics: No
Host activation date: N/A
License management URL: https://xcp.netapp.com
```

## activate

The SMB activate command activates the XCP license. Before running this command, verify that the license file is downloaded and copied on the C:\NetApp\XCP directory on the XCP host or client machine. The license can be activated on any number of hosts.

### Syntax

```
xcp activate
```

## Show example

```
C:\Users\Administrator\Desktop\xcp>xcp activate  
XCP activated
```

## scan

The SMB scan command recursively scans the entire SMB share and lists all the files by the end of the scan command.

### Syntax

```
xcp scan \\<SMB share path>
```

## Show example

```
C:\Users\Administrator\Desktop\xcp>xcp scan \\<IP address or hostname  
of SMB server>\volxcp  
c:\netapp\xcp\xcp scan \\<IP address of SMB destination  
server>\source_share

volxcp\com.txt  
volxcp\commands.txt  
volxcp\console.txt  
volxcp\linux.txt  
volxcp\net use.txt  
volxcp\newcom.txt  
volxcp\notepad.txt  
c:\netapp\xcp\xcp scan \\<IP address of SMB destination  
server>\source_share  
60,345 scanned, 0 matched, 0 errors  
Total Time : 8s  
STATUS : PASSED  
C:\Users\Administrator\Desktop\xcp>Parameters
```

The following table lists the scan parameters and their description.

Parameter	Description
<a href="#">scan -h, --help</a>	Displays detailed information about how to use the scan command.

Parameter	Description
<code>scan -v</code>	Increases debug verbosity.
<code>scan -parallel &lt;n&gt;</code>	Specifies the number of concurrent processes (default: <cpu-count>).
<code>scan -match &lt;filter&gt;</code>	Only processes files and directories that match the filter.
<code>scan -exclude &lt;filter&gt;</code>	Only excludes files and directories in the filter.
<code>scan -preserve-atime</code>	Restores the last accessed date on source.
<code>scan -depth &lt;n&gt;</code>	Limits the search depth to n levels.
<code>scan -stats</code>	Lists files in the tree statistic report format.
<code>scan -html</code>	Lists files in the tree statistic HTML report format.
<code>scan -csv</code>	Lists files in the tree statistic CSV report format.
<code>scan -l</code>	Lists files in the long listing output format.
<code>scan -ownership</code>	Retrieves ownership information of files and directories on the source system.
<code>scan -du</code>	Summarizes space usage of each directory including subdirectories.
<code>scan -fmt &lt;expression&gt;</code>	Formats file listing according to the Python expression (see <code>xcp help -fmt</code> for details).
<code>scan -ads</code>	Recursively scans the entire SMB share and lists all files and any associated alternate data streams.

## scan -h, --help

Use the `-h` and `--help` parameters with the `scan` command to display detailed information about how to use the `scan` command.

## Syntax

```
xcp scan --help
```

## Show example

```
C:\netapp\xcp>xcp scan --help

usage: xcp scan [-h] [-v] [-parallel <n>] [-match <filter>] [-exclude
<filter>] [-preserve-atime] [-depth
<n>] [-loglevel <name>] [-stats] [-l] [-ownership] [-du]
[-fmt <expression>] [-html] [-csv] [-edupe] [-bs <n>]
[-ads]

source

positional arguments:
  source

optional arguments:
  -h, --help            show this help message and exit
  -v                   increase debug verbosity
  -parallel <n>        number of concurrent processes (default: <cpu-
count>)
  -match <filter>       only process files and directories that match
the filter (see `xcp help -match` for details)
  -exclude <filter>     Exclude files and directories that match the
filter (see `xcp help -exclude` for details)
  -preserve-atime      restore last accessed date on source
  -depth <n>           limit the search depth
  -loglevel <name>     option to set log level filter (default:INFO)
  -stats               print tree statistics report
  -l                  detailed file listing output
  -ownership           retrieve ownership information
  -du                 summarize space usage of each directory
including subdirectories
  -fmt <expression>    format file listing according to the python
expression (see `xcp help -fmt` for details)
  -html                Save HTML statistics report
  -csv                 Save CSV statistics report
  -edupe               Include dedupe and sparse data estimate in
reports (see documentation for details)
  -bs <n>              read/write block size for scans which read data
with -edupe (default: 64k)
  -ads                 scan NTFS alternate data stream
```

## scan -v

Use the `-v` parameter with the `scan` command to provide detailed logging information to troubleshoot or debug when an error or warning is reported.

## Syntax

```
xcp scan -v \\<IP address or hostname of SMB server>\source_share
```

## Show example

```
c:\netapp\xcp>xcp scan -v \\<IP address or hostname of SMB server>\source_share
xcp scan -v \\<IP address or hostname of SMB server>\source_share

STATUS : PASSED
```

## scan -parallel <n>

Use the `-parallel <n>` parameter with the `scan` command to set a higher or lower number of XCP concurrent processes.

The maximum value for n is 61.

## Syntax

```
xcp scan -parallel <n> \\<IP address or hostname of SMB  
server>\source_share
```

## Show example

```
c:\netapp\xcp>xcp scan -parallel 8 \\<IP address or hostname of SMB
server>\cifs_share
xcp scan -parallel 8 \\<IP address or hostname of SMB
server>\cifs_share

cifs_share
xcp scan -parallel 8 \\<IP address or hostname of SMB
server>\cifs_share
317 scanned, 0 matched, 0 errors
Total Time : 0s
STATUS : PASSED
```

## scan -match <filter>

Use the `-match <filter>` parameter with the `scan` command to only process files and directories that match the filter.

## Syntax

```
xcp scan -match <filter> \\<IP address or hostname of SMB  
server>\source_share
```

In the following example, `scan -match` scans all files that have changed between one month and one year and prints a line to the console for each file found. The ISO format of its last modification time, a human-readable size of the file, its type, and its relative path are returned for each file.

### Show example

```
c:\netapp\xcp>xcp scan -match "1*month < modified < 1*year" -fmt  
'{:>15} {:>7} {}  
{''.format(iso(mtime), humanize_size(size), type, relpath)} \\<IP  
address or hostname of SMB server>\source_share  
xcp scan -match "1*month < modified < 1*year" -fmt '{:>15} {:>7} {}  
{''.format(iso(mtime), humanize_size(size), type, relpath)} \\<IP  
address or hostname of SMB server>\source_share  
  
xcp scan -match 1*month < modified < 1*year -fmt '{:>15} {:>7} {}  
{''.format(iso(mtime), humanize_size(size), type, relpath)} \\<IP  
address or hostname of SMB server>\source_share  
317 scanned, 0 matched, 0 errors  
Total Time : 0s  
STATUS : PASSED
```

In the following example, `scan -match` lists the files that have not been modified for more than 3 months and have a size bigger than 4MB.

## Show example

```
c:\netapp\xcp>xcp scan -match "modified > 3*month and size > 4194304"
-fmt "'{}, {}, {}'.format(iso(mtime), humanize_size(size), relpath)" \\<IP address or
hostname of SMB
server>\source_share
xcp scan -match "modified > 3*month and size > 4194304" -fmt "'{}, {}, {}'.format(iso(mtime), humanize_size(size), relpath)" \\<IP address or
hostname of SMB server>\source_share

xcp scan -match modified > 3*month and size > 4194304 -fmt '{}, {}, {}'.format(iso(mtime), humanize_size(size), relpath) \\<IP address or
hostname of SMB server>\source_share
317 scanned, 0 matched, 0 errors
Total Time : 0s
STATUS : PASSED
```

The first of the following two examples only matches the directories and the formatting adds a comma between the variables "mtime", "relative path", and "depth".

The second example redirects the same output to "name.csv".

## Show example

```
c:\netapp\xcp>xcp scan -match "type is directory" -fmt
', '.join(map(str, [iso(mtime), relpath, depth]))" \\<IP address or
hostname of SMB server>\source_share
xcp scan -match "type is directory" -fmt ', '.join(map(str,
[iso(mtime), relpath, depth]))" \\<IP address or hostname of SMB
server>\source_share

2013-03-07_15:41:40.376072,source_share\agnostic,1
2020-03-05_04:15:07.769268,source_share,0

xcp scan -match type is directory -fmt ', '.join(map(str, [iso(mtime),
relpath, depth]))" \\<IP address or hostname of SMB server>\source_share
317 scanned, 2 matched, 0 errors
Total Time : 0s
STATUS : PASSED
```

## Show example

```
c:\netapp\xcp>xcp scan -match "type is directory" -fmt
"','.join(map(str, [iso(mtime), relpath, depth]))" \\<IP address or
hostname of SMB server>\source_share > name.csv
xcp scan -match "type is directory" -fmt "''.join(map(str,
[iso(mtime), relpath, depth]))" \\<IP address or hostname of SMB
server>\source_share > name.csv
```

The following example prints the full path and the raw mtime value of all the files that are not directories. The mtime value is padded with 70 characters to facilitate a readable console report.

## Show example

```
c:\netapp\xcp>xcp scan -match "type is not directory" -fmt
"'\{}{:>70}'.format(abspath, mtime)" \\<IP address or hostname of SMB
server>\source_share
xcp scan -match "type is not directory" -fmt "'{}'
{:>70}'.format(abspath, mtime)" \\<IP address or hostname of SMB
server>\source_share

```

### **scan -exclude <filter>**

Use the `-exclude <filter>` with the `scan` command to exclude directories and files based on the pattern in the filter.

#### **Syntax**

```
xcp scan -exclude <filter> \\<IP address or hostname of SMB
server>\source_share
```

In the following example, `scan -exclude` excludes any file that has changed between one month and one year, and prints a line to the console for each file that is not excluded. The details printed for each file are the ISO format of its last modification time, a human-readable size of the file, its type, and its relative path.

## Show example

```
c:\netapp\xcp>xcp scan -exclude "1*month < modified < 1*year" -fmt
'{}{:>15} {:>7}{}'
{}.format(iso(mtime), humanize_size(size), type, relpath) "\\\<IP
address or hostname of SMB server>\localtest\arch\win32\agnostic
xcp scan -exclude "1*month < modified < 1*year" -fmt '{}{:>15} {:>7}{}'
{}.format(iso(mtime), humanize_size(size), type, relpath) "\\\<IP
address or hostname of SMB server>\localtest\arch\win32\agnostic

xcp scan -exclude modified > 3*month and size > 5650 -fmt '{}, {}, {}'.
format(iso(mtime), humanize_size(size), relpath) \\<IP address or
hostname of SMB server>\localtest\arch\win32\agnostic\snapmirror
18 scanned, 6 excluded, 0 errors Total Time : 0s
STATUS : PASSED
```

This following example excludes directories. It lists the not excluded files with formatting that adds a comma between the variables `mtime`, `relpath`, and `depth`.

## Show example

```
c:\netapp\xcp>xcp scan -exclude "type is directory" -fmt
'','.join(map(str, [iso(mtime), relpath, depth]))" \\<IP address or
hostname of SMB server>\localtest\arch\win32\agnostic\snapmirror
xcp scan -exclude "type is directory" -fmt "','.join(map(str,
[iso(mtime), relpath,depth]))"
\\<IP address or hostname of

xcp scan -exclude type is directory -fmt ','.join(map(str, [iso(mtime),
relpath, depth])) \\<IP address or hostname of SMB
server>\localtest\arch\win32\agnostic\snapmirror
18 scanned, 1 excluded, 0 errors
Total Time : 0s
STATUS : PASSED
```

This following example prints the complete file path and the raw mtimevalue of all files that are not directories. The mtimevalue is padded with 70 characters to facilitate a readable console report.

## Show example

```
c:\netapp\xcp>xcp scan -exclude "type is not directory" -fmt "'{}  
{:>70}'.format(abspath, mtime)" \\<IP address or hostname of  
SMBserver>\source_share  
  
xcp scan -exclude type is not directory -fmt '{}  
{:>70}'.format(abspath, mtime) \\<IP address or hostname of SMB  
server>\source_share  
18 scanned, 17 excluded, 0 errors  
Total Time : 0s  
STATUS : PASSED
```

## scan -preserve-atime

Use the `-preserve-atime` parameter with the `scan` command to restore the last accessed date of all the files on the source and reset the `atime` to the original value before XCP read the file.

When you scan an SMB share, the access time is modified on the files (if the storage system is configured to modify `atime` on read) because XCP is reading the files one by one. XCP never changes the `atime`, it just reads the file, which triggers an update on `atime`.

## Syntax

```
xcp scan -preserve-atime \\<IP address or hostname of SMB  
server>\source_share
```

## Show example

```
c:\netapp\xcp>xcp scan -preserve-atime \\<IP address or hostname of SMB  
server>\source_share  
xcp scan -preserve-atime \\<IP address or hostname of SMB  
server>\source_share

xcp scan -preserve-atime \\<IP address or hostname of  
SMBserver>\source_share  
317 scanned, 0 matched, 0 errors  
Total Time : 1s  
STATUS : PASSED
```

## scan -depth <n>

Use the `-depth <n>` parameter with the `scan` command to limit the search depth of directories inside an SMB share.

The `-depth` option specifies how deep XCP can scan the files into the subdirectories.

## Syntax

```
xcp scan -depth <2> \\<IP address or hostname of SMB server>\source_share
```

## Show example

```
c:\netapp\xcp>xcp scan -depth 2 \\<IP address or hostname of SMB server>\source_share
xcp scan -depth 2 \\<IP address or hostname of SMB server>\source_share

## **scan -stats**

Use the `-stats` parameter with the `scan` command to list files in a tree statistics report format.

### **Syntax**

```
xcp scan -stats \\<IP address or hostname of SMB server>\source_share
```

## Show example

```
C:\netapp\xcp>xcp scan -stats \\<IP address or hostname of SMB  
server>\cifs_share

## scan -html

Use the `-html` parameter with the `scan` command to list files in a HTML statistics report.

 XCP reports (.csv, .html) are saved in the same location as the XCP binary. The file name is in the format `<xcp_process_id>_<time_stamp>.html`. When XCP cannot map security identifiers (SIDs) to owner names, it uses the last few digits after the final “-” in the SID to represent the owner. For example, when XCP is unable to map the SID S-1-5-21-1896871423-3211229150-3383017265-4854184 to its owner, it represents the owner by using 4854184.

## Syntax

```
xcp scan -stats -html -preserve-atime -ownership \\<IP address or hostname
of SMB server>\source_share
```

## Show example

```
z:\scripts\xcp\windows>xcp scan -stats -html -preserve-atime -ownership

xcp scan -l \\<IP address or hostname of SMB server>\source_share  
317 scanned, 0 matched, 0 errors
```

```
Total Time : 0s
STATUS : PASSED
```

## scan -ownership

Use the `-ownership` parameter with the `scan` command to retrieve ownership information for files.

You can only use `-ownership` with the `-l`, `-match`, `-fmt`, or `-stats` parameters.

## Syntax

```
xcp scan -l -ownership \\<IP address or hostname of SMB
server>\source_share
```

## Show example

```
c:\netapp\xcp>xcp scan -l -ownership \\<IP address or hostname of SMB  
server>\source_share xcp scan -l -ownership \\<IP address or hostname  
of SMB server>\source_share

xcp scan -l -ownership \\<IP address or hostname of SMB
server>\source_share
317 scanned, 0 matched, 0 errors Total Time : 1s
STATUS : PASSED
```

## scan -du

Use the `-du` parameter with the `scan` command to summarize the space usage of each directory, including subdirectories.

### Syntax

```
xcp scan -du \\<IP address or hostname of SMB server>\source_share
```

### Show example

```
c:\netapp\xcp>xcp scan -du \\<IP address or hostname of SMB
server>\source_share xcp scan -du \\<IP address or hostname of SMB
server>\source_share

569KiB source_share\agnostic
19.8MiB source_share

xcp scan -du \\<IP address or hostname of SMB server>\source_share
317 scanned, 0 matched, 0 errors
Total Time : 0s
STATUS : PASSED
```

## scan -fmt <expression>

Use the `-fmt <expression>` parameter with the `scan` command to format a file listing according to a defined expression.

### Syntax

```
xcp scan -fmt "", '.join(map(str, [relpath, name, size, depth]))"
\\<IP address or hostname of SMB server>\source_share
```

## Show example

```
c:\netapp\xcp>xcp scan -fmt "''.join(map(str, [relpath, name, size, depth]))" \\<IP address or hostname of SMB server>\source_share
xcp scan -fmt "''.join(map(str, [relpath, name, size, depth]))" \\<IP address or hostname of SMB server>\source_share

## scan -ads

Use the `-ads` flag parameter with the `scan` command with to recursively scan the entire SMB share and list all files and any associated alternate data streams.

## Syntax

```
xcp scan -ads \\<source_ip_address>\source_share\src
```

## Show example

```
C:\netapp\xcp>xcp scan -ads \\<source_ip_address>\source_share\src

xcp scan -ads \\<source_ip_address>\source_share\src
6 scanned, 0 matched, 0 errors, 15 ads scanned
Total Time : 2s
STATUS : PASSED
```

## copy

The `copy` command scans and copies the entire source directory structure to a destination SMB share. The `copy` command requires source and destination paths as variables. The scanned and copied files, throughput/speed, and elapsed time details are printed to the console once every five seconds.

- The run-time log file is stored under "C:\NetApp\XCP".
- This `copy` command copies data without an access control list (ACL).

## Syntax

```
xcp copy \\<IP address or hostname of SMB server>\source_share \\<IP address of SMB destination server>\dest_share
```

### Show example

```
c:\netapp\xcp>xcp copy \\<IP address or hostname of SMB server>\source_share \\<IP address of SMB destination server>\dest_share
```

```
xcp copy \\<IP address or hostname of SMB server>\source_share \\<IP address of SMB destination server>\dest_share  
317 scanned, 0 matched, 316 copied, 0 errors  
Total Time : 2s  
STATUS : PASSED
```

The following table lists the `copy` parameters and their description.

Parameter	Description
<code>copy -h, --help</code>	Displays detailed information about the <code>copy</code> command.
<code>copy -v</code>	Increase debug verbosity.
<code>copy -parallel &lt;n&gt;</code>	Specifies the number of concurrent processes (default: <cpu-count>).
<code>copy -match &lt;filter&gt;</code>	Only processes files and directories that match the filter (see <code>xcp help - match</code> for details).
<code>copy -exclude &lt;filter&gt;</code>	Only excludes files and directories in the filter
<code>copy -preserve-atime</code>	Restores last accessed date on source.
<code>copy -acl</code>	Copies security information.
<code>copy -fallback-user &lt;fallback_user&gt;</code>	Specifies the Active Directory user or local (non-domain) user on the target machine that receives the permissions of local (non-domain) source machine users. For example, domain\administrator.
<code>copy -fallback-group &lt;fallback_group&gt;</code>	Specifies the Active Directory group or local (non-domain) group on the target machine that receives the permissions of local (non-domain) source machine groups. For example, domain\administrators.

Parameter	Description
<code>copy -root</code>	Copies the ACLs for a root directory.
<code>copy -aclverify {yes,no}</code>	Provides an option to skip or include ACL verification during the copy -acl operation.
<code>copy -noownership</code>	Does not copy ownership.
<code>copy -bs &lt;n&gt;</code>	Read/Write blocksize (default:1M)
<code>copy -ads</code>	Copies NTFS alternate data streams from the source SMB share to the destination SMB share.

## **copy -h, --help**

Use the `-h` and `--help` parameters with the `copy` command to display detailed information about the `copy` command

### **Syntax**

```
xcp copy -help
```

## Show example

```
C:\netapp\xcp>xcp copy -help

usage: xcp copy [-h] [-v] [-parallel <n>] [-match <filter>] [-exclude
<filter>] [-preserve- atime] [-acl] [-fallback-user FALBACK_USER]
[-fallback-group FALBACK_GROUP] [-loglevel <name>] [-root] [-
noownership] [- aclverify {yes,no}] [-bs <n>] [-ads]
source target

positional arguments:
  source
  target

optional arguments:
  -h, --help            show this help message and exit
  -v                   increase debug verbosity
  -parallel <n>        number of concurrent processes (default: <cpu-
count>)
  -match <filter>       only process files and directories that match the
filter (see `xcp help -match` for details)
  -exclude <filter>     Exclude files and directories that match the
filter (see `xcp help - exclude` for details)
  -preserve-atime      restore last accessed date on source
  -acl                 copy security information
  -fallback-user FALBACK_USER
                      the name of the user on the target machine to
receive the permissions of local (non-domain) source machine users (eg.
domain\administrator)
  -fallback-group FALBACK_GROUP
                      the name of the group on the target machine to
receive the permissions of local (non-domain) source machine groups
(eg. domain\administrators)
  -loglevel <name>      option to set log level filter (default:INFO)
  -root                copy acl for root directory
  -noownership         do not copy ownership
  -aclverify {yes,no}   choose whether you need to skip acl verification
  -bs <n>              read/write block size for copy (default: 1M)
  -ads                 copy NTFS alternate data streams.
```

## copy -v

Use the `-v` parameter with the `copy` command to provide detailed debug information.

## Syntax

```
xcp copy -v \\<IP address or hostname of SMB server>\source_share \\<IP address of SMB destination server>\dest_share
```

## Show example

```
c:\netapp\xcp>xcp copy -v \\<IP address of SMB destination server>\src \\<IP address of SMB destination server>\dest\d1

failed to set attributes for "d1": (5, 'CreateDirectory', 'Access is denied.')
failed to copy "f1.txt": (5, 'CreateFile', 'Access is denied.')
failed to set attributes for "": (5, 'SetFileAttributesW', 'Access is denied.') error setting timestamps on "": errno (code: 5) Access is denied.

H:\p 4\xcp_latest\xcp_cifs\xcp\ main .py copy -v \\<IP address of SMB destination server>\src \\<IP address of SMB destination server>\dest\d1

3 scanned, 0 matched, 0 skipped, 1 copied, 0 (0/s), 3 errors
Total Time : 3s
STATUS : FAILED
```

## copy -parallel <n>

Use the `-parallel <n>` parameter with the `copy` command to set a higher or lower number of XCP concurrent processes. The default value for `-parallel` is equal to the CPU count.

The maximum value for n is 61.

## Syntax

```
xcp copy -parallel <n> \\<IP address or hostname of SMB server>\source_share \\<IP address of SMB destination server>\dest_share
```

## Show example

```
c:\netapp\xcp>xcp copy -parallel 7 \\<IP address or hostname of SMB  
server>\source_share \\<IP address of SMB destination  
server>\dest_share  
  
xcp copy -parallel 7 \\<IP address or hostname of SMB  
server>\source_share \\<IP address of SMB destination  
server>\dest_share  
317 scanned, 0 matched, 316 copied, 0 errors  
Total Time : 2s  
STATUS : PASSED
```

## copy -match <filter>

Use the `-match <filter>` parameter with the `copy` command to copy only the data that matches the argument passed.

### Syntax

```
xcp copy -match <filter> \\<IP address or hostname of SMB  
server>\source_share \\<IP address of SMB destination server>\dest_share
```

## Show example

```
c:\netapp\xcp>xcp copy -match "'gx' in name" \\<IP address or hostname  
of SMB server>\source_share \\<IP address of SMB destination  
server>\dest_share  
  
xcp copy -match 'gx' in name \\<IP address or hostname of SMB  
server>\source_share \\<IP address of SMB destination  
server>\dest_share  
317 scanned, 5 matched, 4 copied, 0 errors  
Total Time : 1s  
STATUS : PASSED
```

## copy -exclude <filter>

Use the `-exclude <filter>` parameter with the `copy` command to only copy excluded data.

## Syntax

```
xcp copy -exclude <filter> \\<IP address or hostname of SMB  
server>\source_share \\<IP address of SMB destination server>\dest_share
```

In the following example, the files and directories that have the string "resync" in their name have been excluded for copy.

## Show example

```
c:\netapp\xcp>xcp copy -exclude "'resync' in name" \\<IP address or  
hostname of SMB server>\source_share \\<IP address or hostname of SMB  
server>\dest_share  
  
xcp copy -exclude 'resync' in name \\<IP address or hostname of SMB  
server>\source_share \\\\"<IP address or hostname of SMB  
server>\dest_share  
18 scanned, 2 excluded, 0 skipped, 15 copied, 122KiB (50.5KiB/s), 0  
errors  
Total Time : 2s  
STATUS : PASSED
```

## copy -preserve-atime

Use the `-preserve-atime` parameter with the `copy` command to reset the "atime" to the original value before XCP read the file.

## Syntax

```
xcp copy -preserve-atime \\<IP address or hostname of SMB  
server>\source_share \\<IP address of SMB destination server>\dest_share
```

## Show example

```
c:\netapp\xcp>xcp copy -preserve-atime \\<IP address or hostname of SMB server>\source_share \\<IP address of SMB destination server>\dest_share

xcp copy -preserve-atime \\<IP address or hostname of SMB server>\source_share \\<IP address of SMB destination server>\dest_share
317 scanned, 0 matched, 316 copied, 0 errors
Total Time : 2s
STATUS : PASSED
```

## copy -acl -fallback-user <fallback\_user> -fallback-group <fallback\_group>

Use the `-acl` parameter with the `copy` command to activate the transfer of the security descriptors (ACLs).

Use the `-acl` parameter with the `-fallback-user` and `-fallback-group` options to specify a user and a group on the target machine or from Active Directory to receive the permissions of local (non-domain) source machine users or groups. This does not refer to unmatched users from an Active Directory.

### Syntax

```
xcp copy -acl -fallback-user <fallback_user> -fallback-group
<fallback_group> \\<IP address or hostname of SMB server>\source_share
\\<IP address of SMB destination server>\dest_share
```

## copy -aclverify {yes,no}

Use the `-aclverify {yes,no}` parameter with the `copy` command to provide an option to skip or include ACL verification during an ACL copy operation.

You must use the `-aclverify {yes,no}` parameter with the `copy -acl` command. By default, the ACL copy operation verifies the ACLs. If you set the `-aclverify` option to `no`, you can skip ACL verification and the `fallback-user` and `fallback-group` options are not required. If you set `-aclverify` to `yes`, it requires the `fallback-user` and `fallback-group` options, as shown in the following example.

### Syntax

```
xcp copy -acl -aclverify yes -fallback-user <fallback_user> -fallback
-group <fallback_group> \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination server>\dest_share
```

## Show example

```
C:\NetApp\xcp>xcp copy -acl -aclverify yes -fallback-user "DOMAIN\User"  
-fallback-group "DOMAIN\Group"  
\\<source_IP_address>\source_share  
\\<destination_IP_address>\dest_share  
  
12 scanned, 0 matched, 0 skipped, 0 copied, 0 (0/s), 0 errors, 5s, 0  
acls copied  
12 scanned, 0 matched, 0 skipped, 0 copied, 0 (0/s), 0 errors, 10s, 0  
acls copied  
12 scanned, 0 matched, 0 skipped, 0 copied, 0 (0/s), 0 errors, 15s, 0  
acls copied xcp copy -acl -aclverify yes -fallback-user "DOMAIN\User"  
-fallback-group "DOMAIN\Group" \\<source_IP_address>\source_share  
\\<destination_IP_address>\dest_share  
12 scanned, 0 matched, 0 skipped, 11 copied, 10KiB (634/s), 0 errors,  
11 acls copied  
Total Time : 16s  
STATUS : PASSED  
  
C:\NetApp\xcp>xcp copy -acl -aclverify no  
\\<source_IP_address>\source_share  
\\<destination_IP_address>\dest_share  
  
xcp copy -acl -aclverify no \\<source_IP_address>\source_share  
\\<destination_IP_address>\dest_share  
12 scanned, 0 matched, 0 skipped, 11 copied, 10KiB (5.61KiB/s), 0  
errors, 11 acls copied  
Total Time : 1s  
STATUS : PASSED
```

## copy -root

Use the `-root` parameter with the `copy` command to copy the ACLs for the root directory.

### Syntax

```
xcp copy -acl -root -fallback-user "DOMAIN\User" -fallback-group  
"DOMAIN\Group" \\<IP address or hostname of SMB server>\source_share \\<IP  
address of SMB destination server>\dest_share
```

## Show example

```
C:\NetApp\XCP>xcp copy -acl -root -fallback-user "DOMAIN\User"  
-fallback-group "DOMAIN\Group" \\<IP address or hostname of SMB  
server>\source_share \\<IP address of SMB destination  
server>\dest_share  
  
xcp copy -acl -root -fallback-user "DOMAIN\User" -fallback-group  
"DOMAIN\Group" \\<IP address or hostname of SMB server>\source_share  
\\<IP address of SMB destination server>\dest_share  
6 scanned, 0 matched, 0 skipped, 5 copied, 200 (108/s), 0 errors, 6  
acls copied  
Total Time : 1s  
STATUS : PASSED
```

## copy -noownership

Use the `-noownership` parameter with the `copy` command to specify not to copy the ownership from the source to the destination. You must use `-noownership` with the `-acl` option and it requires `fallback-user` and `fallback-group` as mandatory parameters.

### Syntax

```
xcp.exe copy -acl -noownership -fallback-user <fallback_user> -fallback  
-group <fallback_group> \\<IP address or hostname of SMB  
server>\source_share \\<IP address of SMB destination server>\dest_share
```

## Show example

```
C:\Netapp\xcp>xcp.exe copy -acl -noownership -fallback-user  
"DOMAIN\User" -fallback-group "DOMAIN\Group"  
\\<source_IP_address>\source_share  
\\<destination_IP_address>\dest_share  
  
568 scanned, 0 matched, 0 skipped, 0 copied, 0 (0/s), 0 errors, 5s, 0  
acls copied  
568 scanned, 0 matched, 0 skipped, 0 copied, 0 (0/s), 0 errors, 10s, 0  
acls copied  
568 scanned, 0 matched, 0 skipped, 135 copied, 4.26MiB (872KiB/s), 0  
errors, 15s, 137 acls copied xcp.exe copy -acl -noownership -fallback  
-user "DOMAIN\User" -fallback-group "DOMAIN\Group"  
\\<source_IP_address>\source_share  
\\<destination_IP_address>\dest_share  
568 scanned, 0 matched, 0 skipped, 567 copied, 17.7MiB (1.01MiB/s), 0  
errors, 567 acls copied  
Total Time : 17s  
STATUS : PASSED
```

## copy -bs <n>

Use the `-bs <n>` parameter with the `copy` command to provide a read/write block size. The default value is 1M.

## Syntax

```
xcp.exe copy -bs <n> \\<IP address or hostname of SMB server>\source_share  
\\<IP address of SMB destination server>\dest_share
```

## Show example

```
c:\Netapp\xcp>xcp.exe copy -bs 32k \\<source_IP_address>\source_share  
\\<destination_IP_address>\dest_share  
  
xcp.exe copy -bs 32k \\<source_IP_address>\source_share  
\\<destination_IP_address>\dest_share

STATUS : PASSED
```

## copy -ads

Use the `-ads` parameter with the `copy` command to copy NTFS alternate data streams from the source SMB share to destination SMB share.

### Syntax

```
xcp copy -ads \\<IP address or hostname of SMB server>\source_share \\<IP address of SMB destination server>\dest_share
```

### Show example

```
c:\netapp\xcp>xcp copy -ads \\<source_IP_address>\source_share\src
\\<dest_IP_address>\dest_share

6 scanned, 0 matched, 0 skipped, 3 copied, 13 (2.41/s), 0 errors, 5s,

Total Time : 3m9s
STATUS : PASSED
```

## sync

The `sync` command scans for changes and modifications in the source and target shares in parallel and applies the appropriate actions to the target to make sure that the target is identical to the source. The `sync` command compares data content, time stamps, file attributes, ownership, and security information.

### Syntax

```
xcp sync \\<source SMB share> \\<IP address of SMB destination server>
```

### Show example

```
c:\netapp\xcp>xcp sync \\<IP address or hostname of SMB server>\source_share \\<IP address of SMB destination server>\dest_share
xcp sync \\<IP address or hostname of SMB server>\source_share \\<IP address of SMB destination server>\dest_share
xcp sync \\<IP address or hostname of SMB server>\source_share \\<IP address of SMB destination server>\dest_share
634 scanned, 0 copied, 634 compared, 0 removed, 0 errors
Total Time : 3s
STATUS : PASSED
```

The following table lists the `sync` parameters and their description.

Parameter	Description
<code>sync -h, --help</code>	Show this help message and exit.
<code>sync -v</code>	Increase debug verbosity.
<code>sync -parallel &lt;n&gt;</code>	Number of concurrent processes (default: <cpu-count>).
<code>sync -match &lt;filter&gt;</code>	Only process files and directories that match the filter (see <code>xcp help - match</code> for details).
<code>sync -exclude &lt;filter&gt;</code>	Only exclude files and directories in the filter.
<code>sync -preserve-atime</code>	Restore last accessed date on source.
<code>sync -noatime</code>	Do not check file access time.
<code>sync -noctime</code>	Do not check file creation time.
<code>sync -nomtime</code>	Do not check file modification time. (This option is deprecated. Sync will continue to run without this option.)
<code>sync -noattrs</code>	Do not check attributes.

Parameter	Description
<code>sync -noownership</code>	Do not check ownership.
<code>sync -atimewindow &lt;float&gt;</code>	Acceptable access time difference, in seconds.
<code>sync -ctimewindow &lt;float&gt;</code>	Acceptable creation time difference, in seconds.
<code>sync -mtimewindow &lt;float&gt;</code>	Acceptable modification time difference, in seconds,
<code>sync -acl</code>	Copy security information.
<code>sync -fallback-user &lt;fallback_user&gt;</code>	Active Directory user or local(non-domain) user on the target machine to receive the permissions of local (non-domain) source machine users (example: domain\administrator).
<code>sync -fallback-group &lt;fallback_group&gt;</code>	Active Directory group or local(non-domain) group on the target machine to receive the permissions of local(non-domain) source machine groups (example: domain\administrators).
<code>sync -l</code>	Increases output detail.
<code>sync -root</code>	Sync ACLs for the root directory.
<code>sync -onlyacl</code>	Copy only the security information.
<code>sync -aclverify{yes,no}</code>	Provide an option to include or skip ACL verification during the ACL sync operation.
<code>sync -bs &lt;n&gt;</code>	Read/Write blocksize (default:1M).
<code>sync -ads</code>	Use the <code>sync</code> command with the <code>-ads</code> flag to scan for changes and modifications of alternate data streams in the source and target SMB share. If there are changes, it applies the change to the target to make sure that the target is identical to the source.

## **sync -h, --help**

Use the `-h` and `--help` parameters with the `sync` command to display detailed information about the `sync` command

## **Syntax**

```
xcp sync --help
```

## Show example

```
C:\Netapp\xcp>xcp sync --help
usage: xcp sync [-h] [-v] [-parallel <n>] [-match <filter>] [-exclude
<filter>] [-preserve-atime] [-noatime] [-noctime] [-nomtime] [-noattrs]
[-atimewindow <float>]
[-ctimewindow <float>] [-mtimewindow <float>] [-acl] [-fallback-user
FALLBACK_USER] [-fallback-group FALLBACK_GROUP] [-loglevel <name>] [-l]
[-root]
[-noownership] [-onlyacl] [-aclverify {yes,no}] [-bs <n>] [-ads] source
target
```

Note: ONTAP does not let a SMB client modify COMPRESSED or ENCRYPTED attributes. XCP sync will ignore these file attributes.

positional arguments:

```
source
target
```

optional arguments:

-h, --help	show this help message and exit
-v	increase debug verbosity
-parallel <n>	number of concurrent processes (default: <cpu-count>)
-match <filter>	only process files and directories that match the filter (see `xcp help -match` for details)
-exclude <filter>	Exclude files and directories that match the filter (see `xcp help -exclude` for details)
-preserve-atime	restore last accessed date on source
-noatime	do not check file access time
-noctime	do not check file creation time
-nomtime	do not check file modification time
-noattrs	do not check attributes
-atimewindow <float>	acceptable access time difference in seconds
-ctimewindow <float>	acceptable creation time difference in seconds
-mtimewindow <float>	acceptable modification time difference in seconds
-acl	copy security information
-fallback-user FALLBACK_USER	the name of the user on the target machine to receive the permissions of local (non-domain) source machine users (eg. domain\administrator)
-fallback-group FALLBACK_GROUP	the name of the group on the target machine to receive the permissions of local (non-domain) source machine groups

```
(eg. domain\administrators)
  -loglevel <name>          option to set log levelfilter
  -l                          increase output detail
  -root                        sync acl for root directory
  -noownership                 do not sync ownership
  -onlyacl                      sync only acls
  -aclverify {yes,no}          choose whether you need to skip acl
verification
  -bs <n>                      read/write block size for sync (default: 1M)
  -ads                         sync ntfs alternate data stream
```

## sync -v

Use the `-v` parameter with the `sync` command to provide detailed debug information.

### Syntax

```
xcp sync -v \\<IP address or hostname of SMB
server>\vol_SMB_source_xxxxxx\warning \\<IP address of SMB destination
server>\vol_SMB_target_xxxxxx
```

## Show example

```
C:\XCP>xcp sync -v \\<IP address or hostname of SMB
server>\vol_SMB_source_xxxxxx\warning \\<IP address of SMB destination
server>\vol_SMB_target_xxxxxx

STATUS : PASSED

```

## sync -parallel <n>

Use the `-parallel <n>` parameter with the `sync` command to set a higher or lower number of XCP concurrent processes. The `sync -parallel <n>` command syncs with the number of concurrent processes (default: <cpu-count>).

The maximum value for n is 61.

## Syntax

```
xcp sync -parallel <n> \\<IP address or hostname of SMB  
server>\volxcp\\<IP address of SMB destination server>\xcp1_test1
```

## Show example

```
C:\xcp>xcp sync -parallel 5 \\<IP address or hostname of SMB  
server>\volxcp\\<IP address of SMB destination server>\xcp1_test1  
658 scanned, 244 compared, 0 errors, 0 skipped, 0 copied, 0 removed, 5s  
658 scanned, 606 compared, 0 errors, 0 skipped, 0 copied, 0 removed,  
10s  
658 scanned, 658 compared, 0 errors, 0 skipped, 0 copied, 0 removed,  
10s  
Sending statistics...
```

## sync -match <filter>

Use the `-match <filter>` parameter with the `sync` command to scan the source and target tree and compare only the files or directories that match the filter argument. If there are any differences, the command applies the required actions on the target to keep them in sync.

## Syntax

```
xcp sync -match <filter> \\<IP address or hostname of SMB  
server>\source_share \\<IP address of SMB destination server>\dest_share
```

## Show example

```
c:\netapp\xcp>xcp sync -match "'gx' in name" \\<IP address or hostname  
of SMB server>\source_share \\<IP address of SMB destination  
server>\dest_share  
xcp sync -match "'gx' in name" \\<IP address or hostname of SMB  
server>\source_share \\<IP address of SMB destination  
server>\dest_share  
  
xcp sync -match 'gx' in name \\<IP address or hostname of SMB  
server>\source_share \\<IP address of SMB destination  
server>\dest_share  
634 scanned, 0 copied, 10 compared, 0 removed, 0 errors  
Total Time : 2s  
STATUS : PASSED
```

## **sync -exclude <filter>**

Use the `-exclude <filter>` parameter with the `sync` command to only exclude files and directories in the filter.

### **Syntax**

```
xcp sync -exclude <filter> \\<IP address or hostname of SMB  
server>\source_share \\<IP address of SMB destination server>\dest_share
```

### **Show example**

```
C:\netapp\xcp>xcp sync -exclude "path('*Exceptions*')" \\<IP address or  
hostname of SMB server>\source_share \\<IP address of SMB destination  
server>\dest_share

xcp sync -exclude path('*Exceptions*') \\<IP address or hostname of SMB  
server>\source_share \\<IP address of SMB destination  
server>\dest_share
451 scanned, 427 excluded, 0 copied, 24 compared, 0 skipped, 0 removed,  
0 errors
Total Time : 2s
STATUS : PASSED
```

## **sync -preserve-atime**

Use the `-preserve-atime` parameter with the `sync` command to reset "atime" to the original value before XCP read the file.

### **Syntax**

```
xcp sync -preserve-atime \\<IP address or hostname of SMB  
server>\source_share \\<IP address of SMB destination server>\dest_share
```

## Show example

```
c:\netapp\xcp>xcp sync -preserve-atime \\<IP address or hostname of SMB  
server>\source_share \\<IP address of SMB destination  
server>\dest_share  
  
xcp sync -preserve-atime \\<IP address or hostname of SMB  
server>\source_share \\<IP address of SMB destination  
server>\dest_share  
634 scanned, 0 copied, 634 compared, 0 removed, 0 errors  
Total Time : 4s  
STATUS : PASSED
```

## sync -noatime

Use the `-noatime` parameter with the `sync` command to sync all the differences in the source to the target, excluding files that only have differences in access time.

## Syntax

```
xcp sync -noatime \\<IP address or hostname of SMB server>\source_share  
\\<IP address of SMB destination server>\dest_share
```

## Show example

```
c:\netapp\xcp>xcp sync -noatime \\<IP address or hostname of SMB  
server>\source_share \\<IP address of SMB destination  
server>\dest_share  
  
xcp sync -noatime \\<IP address or hostname of SMB server>\source_share  
\\<IP address of SMB destination server>\dest_share  
  
xcp sync -noatime \\<IP address or hostname of SMB server>\source_share  
\\<IP address of SMB destination server>\dest_share  
634 scanned, 0 copied, 634 compared, 0 removed, 0 errors  
Total Time : 3s  
STATUS : PASSED
```

## sync -noctime

Use the `-noctime` parameter with the `sync` command to sync all the differences in the source to the target,

excluding files that only have differences in creation time.

## Syntax

```
xcp sync -noctime \\<IP address or hostname of SMB server>\source_share  
\\<IP address of SMB destination server>\dest_share
```

## Show example

```
c:\netapp\xcp>xcp sync -noctime \\<IP address or hostname of SMB  
server>\source_share \\<IP address of SMB destination  
server>\dest_share  
  
xcp sync -noctime \\<IP address or hostname of SMB server>\source_share  
\\<IP address of SMB destination server>\dest_share  
  
xcp sync -noctime \\<IP address or hostname of SMB server>\source_share  
\\<IP address of SMB destination server>\dest_share  
634 scanned, 0 copied, 634 compared, 0 removed, 0 errors  
Total Time : 3s  
STATUS : PASSED
```

## sync -nomtime

Use the `-nomtime` parameter with the `sync` command to sync all the differences in the source to the target, excluding files that only have differences in modification time. (This option is deprecated. The `sync` command will continue to run without this option.)

## Syntax

```
xcp sync -nomtime \\<IP address or hostname of SMB server>\source_share  
\\<IP address of SMB destination server>\dest_share
```

## Show example

```
c:\netapp\xcp>xcp sync -nomtime \\<IP address or hostname of SMB server>\source_share \\<IP address of SMB destination server>\dest_share  
xcp sync -nomtime \\<IP address or hostname of SMB server>\source_share \\<IP address of SMB destination server>\dest_share  
  
xcp sync -nomtime \\<IP address or hostname of SMB server>\source_share \\<IP address of SMB destination server>\dest_share  
634 scanned, 0 copied, 634 compared, 0 removed, 0 errors  
Total Time : 3s  
STATUS : PASSED
```

## sync -noattrs

Use the `-noattrs` parameter with the `sync` command to sync all the differences in the source to the target, excluding files that only have differences in file attributes. XCP copies a file only when it has different content (the ACLs are transferred).

## Syntax

```
xcp sync -noattrs \\<IP address or hostname of SMB server>\source_share \\<IP address of SMB destination server>\dest_share
```

## Show example

```
c:\netapp\xcp>xcp sync -noattrs \\<IP address or hostname of SMB server>\source_share \\<IP address of SMB destination server>\dest_share  
xcp sync -noattrs \\<IP address or hostname of SMB server>\source_share \\<IP address of SMB destination server>\dest_share  
  
xcp sync -noattrs \\<IP address or hostname of SMB server>\source_share \\<IP address of SMB destination server>\dest_share  
634 scanned, 0 copied, 634 compared, 0 removed, 0 errors  
Total Time : 3s  
STATUS : PASSED
```

## sync -noownership

Use the `-noownership` parameter with the `sync` command to sync all the differences of the source to the

target, excluding files that only have differences in ownership.

## Syntax

```
xcp sync -noownership \\<IP address or hostname of SMB  
server>\vol_SMB_source_xxxxxx \\<IP address of SMB destination  
server>\vol_SMB_target_xxxxxx
```

## Show example

```
>xcp sync -acl -noownership -fallback-user "DOMAIN\User" -fallback  
-group "DOMAIN\Group" \\<source_IP_address>\source_share \\<IP address  
of SMB destination server>\dest_share
```

### Truncated Output

```

323,906 scanned, 323,906 compared, 0 errors, 0 skipped, 0  
copied, 0 removed, 10m29s
```

```
xcp sync -acl -noownership -fallback-user "DOMAIN\User" -fallback-group  
"DOMAIN\Group" \\<source_IP_address>\source_share \\<IP address of SMB  
destination server>\dest_share  
323,906 scanned, 0 copied, 323,906 compared, 0 removed, 0 errors  
Total Time : 10m29s  
STATUS : PASSED
```

## **sync -atimewindow <float>**

Use the `-atimewindow <float>` parameter with the `sync` command to specify the acceptable difference, in seconds, for the atime of a file from the source to the destination. XCP does not report files as being different if the difference in atime is less than `<value>`.

### **Syntax**

```
xcp sync -atimewindow <float> \\<IP address or hostname of SMB  
server>\source_share \\<IP address of SMB destination server>\dest_share
```

In the following example, XCP accepts a difference in atime of up to 10 minutes between the source and the destination files, and it does not update the atime on the target.

### **Show example**

```
c:\netapp\xcp>xcp sync -atimewindow 600 \\<IP address or hostname of  
SMB server>\source_share \\<IP address of SMB destination  
server>\source_share  
xcp sync -atimewindow 600 \\<IP address or hostname of SMB  
server>\source_share \\<IP address of SMB destination  
server>\source_share  
  
xcp sync -atimewindow 600 \\<IP address or hostname of SMB  
server>\source_share \\<IP address of SMB destination  
server>\source_share  
634 scanned, 0 copied, 634 compared, 0 removed, 0 errors  
Total Time : 3s  
STATUS : PASSED
```

## **sync -ctimewindow <float>**

Use the `-ctimewindow <float>` parameter with the `sync` command to specify the acceptable difference, in seconds, for the ctime of a file from the source to the destination. XCP does not report files as being different when the difference in ctime is less than `<value>`.

### **Syntax**

```
xcp sync -ctimewindow <float> \\<IP address or hostname of SMB  
server>\source_share \\<IP address of SMB destination server>\dest_share
```

In the following example, XCP accepts a difference in atime for up to 10 minutes between the source and the destination files, and it does not update the ctime on the target.

## Show example

```
c:\netapp\xcp>xcp sync -ctimewindow 600 \\<IP address or hostname of  
SMB server>\source_share \\<IP address of SMB destination  
server>\dest_share  
xcp sync -ctimewindow 600 \\<IP address or hostname of SMB  
server>\source_share \\<IP address of SMB destination  
server>\dest_share  
  
xcp sync -ctimewindow 600 \\<IP address or hostname of SMB  
server>\source_share \\<IP address of SMB destination  
server>\dest_share  
634 scanned, 0 copied, 634 compared, 0 removed, 0 errors  
Total Time : 3s  
STATUS : PASSED
```

## sync -mtimewindow <float>

Use the `-mtimewindow <float>` parameter with the `sync` command to specify the acceptable difference, in seconds, for the mtime of a file from the source to the destination. XCP does not report files as being different when the difference in mtime is less than `<value>`.

## Syntax

```
xcp sync -mtimewindow <float> \\<IP address or hostname of SMB  
server>\source_share \\<IP address of SMB destination server>\dest_share
```

## Show example

```
c:\netapp\xcp>xcp sync -mtimewindow 600 \\<IP address or hostname of  
SMB server>\source_share \\<IP address of SMB destination  
server>\dest_share  
xcp sync -mtimewindow 600 \\<IP address or hostname of SMB  
server>\source_share \\<IP address of SMB destination  
server>\dest_share  
  
xcp sync -mtimewindow 600 \\<IP address or hostname of SMB  
server>\source_share \\<IP address of SMB destination  
server>\dest_share  
634 scanned, 0 copied, 634 compared, 0 removed, 0 errors Total Time :  
3s  
STATUS : PASSED
```

## **sync -acl -fallback-user <fallback\_user> -fallback-group <fallback\_group>**

Use the **-acl**, **-fallback-user** and **-fallback-group** parameters with the **sync** command to compare the data and the security information from the source with the target and apply the required actions on the target. The **-fallback-user** and **-fallback-group** options are a user or group on the target machine or in the Active Directory that receive the permissions of the local (non-domain) source users or groups.

You cannot use the **-acl** option without the **-fallback-user** and **-fallback-group** options.

### **Syntax**

```
xcp sync -acl -fallback-user <fallback_user> -fallback-group  
<fallback_group> \\<IP address or hostname of SMB  
server>\performance_SMB_home_dirs \\<IP address of SMB destination  
server>\performance_SMB_home_dirs
```

## Show example

```
C:\xcp>xcp sync -acl -fallback-user "DOMAIN\User" -fallback-group  
"DOMAIN\Group" \\<IP address or hostname of SMB server>\source_share  
\\<IP address of SMB destination server>\dest_share

xcp sync -acl -fallback-user "DOMAIN\User" -fallback-group
"DOMAIN\Group \\<IP address or hostname of SMB server>\source_share
\\<IP address of SMB destination server>\dest_share
15,796 scanned, 0 copied, 15,796 compared, 0 removed, 0 errors
Total Time : 1m51
STATUS : PASSED

```

## **sync -l**

Use the **-l** parameter with the **sync** command to provide detailed logging information in the standard output for all actions performed by XCP on the target.

### **Syntax**

```
xcp sync -l \\<IP address or hostname of SMB server>\source_share \\<IP
address of SMB destination server>\dest_share
```

### **Show example**

```

c:\netapp\xcp>xcp sync -l \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share
xcp sync -l \\<IP address or hostname of SMB server>\source_share \\<IP
address of SMB destination server>\dest_share

File "atime" changed, timestamps set for "agnostic"
File "atime" changed, timestamps set for "<root>"
xcp sync -l \\<IP address or hostname of SMB server>\source_share \\<IP
address of SMB destination server>\dest_share
634 scanned, 0 copied, 634 compared, 0 removed, 0 errors
Total Time : 3s
STATUS : PASSED

```

## **sync -root**

Use the **-root** parameter with the **sync** command to sync the ACLs for the root directory.

## Syntax

```
xcp sync -acl -root -fallback-user "DOMAIN\User" -fallback-group  
"DOMAIN\Group" \\<IP address or hostname of SMB server>\source_share \\<IP  
address of SMB destination server>\dest_share
```

## Show example

```
C:\NetApp\XCP>xcp sync -acl -root -fallback-user "DOMAIN\User"  
-fallback-group "DOMAIN\Group" \\<IP address or hostname of SMB  
server>\source_share \\<IP address of SMB destination  
server>\dest_share  
  
xcp sync -acl -root -fallback-user "DOMAIN\User" -fallback-group  
"DOMAIN\Group" \\<IP address or hostname of SMB server>\source_share  
\\<IP address of SMB destination server>\dest_share  
12 scanned, 0 copied, 12 compared, 0 skipped, 0 removed, 0 errors, 1  
acls copied  
Total Time : 2s  
STATUS : PASSED
```

## sync -onlyacl-fallback-user <fallback\_user> -fallback-group <fallback\_group>

Use the `-onlyacl`, `-fallback-user`, and `-fallback-group` parameters with the `sync` command to compare the security information between the source with the target and apply the required actions on the target. The `-fallback-user` and `-fallback-group` are a user or group on the target machine or in the Active Directory that receive the permissions of the local (non-domain) source users or groups.

You cannot use the `-onlyacl` parameter without the `-fallback-user` and `-fallback-group` options.

## Syntax

```
xcp sync -onlyacl -fallback-user <fallback_user> -fallback-group  
<fallback_group> \\<IP address or hostname of SMB server>\source_share  
\\<IP address of SMB destination server>\dest_share
```

## Show example

```
C:\Users\ctladmin\Desktop>xcp sync -onlyacl -fallback-user  
"DOMAIN\User" -fallback-group "DOMAIN\Group"  
\<source_IP_address>\source_share \\server>\dest_share  
  
8,814 scanned, 0 copied, 620 compared, 0 skipped, 0  
removed, 0 errors, 6s  
9,294 scanned, 0 copied, 2,064 compared, 0 skipped, 0  
removed, 0 errors, 11s  
12,614 scanned, 0 copied, 3,729 compared, 0 skipped, 0  
removed, 0 errors, 16s  
13,034 scanned, 0 copied, 5,136 compared, 0 skipped, 0  
removed, 0 errors, 21s  
14,282 scanned, 0 copied, 7,241 compared, 0 skipped, 0  
removed, 0 errors, 26s  
14,282 scanned, 0 copied, 8,101 compared, 0 skipped, 0  
removed, 0 errors, 31s  
14,282 scanned, 0 copied, 8,801 compared, 0 skipped, 0  
removed, 0 errors, 36s  
14,282 scanned, 0 copied, 9,681 compared, 0 skipped, 0  
removed, 0 errors, 41s  
14,282 scanned, 0 copied, 10,405 compared, 0 skipped, 0  
removed, 0 errors, 46s  
14,282 scanned, 0 copied, 11,431 compared, 0 skipped, 0  
removed, 0 errors, 51s  
14,282 scanned, 0 copied, 12,471 compared, 0 skipped, 0  
removed, 0 errors, 56s  
14,282 scanned, 0 copied, 13,495 compared, 0 skipped, 0

14,282 scanned, 0 copied, 14,282 compared, 0 skipped, 0  
removed, 0 errors, 1m6s  
  
xcp sync -onlyacl -preserve-atime -fallback-user "DOMAIN\User"  
-fallback-group "DOMAIN\Group" \<source_IP_address>\source_share \\address of SMB destination server>\dest_share  
14,282 scanned, 0 copied, 14,282 compared, 0 skipped, 0 removed, 0  
errors  
Total Time : 1m7s  
STATUS : PASSED
```

## **sync -aclverify{yes,no}**

Use the `-aclverify{yes,no}` parameter with the `sync` command to provide an option to include or skip ACL verification during the ACL sync operation. This option can only be used with the `sync -acl` and `sync -onlyacl` commands. ACL sync performs ACL verification by default. If you set the `-aclverify` option to no, you can skip ACL verification and the `fallback-user` and `fallback-group` options are not required. If you set `-aclverify` to yes, it requires the `fallback-user` and `fallback-group` options, as shown in the following example.

### **Syntax**

```
xcp sync -acl -aclverify yes -fallback-user <fallback_user> -fallback  
-group <fallback_group> \\<IP address or hostname of SMB  
server>\source_share \\<IP address of SMB destination server>\dest_share
```

## Show example

```
C:\NetApp\xcp>xcp sync -acl -aclverify yes -fallback-user "DOMAIN\User"
-fallback-group "DOMAIN\Group" \\<source_IP_address>\source_share \\<IP
address of SMB destination server>\dest_share

```

```
Total Time : 2s
STATUS : PASSED
```

## sync -bs <n>

Use the `-bs <n>` parameter with the `sync` command to provide a read/write block size. The default size is 1M.

### Syntax

```
xcp.exe sync -bs <n> \\<IP address or hostname of SMB server>\source_share
\\<IP address of SMB destination server>\dest_share
```

### Show example

```
C:\Netapp\xcp>xcp.exe sync -bs 64k \\<source_IP_address>\source_share
\\<IP address of SMB destination server>\dest_share
1,136 scanned, 0 copied, 1,135 compared, 0 skipped, 95 removed, 0
errors, 5s
xcp.exe sync -bs 64k \\<source_IP_address>\source_share \\<IP address
of SMB destination server>\dest_share 1,136 scanned, 283 copied, 1,136
compared, 0 skipped, 283 removed, 0 errors
Total Time : 10s
STATUS : PASSED
```

## sync -ads

Use `-ads` parameter with the `sync` command to scan for changes and modifications to alternate data streams in the source and target SMB share. If there are changes, it applies the change to the target to make sure that the target is identical to the source.

### Syntax

```
xcp sync -ads \\<IP address or hostname of SMB server>\source_share \\<IP
address of SMB destination server>\dest_share
```

## Show example

```
C:\netapp\xcp>xcp sync -ads \\<source_IP_address>\source_share\src  
\\<dest_IP_address>\dest_share

Total Time : 6m9s
STATUS : PASSED
```

## verify

The `verify` command reads and compares the source and target shares and provides information about what is different. You can use the `verify` command on any source and destination, regardless of the tool used to perform the copy or sync operation.

### Syntax

```
xcp verify \\<IP address or hostname of SMB server>\source_share \\<IP
address of SMB destination server>\dest_share
```

### Show example

```
c:\netapp\xcp>xcp verify \\<IP address of SMB source
server>\source_share \\<IP address of SMB destination
server>\dest_share
xcp verify \\<IP address of SMB source server>\source_share \\ <IP
address of SMB destination server>\dest_share

xcp verify \\<IP address of SMB source server>\source_share \\<IP
address of SMB destination server>\dest_share
374 scanned, 373 compared, 373 same, 0 different, 0 missing, 0 errors
xcp verify \\<IP address of SMB source server>\source_share \\<IP
address of SMB destination server>\dest_share
Total Time : 3s
STATUS : PASSED
```

The following table lists the `verify` parameters and their description.

Parameter	Description
<code>verify -h, --help</code>	Show this help message and exit.
<code>verify -v</code>	Increase debug verbosity.
<code>verify -parallel &lt;n&gt;</code>	Number of concurrent processes (default: <cpu-count>).
<code>verify -match &lt;filter&gt;</code>	Only process files and directories that match the filter (see <code>xcp help - match</code> for details).
<code>verify -exclude &lt;filter&gt;</code>	Only exclude files and directories in the filter.

Parameter	Description
<code>verify -preserve-atime</code>	Restore last accessed date on source.
<code>verify -nodata</code>	Do not check data.
<code>verify -atime</code>	Verify file access time.
<code>verify -noctime</code>	Do not check file creation time.
<code>verify -nomtime</code>	Do not check file modification time.
<code>verify -noattrs</code>	Do not check attributes.
<code>verify -noownership</code>	Do not check ownership.
<code>verify -ads</code>	Scan for changes and modifications of alternate data streams in the source and target SMB share. If there are changes, it applies the change to the target to make sure that the target is identical to the source.
<code>verify -noacls</code>	Do not check ACLs.
<code>verify -atimewindow &lt;float&gt;</code>	Acceptable access time difference, in seconds.
<code>verify -ctimewindow &lt;float&gt;</code>	Acceptable creation time difference, in seconds.
<code>verify -mtimewindow &lt;float&gt;</code>	Acceptable modification time difference, in seconds,
<code>verify -stats</code>	Scan source and target trees in parallel and compare tree statistics.
<code>verify -l</code>	Increases output detail.
<code>verify -ll</code>	Increases output detail (git diff format).
<code>verify -fallback-user &lt;fallback_user&gt;</code>	Active Directory user or local(non-domain) user on the target machine to receive the permissions of local (non-domain) source machine users (example: domain\administrator).
<code>verify -fallback-group &lt;fallback_group&gt;</code>	Active Directory group or local(non-domain) group on the target machine to receive the permissions of local(non-domain) source machine groups (example: domain\administrators).
<code>verify -root</code>	Sync ACLs for the root directory.
<code>verify -onlyacl</code>	Copy only the security information.

## **verify -h, --help**

Use the `-h` and `--help` parameters with the `verify` command to display detailed information about the `verify` command

## **Syntax**

```
xcp verify -help
```

## Show example

```
C:\Netapp\xcp>xcp verify -help
usage: xcp verify [-h] [-v] [-parallel <n>] [-match <filter>] [-exclude
<filter>] [-preserve-atime]
[-loglevel <name>] [-fallback-user FALBACK_USER]
[-fallback-group FALBACK_GROUP] [-noacls] [-nodata] [-stats] [-l] [-
root] [-noownership] [-onlyacl] [-noctime] [-nomtime] [-noattrs] [-
atime]
[-atimewindow <float>] [-ctimewindow <float>] [-mtimewindow <float>] [-
ads] source target
```

Note: ONTAP does not let a SMB client modify COMPRESSED or ENCRYPTED attributes. XCP sync will ignore these file attributes.

positional arguments:

```
source
target
```

optional arguments:

```
-h, --help                  show this help message and exit
-v                         increase debug verbosity
-parallel <n>              number of concurrent processes (default: <cpu-
count>)
-match <filter>            only process files and directories that match
the filter (see `xcp help -match` for details)
-exclude <filter>          Exclude files and directories that match the
filter (see `xcp help -exclude` for details)
-preserve-atime            restore last accessed date on source
--help-diag                Show all options including diag. The diag options
should be used only on recommendation by NetApp support.
-loglevel <name>           option to set log level filter (default:INFO)
-fallback-user FALBACK_USER
                           a user on the target machine to translate the
permissions of local (non-domain) source machine users (eg.
domain\administrator)
-fallback-group FALBACK_GROUP
                           a group on the target machine to translate the
permissions of local (non- domain) source machine groups (eg.
domain\administrators)
-nodata                    do not check data
-stats                     scan source and target trees in parallel and
compare tree statistics
-l                         detailed file listing output
-root                      verify acl for root directory
-noacls                   do not check acls
```

-noownership	do not check ownership
-onlyacl	verify only acls
-noctime	do not check file creation time
-nomtime	do not check file modification time
-noattrs	do not check attributes
-atime	verify access time as well
-atimewindow <float>	acceptable access time difference in seconds
-ctimewindow <float>	acceptable creation time difference in seconds
-mtimewindow <float>	acceptable modification time difference in seconds
-ads	verify ntfs alternate data stream

## verify -v

Use the `-v` parameter with the `verify` command to provide detailed debug information.

### Syntax

```
xcp verify -v \\<IP address of SMB source server>\source_share address of
SMB destination server>\dest_share
```

### Show example

```
c:\netapp\xcp> xcp verify -v \\<IP address of SMB source
server>\source_share address of SMB destination server>\dest_share
xcp verify -v \\<IP address of SMB source server>\source_share \\<IP
address of SMB destination server>\dest_share

xcp verify -v \\< IP address of SMB source server>\source_share \\<IP
address of SMB destination server>\dest_share
374 scanned, 373 compared, 373 same, 0 different, 0 missing, 0 errors
Total Time : 3s
STATUS : PASSED
```

## verify -parallel <n>

Use the `-parallel <n>` parameter with the `verify` command to set a higher or lower number of XCP concurrent processes. The `verify -parallel <n>` command verifies the number of concurrent processes (default: <cpu-count>).

The maximum value for n is 61.

## Syntax

```
xcp verify -v -parallel <n> \\<IP address of SMB source  
server>\source_share \\<IP address of SMB destination server>\dest_share
```

## Show example

```
c:\netapp\xcp>xcp verify -v -parallel 8 \\<IP address of SMB source  
server>\source_share \\<IP address of SMB destination  
server>\dest_share  
  
xcp verify -v -parallel 8 \\<IP address of SMB source  
server>\source_share \\<IP address of SMB destination  
server>\dest_share  
  
xcp verify -v -parallel 8 \\<IP address of SMB source  
server>\source_share \\<IP address of SMB destination  
server>\dest_share  
374 scanned, 373 compared, 373 same, 0 different, 0 missing, 0 errors  
Total Time : 4s  
STATUS : PASSED
```

## verify -match <filter>

Use the `-match <filter>` parameter with the `verify` command to scan the source and target tree and compare only the files or directories that match the filter argument. If there are any differences, the command applies the required actions on the target to keep them in sync.

## Syntax

```
xcp verify -v -match <filter> \\<IP address of SMB source  
server>\source_share \\<IP address of SMB destination server>\dest_share
```

## Show example

```
c:\netapp\xcp>xcp verify -v -match "'Microsoft' in name" \\<IP address  
of SMB source server>\source_share \\<IP address of SMB destination  
server>\dest_share  
xcp verify -v -match "'Microsoft' in name" \\<IP address of SMB source  
server>\source_share \\<IP address of SMB destination  
server>\dest_share  
  
xcp verify -v -match 'Microsoft' in name \\<IP address of SMB source  
server> \source_share \\<IP address of SMB destination  
server>\dest_share  
374 scanned, 0 compared, 0 same, 0 different, 0 missing, 0 errors  
Total Time : 1s  
STATUS : PASSED
```

## verify -exclude <filter>

Use the `-exclude <filter>` parameter with the `verify` command to only exclude files and directories in the filter.

### Syntax

```
xcp verify -exclude <filter> \\<IP address of SMB source  
server>\source_share \\<IP address of SMB destination server>\dest_share
```

## Show example

```
C:\netapp\xcp>xcp verify -exclude "path('*Exceptions*')" \\<IP address  
of SMB sourceserver>\source_share \\<IP address of SMB destination  
server>\dest_share  
  
210 scanned, 99 excluded, 6 compared, 5 same, 1 different, 0 missing, 0  
errors, 5s  
210 scanned, 107 excluded, 13 compared, 12 same, 1 different, 0  
missing, 0 errors, 10s  
210 scanned, 107 excluded, 13 compared, 12 same, 1 different, 0  
missing, 0 errors, 15s  
210 scanned, 107 excluded, 13 compared, 12 same, 1 different, 0  
missing, 0 errors, 20s  
335 scanned, 253 excluded, 13 compared, 12 same, 1 different, 0  
missing, 0 errors, 25s  
445 scanned, 427 excluded, 15 compared, 14 same, 1 different, 0  
missing, 0 errors, 30s  
445 scanned, 427 excluded, 15 compared, 14 same, 1 different, 0  
missing, 0 errors, 35s  
445 scanned, 427 excluded, 15 compared, 14 same, 1 different, 0  
missing, 0 errors, 40s  
445 scanned, 427 excluded, 15 compared, 14 same, 1 different, 0  
missing, 0 errors, 45s  
445 scanned, 427 excluded, 16 compared, 15 same, 1 different, 0  
missing, 0 errors, 50s  
xcp verify -exclude path('*Exceptions*') \\<IP address of SMB  
sourceserver>\source_share \\<IP address of SMB destination  
server>\dest_share  
445 scanned, 427 excluded, 17 compared, 17 same, 0 different, 0  
missing, 0 errors  
Total Time : 1m11s  
STATUS : PASSED
```

## verify -preserve-atime

Use the `-preserve-atime` parameter with the `verify` command to reset `atime` to the original value before XCP read the file.

### Syntax

```
xcp verify -preserve-atime \\<IP address of SMB source  
server>\source_share \\<IP address of SMB destination server>\dest_share
```

## Show example

```
c:\netapp\xcp>xcp verify -preserve-atime \\<IP address of SMB source server>\source_share \\<IP address of SMB destination server>\dest_share  
xcp verify -preserve-atime \\<IP address of SMB source server>\source_share \\<IP address of SMB destination server>\dest_share  
  
374 scanned, 179 compared, 179 same, 0 different, 0 missing, 0 errors,  
5s  
xcp verify -preserve-atime \\<IP address of SMB source server>\source_share \\<IP address of SMB destination server>\dest_share  
374 scanned, 373 compared, 373 same, 0 different, 0 missing, 0 errors  
Total Time : 8s  
STATUS : PASSED
```

## verify -nodata

Use the `-nodata` parameter with the `verify` command to not compare data.

### Syntax

```
xcp verify -nodata \\<IP address of SMB source server>\source_share \\<IP address of SMB destination server>\dest_share
```

## Show example

```
c:\netapp\xcp>xcp verify -nodata \\<IP address of SMB source server>\source_share \\<IP address of SMB destination server>\dest_share  
xcp verify -nodata \\<IP address of SMB source server>\source_share  
\\<IP address of SMB destination server>\dest_share : PASSED  
374 scanned, 373 compared, 373 same, 0 different, 0 missing, 0 errors  
Total Time : 3s  
STATUS : PASSED
```

## **verify -atime**

Use the `-atime` parameter with the `verify` command to compare file access time stamps from the source to destination.

### **Syntax**

```
xcp verify -ll -atime \\<IP address of SMB source server>\source_share  
\\<IP address of SMB destination server>\dest_share
```

### **Show example**

```
c:\Netapp\xcp> xcp verify -ll -atime \\<IP address of SMB source server>\source_share \\<IP address of SMB destination server>\dest_share

## **verify -noctime**

Use the `-noctime` parameter with the `verify` command to not compare file creation time stamps from the source to destination.

### **Syntax**

```
xcp verify -noctime \\<IP address of SMB source server>\source_share \\<IP address of SMB destination server>\dest_share
```

## Show example

```
c:\netapp\xcp>xcp verify -noctime \\<IP address of SMB source server>\source_share \\<IP address of SMB destination server>\dest_share  
xcp verify -noctime \\<IP address of SMB source server>\source_share  
\\<IP address of SMB destination server>\dest_share  
  
xcp verify -noctime \\<IP address of SMB source server>\source_share

374 scanned, 373 compared, 373 same, 0 different, 0 missing, 0 errors  
Total Time : 3s  
STATUS : PASSED
```

## verify -nomtime

Use the `-nomtime` parameter with the `verify` command to not compare file modification time stamps from the source to destination.

## Syntax

```
xcp verify -nomtime \\<IP address of SMB source server>\source_share \\<IP address of SMB destination server>\dest_share
```

## Show example

```
c:\netapp\xcp>xcp verify -nomtime \\<IP address of SMB source server>\source_share \\<IP address of SMB destination server>\dest_share  
xcp verify -nomtime \\<IP address of SMB source server>\source_share  
\\<IP address of SMB destination server>\dest_share : PASSED  
374 scanned, 373 compared, 373 same, 0 different, 0 missing, 0 errors  
Total Time : 3s  
STATUS : PASSED
```

## verify -noattrs

Use the `-noattrs` parameter with the `verify` command to not check attributes.

## Syntax

```
xcp verify -noattrs \\<IP address of SMB source server>\source_share \\<IP address of SMB destination server>\dest_share
```

## Show example

```
c:\netapp\xcp>xcp verify -noattrs \\<IP address of SMB source server>\source_share \\<IP address of SMB destination server>\dest_share  
xcp verify -noattrs \\<IP address of SMB source server>\source_share \\<IP address of SMB destination server>\dest_share  
  
xcp verify -noattrs \\<IP address of SMB source server>\source_share \\<IP address of SMB destination server>\dest_share : PASSED  
374 scanned, 373 compared, 373 same, 0 different, 0 missing, 0 errors  
Total Time : 3s  
STATUS : PASSED
```

## verify -noownership

Use the `-noownership` parameter with the `verify` command to not check ownership.

## Syntax

```
xcp verify -noownership \\<IP address of SMB source server>\source_share \\<IP address of SMB destination server>\dest_share
```

## Show example

```
c:\netapp\xcp>xcp verify -noownership \\<IP address of SMB source  
server>\source_share \\<IP address of SMB destination  
server>\dest_share  
xcp verify -noownership \\<IP address of SMB source  
server>\source_share \\<IP address of SMB destination  
server>\dest_share  
  
xcp verify -noownership \\<IP address of SMB source  
server>\source_share \\<IP address of SMB destination  
server>\dest_share : PASSED  
374 scanned, 373 compared, 373 same, 0 different, 0 missing, 0 errors  
Total Time : 3s  
STATUS : PASSED
```

## verify -ads

Using `-ads` parameter with the `verify` command to read if there are any alternate data streams on the source and destination and display any differences.

### Syntax

```
xcp verify -ads \\<IP address or hostname of SMB server>\source_share  
\\<IP address of SMB destination server>\dest_share
```

## Show example

```
c:\netapp\xcp>xcp verify -ads \\<source_IP_address>\source_share\src  
\\<dest_IP_address>\dest_share

## verify -noacls

Use the `-noacls` parameter with the `verify` command to not check ACLs.

### Syntax

```
xcp verify -noacls -noownership \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination server>\dest_share
```

### Show example

```
c:\netapp\xcp>xcp verify -noacls -noownership \\<IP address or hostname
of SMB server>\source_share \\<IP address of SMB destination
server>\dest_share
xcp verify -noacls -noownership \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share

xcp verify -noacls -noownership \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share
318 scanned, 317 compared, 317 same, 0 different, 0 missing, 0 errors
Total Time : 1s
STATUS : PASSED
```

## verify -noacls -noownership

Use the `-noownership` parameter with `verify -noacls` to not check ACLs or ownership from the source to the destination.

### Syntax

```
xcp verify -noacls -noownership <source> <target>
```

## **verify -atimewindow <float>**

Use the `-atimewindow <float>` parameter with the `verify` command to specify the acceptable difference, in seconds, for the `atime` of a file from the source to the destination. XCP does not report files as being different if the difference in `atime` is less than `<value>`. The `verify -atimewindow` command can only be used with the `-atime` flag.

### **Syntax**

```
xcp verify -atimewindow <float> \\<IP address of SMB source server>\source_share \\<IP address of SMB destination server>\dest_share
```

### **Show example**

```
c:\Netapp\xcp> xcp verify -atimewindow 600 -atime \\<IP address of SMB source server>\source_share \\<IP address of SMB destination server>\dest_share

xcp verify -atimewindow 600 -atime \\<IP address of SMB source server>\source_share \\<IP address of SMB destination server>\dest_share

14 scanned, 13 compared, 13 same, 0 different, 0 missing, 0 errors
```

## **verify -ctimewindow <float>**

Use the `-ctimewindow <float>` parameter with the `verify` command to specify the acceptable difference, in seconds, for the `ctime` of a file from the source to the destination. XCP does not report files as being different when the difference in `ctime` is less than `<value>`.

### **Syntax**

```
xcp verify -ctimewindow <float> \\<IP address or hostname of SMB server>\source_share \\<IP address of SMB destination server>\dest_share
```

## Show example

```
c:\netapp\xcp>xcp verify -ctimewindow 600 \\<IP address of SMB  
sourceserver>\source_share \\<IP address of SMB destination  
server>\dest_share  
xcp verify -ctimewindow 600 \\<IP address of SMB source  
server>\source_share \\<IP address of SMB destination  
server>\dest_share  
  
xcp verify -ctimewindow 600 \\<IP address of SMB source  
server>\source_share \\<IP address of SMB destination  
server>\dest_share  
374 scanned, 373 compared, 373 same, 0 different, 0 missing, 0 errors  
Total Time : 3s  
STATUS : PASSED
```

## verify -mtimewindow <float>

Use the `-mtimewindow <float>` parameter with the `verify` command to specify the acceptable difference, in seconds, for the `mtime` of a file from the source to the destination. XCP does not report files as being different when the difference in `mtime` is less than `<value>`.

## Syntax

```
xcp verify -mtimewindow <float> \\<IP address of SMB  
sourceserver>\source_share \\<IP address of SMB destination  
server>\dest_share
```

## Show example

```
c:\netapp\xcp>xcp verify -mtimewindow 600 \\<IP address of SMB  
sourceserver>\source_share \\<IP address of SMB destination  
server>\dest_share  
xcp verify -mtimewindow 600 \\<IP address of SMB source  
server>\source_share \\<IP address of SMB destination  
server>\dest_share  
  
xcp verify -mtimewindow 600 \\<IP address of SMB source  
server>\source_share \\<IP address of SMB destination  
server>\dest_share  
374 scanned, 373 compared, 373 same, 0 different, 0 missing, 0 errors  
Total Time : 3s  
STATUS : PASSED
```

## **verify -stats**

Use the **-stats** parameter with the **verify** command to scan the source and the destination and print a tree statistics report showing similarities or differences between the two shares.

### **Syntax**

```
xcp verify -stats \\<IP address or hostname of SMB server>\source_share  
\\<IP address of SMB destination server>\dest_share
```

**Show example**

```

c:\netapp\xcp>xcp verify -stats \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share
xcp verify -stats \\<IP address or hostname of SMB server>\source_share
\\<IP address of SMB destination server>\dest_share

635 scanned, 0 errors Total Time : 1s
STATUS : PASSED

```

## **verify -l**

Use the **-l** parameter with the **verify** command to list the differences between files and directories on the source and destination.

### **Syntax**

```
xcp verify -l \\<IP address of SMB source server>\source_share \\<IP  
address of SMB destination server>\dest_share
```

In the following example, during copy, the ownership information was not transferred, and you can see the differences in the command output.

### **Show example**

```
c:\netapp\xcp>xcp verify -l \\<IP address of SMB source  
server>\source_share \\<IP address of SMB destination  
server>\dest_share  
xcp verify -l \\<IP address of SMB source server>\source_share \\<IP  
address of SMB destination server>\dest_share  
  
xcp verify -l \\<IP address of SMB source server>\source_share \\<IP  
address of SMB destination server>\dest_share  
374 scanned, 373 compared, 373 same, 0 different, 0 missing, 0 errors  
Total Time : 3s  
STATUS : PASSED
```

## **verify -ll**

Use the **-ll** parameter with the **verify** command to list the detailed differences of the files or directories from the source and the target. The format is like git diff. The red value is the old one from the source, and the green value is the new one from the target.

### **Syntax**

```
xcp verify -ll \\<IP address of SMB source server>\source_share \\<IP  
address of SMB destination server>\dest_share
```

## Show example

```
c:\netapp\xcp>xcp verify -ll \\<IP address of SMB source server>\source_share \\<IP address of SMB destination server>\dest_share  
xcp verify -ll \\<IP address of SMB source server>\source_share \\<IP address of SMB destination server>\dest_share  
  
xcp verify -ll \\<IP address of SMB source server>\source_share \\<IP address of SMB destination server>\dest_share  
374 scanned, 373 compared, 373 same, 0 different, 0 missing, 0 errors  
Total Time : 3s  
STATUS : PASSED
```

### **verify-fallback-user <fallback\_user> -fallback-group <fallback\_group>**

Use the `-fallback-user` and `-fallback-group` parameters with the `verify` command to list the ACL and ownership differences between files and directories on the source and destination.

If you use `fallback-user` and `fallback-group` with a copy or sync operation, NetApp recommends that you also use the `fallback-user` and `fallback-group` parameters with the `verify` operation.

## Syntax

```
xcp verify -fallback-user <fallback_user> -fallback-group <fallback_group>  
\\<IP address of SMB source server>\source_share \\<IP address of SMB destination server>\dest_share
```

### **verify -noownership-fallback-user <fallback\_user> -fallback-group <fallback\_group>**

Use the `-noownership`, `-fallback-user`, and `-fallback-group` parameters with the `verify` command to list the ACL differences and skip verification of ownership between files and directories on the source and destination.

## Syntax

```
xcp verify -noownership -fallback-user <fallback_user> -fallback-group <fallback_group>  
\\<IP address of SMB source server>\source_share \\<IP address of SMB destination server>\dest_share
```

### **verify -noacls-fallback-user <fallback\_user> -fallback-group <fallback\_group>**

Use the `-noacls`, `-fallback-user`, and `-fallback-group` parameters with the `verify` command to skip verification of ACLs and verify ownership between files and directories on the source and destination.

## Syntax

```
xcp verify -noacls -fallback-user <fallback_user> -fallback-group  
<fallback_group> \\<IP address of SMB source server>\source_share \\<IP  
address of SMB destination server>\dest_share
```

## verify -root

Use the `-root` parameter with the `verify` command to sync the ACLs for the root directory.

## Syntax

```
xcp verify -root -fallback-user <fallback_user> -fallback- group  
<fallback_group> \\<IP address of SMB source server>\source_share \\<IP  
address of SMB destination server>\dest_share
```

## Show example

```
C:\NetApp\XCP>xcp verify -root -fallback-user "DOMAIN\User" -fallback  
-group "DOMAIN\Group" \\<IP address of SMB source server>\source_share  
\\<IP address of SMB destination server>\dest_share

xcp verify -l -root -fallback-user "DOMAIN\User" -fallback-group  
"DOMAIN\Group" \\<IP address of SMB source server>\source_share \\<IP  
address of SMB destination server>\dest_share

```

## verify -onlyacl -fallback-user <fallback\_user> -fallback- group <fallback\_group>

Use the `-onlyacl`, `-fallback-user` and `-fallback-group` parameters with the `verify` command to compare only the security information between the source and destination.

## Syntax

```
xcp verify -onlyacl -preserve-atime -fallback-user <fallback_user>  
-fallback- group <fallback_group> \\<IP address of SMB source  
server>\source_share \\<IP address of SMB destination server>\dest_share
```

## Show example

```
C:\Users\ctladmin\Desktop>xcp verify -onlyacl -preserve-atime -fallback  
-user "DOMAIN\User" -fallback-group "DOMAIN\Group" -ll  
\\"<source_IP_address>\source_share \\"<IP address of SMB destination  
server>\dest_share

```

## configure

The `configure` command configures the SMB system and connects to the system where the PostgreSQL database is running.

## Syntax

```
xcp.exe configure
```

## Show example

```
C:\NetApp\XCP>xcp.exe configure

Please choose the menu you want to start:
1. Configure xcp.ini file
0. Quit
```

## listen

The `listen` command reads the XCP binary and starts the XCP services.

## Syntax

```
xcp.exe listen
```

## Show example

```
c:\NetApp\XCP>xcp.exe listen
* Serving Flask app "xcp_rest_smb_app" (lazy loading)
* Environment: production
  WARNING: This is a development server. Do not use it in a production
  deployment. Use a production WSGI server instead.
* Debug mode: off
```

# XCP use cases

## Use cases for XCP NFS and SMB

Learn about XCP different data migration use cases for NetApp XCP.

[Data migration from 7-Mode to ONTAP](#)

[CIFS data migration with ACLs from a source storage box to ONTAP](#)

# XCP logging

## Set the logConfig option

Learn about the logConfig option in the `xcpLogConfig.json` JSON configuration file for XCP NFS and SMB.

The following example shows the JSON configuration file set with the “logConfig” option:

### Example

```
{  
  "level": "INFO",  
  "maxBytes": "52428800",  
  "name": "xcp.log"  
}
```

- With this configuration you can filter messages according to their severity by selecting a valid level value from CRITICAL, ERROR, WARNING, INFO, and Debug.
- The `maxBytes` setting enables you to change the file size of the rotating log files. The default is 50MB. Setting the value to 0 stops rotation and a single file is created for all logs.
- The `name` option configures the name of the log file.
- If any key value pair is missing, the system uses the default value. If you make a mistake specifying the name of an existing key, it is treated as a new key, and the new key does not affect how the systems works or system functionality.

## Set the eventlog option

XCP supports event messaging, which you can enable using the `eventlog` option in the `xcpLogConfig.json` config file.

For NFS, all event messages are written to the `xcp_event.log` file located in either the default location `/opt/NetApp/xFiles/xcp/` or a custom location configured using the following environment variable:

`XCP_CONFIG_DIR`

When both locations are set, `XCP_LOG_DIR` is used.

For SMB, all event messages are written to the file `xcp_event.log` located in the default location `C:\NetApp\XCP\`.

### JSON configuration for event messaging for NFS and SMB

In the following examples, the JSON configuration files enable event messaging for NFS and SMB.

### Example JSON configuration file with the eventlog option enabled

```
{  
  "eventlog": {  
    "isEnabled": true,  
    "level": "INFO"  
  },  
  "sanitize": false  
}
```

### Example JSON configuration file with eventlog and other options enabled

```
{  
  "logConfig": {  
    "level": "INFO",  
    "maxBytes": 52428800,  
    "name": "xcp.log"  
  },  
  "eventlog": {  
    "isEnabled": true,  
    "level": "INFO"  
  },  
  "syslog": {  
    "isEnabled": true,  
    "level": "info",  
    "serverIp": "10.101.101.10",  
    "port": 514  
  },  
  "sanitize": false  
}
```

The following table shows the eventlog sub options and their description:

Sub option	JSON data type	Default value	Description
isEnabled	Boolean	False	This boolean option is used to enable event messaging. If set to false, it does not generate any event messages and no event logs are published to the event log file.
level	String	INFO	Event message severity filter level. Event messaging support five severity levels in order of decreasing severity: CRITICAL, ERROR, WARNING, INFO, and DEBUG

### Template for an NFS event log message

The following table shows a template and an example for an NFS event log message:

Template	Example
<pre>&lt;Time stamp&gt; - &lt;Severity level&gt; {"Event ID": &lt;ID&gt;, "Event Category":&lt;category of xcp event log&gt;, "Event Type": &lt;type of event log&gt;, "ExecutionId": &lt; unique ID for each xcp command execution &gt;, "Event Source": &lt;host name&gt;, "Description": &lt;XCP event log message&gt;}</pre>	<pre>2020-07-14 07:07:07,286 - ERROR {"Event ID": 51, "Event Category": "Application failure", "Event Type": "No space left on destination error", "ExecutionId": 408252316712, "Event Source": "NETAPP-01", "Description": "Target volume is left with no free space while executing : copy {}. Please increase the size of target volume 10.101.101.101:/cat_vol"}</pre>

### Eventlog message options

The following options are available for an eventlog message:

- Event ID: The unique identifier for each event log message.
- Event Category: Explains the category of event type and event log message.
- Event Type: This is a short string that describes the event message. Multiple event types can belong to one category.
- Description: The description field contains the event log message generated by XCP.
- ExecutionId: A unique identifier for each XCP command executed.

### Enable the syslog client

XCP supports a syslog client to send XCP event log messages to a remote syslog receiver for NFS and SMB. It supports the UDP protocol using the default port 514.

#### Configure the syslog client for NFS and SMB

Enabling the syslog client requires configuring the `syslog` option in the the `xcpLogConfig.json` configuration file for NFS and SMB.

The following example configuration for the syslog client for NFS and SMB:

```
{
  "syslog": {
    "isEnabled": true,
    "level": "INFO",
    "serverIp": "10.101.101.d",
    "port": 514
  },
  "sanitize": false
}
```

## Syslog options

The following table shows the syslog sub options and their description:

Sub option	JSON data type	Default value	Description
isEnabled	Boolean	False	This Boolean option enables the syslog client in XCP. Setting it to false will ignore the syslog configuration.
level	String	INFO	Event message severity filter level. Event messaging support five severity levels in order of decreasing severity: CRITICAL, ERROR, WARNING, INFO, and DEBUG
serverIp	String	None	This option lists the remote syslog server IP addresses or hostnames.
port	Integer	514	This option is the remote syslog receiver port. You can configure syslog receivers to accept syslog datagrams on a different port with this option. The default UDP port is 514.

The sanitize option should not be specified within "syslog" configuration. This option has a global scope and is common to logging, event log, and syslog within JSON config. Setting this value to "true" will hide sensitive information in syslog messages posted to the syslog server.

## Syslog message format

Every syslog messages sent to the remote syslog server over UDP is formatted as per the RFC 5424 format for NFS and SMB.

The following table shows the severity level as per RFC 5424 supported for syslog messages for XCP:

Severity values	Severity level
3	Error: error conditions
4	Warning: warning conditions
6	Informational: informational messages
7	Debug: debug-level messages

In the syslog header for NFS and SMB, version has a value of 1 and the facility value for all messages for XCP is set to 1 (user-level messages):

<PRI> = syslog facility \* 8 + severity value

## XCP application syslog message format with a syslog header for NFS:

The following table shows a template and example of the syslog message format with a syslog header for NFS:

Template	Example
<PRI><version> <Time stamp> <hostname> xcp_nfs - - - <XCP message>	<14>1 2020-07-08T06:30:34.341Z netapp xcp_nfs - - - INFO {"Event ID": 14, "Event Category": "XCP job status", "Event Type": "XCP scan completion", "Event Source": "netapp", "Description": "XCP scan is completed by scanning 8 items"}

### XCP application message without syslog header for NFS

The following table shows a template and example of the syslog message format without a syslog header for NFS:

Template	Example
<message severity level i.e CRITICAL, ERROR, WARNING, INFO, DEBUG> <XCP event log message>	INFO {"Event ID": 14, "Event Category": "XCP job status", "Event Type": "XCP scan completion", "Event Source": "netapp", "Description": "XCP scan is completed by scanning 8 items"}

### XCP application syslog message format with syslog header for SMB

The following table shows a template and example of the syslog message format with a syslog header for SMB:

Template	Example
<PRI><version> <Time stamp> <hostname> xcp_smb - - - <XCP message>	<14>1 2020-07-10T10:37:18.452Z bansala01 xcp_smb - - - INFO {"Event ID": 14, "Event Category": "XCP job status", "Event Type": "XCP scan completion", "Event Source": "NETAPP-01", "Description": "XCP scan is completed by scanning 17 items"}

### XCP application message without syslog header for SMB

The following table shows a template and example of the syslog message format without a syslog header for SMB:

Template	Example
<message severity level i.e CRITICAL, ERROR, WARNING, INFO, DEBUG> <XCP event log message>	NFO {"Event ID": 14, "Event Category": "XCP job status", "Event Type": "XCP scan completion", "Event Source": "NETAPP-01", "Description": "XCP scan is completed by scanning 17 items"}

# XCP event logs

## XCP NFS event logs

Review example event logs for XCP NFS.

The following table shows event logs for XCP NFS.

Event ID	Event template	Event example
